

Programmable Controller

Transition from MELSEC-AnS/QnAS (Small Type) Series to L Series Handbook

(Intelligent Function Modules)

Feb. 2020 Edition

● SAFETY PRECAUTIONS ●

(Read these precautions before using this product.)

Before using this product, please read this handbook and the relevant manuals introduced in this handbook carefully and pay full attention to safety to handle the product correctly.

In this manual, the safety precautions are classified into two levels: "⚠ WARNING" and "⚠ CAUTION".

Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.

Indicates that incorrect handling may cause hazardous conditions, resulting in minor or moderate injury or property damage.

Under some circumstances, failure to observe the precautions given under "⚠ CAUTION" may lead to serious consequences.

Observe the precautions of both levels because they are important for personal and system safety.

[Design Precautions]

WARNING

- Configure safety circuits external to the programmable controller to ensure that the entire system operates safely even when a fault occurs in the external power supply or the programmable controller. Failure to do so may result in an accident due to an incorrect output or malfunction.
 - (1) Emergency stop circuits, protection circuits, and protective interlock circuits for conflicting operations (such as forward/reverse rotations or upper/lower limit positioning) must be configured external to the programmable controller.
 - (2) Machine OPR (Original Point Return) of the positioning function is controlled by two kinds of data: an OPR direction and an OPR speed. Deceleration starts when the near-point watchdog signal turns on. If an incorrect OPR direction is set, motion control may continue without deceleration. To prevent machine damage caused by this, configure an interlock circuit external to the programmable controller.
 - (3) When the CPU module detects an error during control by the positioning function, the motion slows down and stops.
 - (4) When the programmable controller detects an abnormal condition, it stops the operation and all outputs are:
 - Turned off if the overcurrent or overvoltage protection of the power supply module is activated.
 - Held or turned off according to the parameter setting if the self-diagnostic function of the CPU module detects an error such as a watchdog timer error.

Also, all outputs may be turned on if an error occurs in a part, such as an I/O control part, where the CPU module cannot detect any error. To ensure safety operation in such a case, provide a safety mechanism or a fail-safe circuit external to the programmable controller. For a fail-safe circuit example, refer to the MELSEC-L CPU Module User's Manual (Hardware Design, Maintenance and Inspection).
 - (5) Outputs may remain on or off due to a failure of a component such as a transistor in an output circuit. Configure an external circuit for monitoring output signals that could cause a serious accident.
- In an output circuit, when a load current exceeding the rated current or an overcurrent caused by a load short-circuit flows for a long time, it may cause smoke and fire. To prevent this, configure an external safety circuit, such as a fuse.
- Configure a circuit so that the programmable controller is turned on first and then the external power supply. If the external power supply is turned on first, an accident may occur due to an incorrect output or malfunction.
- Configure a circuit so that the external power supply is turned off first and then the programmable controller. If the programmable controller is turned off first, an accident may occur due to an incorrect output or malfunction.
- For the operating status of each station after a communication failure, refer to relevant manuals for each network. Incorrect output or malfunction due to a communication failure may result in an accident.

[Design Precautions] **WARNING**

- When changing data from a peripheral device connected to the CPU module to the running programmable controller, configure an interlock circuit in the program to ensure that the entire system will always operate safely. For other forms of control (such as program modification or operating status change) of a running programmable controller, read the relevant manuals carefully and ensure that the operation is safe before proceeding. Especially, when a remote programmable controller is controlled by an external device, immediate action cannot be taken if a problem occurs in the programmable controller due to a communication failure. To prevent this, configure an interlock circuit in the program, and determine corrective actions to be taken between the external device and CPU module in case of a communication failure.
- An absolute position restoration by the positioning function may turn off the servo-on signal (servo off) for approximately 20ms, and the motor may run unexpectedly. If this causes a problem, provide an electromagnetic brake to lock the motor during absolute position restoration.

[Design Precautions]

CAUTION

- Do not install the control lines or communication cables together with the main circuit lines or power cables. Keep a distance of 100mm or more between them. Failure to do so may result in malfunction due to noise.
- During control of an inductive load such as a lamp, heater, or solenoid valve, a large current (approximately ten times greater than normal) may flow when the output is turned from off to on. Therefore, use a module that has a sufficient current rating.
- After the CPU module is powered on or is reset, the time taken to enter the RUN status varies depending on the system configuration, parameter settings, and/or program size. Design circuits so that the entire system will always operate safely, regardless of the time.

[Installation Precautions]

WARNING

- Shut off the external power supply (all phases) used in the system before mounting or removing a module. Failure to do so may result in electric shock or cause the module to fail or malfunction.

CAUTION

- Use the programmable controller in an environment that meets the general specifications in the MELSEC-L CPU Module User's Manual (Hardware Design, Maintenance and Inspection). Failure to do so may result in electric shock, fire, malfunction, or damage to or deterioration of the product.
- To interconnect modules, engage the respective connectors and securely lock the module joint levers. Incorrect interconnection may cause malfunction, failure, or drop of the module.
- Do not directly touch any conductive parts and electronic components of the module. Doing so can cause malfunction or failure of the module.
- Securely connect an extension cable to the connectors of a branch module and an extension module. After connections, check that the cable is inserted completely. Poor contact may cause malfunction.
- When using an SD memory card, fully insert it into the SD memory card slot. Check that it is inserted completely. Poor contact may cause malfunction.
- Do not directly touch any conductive parts and electronic components of the module or SD memory card. Doing so can cause malfunction or failure of the module.

[Wiring Precautions]

WARNING

- Shut off the external power supply (all phases) used in the system before wiring. Failure to do so may result in electric shock or cause the module to fail or malfunction.
- After installation and wiring, attach the included terminal cover to the module before turning it on for operation. Failure to do so may result in electric shock.

[Wiring Precautions]

CAUTION

- Individually ground the FG and LG terminals of the programmable controller with a ground resistance of 100Ω or less. Failure to do so may result in electric shock or malfunction.
- Use applicable solderless terminals and tighten them within the specified torque range. If any spade solderless terminal is used, it may be disconnected when a terminal block screw comes loose, resulting in failure.
- Check the rated voltage and terminal layout before wiring to the module, and connect the cables correctly. Connecting a power supply with a different voltage rating or incorrect wiring may cause a fire or failure.
- Connectors for external devices must be crimped or pressed with the tool specified by the manufacturer, or must be correctly soldered. Incomplete connections may cause short circuit, fire, or malfunction.
- Securely connect the connector to the module.
- Do not install the control lines or communication cables together with the main circuit lines or power cables. Keep a distance of 100mm or more between them. Failure to do so may result in malfunction due to noise.
- Place the cables in a duct or clamp them. If not, dangling cable may swing or inadvertently be pulled, resulting in damage to the module or cables or malfunction due to poor contact.
- Check the interface type and correctly connect the cable. Incorrect wiring (connecting the cable to an incorrect interface) may cause failure of the module and external device.
- Tighten the terminal block screws within the specified torque range. Undertightening can cause short circuit, fire, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, fire, or malfunction.
- When disconnecting the cable from the module, do not pull the cable by the cable part. For the cable with connector, hold the connector part of the cable. For the cable connected to the terminal block, loosen the terminal screw. Pulling the cable connected to the module may result in malfunction or damage to the module or cable.
- Prevent foreign matter such as dust or wire chips from entering the module. Such foreign matter can cause a fire, failure, or malfunction.
- A protective film is attached to the top of the module to prevent foreign matter, such as wire chips, from entering the module during wiring. Do not remove the film during wiring. Remove it for heat dissipation before system operation.
- To use the high-speed counter function, ground the shield cable on the encoder side (relay box) with a ground resistance of 100Ω or less. Failure to do so may cause malfunction.
- Mitsubishi programmable controllers must be installed in control panels. Connect the main power supply to the power supply module in the control panel through a relay terminal block.
Wiring and replacement of a power supply module must be performed by qualified maintenance personnel with knowledge of protection against electric shock. For wiring methods, refer to the MELSEC-L CPU Module User's Manual (Hardware Design, Maintenance and Inspection).

[Startup and Maintenance Precautions]

WARNING

- Do not touch any terminal while power is on. Doing so will cause electric shock or malfunction.
- Correctly connect the battery connector. Do not charge, disassemble, heat, short-circuit, solder, or throw the battery into the fire. Also, do not expose it to liquid or strong shock.
Doing so will cause the battery to produce heat, explode, ignite, or leak, resulting in injury and fire.
- Shut off the external power supply (all phases) used in the system before cleaning the module or retightening the terminal block screws or the connector screws. Failure to do so may result in electric shock.

CAUTION

- Before performing online operations (especially, program modification, forced output, and operating status change) for the running CPU module from the peripheral device connected, read relevant manuals carefully and ensure the safety. Improper operation may damage machines or cause accidents.
- Do not disassemble or modify the modules. Doing so may cause failure, malfunction, injury, or a fire.
- Use any radio communication device such as a cellular phone or PHS (Personal Handy-phone System) more than 25cm away in all directions from the programmable controller. Failure to do so may cause malfunction.
- Shut off the external power supply (all phases) used in the system before mounting or removing a module. Failure to do so may cause the module to fail or malfunction.
- Tighten the terminal block screws and the connector screws within the specified torque range.
Undertightening can cause drop of the component or wire, short circuit, or malfunction.
Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction.
- After the first use of the product (module, display unit, and terminal block), the number of connections/disconnections is limited to 50 times (in accordance with IEC 61131-2). Exceeding the limit may cause malfunction.
- After the first use of the SD memory card, the number of insertions/removals is limited to 500 times. Exceeding the limit may cause malfunction.
- Do not drop or apply shock to the battery to be installed in the module. Doing so may damage the battery, causing the battery fluid to leak inside the battery. If the battery is dropped or any shock is applied to it, dispose of it without using.
- Before handling the module, touch a conducting object such as a grounded metal to discharge the static electricity from the human body. Failure to do so may cause the module to fail or malfunction.
- Before testing the operation by the positioning function, set a low speed value for the speed limit parameter so that the operation can be stopped immediately upon occurrence of a hazardous condition.

[Disposal Precautions] **CAUTION**

- When disposing of this product, treat it as industrial waste. When disposing of batteries, separate them from other wastes according to the local regulations. For details on battery regulations in EU member states, refer to the MELSEC-L CPU Module User's Manual (Hardware Design, Maintenance and Inspection).

[Transportation Precautions] **CAUTION**

- When transporting lithium batteries, follow the transportation regulations. For details on the regulated models, refer to the MELSEC-L CPU Module User's Manual (Hardware Design, Maintenance and Inspection).

● CONDITIONS OF USE FOR THE PRODUCT ●

- (1) Mitsubishi programmable controller ("the PRODUCT") shall be used in conditions;
 - i) where any problem, fault or failure occurring in the PRODUCT, if any, shall not lead to any major or serious accident; and
 - ii) where the backup and fail-safe function are systematically or automatically provided outside of the PRODUCT for the case of any problem, fault or failure occurring in the PRODUCT.

- (2) The PRODUCT has been designed and manufactured for the purpose of being used in general industries.

MITSUBISHI SHALL HAVE NO RESPONSIBILITY OR LIABILITY (INCLUDING, BUT NOT LIMITED TO ANY AND ALL RESPONSIBILITY OR LIABILITY BASED ON CONTRACT, WARRANTY, TORT, PRODUCT LIABILITY) FOR ANY INJURY OR DEATH TO PERSONS OR LOSS OR DAMAGE TO PROPERTY CAUSED BY the PRODUCT THAT ARE OPERATED OR USED IN APPLICATION NOT INTENDED OR EXCLUDED BY INSTRUCTIONS, PRECAUTIONS, OR WARNING CONTAINED IN MITSUBISHI'S USER, INSTRUCTION AND/OR SAFETY MANUALS, TECHNICAL BULLETINS AND GUIDELINES FOR the PRODUCT.

("Prohibited Application")

Prohibited Applications include, but not limited to, the use of the PRODUCT in;

- Nuclear Power Plants and any other power plants operated by Power companies, and/or any other cases in which the public could be affected if any problem or fault occurs in the PRODUCT.
- Railway companies or Public service purposes, and/or any other cases in which establishment of a special quality assurance system is required by the Purchaser or End User.
- Aircraft or Aerospace, Medical applications, Train equipment, transport equipment such as Elevator and Escalator, Incineration and Fuel devices, Vehicles, Manned transportation, Equipment for Recreation and Amusement, and Safety devices, handling of Nuclear or Hazardous Materials or Chemicals, Mining and Drilling, and/or other applications where there is a significant risk of injury to the public or property.

Notwithstanding the above restrictions, Mitsubishi may in its sole discretion, authorize use of the PRODUCT in one or more of the Prohibited Applications, provided that the usage of the PRODUCT is limited only for the specific applications agreed to by Mitsubishi and provided further that no special quality assurance or fail-safe, redundant or other safety features which exceed the general specifications of the PRODUCTS are required. For details, please contact the Mitsubishi representative in your region.

REVISIONS

4.2.2	Functional comparison	4 - 10
4.2.3	I/O signal comparison	4 - 12
4.2.4	Buffer memory address comparison	4 - 13
4.3	A1S66ADA	4 - 24
4.3.1	Performance specifications comparison	4 - 24
4.3.2	Functional comparison	4 - 28
4.3.3	I/O signal comparison	4 - 30
4.3.4	Buffer memory address comparison	4 - 32

CHAPTER 5 HEATING-COOLING TEMPERATURE CONTROL MODULE/ TEMPERATURE CONTROL MODULE REPLACEMENT

5 - 1 to 5 - 65

5.1	List of Heating-cooling Temperature Control Module/Temperature Control Module Alternative Models for Replacement	5 - 1
5.2	Performance Specifications Comparison	5 - 3
5.2.1	A1S64TCTRT(BW) (thermocouple connection)	5 - 3
5.2.2	A1S64TCTRT(BW) (platinum resistance thermometer connection)	5 - 7
5.2.3	A1S64TCTT(BW)-S1	5 - 11
5.2.4	A1S64TCRT(BW)-S1	5 - 17
5.2.5	A1S62TCTT(BW)-S2	5 - 21
5.2.6	A1S62TCRT(BW)-S2	5 - 27
5.3	Functional Comparison	5 - 33
5.4	I/O Signal Comparison	5 - 35
5.4.1	A1S64TCTRT(BW) and L series modules (standard control)	5 - 35
5.4.2	A1S64TCTRT(BW) and L series modules (heating-cooling control)	5 - 37
5.4.3	A1S64TCTT(BW)-S1/A1S64TCRT(BW)-S1 and L series modules	5 - 39
5.4.4	A1S62TCTT(BW)-S2/A1S62TCRT(BW)-S2 and L series modules	5 - 41
5.5	Buffer Memory Address Comparison	5 - 43
5.5.1	A1S64TCTRT(BW) and L series modules (standard control)	5 - 43

5.5.2	A1S64TCTRT(BW) and L series modules (heating-cooling control)	5 - 49
5.5.3	A1S64TCTT(BW)-S1/A1S64TCRT(BW)-S1 and L series modules	5 - 55
5.5.4	A1S62TCTT(BW)-S2/A1S62TCRT(BW)-S2 and L series modules	5 - 61

CHAPTER 6 HIGH-SPEED COUNTER MODULE REPLACEMENT **6 - 1 to 6 - 24**

6.1	List of High-Speed Counter Module Alternative Models for Replacement	6 - 1
6.2	A1SD61	6 - 6
6.2.1	Performance specifications comparison	6 - 6
6.2.2	Functional comparison	6 - 10
6.2.3	I/O signal comparison	6 - 11
6.2.4	Buffer memory address comparison	6 - 12
6.3	A1SD62(E/D/D-S1)	6 - 13
6.3.1	Performance specifications comparison	6 - 13
6.3.2	Functional comparison	6 - 21
6.3.3	I/O signal comparison	6 - 22
6.3.4	Buffer memory address comparison	6 - 24

CHAPTER 7 POSITIONING MODULE REPLACEMENT **7 - 1 to 7 - 18**

7.1	List of Positioning Module Alternative Models for Replacement	7 - 1
7.2	A1SD75P1-S3/P2-S3/P3-S3	7 - 3
7.2.1	Performance specifications comparison	7 - 3
7.2.2	Functional comparison	7 - 7
7.2.3	I/O signal comparison	7 - 10
7.2.4	Buffer memory address comparison	7 - 11
7.2.5	External interface specifications comparison	7 - 18

CHAPTER 8 REPLACEMENT OF OTHER MODULES **8 - 1 to 8 - 2**

8.1	Replacement of Other Modules	8 - 1
-----	------------------------------	-------

APPENDICES **APPX - 1 to APPX - 8**

Appendix 1	External Dimensions	APPX - 1
Appendix 2	Spare Parts Storage	APPX - 1
Appendix 3	Relevant Manuals	APPX - 2
Appendix 3.1	Replacement handbooks	APPX - 2
Appendix 3.2	AnS series manuals	APPX - 3
Appendix 3.3	L series manuals	APPX - 4
Appendix 3.4	Programming tool manuals	APPX - 4
Appendix 4	How to Change Resolution After Analog I/O Module is Replaced	APPX - 5
Appendix 4.1	Resolution	APPX - 5
Appendix 4.2	Using the scaling function of an analog I/O module	APPX - 5
Appendix 4.3	Adding the scaling operation function to sequence program	APPX - 6

- For the products shown in handbooks for transition, catalogues, and transition examples, refer to the manuals for the relevant products and check the detailed specifications, precautions for use, and restrictions before replacement.

For the products manufactured by Mitsubishi Electric Engineering Co., Ltd., Mitsubishi Electric System & Service Co., Ltd., and other companies, refer to the catalogue for each product and check the detailed specifications, precautions for use, and restrictions before use.

The manuals and catalogues for our products, products manufactured by Mitsubishi Electric Engineering Co., Ltd., and Mitsubishi Electric System & Service Co., Ltd. are shown in Appendix of each handbook for transition.

- Details of models certified by each standard are available at the following Mitsubishi Electric FA site:
<http://www.mitsubishielectric.com/fa/worldwide/index.html>
- Products shown in this handbook are subject to change without notice.

GENERIC TERMS AND ABBREVIATIONS

Unless otherwise specified, this handbook uses the following generic terms and abbreviations.

Generic term/abbreviation	Description
■Series	
A series	The abbreviation for large types of Mitsubishi Electric MELSEC-A series programmable controllers
AnS series	The abbreviation for compact types of Mitsubishi Electric MELSEC-A series programmable controllers
A/AnS series	A generic term for A series and AnS series
QnA series	The abbreviation for large types of Mitsubishi Electric MELSEC-QnA series programmable controllers
QnAS series	The abbreviation for compact types of Mitsubishi Electric MELSEC-QnA series programmable controllers
QnA/QnAS series	A generic term for QnA series and QnAS series
A/AnS/QnA/QnAS series	A generic term for A series, AnS series, QnA series, and QnAS series
Q series	The abbreviation for Mitsubishi Electric MELSEC-Q series programmable controllers
L series	The abbreviation for Mitsubishi Electric MELSEC-L series programmable controllers
■CPU module type	
CPU module	A generic term for A series, AnS series, QnA series, QnAS series, Q series, and L series CPU modules
Process CPU	A generic term for the Q02PHCPU, Q06PHCPU, Q12PHCPU, and Q25PHCPU
Redundant CPU	A generic term for the Q12PRHCPU and Q25PRHCPU
Universal model QCPU	A generic term for the Q00UJCPU, Q00UCPU, Q01UCPU, Q02UCPU, Q03UDCPU, Q03UDVCPU, Q03UDECPU, Q04UDHCPU, Q04UDVCPU, Q04UDEHCPU, Q06UDHCPU, Q06UDVCPU, Q06UDEHCPU, Q10UDHCPU, Q10UDEHCPU, Q13UDHCPU, Q13UDVCPU, Q13UDEHCPU, Q20UDHCPU, Q20UDEHCPU, Q26UDHCPU, Q26UDVCPU, and Q26UDEHCPU
■CPU module model	
ACPU	A generic term for MELSEC-A series CPU modules
AnSCPU	A generic term for MELSEC-AnS series CPU modules
AnNCP	A generic term for the A1NCP, A1NCPUP21/R21, A1NCPUP21-S3, A2NCP, A2NCP-S1, A2NCPUP21/R21, A2NCPUP21/R21-S1, A2NCPUP21-S3(S4), A3NCP, A3NCPUP21/R21, and A3NCPUP21-S3
AnACPU	A generic term for the A2ACPU, A2ACPU-S1, A3ACPU, A2ACPUP21/R21, A2ACPUP21/R21-S1, and A3ACPUP21/R21
AnUCPU	A generic term for the A2UCPU, A2UCPU-S1, A3UCPU, and A4UCPU
AnUS(H)CPU	A generic term for the A2USCPU, A2USCPU-S1, A2USHCPU-S1
A/AnSCPU	A generic term for MELSEC-A series and MELSEC-AnS series CPU modules
AnN/AnACPU	A generic term for the AnNCP and AnACPU
AnN/AnA/AnSCPU	A generic term for the AnNCP, AnACPU, and AnSCPU
QnACPU	A generic term for MELSEC-QnA series CPU modules
QnASCPU	A generic term for MELSEC-QnAS series CPU modules
QnA/QnASCPU	A generic term for MELSEC-QnA series and MELSEC-QnAS series CPU modules
A/AnS/QnA/QnASCPU	A generic term for A series, AnS series, QnA series, and QnAS series CPU modules
QCPU	A generic term for MELSEC-Q series CPU modules
LCPU	A generic term for MELSEC-L series CPU modules

1 INTRODUCTION

1.1 Advantages of Transition to L Series

Advantage 1) Advanced performance of equipments (shortened takt time)

In addition to the processing performance improvement for L series CPU, the processing speed for L series intelligent function module is also increased, so that the equipment capability to improve is possible.

Advantage 2) Baseless, flexible composition

The L series does not require a main base unit and can be installed in a minimum space without restrictions of the base unit size.

Even when a module is added, the number of modules is not constrained by the number of base slots, therefore the system cost such as addition of an extension base unit can be suppressed.

Advantage 3) Improved operating efficiency for programming and monitoring

The intelligent function module operation of GX Works2 can be used on the L series intelligent function module.

Though using the intelligent function module operation of GX Works2 is not required, the use enables the following and can reduce sequence programs.

- Initial setting is possible without a program.
- The auto refresh setting allows to read/write buffer memory data of intelligent function module automatically from/to the CPU device memory.
- Checking of the setting status or operating status of intelligent function module is simplified.

1.2 Precautions for Transition

- (1) When replacing the AnS/QnAS series with the L series, be sure to read the manuals of each L series module and confirm the functions, specifications, and how to use before using the L series.
- (2) After the AnS/QnAS series is replaced with the L series, be sure to verify the operation of the entire system before the start of operations.

2 ANALOG INPUT MODULE REPLACEMENT

2.1 List of Analog Input Module Alternative Models for Replacement

AnS/QnAS series		Transition to L series	
Product	Model	Model	Remarks (Restrictions)
Analog input module	A1S64AD	L60AD4	1) External wiring: Cable size is changed. 2) Number of slots: Not changed 3) Program: The number of occupied I/O points, I/O signals, resolution, and buffer memory addresses are changed. 4) Performance specifications: Not changed 5) Functional specifications: Not changed
		L60AD4	1) External wiring: Cable size is changed. 2) Number of slots: Changed (Two modules are required.) 3) Program: The number of occupied I/O points, I/O signals, resolution, and buffer memory addresses are changed. 4) Performance specifications: Four channels per module 5) Functional specifications: Not changed
	A1S68AD	L60ADVL8 (voltage)	1) External wiring: Cable size is changed. 2) Number of slots: Not changed
		L60ADIL8 (current)	3) Program: The number of occupied I/O points, I/O signals, resolution, and buffer memory addresses are changed. 4) Performance specifications: Input signals are changed (V or I input only). 5) Functional specifications: Not changed

☒ Point

The upgrade tool (conversion adapter) manufactured by Mitsubishi Electric Engineering Co., Ltd. enables to connect the existing wiring that was connected to the A1S64AD to L series modules without change.

Product	Existing module model	Alternative module model	Conversion adapter model*1	Space module LG69*1
Analog input module	A1S64AD	L60AD4	ERNT-ASLT64AD	Available

*1 For details on the conversion adapter or LG69, refer to the Transition from MELSEC-AnS/QnAS (Small Type) Series to L Series Handbook (Fundamentals)

2.2 A1S64AD

2.2.1 Performance specifications comparison

Item		A1S64AD
Analog input	Voltage	-10 to 0 to +10VDC (Input resistance value: 1MΩ)
	Current	-20 to 0 to +20mA (Input resistance value: 250Ω)
Digital output		16-bit signed binary When 1/4000 is set: -4096 to +4095 When 1/8000 is set: -8192 to +8191 When 1/12000 is set: -12288 to +12287
I/O characteristics		*1
Resolution		
Overall accuracy (Accuracy in respect to maximum digital output value)		±1% When 1/4000 is set: ±40 When 1/8000 is set: ±80 When 1/12000 is set: ±120

*1 I/O characteristics and maximum resolutions of the A1S64AD are shown below.

Item		Specifications		
I/O characteristics	Analog input	Digital output value (when gain 5V/20mA, offset 0V/0mA)		
		1/4000	1/8000	1/12000
	+10V	+4000	+8000	+12000
	+5V or +20mA	+2000	+4000	+6000
	0V or 0mA	0	0	0
	-5V or -20mA	-2000	-4000	-6000
	-10V	-4000	-8000	-12000
Resolution		1/4000	1/8000	1/12000
	Voltage input	2.5mV	1.25mV	0.83mV
	Current input	10μA	5μA	3.33μA

○ : Compatible, △ : Partial change required, × : Incompatible

Item	A1S64AD	
Maximum conversion speed	20ms/channel	
Absolute maximum input	Voltage: ±15V Current: ±30mA	
Number of analog input channels	4 channels/module	
Number of offset/gain settings	-	
Insulation method	Between the input terminal and programmable controller power supply: Photocoupler Between channels: Not insulated	
Withstand voltage	Between the input terminal and programmable controller power supply: 500VAC, for 1 minute	
Insulation resistance	Between the input terminal and programmable controller power supply: 500VDC, 5MΩ or higher	
Number of occupied I/O points	32 points (I/O assignment: special 32 points)	
External interface	20-point terminal block	
Applicable wire size	0.75 to 1.5mm ² (Applicable tightening torque: 39 to 59N•cm)	
Applicable solderless terminal	1.25-3, 1.25-YS3, V1.25-3, V1.25-YS3A	
Internal current consumption (5VDC)	0.40A	
Weight	0.25kg	

○ : Compatible, △ : Partial change required, × : Incompatible

	L60AD4	Compatibility	Precautions for replacement
	High speed: 20μs/channel (default) Medium speed: 80μs/channel Low speed: 1ms/channel	○	The conversion speed of L60AD4 is faster than A1S64AD. Therefore, noise which were not imported to A1S64AD can be imported as analog signals. In this case, use the averaging processing function to remove the effect of noise.
	Voltage: ±15V Current: ±30mA	○	
	4 channels/module	○	
	Up to 50000 times	○	
	Between the I/O terminal and programmable controller power supply: Photocoupler Between channels: Not insulated	○	
	Between the I/O terminal and programmable controller power supply: 500VACrms, for 1 minute	○	
	Between the I/O terminal and programmable controller power supply: 500VDC, 10MΩ or higher	○	
	16 points (I/O assignment: intelligent 16 points)	△	The number of occupied I/O points is changed to 16 points.
	18-point terminal block	×	Wiring needs to be changed.
	0.3 to 0.75mm ²	×	
	R1.25-3 (Solderless terminals with an insulation sleeve cannot be used.)	×	
	0.52A	△	Recalculation of internal current consumption (5VDC) is required.
	0.19kg	△	

2.2.2 Functional comparison

○ : Supported, – : Not supported

Item	Description	A1S64AD	L60AD4	Precautions for replacement
A/D conversion enable/ disable function	Sets whether to enable or disable the A/D conversion for each channel. By disabling the conversion for the channels that are not used, the sampling time can be shortened.	○	○	
Sampling processing	Performs the A/D conversion for analog input values successively for each channel, and outputs digital output values upon each conversion.	○	○	
Averaging processing	Time average	○	○	The setting range of average time and count differ. Refer to the MELSEC-L Analog-Digital Converter Module User's Manual, and check the specifications.
	Count average	○	○	
	Moving average	–	○	
Range switching function	Sets the input range to be used.	–	○	
Offset/gain setting function	Compensates for errors in digital output values.	○	○	
Conversion speed switch function	Sets the conversion speed.	–	○	
Input range extended mode function	Extends the input range. By combining this function with the input signal error detection function, simple disconnection detection can be executed.	–	○	This function can be used on GX Works2.*2
Maximum value/minimum value hold function	Stores the maximum and minimum values of the digital output values in the module.	–	○	This function can be used on GX Works2.*2
Input signal error detection function	Detects the analog input value which exceeds the setting range.	–	○	This function can be used on GX Works2.*2
Input signal error detection extension function	Extends the detection method of the input signal error detection function. Use this function to detect the input signal error only in the lower limit or upper limit, or to execute the disconnection detection.	–	○	This function can be used on GX Works2.*2
Warning output function (process alarm)	Outputs an alarm when a digital output value is within the range set in advance.	–	○	This function can be used on GX Works2.*2
Resolution mode	Sets the resolution according to the application. The resolution mode setting is applicable to all channels.*1	○	–	
Scaling function	Scale-converts the output digital value to the set range of the scaling upper limit value and scaling lower limit value. This omits the programming of the scale conversion.	–	○	By setting the same scaling upper limits and scaling lower limits as the resolution mode of A1S64AD, the same digital output values as A1S64AD can be used.*2
Shift function	Adds the set shifting amount of the conversion value to the scaling value (digital operation value) and stores the value in the buffer memory. Fine adjustment can be performed easily when the system starts.	–	○	This function can be used on GX Works2.*2
Digital clipping function	Sets the maximum value of the scaling value (digital operation value) to 20000 and the minimum value to 0 or -20000 when the input voltage or current exceeds the input range.	–	○	This function can be used on GX Works2.*2
Difference conversion function	Subtracts the difference conversion reference value from the scaling value (digital operation value) and stores the acquired value in the buffer memory.	–	○	This function can be used on GX Works2.*2
Logging function	Logs the digital output value or scaling value (digital operation value). The data of 10000 points can be logged for each channel.	–	○	This function can be used on GX Works2.*2
Flow amount integration function	Performs the A/D conversion of analog input value (voltage or current) from a source such as a flow meter and integrates the digital output value.	–	○	This function can be used on GX Works2.*2
Error log function	Stores the errors and alarms occurred in the A/D converter module to the buffer memory as a history. Up to 16 errors and alarms can be stored.	–	○	
Module error collection function	Collects the errors and alarms occurred in the A/D converter module and stores them in the CPU module.	–	○	

○ : Supported, –: Not supported

Item	Description	A1S64AD	L60AD4	Precautions for replacement
Error clear function	Clears the error from the system monitor window of the programming tool.	–	○	This function can be used on GX Works2.
Saving and restoring offset/gain values	Saves and restores the offset/gain values in the user setting range.	–	○	

- *1 For the A1S64AD, the resolution setting can be selected from 1/4000, 1/8000, and 1/12000 for both voltage and current inputs.
The L60AD4, however, does not support the resolution mode. To use the same digital value that is used for the A1S64AD, set the scaling upper and lower limit values that match the resolution of the A1S64AD using the scaling function.
- *2 Only the L60AD4 with a serial number (first five digits) 13041 or later supports this function.

2.2.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L Analog-Digital Converter Module User's Manual.

2.2.4 Buffer memory address comparison

Sequence programs need to be changed because the buffer memory address assignment differs. For details of the buffer memory areas and sequence programs, refer to the MELSEC-L Analog-Digital Converter Module User's Manual.

	16 points (I/O assignment: intelligent 16 points)	△	The number of occupied I/O points is changed to 16 points.																																		
	18-point terminal block	×	Wiring needs to be changed.																																		
	0.3 to 0.75mm ²	×																																			
	R1.25-3 (Solderless terminals with an insulation sleeve cannot be used.)	×																																			
	0.52A	△	Recalculation of internal current consumption (5VDC) is required.																																		
	0.19kg	△																																			

2.3.2 Functional comparison

○ : Supported, – : Not supported

Item	Description	A1S68AD	L60AD4	Precautions for replacement
A/D conversion enable/ disable function	Sets whether to enable or disable the A/D conversion for each channel. By disabling the conversion for the channels that are not used, the sampling time can be shortened.	○	○	
Sampling processing	Performs the A/D conversion for analog input values successively for each channel, and outputs digital output values upon each conversion.	○	○	
Averaging processing	Time average	○	○	The setting range of average time and count differ. Refer to the MELSEC-L Analog-Digital Converter Module User's Manual, and check the specifications.
	Count average	○	○	
	Moving average	–	○	
Range switching function	Sets the input range to be used.	–	○	
Offset/gain setting function	Compensates for errors in digital output values.	–	○	
Conversion speed switch function	Sets the conversion speed.	–	○	
Input range extended mode function	Extends the input range. By combining this function with the input signal error detection function, simple disconnection detection can be executed.	–	○	This function can be used on GX Works2.*2
Maximum value/minimum value hold function	Stores the maximum and minimum values of the digital output values in the module.	–	○	This function can be used on GX Works2.*2
Input signal error detection function	Detects the analog input value which exceeds the setting range.	–	○	This function can be used on GX Works2.*2
Input signal error detection extension function	Extends the detection method of the input signal error detection function. Use this function to detect the input signal error only in the lower limit or upper limit, or to execute the disconnection detection.	–	○	This function can be used on GX Works2.*2
Warning output function (process alarm)	Outputs an alarm when a digital output value is within the range set in advance.	–	○	This function can be used on GX Works2.*2
Resolution mode	Sets the resolution according to the application. The resolution mode setting is applicable to all channels.*1	–	–	
Scaling function	Scale-converts the output digital value to the set range of the scaling upper limit value and scaling lower limit value. This omits the programming of the scale conversion.	–	○	By setting the same scaling upper limits and scaling lower limits as the resolution of A1S68AD, the same digital output values as A1S68AD can be used.*2
Shift function	Adds the set shifting amount of the conversion value to the scaling value (digital operation value) and stores the value in the buffer memory. Fine adjustment can be performed easily when the system starts.	–	○	This function can be used on GX Works2.*2
Digital clipping function	Sets the maximum value of the scaling value (digital operation value) to 20000 and the minimum value to 0 or -20000 when the input voltage or current exceeds the input range.	–	○	This function can be used on GX Works2.*2
Difference conversion function	Subtracts the difference conversion reference value from the scaling value (digital operation value) and stores the acquired value in the buffer memory.	–	○	This function can be used on GX Works2.*2
Logging function	Logs the digital output value or scaling value (digital operation value). The data of 10000 points can be logged for each channel.	–	○	This function can be used on GX Works2.*2
Flow amount integration function	Performs the A/D conversion of analog input value (voltage or current) from a source such as a flow meter and integrates the digital output value.	–	○	This function can be used on GX Works2.*2
Error log function	Stores the errors and alarms occurred in the A/D converter module to the buffer memory as a history. Up to 16 errors and alarms can be stored.	–	○	
Module error collection function	Collects the errors and alarms occurred in the A/D converter module and stores them in the CPU module.	–	○	

○ : Supported, –: Not supported

Item	Description	A1S68AD	L60AD4	Precautions for replacement
Error clear function	Clears the error from the system monitor window of the programming tool.	–	○	This function can be used on GX Works2.
Saving and restoring offset/gain values	Saves and restores the offset/gain values in the user setting range.	–	○	

- *1 For the A1S68AD, the resolution is 1/4000 (fixed).
For the L60AD4, the resolution is 1/20000 (fixed). To use the same digital value that is used for the A1S68AD, set the scaling upper and lower limit values that match the resolution of the A1S68AD using the scaling function.
- *2 Only the L60AD4 with a serial number (first five digits) 13041 or later supports this function.

2.3.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L Analog-Digital Converter Module User's Manual.

A1S68AD				L60AD4

2.4.2 Functional comparison

○: Compatible, △: Partial change required, ×: Incompatible

Item	Description	A1S68AD	L60ADVL8 L60ADIL8	Precautions for replacement
A/D conversion enable/ disable function	Sets whether to enable or disable the A/D conversion. By disabling the conversion for the channels that are not used, the sampling time can be shortened.	○	○	
Sampling processing	Performs the A/D conversion for analog input values successively for each channel, and outputs digital output values upon each conversion.	○	○	
Averaging processing	Time average	○	○	The setting range of average time and count differs. Refer to the MELSEC-L Analog-Digital Converter Module User's Manual, and check the specifications.
	Count average	○	○	
	Moving average	—	○	
Range switching function	Sets the input range to be used.	—	○	
Offset/gain setting function	Compensates for errors in digital output values.	—	○	
Input range extended mode function	Extends the input range. By combining this function with the input signal error detection function, simple disconnection detection can be executed.	—	○	This function can be used on GX Works2.
Maximum value/minimum value hold function	Stores the maximum and minimum values of the digital output values in the module.	—	○	This function can be used on GX Works2.
Input signal error detection function	Detects the analog input value which exceeds the setting range.	—	○	This function can be used on GX Works2.
Input signal error detection extension function	Extends the detection method of the input signal error detection function. Use this function to detect the input signal error only in the lower limit or upper limit, or to execute the disconnection detection.	—	○	This function can be used on GX Works2.
Warning output function (process alarm)	Outputs an alarm when a digital output value is within the range set in advance.	—	○	This function can be used on GX Works2.
Resolution mode	Sets the resolution according to the application. The resolution mode setting is applicable to all channels.*1	—	—	
Scaling function	Scale-converts the output digital value to the set range of the scaling upper limit value and scaling lower limit value. This omits the programming of the scale conversion.	—	○	By setting the same scaling upper limit value and scaling lower limit value as the resolution of A1S68AD, the same digital output values as A1S68AD can be used.
Shift function	Adds the set shifting amount of the conversion value to the scaling value (digital operation value) and stores the value in the buffer memory. Fine adjustment can be performed easily when the system starts.	—	△*2	This function can be used on GX Works2.
Digital clipping function	Sets the maximum value of the scaling value (digital operation value) to 20000 and the minimum value to 0 or -20000 when the input voltage or current exceeds the input range.	—	△*2	This function can be used on GX Works2.
Difference conversion function	Subtracts the difference conversion reference value from the scaling value (digital operation value) and stores the acquired value in the buffer memory.	—	△*2	This function can be used on GX Works2.*2
Logging function	Logs the digital output value or scaling value (digital operation value). The data of 10000 points can be logged for each channel.	—	△*3	This function can be used on GX Works2.
Error log function	Stores the errors and alarms occurred in the A/D converter module to the buffer memory as a history. Up to 16 errors and alarms can be stored.	—	○	This function can be used on GX Works2.
Module error collection function	Collects the errors and alarms occurred in the A/D converter module and stores them in the CPU module.	—	○	
Error clear function	Clears the error from the system monitor window of the programming tool.	—	○	This function can be used on GX Works2.
Saving and restoring offset/gain values	Saves and restores the offset/gain values in the user setting range.	—	○	

- *1 For the A1S68AD, the resolution is 1/4000 (fixed).
For the L60ADVL8 or L60ADIL8, the resolution is fixed by each analog input range. To use the same digital value that is used for the A1S68AD, set the scaling upper and lower limit values that match the resolution of the A1S68AD using the scaling function.
- *2 When the shift function, digital clipping function, or difference conversion function with the L60ADVL8 or L60ADIL8, use function blocks (FBs).
For function blocks, refer to the following. (SH-080899ENG)
MELSEC-L Analog-Digital Converter Module User's Manual
- *3 When the logging function is used with the L60ADVL8 or L60ADIL8, use the data logging function of a CPU module. For the function of the CPU module, refer to the following.
QnUDVCPULCPU User's Manual (Data Logging Function) (SH-080893ENG)

2.4.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L Analog-Digital Converter Module User's Manual.

A1S68AD				L60ADVL8/L60ADIL8

3 ANALOG OUTPUT MODULE REPLACEMENT

3.1 List of Analog Output Module Alternative Models for Replacement

AnS/QnAS series		Transition to L series	
Product	Model	Model	Remarks (Restrictions)
Analog output module	A1S62DA	L60DA4	1) External wiring: Cable size is changed. 2) Number of slots: Not changed 3) Program: The number of occupied I/O points, I/O signals, resolution, and buffer memory addresses are changed. 4) Performance specifications: Changed. Four channels per module and an external power supply (24VDC) are required. 5) Functional specifications: Not changed
		L60DA4	1) External wiring: Cable size is changed. 2) Number of slots: Changed (Two modules are required.) 3) Program: The number of occupied I/O points, I/O signals, resolution, and buffer memory addresses are changed. 4) Performance specifications: Changed. Four channels per module and an external power supply (24VDC) are required. 5) Functional specifications: Not changed
	A1S68DAI	L60DA4	1) External wiring: Cable size is changed. 2) Number of slots: Changed (1 → 2) 3) Program: The number of occupied I/O points, I/O signals, resolution, and buffer memory addresses are changed. 4) Performance specifications: An external power supply (24VDC) is required. 5) Functional specifications: Not changed
		L60DAI8	1) External wiring: Cable size is changed. 2) Number of slots: Changed (Two modules are required.) 3) Program: The number of occupied I/O points, I/O signals, and buffer memory addresses are changed. 4) Performance specifications: Changed. Four channels per module and an external power supply (24VDC) are required. 5) Functional specifications: Not changed
	A1S68DAV	L60DA4	1) External wiring: Cable size is changed. 2) Number of slots: Changed (1 → 2) 3) Program: The number of occupied I/O points, I/O signals, resolution, and buffer memory addresses are changed. 4) Performance specifications: An external power supply (24VDC) is required. 5) Functional specifications: Not changed
		L60DAVL8	1) External wiring: Cable size is changed. 2) Number of slots: Changed (1 → 2) 3) Program: The number of occupied I/O points, I/O signals, resolution, and buffer memory addresses are changed. 4) Performance specifications: An external power supply (24VDC) is required. 5) Functional specifications: Not changed

☒ Point

The upgrade tool (conversion adapter) manufactured by Mitsubishi Electric Engineering Co., Ltd. enables to connect the existing wiring that was connected to the A1S62DA to L series modules without change.

Product	Existing module model	Alternative module model	Conversion adapter model*1	Space module LG69*1
Analog output module	A1S62DA	L60DA4	ERNT-ASLT62DA	Available

*1 For details on the conversion adapter or LG69, refer to the Transition from MELSEC-AnS/QnAS (Small Type) Series to L Series Handbook (Fundamentals)

3.2.2 Functional comparison

○ : Available, – : Not available

Item	Description	A1S62DA	L60DA4	Precautions for replacement																
D/A conversion enable/disable function	Sets whether to enable or disable D/A conversion for each channel.	○	○	With the L60DA4, disabling the D/A conversion for an unused channel reduces the conversion cycles.																
D/A output enable/disable function	Sets whether to output the D/A conversion value or the offset value for each channel. The conversion speed is constant, regardless of the output enable/disable status.	○	○																	
Range switching function	Sets the output range to be used.	–	○																	
Offset/gain setting function	Corrects errors in analog output values.	○	○																	
Analog output HOLD/CLEAR function	Sets the status of analog output values (HOLD or CLEAR), according to the CPU module operating status (RUN, STOP, or stop error).	○	○	The A1S62DA is set the status for all channels at once using the HLD/CLR terminal on the front of the module. With the L60DA4, HOLD/CLEAR can be set for each channel.																
Analog output test when CPU module is in STOP status	Outputs the converted analog values when CH□ Output enable/disable flag is forcibly turned on while the CPU module is in the STOP status. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th rowspan="2">Setting combination</th> <th rowspan="2">D/A conversion enable/disable CH□ Output enable/disable flag</th> <th colspan="2">Enable</th> <th colspan="2">Disable</th> </tr> <tr> <th>Enable</th> <th>Disable</th> <th>Enable</th> <th>Disable</th> </tr> </thead> <tbody> <tr> <td colspan="2" style="text-align: center;">Analog output test</td> <td style="text-align: center;">Allowed</td> <td style="text-align: center;">Not allowed</td> <td colspan="2" style="text-align: center;">Not allowed</td> </tr> </tbody> </table>	Setting combination	D/A conversion enable/disable CH□ Output enable/disable flag	Enable		Disable		Enable	Disable	Enable	Disable	Analog output test		Allowed	Not allowed	Not allowed		–	○

		Enable	Disable	Enable	Disable															
Analog output test		Allowed	Not allowed	Not allowed																
Resolution mode	Sets the resolution according to the application.*1	○	–	Since the resolution differs between AnS series and L series modules, it needs to be matched using a sequence program, user range settings, or the scaling function. (Refer to Appendix 4.)																
Scaling function	Scale-converts the input digital value to the set range of the scaling upper limit value and scaling lower limit value. This omits the programming of the scale conversion.	–	○	By setting the same scaling upper limits and scaling lower limits as the resolution of A1S62DA, the same digital output values as A1S62DA can be used.																
Alarm output function	Outputs an alarm when the digital value is out of the preset range.	–	○																	
Wave output function	Registers the prepared wave data (digital value) into the D/A converter module and continuously outputs the data (analog value) in the set conversion cycle.	–	○	This function can be used on the GX Works2. Only the L60DA4 with a serial number (first five digits) 14041 or later supports this function.																
External power supply READY flag	Turns on when the external power supply (24VDC) is supplied. When this flag is off, the analog output value becomes 0V/0mA regardless of other settings.	–	○																	
Error log function	Stores the errors and alarms occurred in the D/A converter module to the buffer memory as a history. Up to 16 errors and alarms can be stored.	–	○																	
Module error collection function	Collects the errors and alarms occurred in the D/A converter module and stores them in the CPU module.	–	○																	
Error clear function	Clears the error from the system monitor window of the programming tool.	–	○	This function can be used on the GX Works2.																
Saving and restoring offset/gain values	Saves and restores the offset/gain values in the user setting range.	–	○																	

*1 For the A1S62DA, the resolution setting can be selected from 1/4000, 1/8000, and 1/12000 for both voltage and current inputs.

The L60DA4, however, does not support the resolution mode. To use the same digital value that is used for the A1S62DA, set the scaling upper and lower limit values that match the resolution of the A1S62DA using the scaling function.

3.2.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L Digital-Analog Converter Module User's Manual.

A1S62DA				L60DA4					
Device No.	Signal name	Device No.	Signal name	Device No.	Signal name	Device No.	Signal name

3.3 A1S68DAI (Alternative Model: L60DA4)

3.3.1 Performance specifications comparison

Item	A1S68DAI									
Digital input	16-bit signed binary Setting range: 0 to 4096									
Analog output	4 to 20mA (External load resistance value: 0 to 600Ω)									
I/O characteristics	<table border="1"> <thead> <tr> <th>Digital input value</th> <th>Analog output</th> </tr> </thead> <tbody> <tr> <td>4000</td> <td>20mA</td> </tr> <tr> <td>2000</td> <td>12mA</td> </tr> <tr> <td>0</td> <td>4mA</td> </tr> </tbody> </table>	Digital input value	Analog output	4000	20mA	2000	12mA	0	4mA	
Digital input value	Analog output									
4000	20mA									
2000	12mA									
0	4mA									
Maximum resolution of analog value	4μA									
Overall accuracy (accuracy at maximum analog output value)	±1.0% (±200μA)									
Maximum conversion speed	Within 4ms/8 channels If the access from the CPU module using the FROM/TO instructions is frequent, the speed may be increased for 6ms.									
Number of analog output channels	8 channels/module									
Number of offset/gain settings	-									
Output short protection	Available									

○: Compatible, △: Partial change required, ×: Incompatible

	L60DA4	Compatibility	Precautions for replacement

3.3.2 Functional comparison

○ : Available, – : Not available

Item	Description	A1S68DAI	L60DA4	Precautions for replacement																	
D/A conversion enable/disable function	Sets whether to enable or disable D/A conversion for each channel.	○	○	With the L60DA4, disabling the D/A conversion for an unused channel reduces the conversion cycles.																	
D/A output enable/disable function	Sets whether to output the D/A conversion value or the offset value for each channel. The conversion speed is constant, regardless of the output enable/disable status.	○	○																		
Range switching function	Sets the output range to be used.	–	○																		
Offset/gain setting function	Corrects errors in analog output values.	–	○																		
Analog output HOLD/CLEAR function	Sets the status of analog output values (HOLD or CLEAR), according to the CPU module operating status (RUN, STOP, or stop error).	○	○	The A1S68DAI is set the status for all channels at once using the HLD/CLR terminal on the front of the module. With L60DA4, HOLD/CLEAR is set for each channel.																	
Analog output test when CPU module is in STOP status	Outputs the converted analog values when CH□ Output enable/disable flag is forcibly turned on while the CPU module is in the STOP status. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th rowspan="2">Setting combination</th> <th>D/A conversion enable/disable</th> <th colspan="2">Enable</th> <th colspan="2">Disable</th> </tr> <tr> <th>CH□ Output enable/disable flag</th> <th>Enable</th> <th>Disable</th> <th>Enable</th> <th>Disable</th> </tr> </thead> <tbody> <tr> <td colspan="2">Analog output test</td> <td>Allowed</td> <td>Not allowed</td> <td colspan="2">Not allowed</td> </tr> </tbody> </table>	Setting combination	D/A conversion enable/disable	Enable		Disable		CH□ Output enable/disable flag	Enable	Disable	Enable	Disable	Analog output test		Allowed	Not allowed	Not allowed		–	○	
Setting combination	D/A conversion enable/disable		Enable		Disable																
	CH□ Output enable/disable flag	Enable	Disable	Enable	Disable																
Analog output test		Allowed	Not allowed	Not allowed																	
Resolution mode	Sets the resolution according to the application.*1	–	–	Since the resolution differs between AnS series and L series modules, it needs to be matched using a sequence program, user range settings, or the scaling function. (Refer to Appendix 4.)																	
Scaling function	Scale-converts the input digital value to the set range of the scaling upper limit value and scaling lower limit value. This omits the programming of the scale conversion.	–	○	By setting the same scaling upper limits and scaling lower limits as the resolution of A1S68DAI, the same digital output values as A1S68DAI can be used.																	
Alarm output function	Outputs an alarm when the digital value is out of the preset range.	–	○																		
Wave output function	Registers the prepared wave data (digital value) into the D/A converter module and continuously outputs the data (analog value) in the set conversion cycle.	–	○	This function can be used on the GX Works2. Only the L60DA4 with a serial number (first five digits) 14041 or later supports this function.																	
External power supply READY flag	Turns on when the external power supply (24VDC) is supplied. When this flag is off, the analog output value becomes 0V/0mA regardless of other settings.	–	○																		
Error log function	Stores the errors and alarms occurred in the D/A converter module to the buffer memory as a history. Up to 16 errors and alarms can be stored.	–	○																		
Module error collection function	Collects the errors and alarms occurred in the D/A converter module and stores them in the CPU module.	–	○																		
Error clear function	Clears the error from the system monitor window of the programming tool.	–	○	This function can be used on the GX Works2.																	
Saving and restoring offset/gain values	Saves and restores the offset/gain values in the user setting range.	–	○																		

*1 For the A1S68DAI, the resolution is 1/4000 (fixed).

For the L60DA4, the resolution is 1/20000 (fixed). To use the same digital value that is used for the A1S68DAI, set the scaling upper and lower limit values that match the resolution of the A1S68DAI using the scaling function.

3.3.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L Digital-Analog Converter Module User's Manual.

	3.9A, 2.0ms or less		
	0.22kg	△	

3.4.2 Functional comparison

○ : Available, – : Not available

Item	Description	A1S68DAI	L60DAI8	Precautions for replacement																	
D/A conversion enable/disable function	Sets whether to enable or disable D/A conversion for each channel.	○	○	With the L60DAI8, disabling the D/A conversion for an unused channel reduces the conversion cycles.																	
D/A output enable/disable function	Sets whether to output the D/A conversion value or the offset value for each channel. The conversion speed is constant, regardless of the output enable/disable status.	○	○																		
Range switching function	Sets the output range to be used.	–	○																		
Offset/gain setting function	Corrects errors in analog output values.	–	○																		
Analog output HOLD/CLEAR function	Sets the status of analog output values (HOLD or CLEAR), according to the CPU module operating status (RUN, STOP, or stop error).	○	○	The A1S68DAI is set the status for all channels at once using the HLD/CLR terminal on the front of the module. With L60DAI8, HOLD/CLEAR is set for each channel.																	
Analog output test when CPU module is in STOP status	Outputs the converted analog values when CH□ Output enable/disable flag is forcibly turned on while the CPU module is in the STOP status. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th rowspan="2">Setting combination</th> <th>D/A conversion enable/disable</th> <th colspan="2">Enable</th> <th colspan="2">Disable</th> </tr> <tr> <th>CH□ Output enable/disable flag</th> <th>Enable</th> <th>Disable</th> <th>Enable</th> <th>Disable</th> </tr> </thead> <tbody> <tr> <td colspan="2">Analog output test</td> <td>Allowed</td> <td>Not allowed</td> <td colspan="2">Not allowed</td> </tr> </tbody> </table>	Setting combination	D/A conversion enable/disable	Enable		Disable		CH□ Output enable/disable flag	Enable	Disable	Enable	Disable	Analog output test		Allowed	Not allowed	Not allowed		–	○	
Setting combination	D/A conversion enable/disable		Enable		Disable																
	CH□ Output enable/disable flag	Enable	Disable	Enable	Disable																
Analog output test		Allowed	Not allowed	Not allowed																	
Resolution mode	Sets the resolution according to the application. *1	–	–	Since the resolution differs between AnS series and L series modules, it needs to be matched using a sequence program, user range settings, or the scaling function. (Refer to Appendix 4.)																	
Scaling function	Scale-converts the input digital value to the set range of the scaling upper limit value and scaling lower limit value. This omits the programming of the scale conversion.	–	○	By setting the same scaling upper limits and scaling lower limits as the resolution of A1S68DAI, the same digital output values as A1S68DAI can be used.																	
Alarm output function	Outputs an alarm when the digital value is out of the preset range.	–	○																		
Wave output function	Registers the prepared wave data (digital value) into the D/A converter module and continuously outputs the data (analog value) in the set conversion cycle.	–	○	This function can be used on the GX Works2.																	
External power supply READY flag	Turns on when the external power supply (24VDC) is supplied. When this flag is off, the analog output value becomes 0V/0mA regardless of other settings.	–	○																		
Error log function	Stores the errors and alarms occurred in the D/A converter module to the buffer memory as a history. Up to 16 errors and alarms can be stored.	–	○																		
Module error collection function	Collects the errors and alarms occurred in the D/A converter module and stores them in the CPU module.	–	○																		
Error clear function	Clears the error from the system monitor window of the programming tool.	–	○	This function can be used on the GX Works2.																	
Saving and restoring offset/gain values	Saves and restores the offset/gain values in the user setting range.	–	○																		

*1 For the A1S68DAI, the resolution is 1/4000 (fixed).

For the L60DAI8, the resolution is 1/8000 (fixed). To use the same digital value that is used for the A1S68DAI, set the scaling upper and lower limit values that match the resolution of the A1S68DAI using the scaling function.

3.4.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L Digital-Analog Converter Module User's Manual.

3.5 A1S68DAV (Alternative Model: L60DA4)

3.5.1 Performance specifications comparison

Item	A1S68DAV												
Digital input	16-bit signed binary Setting range: -2048 to 2047												
Analog output	-10 to 0 to 10VDC (External load resistance value: 2KΩ to 1MΩ)												
I/O characteristics	<table border="1"> <thead> <tr> <th>Digital input value</th> <th>Analog output value</th> </tr> </thead> <tbody> <tr> <td>2000</td> <td>10V</td> </tr> <tr> <td>1000</td> <td>5V</td> </tr> <tr> <td>0</td> <td>0V</td> </tr> <tr> <td>-1000</td> <td>-5V</td> </tr> <tr> <td>-2000</td> <td>-10V</td> </tr> </tbody> </table>	Digital input value	Analog output value	2000	10V	1000	5V	0	0V	-1000	-5V	-2000	-10V
Digital input value	Analog output value												
2000	10V												
1000	5V												
0	0V												
-1000	-5V												
-2000	-10V												
Maximum resolution of analog value	5mV												
Overall accuracy (accuracy at maximum analog output value)	±1.0% (±100mV)												
Maximum conversion speed	Within 4ms/8 channels If the access from the CPU module using the FROM/TO instructions is frequent, the speed may be increased for 6ms.												
Number of analog output channels	8 channels/module												
Number of offset/gain settings	-												
Output short protection	Available												

○ : Compatible, △ : Partial change required, × : Incompatible

	L60DA4	Compatibility	Precautions for replacement																								
	16-bit signed binary (-20480 to 20479, When the scaling function is used: -32768 to 32767)	○	Since the resolution differs between AnS series and L series modules, it needs to be matched using a sequence program, user range settings, or the scaling function. (Refer to Appendix 4.)																								
	Voltage: -10 to 10VDC (External load resistance value: 1KΩ to 1MΩ) Current: 0 to 20mA (External load resistance value: 0 to 600Ω)	○																									
	<table border="1"> <thead> <tr> <th colspan="2">Analog output range</th> <th>Digital value</th> <th>Maximum resolution</th> </tr> </thead> <tbody> <tr> <td rowspan="4">Voltage</td> <td>0 to 5V</td> <td rowspan="2">0 to 20000</td> <td>250μV</td> </tr> <tr> <td>1 to 5V</td> <td>200μV</td> </tr> <tr> <td>-10 to 10V</td> <td rowspan="2">-20000 to 20000</td> <td>500μV</td> </tr> <tr> <td>User range settings</td> <td>333μV</td> </tr> <tr> <td rowspan="3">Current</td> <td>0 to 20mA</td> <td rowspan="2">0 to 20000</td> <td>1000nA</td> </tr> <tr> <td>4 to 20mA</td> <td>800nA</td> </tr> <tr> <td>User range settings</td> <td>-20000 to 20000</td> <td>700nA</td> </tr> </tbody> </table>	Analog output range		Digital value	Maximum resolution	Voltage	0 to 5V	0 to 20000	250μV	1 to 5V	200μV	-10 to 10V	-20000 to 20000	500μV	User range settings	333μV	Current	0 to 20mA	0 to 20000	1000nA	4 to 20mA	800nA	User range settings	-20000 to 20000	700nA	○	Since the resolution differs between AnS series and L series modules, it needs to be matched using a sequence program, user range settings, or the scaling function. (Refer to Appendix 4.)

	4.3A, 1000μs or less		
	0.20kg		

3.5.2 Functional comparison

○ : Available, – : Not available

Item	Description	A1S68DAV	L60DA4	Precautions for replacement																	
D/A conversion enable/disable function	Sets whether to enable or disable D/A conversion for each channel.	○	○	With the L60DA4, disabling the D/A conversion for an unused channel reduces the conversion cycles.																	
D/A output enable/disable function	Sets whether to output the D/A conversion value or the offset value for each channel. The conversion speed is constant, regardless of the output enable/disable status.	○	○																		
Range switching function	Sets the output range to be used.	–	○																		
Offset/gain setting function	Corrects errors in analog output values.	–	○																		
Analog output HOLD/CLEAR function	Sets the status of analog output values (HOLD or CLEAR), according to the CPU module operating status (RUN, STOP, or stop error).	○	○	The A1S68DAV is set the status for all channels at once using the HLD/CLR terminal on the front of the module. With L60DA4, HOLD/CLEAR is set for each channel.																	
Analog output test when CPU module is in STOP status	Outputs the converted analog values when CH□ Output enable/disable flag is forcibly turned on while the CPU module is in the STOP status. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th rowspan="2">Setting combination</th> <th>D/A conversion enable/disable</th> <th colspan="2">Enable</th> <th colspan="2">Disable</th> </tr> <tr> <th>CH□ Output enable/disable flag</th> <th>Enable</th> <th>Disable</th> <th>Enable</th> <th>Disable</th> </tr> </thead> <tbody> <tr> <td colspan="2">Analog output test</td> <td>Allowed</td> <td>Not allowed</td> <td colspan="2">Not allowed</td> </tr> </tbody> </table>	Setting combination	D/A conversion enable/disable	Enable		Disable		CH□ Output enable/disable flag	Enable	Disable	Enable	Disable	Analog output test		Allowed	Not allowed	Not allowed		–	○	
Setting combination	D/A conversion enable/disable		Enable		Disable																
	CH□ Output enable/disable flag	Enable	Disable	Enable	Disable																
Analog output test		Allowed	Not allowed	Not allowed																	
Resolution mode	Sets the resolution according to the application. *1	–	–	Since the resolution differs between AnS series and L series modules, it needs to be matched using a sequence program, user range settings, or the scaling function. (Refer to Appendix 4.)																	
Scaling function	Scale-converts the input digital value to the set range of the scaling upper limit value and scaling lower limit value. This omits the programming of the scale conversion.	–	○	By setting the same scaling upper limits and scaling lower limits as the resolution of A1S68DAV, the same digital output values as A1S68DAV can be used.																	
Alarm output function	Outputs an alarm when the digital value is out of the preset range.	–	○																		
Wave output function	Registers the prepared wave data (digital value) into the D/A converter module and continuously outputs the data (analog value) in the set conversion cycle.	–	○	This function can be used on the GX Works2. Only the L60DA4 with a serial number (first five digits) 14041 or later supports this function.																	
External power supply READY flag	Turns on when the external power supply (24VDC) is supplied. When this flag is off, the analog output value becomes 0V/0mA regardless of other settings.	–	○																		
Error log function	Stores the errors and alarms occurred in the D/A converter module to the buffer memory as a history. Up to 16 errors and alarms can be stored.	–	○																		
Module error collection function	Collects the errors and alarms occurred in the D/A converter module and stores them in the CPU module.	–	○																		
Error clear function	Clears the error from the system monitor window of the programming tool.	–	○	This function can be used on the GX Works2.																	
Saving and restoring offset/gain values	Saves and restores the offset/gain values in the user setting range.	–	○																		

*1 For the A1S68DAV, the mode is fixed at 1/4000 (-2000 to 2000).
For the L60DA4, the resolution is 1/20000 (fixed). To use the same digital value that is used for the A1S68DAV, set the scaling upper and lower limit values that match the resolution of the A1S68DAV using the scaling function.

3.5.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L Digital-Analog Converter Module User's Manual.

A1S68DAV				L60DA4			
Device No.	Signal name	Device No.	Signal name	Device No.	Signal name	Device No.	Signal name

3.5.4 Buffer memory address comparison

Sequence programs need to be changed because the buffer memory address assignment differs. For details of the buffer memory areas and sequence programs, refer to the MELSEC-L Digital-Analog Converter Module User's Manual.

3.6 A1S68DAV (Alternative Model: L60DAVL8)

3.6.1 Performance specifications comparison

Item	A1S68DAV												
Digital input	16-bit signed binary Setting range: -2048 to 2047												
Analog output	-10 to 0 to 10VDC (External load resistance value: 2KΩ to 1MΩ)												
I/O characteristics	<table border="1"> <thead> <tr> <th>Digital input value</th> <th>Analog output value</th> </tr> </thead> <tbody> <tr> <td>2000</td> <td>10V</td> </tr> <tr> <td>1000</td> <td>5V</td> </tr> <tr> <td>0</td> <td>0V</td> </tr> <tr> <td>-1000</td> <td>-5V</td> </tr> <tr> <td>-2000</td> <td>-10V</td> </tr> </tbody> </table>	Digital input value	Analog output value	2000	10V	1000	5V	0	0V	-1000	-5V	-2000	-10V
Digital input value	Analog output value												
2000	10V												
1000	5V												
0	0V												
-1000	-5V												
-2000	-10V												
Maximum resolution of analog value	5mV												
Overall accuracy (accuracy at maximum analog output value)	±1.0% (±100mV)												
Maximum conversion speed	Within 4ms/8 channels If the access from the CPU module using the FROM/TO instructions is frequent, the speed may be increased for 6ms.												
Number of analog output channels	8 channels/module												
Number of offset/gain settings	–												
Output short protection	Available												

○ : Compatible, △ : Partial change required, × : Incompatible

		L60DAVL8	Compatibility	Precautions for replacement														
		16-bit signed binary (-16384 to 16383, When the scaling function is used: -32768 to 32767)	○	Since the resolution differs between AnS series and L series modules, it needs to be matched using a sequence program, user range settings, or the scaling function. (Refer to Appendix 4.)

3.6.2 Functional comparison

○ : Available, – : Not available

Item	Description	A1S68DAV	L60DAVL8	Precautions for replacement																	
D/A conversion enable/disable function	Sets whether to enable or disable D/A conversion for each channel.	○	○	With the L60DAVL8, disabling the D/A conversion for an unused channel reduces the conversion cycles.																	
D/A output enable/disable function	Sets whether to output the D/A conversion value or the offset value for each channel. The conversion speed is constant, regardless of the output enable/disable status.	○	○																		
Range switching function	Sets the output range to be used.	–	○																		
Offset/gain setting function	Corrects errors in analog output values.	–	○																		
Analog output HOLD/CLEAR function	Sets the status of analog output values (HOLD or CLEAR), according to the CPU module operating status (RUN, STOP, or stop error).	○	○	The A1S68DAV is set the status for all channels at once using the HLD/CLR terminal on the front of the module. With L60DAVL8, HOLD/CLEAR is set for each channel.																	
Analog output test when CPU module is in STOP status	Outputs the converted analog values when CH□ Output enable/disable flag is forcibly turned on while the CPU module is in the STOP status. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th rowspan="2">Setting combination</th> <th>D/A conversion enable/disable</th> <th colspan="2">Enable</th> <th colspan="2">Disable</th> </tr> <tr> <th>CH□ Output enable/disable flag</th> <th>Enable</th> <th>Disable</th> <th>Enable</th> <th>Disable</th> </tr> </thead> <tbody> <tr> <td colspan="2">Analog output test</td> <td>Allowed</td> <td>Not allowed</td> <td colspan="2">Not allowed</td> </tr> </tbody> </table>	Setting combination	D/A conversion enable/disable	Enable		Disable		CH□ Output enable/disable flag	Enable	Disable	Enable	Disable	Analog output test		Allowed	Not allowed	Not allowed		–	○	
Setting combination	D/A conversion enable/disable		Enable		Disable																
	CH□ Output enable/disable flag	Enable	Disable	Enable	Disable																
Analog output test		Allowed	Not allowed	Not allowed																	
Resolution mode	Sets the resolution according to the application.*1	–	–	Since the resolution differs between AnS series and L series modules, it needs to be matched using a sequence program, user range settings, or the scaling function. (Refer to Appendix 4.)																	
Scaling function	Scale-converts the input digital value to the set range of the scaling upper limit value and scaling lower limit value. This omits the programming of the scale conversion.	–	○	By setting the same scaling upper limits and scaling lower limits as the resolution of A1S68DAV, the same digital output values as A1S68DAV can be used.																	
Alarm output function	Outputs an alarm when the digital value is out of the preset range.	–	○																		
Wave output function	Registers the prepared wave data (digital value) into the D/A converter module and continuously outputs the data (analog value) in the set conversion cycle.	–	○	This function can be used on the GX Works2.																	
External power supply READY flag	Turns on when the external power supply (24VDC) is supplied. When this flag is off, the analog output value becomes 0V/0mA regardless of other settings.	–	○																		
Error log function	Stores the errors and alarms occurred in the D/A converter module to the buffer memory as a history. Up to 16 errors and alarms can be stored.	–	○																		
Module error collection function	Collects the errors and alarms occurred in the D/A converter module and stores them in the CPU module.	–	○																		
Error clear function	Clears the error from the system monitor window of the programming tool.	–	○	This function can be used on the GX Works2.																	
Saving and restoring offset/gain values	Saves and restores the offset/gain values in the user setting range.	–	○																		

*1 For the A1S68DAV, the mode is fixed at 1/4000 (-2000 to 2000).
 For the L60DAVL8, the resolution is 1/16000 (-10 to 10V) or 1/8000 (1 to 5V, 0 to 5V, user range setting). To use the same digital value that is used for the A1S68DAV, set the scaling upper and lower limit values that match the resolution of the A1S68DAV using the scaling function.

3.6.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L Digital-Analog Converter Module User's Manual.

A1S68DAV				L60DAVL8

3.6.4 Buffer memory address comparison

Sequence programs need to be changed because the buffer memory address assignment differs. For details of the buffer memory areas and sequence programs, refer to the MELSEC-L Digital-Analog Converter Module User's Manual.

4 ANALOG I/O MODULE REPLACEMENT

4.1 List of Analog I/O Module Alternative Models for Replacement

AnS/QnAS series		Transition to L series	
Product	Model	Model	Remarks (Restrictions)
Analog I/O module	A1S63ADA	L60AD2DA2	1) External wiring: Cable size is changed. 2) Number of slots: Not changed 3) Program: The number of occupied I/O points, I/O signals, and buffer memory addresses are changed. 4) Performance specifications: An external power supply (24VDC) is required. 5) Functional specifications: Simple loop control (function expression) function available → Variable arithmetic function or variable conversion characteristics function can be used.*1
	A1S66ADA	L60AD2DA2	1) External wiring: Cable size is changed. 2) Number of slots: Not changed 3) Program: The number of occupied I/O points, I/O signals, and buffer memory addresses are changed. 4) Performance specifications: Analog input 4CH → 2CH 5) Functional specifications: Not changed

*1 Only the L60AD2DA2 with a serial number (first five digits) 17042 or later supports these functions.

Point

The following shows the replacement method for the simple loop control (function expression) function with the A1S63ADA.

Examples of function formula

1) $y = AX_1 + BX_2 + C$

A, B, C: constant
 X1: CH1 Analog input value
 X2: CH2 Analog input value
 y: CH3 Analog output value

2) $y = A \frac{X_1}{X_2} + C$

3) Coordinate specification: CH1 Analog input/CH3 Analog output

Function expression used with the A1S63ADA	Function of the L60AD2DA2
(1) $y = AX_1 + BX_2 + C$	Variable arithmetic function
(2) $y = A \frac{X_1}{X_2} + C$	
(3) Coordinate specification	Variable conversion characteristics function

4.2 A1S63ADA

4.2.1 Performance specifications comparison

80μs/channel		○	The conversion speed of L60AD2DA2 is faster than A1S63ADA. Therefore, noise which were not imported to A1S63ADA can be imported as analog signals. In this case, use the averaging processing function to remove the effect of noise.

4.2.2 Functional comparison

(1) A/D conversion functions

○ : Available, - : Not available

Item		Description	A1S63ADA	L60AD2DA2	Precautions for replacement
A/D conversion enable/disable function		Sets whether to enable or disable A/D conversion for each channel. By disabling the conversion for the channels that are not used, the sampling time can be shortened.	○	○	
Sampling processing		Performs the A/D conversion for analog input values successively for each channel, and outputs digital output values upon each conversion.	○	○	
Averaging processing	Time average	For each channel, averages A/D conversion values by the amount of time, and outputs the average value as a digital value.	○	○	The setting range of average time and count differ. Refer to the MELSEC-L Analog I/O Module User's Manual, and check the specifications.
	Count average	For each channel, averages A/D conversion values by the number of times, and outputs the average value as a digital value.	○	○	
	Moving average	For each channel, averages A/D conversion values by the number of times on a moving of each sampling processing, and outputs the average value as a digital value.	-	○	
Range switching function		Sets the input range to be used.	○	○	
Input range extended function		Extends the input range. By combining this function with the input signal error detection function, simple disconnection detection can be executed.	-	○	
Maximum value/minimum value hold function		Stores the maximum and minimum values of the digital output values in the module.	-	○	
Input signal error detection function		Detects the analog input value which exceeds the setting range.	-	○	
Scaling function		Scale-converts the digital output value to the set range of the A/D conversion scaling upper limit value and A/D conversion scaling lower limit value. This omits the programming of the scale conversion.	-	○	To use the same digital output value that is used for the A1S63ADA, set the scaling upper and lower limit values that match the resolution of the A1S63ADA using the scaling function.
Logging function		Logs the digital output value or scaling value (digital operation value). The data of 10000 points can be logged for each channel.	-	○	

(2) D/A conversion functions

○ : Available, - : Not available

Item		Description	A1S63ADA	L60AD2DA2	Precautions for replacement
D/A conversion enable/disable function		Sets whether to enable or disable D/A conversion for each channel.	○	○	With the L60AD2DA2, disabling the D/A conversion for an unused channel reduces the conversion cycles.
D/A output enable/disable function		Sets whether to output the D/A conversion value or the offset value for each channel. The conversion speed is constant, regardless of the output enable/disable status.	○	○	
Range switching function		Sets the output range to be used.	○	○	
Analog output HOLD/CLEAR function		Sets the status of analog output values (HOLD or CLEAR), according to the CPU module operating status (RUN, STOP, or stop error).	○	○	The A1S63ADA is set the status for all channels at once using the HLD/CLR terminal on the front of the module. With the L60AD2DA2, the status can be set for each channel on the Switch Setting window of GX Works2.
Analog output test when CPU module is in STOP status		Outputs the D/A converted analog values when CH□ Output enable/disable flag is forcibly turned on while the CPU module is in the STOP status.	-	○	

○ : Available, – : Not available

Item	Description	A1S63ADA	L60AD2DA2	Precautions for replacement
Scaling function	Scale-converts the digital input value to the set range of the D/A conversion scaling upper limit value and D/A conversion scaling lower limit value. This omits the programming of the scale conversion.	–	○	The A1S63ADA is set the status for all channels at once using the HLD/CLR terminal on the front of the module. With the L60AD2DA2, HOLD/CLEAR can be set for each channel.
Alarm output function	Outputs an alarm when the digital value is out of the preset range.	–	○	
Wave output function	Reads the wave data (digital input values) prepared in advance and outputs analog data at the preset conversion cycle.	–	○	This function can be used on GX Works2.

(3) Common functions

○ : Available, – : Not available

Item	Description	A1S63ADA	L60AD2DA2	Precautions for replacement
Resolution mode	Sets the resolution according to the application. The resolution mode setting is applicable to all channels. *1	○	–	
Simple loop control (function expression)	Converts the analog values input through CH1 and CH2 to digital values and calculates the converted values with the function expression. The calculation result is converted to the analog value and output through CH3.	○	–	
External power supply READY flag	Turns on when the external power supply (24VDC) is supplied. When the external power supply READY flag (X7) is off, A/D and D/A conversion processing is not performed.	–	○	
Error log function	Stores the errors and alarms occurred in the L60AD2DA2 to the buffer memory as a history. Up to 16 errors and alarms can be stored.	–	○	
Module error collection function	Collects the errors and alarms occurred in the L60AD2DA2 and stores them in the CPU module.	–	○	
Error clear function	Clears the error from the system monitor window of the programming tool.	–	○	This function can be used on GX Works2.
Saving and restoring offset/gain values	Saves and restores the offset/gain values in the user setting range.	–	○	
Offset/gain setting function	Corrects errors in the analog and digital output values.	○	○	
Variable arithmetic function	Executes polynomial operations in the analog I/O module. For the polynomial expressions, any combination of parentheses, operators, constants set by users, and data stored in the buffer memory can be used. When conversion is enabled for a D/A conversion channel, operation results are output in analog.	–	○	This function can be used on GX Works2.*2
Variable conversion characteristics function	Conventionally, the I/O conversion characteristic of the analog I/O module (A/D conversion and D/A conversion) is indicated with a straight line connecting the offset value and the gain value. However, with this function, the conversion characteristic can be set by users.	–	○	This function can be used on GX Works2.*2
Variable conversion characteristics function + variable arithmetic function	Executes the operation for digital values converted according to variable conversion characteristics with polynomial expressions registered by users.	–	○	This function can be used on GX Works2.*2
PID control function	An analog input signal from a sensor (such as pressure and flow rate) is input to the module as the process value (PV) (16-bit signed binary) and the PID operation is performed in the module so that the input value reaches the set value (SV). The manipulated value (MV) calculated in the PID operation is output to an external operation device as an analog value of current or voltage.	–	○	*3

*1 For the A1S63ADA, the resolution setting can be selected from 1/4000, 1/8000, and 1/12000 for both voltage and current inputs.

The L60AD2DA2, however, does not support the resolution mode. To use the same digital value that is used for the A1S63ADA, set the scaling upper and lower limit values that match the resolution of the A1S63ADA using the scaling function.

*2 Only the L60AD2DA2 with a serial number (first five digits) 17042 or later supports this function.

*3 Only the L60AD2DA2 with a serial number (first five digits) 17112 or later supports this function.

4.2.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L Analog I/O Module User's Manual.

4.3 A1S66ADA

4.3.1 Performance specifications comparison

Item		A1S66ADA		
Number of analog input points		4 channels/module		
Analog input	Voltage	-10 to 0 to 10VDC (Input resistance value: 1MΩ)		
	Current	0 to 20mA (Input resistance value: 250Ω)		
Digital output		12-bit binary value 0 to 4095		
I/O characteristics	Analog input range		Digital output value	Resolution
	Voltage	0 to 10V	0 to 4000	2.5mV
		0 to 5V		1.25mV
		1 to 5V		1.0mV
		-10 to 10V		5.0mV
	Current	0 to 20mA		5μA
		4 to 20mA		4μA
Resolution				
Overall accuracy (Accuracy for the maximum digital output value)		Within ±1% (±40)		
Maximum conversion speed		400μs or less/4 channels (Sampling period: 80μs/channel)		
Absolute maximum input		Voltage: ±15V Current: 30mA		

○ : Compatible, △ : Partial change required, × : Incompatible

4.3.2 Functional comparison

(1) A/D conversion functions

○ : Available, -: Not available

Item		Description	A1S66ADA	L60AD2DA2	Precautions for replacement
A/D conversion enable/disable function		Sets whether to enable or disable A/D conversion for each channel. By disabling the conversion for the channels that are not used, the sampling time can be shortened.	-	○	
Sampling processing		Performs the A/D conversion for analog input values successively for each channel, and outputs digital output values upon each conversion.	-	○	
Averaging processing	Time average	For each channel, averages A/D conversion values by the amount of time, and outputs the average value as a digital value.	-	○	
	Count average	For each channel, averages A/D conversion values by the number of times, and outputs the average value as a digital value.	-	○	
	Moving average	For each channel, averages A/D conversion values by the number of times on a moving of each sampling processing, and outputs the average value as a digital value.	-	○	
Range switching function		Sets the input range to be used.	○	○	
Input range extended function		Extends the input range. By combining this function with the input signal error detection function, simple disconnection detection can be executed.	-	○	
Maximum value/minimum value hold function		Stores the maximum and minimum values of the digital output values in the module.	-	○	
Input signal error detection function		Detects the analog input value which exceeds the setting range.	-	○	
Scaling function		Scale-converts the digital output value to the set range of the A/D conversion scaling upper limit value and A/D conversion scaling lower limit value. This omits the programming of the scale conversion.	-	○	To use the same digital output value that is used for the A1S66ADA, set the scaling upper and lower limit values that match the resolution of the A1S66ADA using the scaling function.
Logging function		Logs the digital output value or scaling value (digital operation value). The data of 10000 points can be logged for each channel.	-	○	

(2) D/A conversion functions

○ : Available, -: Not available

Item		Description	A1S66ADA	L60AD2DA2	Precautions for replacement
D/A conversion enable/disable function		Sets whether to enable or disable D/A conversion for each channel. With the L60AD2DA2, disabling the D/A conversion for an unused channel reduces the conversion cycles.	-	○	
D/A output enable/disable function		Sets whether to output the D/A conversion value or 0V/0mA for each channel. The conversion speed is constant, regardless of the output enable/disable status.	○	-	Output varies when D/A output is disabled.
		Sets whether to output the D/A conversion value or the offset value for each channel. The conversion speed is constant, regardless of the output enable/disable status.	-	○	
Range switching function		Sets the output range to be used.	○	○	
Analog output HOLD/CLEAR function		Sets the status of analog output values (HOLD or CLEAR), according to the CPU module operating status (RUN, STOP, or stop error).	-	○	
Analog output test when CPU module is in STOP status		Outputs the D/A converted analog values when CH. Output enable/disable flag is forcibly turned on while the CPU module is in the STOP status.	-	○	

○ : Available, – : Not available

Item	Description	A1S66ADA	L60AD2DA2	Precautions for replacement
Scaling function	Scale-converts the digital input value to the set range of the D/A conversion scaling upper limit value and D/A conversion scaling lower limit value. This omits the programming of the scale conversion.	–	○	To use the same digital input value that is used for the A1S66ADA, set the scaling upper and lower limit values that match the resolution of the A1S66ADA using the scaling function.
Alarm output function	Outputs an alarm when the digital value is out of the preset range.	–	○	
Wave output function	Reads the wave data (digital input values) prepared in advance and outputs analog data at the preset conversion cycle.	–	○	This function can be used on the GX Works2.

(3) Common functions

○ : Available, – : Not available

Item	Description	A1S66ADA	L60AD2DA2	Precautions for replacement
External power supply READY flag	Turns on when the external power supply (24VDC) is supplied. When the external power supply READY flag (X7) is off, A/D and D/A conversion processing is not performed.	–	○	
Error log function	Stores the errors and alarms occurred in the L60AD2DA2 to the buffer memory as a history. Up to 16 errors and alarms can be stored.	–	○	
Module error collection function	Collects the errors and alarms occurred in the L60AD2DA2 and stores them in the CPU module.	–	○	
Error clear function	Clears the error from the system monitor window of the programming tool.	–	○	This function can be used on the GX Works2.
Saving and restoring offset/gain values	Saves and restores the offset/gain values in the user setting range.	–	○	
Offset/gain setting	Corrects errors in the analog and digital output values.	○	○	
Variable arithmetic function	Executes polynomial operations in the analog I/O module. For the polynomial expressions, any combination of parentheses, operators, constants set by users, and data stored in the buffer memory can be used. When conversion is enabled for a D/A conversion channel, operation results are output in analog.	–	○	This function can be used on GX Works2.*1
Variable conversion characteristics function	Conventionally, the I/O conversion characteristic of the analog I/O module (A/D conversion and D/A conversion) is indicated with a straight line connecting the offset value and the gain value. However, with this function, the conversion characteristic can be set by users.	–	○	This function can be used on GX Works2.*1
Variable conversion characteristics function + variable arithmetic function	Executes the operation for digital values converted according to variable conversion characteristics with polynomial expressions registered by users.	–	○	This function can be used on GX Works2.*1
PID control function	An analog input signal from a sensor (such as pressure and flow rate) is input to the module as the process value (PV) (16-bit signed binary) and the PID operation is performed in the module so that the input value reaches the set value (SV). The manipulated value (MV) calculated in the PID operation is output to an external operation device as an analog value of current or voltage.	–	○	*2

*1 Only the L60AD2DA2 with a serial number (first five digits) 17042 or later supports this function.

*2 Only the L60AD2DA2 with a serial number (first five digits) 17112 or later supports this function.

4.3.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L Analog I/O Module User's Manual.

4.3.4 Buffer memory address comparison

A1S66ADA uses I/O signals to exchange data with the CPU module. L60AD2DA2 uses the buffer memory to exchange data with the CPU module. The sequence program to exchange data needs to be modified.

For details of the buffer memory areas and sequence programs, refer to the MELSEC-L Analog I/O Module User's Manual.

5 HEATING-COOLING TEMPERATURE CONTROL MODULE/TEMPERATURE CONTROL MODULE REPLACEMENT

5.1 List of Heating-cooling Temperature Control Module/Temperature Control Module Alternative Models for Replacement

AnS/QnAS series		Transition to L series	
Product	Model	Model	Remarks (Restrictions)
Heating-cooling temperature control module Temperature control module	A1S64TCTRT Thermocouple connection	L60TCTT4	1) External wiring: Cable size is changed. 2) Number of slots: Not changed 3) Program: The number of occupied I/O points, I/O signals, and buffer memory addresses are changed. 4) Performance specifications: Not changed 5) Functional specifications: Changed (Refer to Section 5.3.)
	A1S64TCTRT Platinum resistance thermometer connection	L60TCRT4	1) External wiring: Cable size is changed. 2) Number of slots: Not changed 3) Program: The number of occupied I/O points, I/O signals, and buffer memory addresses are changed. 4) Performance specifications: Not changed 5) Functional specifications: Changed (Refer to Section 5.3.)
	A1S64TCTRTBW Thermocouple connection	L60TCTT4BW	1) External wiring: Cable size is changed. 2) Number of slots: Changed (2 modules occupied, 16 intelligent points) 3) Program: The number of occupied I/O points, I/O signals, and buffer memory addresses are changed. 4) Performance specifications: Not changed 5) Functional specifications: Changed (Refer to Section 5.3.)
	A1S64TCTRTBW Platinum resistance thermometer connection	L60TCRT4BW	1) External wiring: Cable size is changed. 2) Number of slots: Changed (2 modules occupied, 16 intelligent points) 3) Program: The number of occupied I/O points, I/O signals, and buffer memory addresses are changed. 4) Performance specifications: Not changed 5) Functional specifications: Changed (Refer to Section 5.3.)

5.2 Performance Specifications Comparison

5.2.1 A1S64TCTRT(BW) (thermocouple connection)

Item		Specifications		
		A1S64TCTRT	A1S64TCTRTBW	
Control output		Transistor output		
Number of temperature input points		Standard control: 4 channels/module Heating-cooling control: 2 channels/module		
Applicable temperature sensor		(Refer to Section 5.2.1 (1).)		
Accuracy	Indication accuracy		(Ambient temperature: 25°C±5°C) Full scale × (±0.3%)±1 digit	
			(Ambient temperature: 0°C to 55°C) Full scale × (±0.7%)±1 digit	
	Cold junction temperature compensation accuracy (ambient temperature: 0°C to 55°C)	Temperature process value (PV): -100°C or more	Within ±1.0°C	
		Temperature process value (PV): -150°C to -100°C	Within ±2.0°C	
Temperature process value (PV): -200°C to -150°C		Within ±3.0°C		
Sampling cycle		0.5s (Constant regardless of the number of channels used)		
Control output cycle		1 to 100s		
Input impedance		1MΩ		
Input filter		0 to 100s		
Sensor correction value setting		-50.00 to 50.00%		
Operation at sensor input disconnection		Upscale processing		
Temperature control method		Standard control: PID ON/OFF pulse or two-position control Heating-cooling control: PID ON/OFF pulse		
PID constants range	PID constants setting		Standard control: Can be set by auto tuning or self-tuning. Heating-cooling control: Can be set by auto tuning.	
	Proportional band (P)		Standard control: 0.0 to 1000.0% Heating-cooling control: 0.1 to 1000.0%	
	Integral time (I)		1 to 3600s	
	Derivative time (D)		0 to 3600s	
Set value (SV) setting range		Within the temperature range set for the temperature sensor to be used		
Transistor output	Output signal		ON/OFF pulse	
	Rated load voltage		10.2 to 30VDC (peak voltage 30.0V)	
	Maximum load current		0.1A/point, 0.4A/common	
	Maximum inrush current		0.4A, 10ms	
	Leakage current at OFF		0.1mA or lower	
	Maximum voltage drop at ON		1.0VDC (TYP) at 0.1A 2.5VDC (MAX) at 0.1A	
	Response time		OFF→ON: 2ms or less, ON→OFF: 2ms or less	
Number of writes to E ² PROM		Maximum 10 ¹² times (number of read/write from/to the FeRAM)		

○: Compatible, △: Partial change required, ×: Incompatible

	Specifications		Compatibility	Precautions for replacement
	L60TCTT4	L60TCTT4BW		
	Transistor output		○	
	Standard control: 4 channels/module Heating-cooling control: 2 channels/module		○	The standard control and heating-cooling control can be combined in the L series module.
	(Refer to Section 5.2.1 (1).)		○	
	(Ambient temperature: 25°C±5°C) Full scale × (±0.3%)* ¹		○	
	(Ambient temperature: 0°C to 55°C) Full scale × (±0.7%)* ¹			
	Within ±1.0°C* ¹		○	
	Within ±2.0°C* ¹			
	Within ±3.0°C* ¹			
	250ms/4 channels, 500ms/4 channels (Constant regardless of the number of channels used)		○	The sampling cycle can be selected in the L series module.
	0.5s to 100.0s		○	
	1MΩ		○	
	0 to 100s		○	
	-50.00 to 50.00%		○	
	Upscale processing		○	
	PID ON/OFF pulse or two-position control		○	
	Standard control: Can be set by auto tuning or self-tuning. Heating-cooling control: Can be set by auto tuning.		○	
	0.0 to 1000.0%		○	
	0 to 3600s		○	
	0 to 3600s		○	
	Within the temperature range set for the temperature sensor to be used		○	
	ON/OFF pulse		○	
	10 to 30VDC		○	
	0.1A/point, 0.4A/common		○	
	0.4A, 10ms		○	
	0.1mA or lower		○	
	1.0VDC (TYP) at 0.1A 2.5VDC (MAX) at 0.1A		○	
	OFF→ON: 2ms or less, ON→OFF: 2ms or less		○	
	Maximum 10 ¹² times (number of read/write from/to a non-volatile memory)		○	

*1 Calculate the accuracy in the following method.

(Accuracy) = (Indication accuracy) + (Cold junction temperature compensation accuracy)

(Example) Accuracy at the input range of 38, the operating ambient temperature of 35°C, and the temperature process value (PV) of 300°C

{400.0-(-200.0)} [Full scale] × (±0.007) [±0.7%] + (±1.0°C) [Cold junction temperature compensation accuracy] = ±5.2°C

Item	Specifications	
	A1S64TCTRT	A1S64TCTRTBW
Insulation method	Between the input terminal and programmable controller power supply: Transformer Between input channels: Transformer	
Dielectric withstand voltage	Between the input terminal and programmable controller power supply: 500VAC, for 1 minute Between input channels: 500VAC, for 1 minute	
Insulation resistance	Between the input terminal and programmable controller power supply: 500VDC, 10MΩ or more Between input channels: 500VDC, 10MΩ or more	
Heater disconnection detection specifications	Current sensor	U.R.D. Co., LTD. CTL-12-S36-8 CTL-6-P(-H)
	Input accuracy	Full scale × (±1.0%)
	Number of alert delay	3 to 255
Number of occupied I/O points	32 points (I/O assignment: special 32 points)	
Connection terminal	20-point terminal block	
Applicable wire size	0.75 to 1.5mm ²	
Applicable solderless terminal	R1.25-3, 1.25-YS3, RAV1.25-3, V1.25-YS3A	
Internal current consumption	0.33A (0.19A)* ²	0.39A (0.25A)* ²
Weight	0.26kg	0.28kg
External dimensions	34.5(W) × 130(H) × 93.6(D)mm	

*2 A current value when the temperature conversion function is not used in an unused channel under heating-cooling control.

5.2.2 A1S64TCTRT(BW) (platinum resistance thermometer connection)

Item		Specifications	
		A1S64TCTRT	A1S64TCTRTBW
Control output		Transistor output	
Number of temperature input points		Standard control: 4 channels/module Heating-cooling control: 2 channels/module	
Applicable temperature sensor		(Refer to Section 5.2.2 (1).)	
Indication accuracy		(Ambient temperature: 25°C±5°C) Full scale × (±0.3%)±1 digit	
		(Ambient temperature: 0°C to 55°C) Full scale × (±0.7%)±1 digit	
Sampling cycle		0.5s (Constant regardless of the number of channels used)	
Control output cycle		1 to 100s	
Input impedance		1MΩ	
Input filter		0 to 100s	
Sensor correction value setting		-50.00 to 50.00%	
Operation at sensor input disconnection		Upscale processing	
Temperature control method		Standard control: PID ON/OFF pulse or two-position control Heating-cooling control: PID ON/OFF pulse	
PID constants range	PID constants setting	Standard control: Can be set by auto tuning or self-tuning. Heating-cooling control: Can be set by auto tuning.	
	Proportional band (P)	Standard control: 0.0 to 1000.0% Heating-cooling control: 0.1 to 1000.0%	
	Integral time (I)	1 to 3600s	
	Derivative time (D)	0 to 3600s	
Set value (SV) setting range		Within the temperature range set for the temperature sensor to be used	
Transistor output	Output signal	ON/OFF pulse	
	Rated load voltage	10.2 to 30VDC (peak voltage 30.0V)	
	Maximum load current	0.1A/point, 0.4A/common	
	Maximum inrush current	0.4A, 10ms	
	Leakage current at OFF	0.1mA or lower	
	Maximum voltage drop at ON	1.0VDC (TYP) at 0.1A 2.5VDC (MAX) at 0.1A	
	Response time	OFF→ON: 2ms or less, ON→OFF: 2ms or less	
Number of writes to E ² PROM		Maximum 10 ¹² times (number of read/write from/to the FeRAM)	

○: Compatible, △: Partial change required, ×: Incompatible

5.3 Functional Comparison

Item	Description	
Auto tuning function	The temperature control module automatically sets the optimal PID constants.	
Self-tuning function	The temperature control module constantly monitors the control status. If the control is affected by disturbance, the module automatically changes or sets PID constants for the optimum control.	
Forward action/reverse action selection function	Selects and controls the heating control (reverse action) or cooling control (forward action).	
RFB limiter function	Suppresses the manipulated value overshoot which frequently occurs when the set value (SV) or the control target is changed.	
Sensor correction function	Corrects the difference between the temperature process value (PV) and actual temperature caused due to the measurement status.	
Unused channel setting	Specifies to not execute the PID operation in a channel that do not perform temperature control.	
PID control forced stop	Forcibly stops the PID operation in a channel that temperature control is in process.	
Heater disconnection detection function	Measures the current that flows in the heater main circuit and detects the disconnection.	
Output off-time current error detection function	Measures the current that is flowing in the heater main circuit when the transistor output is off, and detects the output off-time current error	
Loop disconnection detection function	Detects errors in the control system (control loop) caused by a load (heater) disconnection, external operation devices (such as magnet relay) error, or sensor disconnection.	
Data storage in E ² PROM	By backing up data in the buffer memory to E ² PROM, the load of sequence program can be reduced.	
Alert function	Monitors the process value (PV) and issues a warning.	
Output setting at CPU stop error	Whether to hold or stop the temperature control output when a CPU stop error occurs can be selected.	
Control function	Specifies a control status by setting output signals and buffer memory areas.	
Simultaneous temperature rise function	Coordinates the time when several loops reach the set value (SV) at the same time.	
Peak current suppression function	Suppresses the peak current by changing automatically the upper limit output limiter value of each channel and dividing the timing of transistor output.	
Temperature conversion function (using unused channels)	Performs only the temperature measurement using unused temperature input terminals in the heating-cooling control (normal mode) and mix control (normal mode).	
Temperature process value (PV) scaling function	Converts the temperature process value (PV) to the set width and stores this value into the buffer memory areas.	
Error history function	Stores the errors and alarms occurred in the module to the buffer memory as a history. Up to 16 errors and alarms can be stored.	
Module error history collection function	Notifies the CPU module of the error detail when errors and alarms occur on the module. Error information is stored to the memory in the CPU module as the module error history.	
Error clear function ^{*2}	Clears the error from the system monitor window of the programming tool.	
Heating-cooling control	Cooling method setting function	Specifies a auto tuning operation formula according to the selected cooling system (water-cooling or air-cooling).
	Overlap/dead band function	Specifies a temperature area near the temperature where heating output and cooling output is switched from the following: <ul style="list-style-type: none"> • Overlap area where both are output • Dead band area where neither is output
	Temperature conversion function (using unused channels)	Performs the temperature conversion in input channels that are not used for the control (monitor channel 1, 2)

*1 When an L series module is used for the temperature control/heating-cooling temperature control, the control mode setting (standard control mode or heating-cooling control mode) using the switch setting is required.

*2 This function can be used on GX Works2.

5.4 I/O Signal Comparison

Sequence programs need to be changed because the I/O signal assignment differs.
For details of the I/O signals and sequence programs, refer to the user' manual for each module.

5.4.1 A1S64TCTRT(BW) and L series modules (standard control)

6 HIGH-SPEED COUNTER MODULE REPLACEMENT

6.1 List of High-Speed Counter Module Alternative Models for Replacement

AnS/QnAS series		Transition to L series	
Product	Model	Model	Remarks (Restrictions)
High-speed counter module	A1SD61	LD62	<ol style="list-style-type: none"> 1) External wiring: Terminal block wiring → Connector wiring Cable size is changed. 2) Number of slots: Not changed 3) Counting speed: 200K, 100K, or 10KPPS 4) Counting range: 32-bit signed binary (-2147483648 to 2147483647) Program does not need to be reviewed. 5) Program: The number of occupied I/O points, I/O signals, and buffer memory addresses are changed. 6) Performance specifications: Number of channels is 2. The input terminal filter characteristics are different. 7) Function specifications: Limit switch output function → Coincidence output function (Two coincidence detection output points can be set.)
		L02SCPU L02CPU L06CPU L26CPU L26CPU-BT	<ol style="list-style-type: none"> 1) External wiring: Terminal block wiring → Connector wiring Cable size is changed. 2) Number of slots: Changed. 0 module (I/O function built in CPU) 3) Counting speed: 200K, 100K, 50K, or 10KPPS 4) Counting range: 32-bit signed binary (-2147483648 to 2147483647) Program does not need to be reviewed. 5) Program: Incompatible, Need to be created. 6) Performance specifications: Number of channels is 2. External input voltage 24V only The input terminal filter characteristics are different. 7) Function specifications: Limit switch output function → Coincidence output function (Two coincidence detection output points can be set.) No periodic pulse counter function

AnS/QnAS series		Transition to L series	
Product	Model	Model	Remarks (Restrictions)
High-speed counter module	A1SD62	LD62	1) External wiring: Terminal block wiring → Connector wiring Cable size is changed. 2) Number of slots: Not changed 3) Counting speed: 200K, 100K, or 10KPPS 4) Counting range: 32-bit signed binary (-2147483648 to 2147483647) Program does not need to be reviewed. 5) Program: The number of occupied I/O points, I/O signals, and buffer memory addresses are changed. 6) Performance specifications: The input terminal filter characteristics are different. 7) Function specifications: Limit switch output function → Coincidence output function (Two coincidence detection output points can be set.)

No periodic pulse counter function

☒ Point

1) Module replacement

A pulse generator, such as an encoder, that is connected to an AnS series module can be connected to a L series module.

Check the operation of the device before actually used in the system because the operating environment (the external wiring method) differs.

2) Counting range of the counter

Counting range differs between AnS series modules and L series modules.

To change the counting range so that the ranges will be the same in the modules before and after the replacement, program needs to be reviewed.

A1SD62(E/D/D-S1): 0 to 16777215 (24-bit unsigned binary)

A1SD61, LCPU (built-in I/O function), LD62(D): -2147483648 to 2147483647 (32-bit signed binary)

3) Wiring

An external wiring method differs between AnS series modules and L series modules.

A1SD61, A1SD62 (E/D/D-S1): Wiring using a terminal block

LD62(D), LCPU (built-in I/O function): Wiring using a connector

When using an I/O signal wire with a solderless terminal of the A1SD61 or A1SD62 for the purpose of module replacement, change the external wiring method according to (a) or (b).

(a) Using the upgrade tool (conversion adapter)

The upgrade tool (conversion adapter) manufactured by Mitsubishi Electric Engineering Co., Ltd. enables to connect the existing wiring that was connected to the A1SD61 or A1SD62 to L series modules without change.

Product	Existing module model	Alternative module model	Conversion adapter model*1	Space module LG69**1
High-speed counter module	A1SD61	LD62	ERNT-ASLTD61	Available
	A1SD62		ERNT-ASLTD62	

*1 For details on the conversion adapter or LG69, refer to the Transition from MELSEC-AnS/QnAS (Small Type) Series to L Series Handbook (Fundamentals)

(b) Using the connector/terminal block converter module

Adopt this method if the upgrade tool (conversion adapter) manufactured by Mitsubishi Electric Engineering Co., Ltd. cannot be used because of restrictions such as a system configuration and installation location when the module is replaced to use the built-in I/O function.

By rewiring an I/O signal cable with a solderless terminal connected to the existing module to the connector/terminal block converter module and connecting it with the dedicated cable, the I/O signal cables can be used for the new module without regard to the existing wire size.

Therefore, this method can be adopted even if the space is not enough.

The following figure shows the wiring method when the connector/terminal block converter module is used.

(When replacing A1SD61 with LD62)

For wiring to the connector/terminal block converter module, refer to the following.

- LD62
 MELSEC-L High-speed Counter Module User's Manual: SH-080920ENG
- Built-in I/O function
 MELSEC-L CPU Module User's Manual (Built-In I/O Function): SH-080892ENG
- Connector/terminal block converter module
 MELSEC-L I/O Module User's Manual: SH-080888ENG

6.2 A1SD61

6.2.1 Performance specifications comparison

(1) Comparison between A1SD61 and LD62

○ : Compatible, △ : Partial change required, × : Incompatible

Item		A1SD61		LD62			Compati- bility	Precautions for replacement	
Number of occupied I/O points		32 points (I/O assignment: special 32 points)		16 points (I/O assignment: intelligent 16 points)			△	*1	
Number of channels		1 channel		2 channels			○		
Counting speed switch setting		50K	10K	200K (100K to 200KPPS)	100K (10K to 100KPPS)	10K (10KPPS or less)	○	Set the counting speed of the LD62 with the switch setting	
Count input signal	Phase	1-phase input, 2-phase input					○		
	Signal level (φA, φB)	5VDC 12VDC 24VDC } 2 to 5mA					○	*2	
Performance specifications of 1 channel Counter	Counting speed (maximum)	1-phase input	50KPPS	10KPPS	200KPPS	100KPPS	10KPPS	○	
		2-phase input	50KPPS	7KPPS	200KPPS	100KPPS	10KPPS		
	Counting range	32-bit signed binary (-2147483648 to 2147483647)					○		
	Type	UP/DOWN preset counter + ring counter function					○		
	Minimum count pulse width, duty ratio: 50%							-	
	(200KPPS)	-		 (Unit : μs) (Minimum phase difference in 2-phase input 1.25μs)			○		
	(100KPPS)	-		 (Unit : μs) (Minimum phase difference in 2-phase input 2.5μs)			○		
	(50KPPS)	 (Unit : μs) (1- and 2-phase input)		-			△	Set the counting speed of the LD62 to "100K".	

* 1 A program used before replacement can be utilized by setting the start I/O signal numbers of the modules connected to the right of the LD62 so that they can be the same as that of the module before replacement. (Set the start number at "Start XY" of the I/O assignment tab. The number of occupied points of the LD62 cannot be changed.)

* 2 The rise/fall time of a pulse affects the counting speed. Countable counting speeds are as follows.
Counting a pulse greater than $t = 50\mu\text{s}$ may result in a miscount.
(For the LD62)

Rise/fall time	Common to 1-phase input and 2-phase input		
	200K	100K	10K
Counter speed switch setting			
$t = 1.25\mu\text{s}$ or less	200KPPS	100KPPS	10KPPS
$t = 2.5\mu\text{s}$ or less	100KPPS	100KPPS	10KPPS
$t = 25\mu\text{s}$ or less	—	10KPPS	10KPPS
$t = 500\mu\text{s}$	—	—	500KPPS

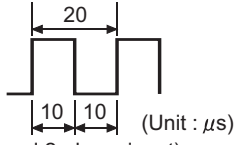

○ : Compatible, △ : Partial change required, × : Incompatible

Item		A1SD61		LD62		Compati- bility	Precautions for replacement

	Limit switch output		Transistor (open collector) output 12/24VDC, 0.1A/point, 0.8A/common				—			
Internal current consumption (5VDC)		0.35A						—		
Weight		0.27kg						—		

* 1 Programs are incompatible and need to be created.

6.2.2 Functional comparison

○: Supported, –: Not supported

Item	Description	A1SD61	LCPU (built-in I/O function)	LD62	Precautions for replacement
Preset function	Changes the counter present value to a specified value.	○	○	○	
Disable function	Terminates counting.	○	○	○	
Ring counter function	Repeatedly executes counting between user's setting values.	○	○	○	For the L series modules, values are set with the intelligent function module switch setting.
Linear counter function	Detects an overflow if the count exceeds the range.	–	○	○	
Coincidence output function	Outputs a signal when the counter present value matches the preset value.	–	○	○	No.1 and No.2 coincidence output points can be set for each channel.
Limit switch output function	Outputs the ON/OFF signal when the present value of the limit switch output command counter matches the output status preset to a channel.	○	–	–	Use the coincidence output function instead. Note that the specifications (such as set point) are different.
Coincidence detection interrupt function	Generates an interrupt signal to the CPU module when coincidence is detected.	–	○	○	
Latch counter function	Latches the present value at the time a signal is input.	○	○	○	
Sampling counter function	Counts the pulse that was input during the sampling time set.	○	○	○	
Periodic pulse counter function	Stores the present value to Periodic pulse count present value and the previous value to Periodic pulse count previous value for each set cycle.	○	–	○	

6.2.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L High-Speed Counter Module User's Manual.

When the built-in I/O functions of the LCPU are used, the special relay is used. For details, refer to the MELSEC-L CPU Module User's Manual (Built-in I/O Function).

6.2.4 Buffer memory address comparison

Sequence programs need to be changed because the buffer memory address assignment differs. For details of the buffer memory areas and sequence programs, refer to the MELSEC-L High-Speed Counter Module User's Manual.

When the built-in I/O functions of the LCPU are used, the special register is used. For details, refer to the MELSEC-L CPU Module User's Manual (Built-in I/O Function).

	(10KPPS) 2-phase input	<p>(Unit : μs) (2-phase input)</p>					

○ : Compatible, △ : Partial change required, × : Incompatible

Item		A1SD62(E)	LD62	Compati- bility	Precautions for replacement	
Performance specifications of 1 channel	Magnitude comparison between the CPU module and high-speed counter module	Comparison range	24-bit unsigned binary	32-bit signed binary	○	
		Comparison result	Set value < count value Set value = count value Set value > count value		○	
	External input	Preset	5/12/24VDC, 2 to 5mA		○	
		Function start			○	
	External output	Coincidence output	Transistor output A1SD62: sink type 12/24VDC, 0.5A/point, 2A/common A1SD62E: source type 12/24VDC, 0.1A/point, 0.4A/common	Transistor (sink type) output 12/24VDC, 0.5A/point, 2A/common	△	Since the external output specifications differ, check the specifications of an external device. When the A1SD62E is replaced, the output type differs. Therefore, consider changing external devices and wiring as well.
			1 point/channel	2 points/channel		
Internal current consumption (5VDC)		0.1A	0.31A	△	Recalculation of internal current consumption (5VDC) is required.	
Weight		0.25kg	0.13kg	△		

(2) Comparison between A1SD62(E) and LCPU (built-in I/O function)

○ : Compatible, △ : Partial change required, × : Incompatible

Item		A1SD62(E)			LCPU (built-in I/O function)			Compati- bility	Precautions for replacement		
Number of occupied I/O points		32 points (I/O assignment: special 32 points)			16 points (I/O assignment: intelligent 16 points)			△	The number of occupied I/O points is changed to 16 points.		
Number of channels		2 channels							○		
Counting speed switch setting		100K	10K		200K (100K to 200KPPS)	100K (10K to 100KPPS)	10K (10KPPS or less)	○			
Performance specifications of 1 channel	Count input signal	Phase	1-phase input, 2-phase input					○			
		Signal level (φA, φB)	5VDC } 12VDC } 2 to 5mA 24VDC }			DC input: 24V, 6.0mA Differential input: The EIA Standard RS-422-A differential line driver can be connected.			△	Since the external input specifications differ, check the specifications of an external device.	
	Counting speed (maximum)	1-phase input	100KPPS	10KPPS		200KPPS	100KPPS	10KPPS	○	200KPPS (1-phase multiple of 2, 2-phase multiple of 4)	
		2-phase input	100KPPS	7KPPS		200KPPS	100KPPS	10KPPS			
	Counting range	24-bit unsigned binary (0 to 16777215)			32-bit signed binary (-2147483648 to 2147483647)			△	Since the LCPU (built-in I/O function) uses 32-bit signed binary values, sequence program needs to be changed.		
	Type	UP/DOWN preset counter + ring counter function							○		
	Minimum count pulse width, duty ratio: 50%		-							-	
	Counter	(200KPPS)	-								
		(100KPPS)	<p>(Unit : µs) (Minimum phase difference in 2-phase input 2.5µs)</p>					1-phase: 5µs 2-phase: 10µs		○	
		(10KPPS) 1-phase input	<p>(Unit : µs) (1-phase input)</p>								
(10KPPS) 2-phase input		<p>(Unit : µs) (2-phase input)</p>									

○ : Compatible, △ : Partial change required, × : Incompatible

Item		A1SD62(E)	LCPU (built-in I/O function)	Compati- bility	Precautions for replace- ment	
Performance specifications of 1 channel	Magnitude comparison between the CPU module and high-speed counter module	Comparison range	24-bit unsigned binary	32-bit signed binary	○	
		Comparison result	Set value < count value Set value = count value Set value > count value		○	
	External input	Preset	5/12/24VDC, 2 to 5mA	-	△	Since the external input specifications differ, check the specifications of an external device.
		Function start				
		External command signal	-	24VDC, 4.1mA		
	External output	Coincidence output	Transistor output A1S62: sink type 12/24VDC, 0.5A/point, 2A/common A1S62E: source type 12/24VDC, 0.1A/point, 0.4A/common	Transistor output (L02SCPU, L02CPU, L06CPU, L26CPU, L26CPU-BT: sink type) L02SCPU-P, L02CPU-P, L06CPU-P, L26CPU-P, L26CPU-PBT: source type) 5 to 24VDC, 0.1 A/point, 8 points/common	△	Since the external output specifications differ, check the specifications of an external device.
			1 point/channel	2 points/channel		
	Internal current consumption (5VDC)		0.10A	-	-	
	Weight		0.25kg	-	-	

(3) Comparison between A1SD62D(-S1) and LD62D

○ : Compatible, △ : Partial change required, × : Incompatible

Item		A1SD62D(-S1)			LD62D				Compati- bility	Precautions for replacement	
Number of occupied I/O points		32 points (I/O assignment: special 32 points)			16 points (I/O assignment: intelligent 16 points)				△	The number of occupied I/O points is changed to 16 points.	
Number of channels					2 channels				○		
Counting speed switch setting		200K	10K	500K (200K to 500KPPS)	200K (100K to 200KPPS)	100K (10K to 100KPPS)	10K (10KPPS or less)	○	Set the counting speed of the LD62D with the switch setting.		
Performance specifications of 1 channel	Count input signal	Phase		1-phase input, 2-phase input				○			
		Signal level (φA, φB)		EIA Standard RS-422-A differential line driver level (AM26LS31 [manufactured by Texas Instruments] or equivalent)				○			
	Counting speed (maximum)	1-phase input	200KPPS	10KPPS	500KPPS	200KPPS	100KPPS	10KPPS	○		
		2-phase input	200KPPS	7KPPS							
	Counting range	24-bit unsigned binary (0 to 16777215)			32-bit signed binary (-2147483648 to 2147483647)				△	Since the LD62D uses 32-bit signed binary values, sequence program needs to be changed.	
	Type	UP/DOWN preset counter + ring counter function							○		
	Minimum count pulse width, duty ratio: 50%										
	Counter	(500KPPS)	-			<p>(Unit : μs) (Minimum phase difference in 2-phase input 0.5μs)</p>				○	
		(200KPPS)	-			<p>(Unit : μs) (Minimum phase difference in 2-phase input 1.25μs)</p>					
		(100KPPS)	-			<p>(Unit : μs) (Minimum phase difference in 2-phase input 2.5μs)</p>					
(10KPPS) 1-phase input		<p>(Unit : μs) (1-phase input)</p>			<p>(Unit : μs) (Minimum phase difference in 2-phase input 25μs)</p>						
(10KPPS) 2-phase input		<p>(Unit : μs) (2-phase input)</p>									

○ : Compatible, △ : Partial change required, × : Incompatible

Item		A1SD62D(-S1)	LD62D	Compati- bility	Precautions for replacement	
Performance specifications of 1 channel	Magnitude comparison between CPU module and high-speed counter module	Comparison range	24-bit unsigned binary	32-bit signed binary	○	
		Comparison result	Set value < count value Set value = count value Set value > count value		○	
	External input	Preset	A1SD62D: 5/12/24VDC, 2 to 5mA A1SD62D-S1: Differential input (The EIA Standard RS-422-A differential line driver can be connected.)	DC input: 5/12/24VDC, 2 to 5mA Differential input: The EIA Standard RS-422-A differential line driver can be connected.	○	The LD62D supports both DC input and differential input.
		Function start	5/12/24VDC, 2 to 5mA			
	External output	Coincidence output	1 point/channel	2 points/channel	○	
Internal current consumption (5VDC)		0.25A	0.36A	△	Recalculation of internal current consumption (5VDC) is required.	
Weight		0.25kg	0.13kg	△		

(4) Comparison between A1SD62D(-S1) and LCPU(Built-in I/O function)

○ : Compatible, △ : Partial change required, × : Incompatible

Item		A1SD62D(-S1)			LCPU (built-in I/O function)			Compati- bility	Precautions for replacement	
Number of occupied I/O points		32 points (I/O assignment: special 32 points)			16 points (I/O assignment: intelligent 16 points)			△	The number of occupied I/O points is changed to 16 points.	
Number of channels		2 channels							○

Weight		0.25kg	-		-		

6.3.2 Functional comparison

○: Supported, -: Not supported

Item	Description	A1SD62 (E/D/D-S1)	LCPU (built-in I/O function)	LD62(D)	Precautions for replacement
Preset function	Changes the counter present value to a specified value.	○	○	○	
Disable function	Terminates counting.	○	○	○	
Ring counter function	Repeatedly executes counting between user's setting values.	○	○	○	For the LD62 (D), values are set with the switch setting.
Linear counter function	Detects an overflow if the count exceeds the range.	-	○	○	
Coincidence output function	Outputs a signal when the counter present value matches the preset value.	○	○	○	No.1 and No.2 coincidence output points can be set for each channel.
Coincidence detection interrupt function	Generates an interrupt signal to the CPU module when coincidence is detected.	-	○	○	
Latch counter function	Latches the present value at the time a signal is input.	○	○	○	
Sampling counter function	Counts the pulse that was input during the sampling time set.	○	○	○	
Periodic pulse counter function	Stores the present value to Periodic pulse count present value and the previous value to Periodic pulse count previous value for each set cycle.	○	-	○	

6.3.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L High-Speed Counter Module User's Manual.

When the built-in I/O functions of the LCPU are used, the special relay is used. For details, refer to the MELSEC-L CPU Module User's Manual (Built-in I/O Function)

A1SD62(E/D/D-S1)				LD62(D)				
Device No.	Signal name	Device No.	Signal name	Device No.	Signal name	Device No.	Signal name

*1 These signals are use-prohibited in the A1SD62D-S1.

6.3.4 Buffer memory address comparison

Sequence programs need to be changed because the buffer memory address assignment differs. For details of the buffer memory areas and sequence programs, refer to the MELSEC-L High-Speed Counter Module User's Manual.

When the built-in I/O functions of the LCPU are used, the special register is used. For details, refer to the MELSEC-L CPU Module User's Manual (Built-in I/O Function).

A1SD62(E/D/D-S1)				LD62(D)				
Address (decimal)		Name	Read/write	Address (decimal)		Name	Read/write	
CH1	CH2			CH1	CH2			
0	32	Unused-	-	0	32			
1	33	Preset value setting	R/W	1	33	Preset value	(L)

7 POSITIONING MODULE REPLACEMENT

7.1 List of Positioning Module Alternative Models for Replacement

AnS series		Transition to L series	
Product	Model	Model	Remarks (Restrictions)
Positioning module	A1SD70	None	There are no alternative models. Consider replacing with the LCPU (built-in I/O function), LD75□, or LD77MH system including external devices.
	A1SD75P1-S3	LCPU (built-in I/O function) (when an open collector is connected)	<ol style="list-style-type: none"> External wiring: Connector and wiring are changed. Number of slots: Changed. 0 module (built-in function of the CPU module) Program: Need to be created (Incompatible) Performance specifications: Changed, such as 2 axes, locus control disabled, and 200KPPS Function specifications: Changed. Positioning pattern: 10 data/axis No Manual pulse generator input, no backlash compensation function, no electronic gear function, no torque limit function, and position unit: pulse, only
		LD75P1 (when an open collector is connected)	<ol style="list-style-type: none"> External wiring: Connector and wiring are changed. Number of slots: Changed. 1 slot → 2 slots (Number of occupied points does not change (32 points).) Program: I/O signals and buffer memory assignment are changed. The entire program is reviewed according to the specifications change. Performance specifications: Not changed Function specifications: Partly changed
		LD75D1 (when a differential driver is connected)	<ol style="list-style-type: none"> Performance specifications: Not changed Function specifications: Partly changed (Example: Manual pulse generator 1/axis → 1/module)

AnS series		Transition to L series	
Positioning module	A1SD75P2-S3	LCPU (built-in I/O function) (when an open collector is connected)	<ol style="list-style-type: none"> External wiring: Connector and wiring are changed. Number of slots: Changed. 0 module (built-in function of the CPU module) Program: Need to be created (Incompatible) Performance specifications: Changed, such as locus control disabled and 200KPPS Function specifications: Changed. Positioning pattern: 10 data/axis No Manual pulse generator input, no backlash compensation function, no electronic gear function, no torque limit function, and position unit: pulse, only
		LD75P2 (when an open collector is connected)	<ol style="list-style-type: none"> External wiring: Connector and wiring are changed. Number of slots: Changed. 1 slot → 2 slots (Number of occupied points does not change (32 points).) Program: I/O signals and buffer memory assignment are changed. The entire program is reviewed according to the specifications change. Performance specifications: Not changed Function specifications: Partly changed (Example: Manual pulse generator 1/axis → 1/module)
	LD75D2 (when a differential driver is connected)		
	A1SD75P3-S3	LCPU (built-in I/O function) (when an open collector is connected)	<ol style="list-style-type: none"> External wiring: Connector and wiring are changed. Number of slots: Changed. 0 module (built-in function of the CPU module) Program: Need to be created (Incompatible) Performance specifications: Changed, such as 2 axes, locus control disabled, and 200KPPS Function specifications: Changed. Positioning pattern: 10 data/axis No Manual pulse generator input, no backlash compensation function, no electronic gear function, no torque limit function, and position unit: pulse, only
		LD75P4 (when an open collector is connected)	<ol style="list-style-type: none"> External wiring: Connector and wiring are changed. Number of slots: Changed. 1 slot → 2 slots (Number of occupied points does not change (32 points).) Program: I/O signals and buffer memory assignment are changed. The entire program is reviewed according to the specifications change. Performance specifications: 3 axes → 4 axes Function specifications: Partly changed (Example: Manual pulse generator 1/axis → 1/module)
	LD75D4 (when a differential driver is connected)		
	A1SD75M1 A1SD75M2 A1SD75M3	None	<p>There are no alternative models.</p> <p>Consider replacement to simple motion module LD77MH4.</p> <p>Note that the entire system needs to be replaced because the existing servo amplifier, servomotor, and SSCNET cable cannot be used.</p>

	In-position (INP)	Available (for monitoring)			Not available	Not available			△	No INP signal. When the signal is required for monitor, monitor using an input module.
	Signal logic switching	Available (Command pulse output signal only)			Available (External command signal only)	Available			○	The default logic of the pulse output differs.
Peripheral (for data setting)	Connection with peripherals	Direct connection			CPU module	Via a CPU module, serial communication module, or network module			○	The connection type differs.
	Teaching unit	AD75TU			Not connectable	Not connectable			×	The teaching unit cannot be used.
	Software package	GX Configurator-AP			GX Works2	GX Works2			△	The software that can be used differs.

- *1 With the A1SD75P□-S3, No.1 to 100 data/axis of positioning data can be set using the buffer memory. No.1 to 600 data/axis can be set with the LD75P□/D□.
The positioning data in the buffer memory areas are not backed up.
- *2 This range indicates the standard mode/stepping motor mode for the A1SD75P□-S3.
- *3 The near pass function is enabled only during the continuous path control. (A1SD75P□-S3: Selected with parameters, LD75P□/D□: Standard function)
The LD75P□/D□ does not support the address pass mode. When passing the positioning address is required, connect the LD75P□/D□ with continuous running.
(However, it will stop once.)
- *4 This is the internal current consumption when the A1SD75P3-S3 is connected to a differential driver.

7.2.2 Functional comparison

(1) Functions deleted from the A1SD75P□-S3

When the following functions are used with the A1SD75P□-S3, change the program.

When the built-in I/O functions of the LCPU are used, refer to the MELSEC-L CPU Module User's Manual (Built-in I/O Function).

Deleted function	Precautions for replacement
Stepping motor mode	Requires no setting of when the stepping motor is used to improve its performance.
Fast machine OPR	With the LD75P□/D□, there is no possible function for replacement.
Special start (stop)	Execute it separately for the start two times.
Indirect designation	In the LD75P□/D□, the start block area in the buffer memory is expanded to five blocks (0 to 4). Each start block can be directly specified with Positioning start No. 7000 to 7004.
Block transfer	With the A1SD75P□-S3, this interface is used to set Positioning data No. 101 to 600 that do not exist in the buffer memory.
Positioning data I/F	Since all positioning data can be set in the buffer memory with the LD75P□/D□, this function is deleted.
Start history during errors	The contents are the same as the start history. Therefore, the LD75P□/D□ stores only the start history.
System monitor data (Module name, OS type, OS version)	These data were deleted because they can be displayed in system monitor "Module's detailed information" of GX Works2.

(2) Functions changed from the A1SD75P□-S3

When the following functions are used with the A1SD75P□-S3, check that there is no problem after the module is replaced with the LD75P□/D□.

When the built-in I/O functions of the LCPU are used, refer to the MELSEC-L CPU Module User's Manual (Built-in I/O Function).

Changed function	Description		
Software stroke limit function	<ol style="list-style-type: none"> The software stroke limit check of arc address is carried out only when a sub point is specified. The check is not carried out when a center point is specified. The software stroke limit check during the speed control is carried out in the following: <ul style="list-style-type: none"> - When the software stroke limit is applied to the current feed value with Pr.14 and the current feed value is updated with Pr.21 - When the software stroke limit is applied to the machine feed value When the current value is changed, an error occurs if the specified address is out of the software stroke limit range. Therefore, the current value is not changed. Error code change A1SD75P□-S3: There are 3 types of errors for each software stroke upper limit and lower limit. (error code: 509 to 512) LD75P□/D□: Errors for the software stroke upper limit are integrated into one (error code: 507). Errors for the software stroke lower limit are integrated into one (error code: 508). Error codes 509 to 512 are deleted. 		
Current value changing M code function	<ol style="list-style-type: none"> An error occurs when the specified new current value is out of the software stroke limit range. The M code set value is enabled during the positioning data current value changing instruction. 		
Acceleration/deceleration speed control	<ol style="list-style-type: none"> An error occurs when the command frequency value converted from the speed limit value exceeds the maximum command frequency of the positioning module being used. Only two-word type (1 to 8388608ms) can be used as the setting value for the acceleration/deceleration time. (Switching between one-word type and two-word type has been stopped.) 		
Stop process and restart after stop positioning operation stop	<ol style="list-style-type: none"> "Peripheral side (emergency) stop" is deleted from the stop causes of Stop group 2 "sudden stop selection". "Test mode fault" in the stop causes of Stop group 3 "sudden stop selection" is changed into the stop causes of Stop group 2 "sudden stop selection". "Stop (LD75 peripheral)" is added to the stop causes of Stop group 3 "sudden stop selection". Error code 100 (Peripheral device stop during operation) is deleted. "CPU module error occurrence" is added to the stop causes of Stop group 2 "Sudden stop selection". 		
READY signal (X0)	A1SD75P□-S3	LD75P□/D□	
	OFF	Normal (READY)	Not READY/WDT error
	ON	Not READY/WDT error	Normal (READY)
Manual pulse generator operation	The number of connected manual pulse generators is changed from 1/axis to 1/module.		
Axis operation status	"Step stopped" is changed to "Stopped" and "Step error occurring" is changed to "Error occurring".		
Continuous path control	<ul style="list-style-type: none"> A1SD75P□-S3: If the reference axis operates in reverse direction, the control is internally changed into the continuous positioning control (restart after deceleration stop). LD75P□/D□: Even if the reference axis operates in reverse direction with interpolation, the control remains as the continuous path control. (In single-axis operation, the operation is the same as that of the A1SD75P□-S3.) 		
Near pass	For the continuous path control, only the near pass function is available. Positioning address pass is not available.		
2-axis interpolation • 2-axis linear interpolation • 2-axis fixed-feed • Circular interpolation	The interpolation target axis can be voluntarily set with a positioning identifier.		
Step function	<ol style="list-style-type: none"> "Step stopped" is changed to "Stopped" and "Step error occurring" is changed to "Error occurring" in the axis operations status. The restart command (02H) of step start information is deleted. The step operation is restarted with the restart command. 		

Changed function	Description		
Command in-position function	The command in-position width is expanded. <ul style="list-style-type: none"> • A1SD75P□-S3: 1 to 32767000 • LD75P□/D□: 1 to 2147483647 		
Positioning start No.	7004 to 7010 (block start designation) and 8000 to 8049 (indirect designation) are deleted.		
block start data	With the LD75P□/D□, the number of blocks has been changed to 5 (7000 to 7004). (With the A1SD75P□-S3, this data is called "Positioning start information".)		
Start history	The configuration of "start information" and "start No." is changed so that the start No. can be directly checked.		
Basic parameter1 "Pr.5 Pulse output mode"	When the CPU module is powered on or reset, the valid value is only the first value after PLC READY (Y0) turns off to on.		
Detailed parameters "Pr.15 Software stroke limit valid/invalid setting"		A1SD75P□-S3	LD75P□/D□
	0 (Factory default setting)	Software stroke limit is disabled at the manual operation.	Software stroke limit is enabled at the manual operation.
	1	Software stroke limit is enabled at the manual operation.	Software stroke limit is enabled at the manual operation.

7.2.3 I/O signal comparison

Sequence programs need to be changed because the I/O signal assignment differs.

For details of the I/O signals and sequence programs, refer to the MELSEC-L LD75P/LD75D Positioning Module User's Manual.

When the built-in I/O functions of the LCPU are used, the special relay is used. For details, refer to the MELSEC-L CPU Module User's Manual (Built-in I/O Function).

Input (X)			Output (Y)		
Signal name	A1SD75P□-S3	LD75P□/D□	Signal name	A1SD75P□-S3	LD75P□/D□
Module READY	X00 ^{*1}	X00 ^{*1}	Axis 1 Positioning start	Y10	Y10

Use prohibited	X10 to X1F	X02, X03 X18 to X1F			

*1 The on/off status of Module READY differs between the LD75P□/D□ and A1SD75P□-S3.

	Not READY/WDT error	READY
LD75P□/D□	OFF	ON
A1SD75P□-S3	ON	OFF

*2 When using a program example of No.10 Reset program described in Section 6.4 Positioning program examples of the "A1SD75P1-S3/P2-S3/P3-S3, AD75P1-S3/P2-S3/P3-S3 Positioning Module User's Manual" for the LD75P□/D□, replace "X4 (BUSY signal for Axis 1)" with "DXC (Direct access input of BUSY signal for Axis 1)". Do the same thing for programs for Axis 2 and Axis 3.

7.2.4 Buffer memory address comparison

Sequence programs need to be changed because the buffer memory address assignment differs.

For details of the buffer memory areas and sequence programs, refer to the MELSEC-L LD75P/LD75D Positioning Module User's Manual.

■ area shows the differences between the A1SD75P□-S3 and LD75P□/D□.

When the built-in I/O functions of the LCPU are used, the special register is used. For details, refer to the MELSEC-L CPU Module User's Manual (Built-in I/O Function).

7.2.5 External interface specifications comparison

The following table lists the differences of the external interface specifications between the A1SD75P□-S3 and LD75P□/D□.

○: Compatible, △: Partial change required

Item ^{*1}		Difference ^{*2}	Compati- bility	Precautions for replacement
Input	Drive unit READY	—	○	
	Upper/lower limit signal	—	○	
	Stop signal	—	○	
	Near-point dog signal	Input resistance: 4.7kΩ → 4.3kΩ	○	
	Speed/position switching signal	Input resistance: 4.7kΩ → 7.7kΩ	○	
	Zero signal	Input resistance: 3.5kΩ → 4.7kΩ (at input of 24V) 0.5kΩ → 0.62kΩ (at input of 5V) Response time: 0.8ms → 1ms ^{*3} ON voltage: 2.5V → 2.0V (at 5V input) Rated input current: 7mA → 5mA (at 24V input)	△	Including the response time differences, reconfirming the specifications is required.
	Manual pulse generator	ON current: 3.5mA → 2mA	○	
Output	Pulse	—	○	
	Deviation counter clear	—	○	

*1 The external start and in-position signals are not listed because the LD75P□/D□ does not have these signals.

*2 The "Difference" is described as the form, [Specifications of A1SD75P□-S3] → [Specifications of LD75P□/D□].

*3 The response time difference (0.2ms) between the A1SD75P□-S3 and LD75P□/D□ is the time difference of 1pls as the creep speed of 5000pps.

If accuracy is required, the creep speed needs to be as low as possible.

8 REPLACEMENT OF OTHER MODULES

8.1 Replacement of Other Modules

This section lists AnS series modules not introduced in previous chapters and describes their alternative methods. The AnS series modules listed in this section require some special alternative methods because there are no L series alternative models, or their functions and specifications differ from those of L series modules.

Product	Model	Alternative method
Pulse catch module	A1SP60	Consider using the pulse catch function of the built-in I/O function of the LCPU.
Temperature input module	A1S68TD	Consider using the CC-Link compatible temperature input module or temperature control module as the temperature input module.
	A1S62RD3N	
	A1S62RD4N	Or, consider using an analog input module by converting signals outside.
Position detection module	A1S62LS	Consider using CC-Link compatible ABSOCODER® VE-2CC manufactured by NSD Corporation.
Analog timer module	A1ST60	Consider using programming by indirect specification of the internal timer.
ID interface module	A1SD35ID1	There are no alternative models. Consider using our partner manufacturer's products (ID system "BIS M series" manufactured by Balluff GmbH or ID system "Z series" manufactured by B&PLUS KK), which can be connected to Mitsubishi programmable controllers. (System migration) For details, refer to the technical bulletin (FA-A-0062).
	A1SD35ID2	
Memory card interface module	A1SD59J-S2	Create a file register in a memory card or the standard RAM, and use the file register as a substitute.

APPENDICES

Appendix 1 External Dimensions

For the external dimensions of each module described in this handbook, refer to the user's manual of each module.

Appendix 2 Spare Parts Storage

- (1) **The general specifications of programmable controllers are as follows. Please do not store spare parts under a high temperature or high humidity condition, even within the range guaranteed by the specifications.**

Storage ambient temperature	-20 to 75°C
Storage ambient humidity	10 to 90%, no condensation

- (2) **Store in a place avoiding direct sunlight.**
- (3) **Store under condition with less dust or no corrosive gas.**
- (4) **The battery capacity of a A6BAT battery or a lithium-coin battery (commercially available) for memory card will be decreased by its self-discharging even when not used. Replace it with new one in 5 years as a guideline.**
- (5) **For a power supply module, CPU module with built-in power supply, or analog module that use any aluminum electrolytic capacitor, which is indicated in the table below, take the following measures since the characteristics will be deteriorated when the aluminum electrolytic capacitor is left un-energized for a long time.**

Product	Model (AnS series)
CPU module (Power supply built-in type)	A1SJHCPU
Power supply module	A1S61PN, A1S62PN, A1S63P
Analog module	A1S64AD, A1S68AD, A1S62DA, A1S68DAI, A1S68DAV, A1S63ADA, A1S66ADA

[Countermeasures for preventing aluminum electrolytic capacitor characteristics deterioration]

Apply the rated voltage to the aluminum electrolytic capacitor for several hours once a year to activate it. Or, rotate products at the periodic inspection (in every 1 year or two).

[Reference]

The life of an aluminum electrolytic capacitor, even if not used, under a normal temperature decreases approximately at 1/4 speed of the case when it is energized.

Appendix 4 How to Change Resolution After Analog I/O Module is Replaced

This section describes how to change the resolution of an analog I/O module after the module is replaced from AnS series to L series.

Appendix 4.1 Resolution

The following table lists an example of the resolutions for the AnS series and L series analog I/O modules.

Each AnS series analog I/O module has different resolution. Please check the resolution of the module in this handbook or user's manual.

If the resolution differs between AnS series and L series modules, it needs to be matched by a user (by creating a sequence program or changing user range settings).

O: Measure required by user, Δ: Measure not required by user

Resolution of AnS series analog I/O module		Resolution of L series analog I/O module	
A1S64AD	1/4000	Selectable	When analog input range is 0 to 10V
A1S62DA	1/8000		L60AD4: 1/20000
A1S63ADA	1/12000		L60ADVL8: 1/16000
			(The resolution differs depending on analog input range.)
			Δ ^{*1*2}
			Δ ^{*1*2}
			Δ ^{*1*2}

*1 Adjust the resolution using the scaling function. (Refer to Appendix 4.2.)

*2 Change the resolution in a sequence program. (Refer to Appendix 4.2.)

Appendix 4.2 Using the scaling function of an analog I/O module

By using the scaling function of the L series analog I/O module, a resolution can be changed.

(1) Example of setting intelligent function module parameters

Parameters can easily be set by using the intelligent function module parameters of GX Works2 without a program. For details of the setting procedure, refer to the manual for each module.

(Setting conditions)

(a) Resolution of the AnS series module: 1/8000 (Only one channel is used.)

(b) L series module: L60AD4

(Example of scaling setting window)

☒ Point

The scaling value (digital operation value) and digital output value of the analog input module are stored in different buffer memory addresses, therefore, the scaling value of each channel needs to be read from the buffer memory.

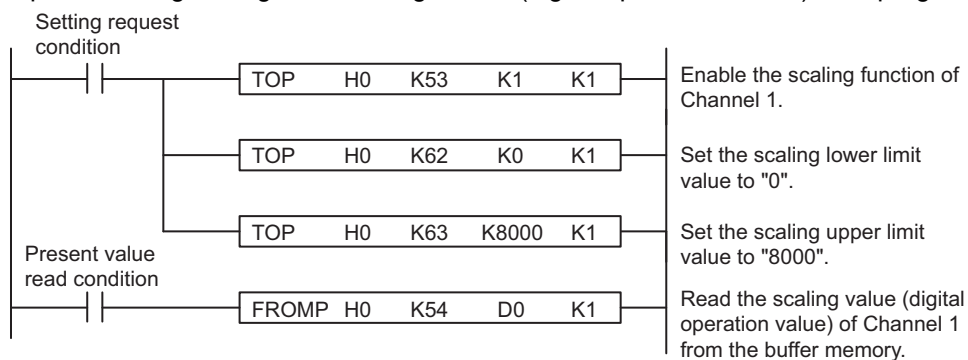

(2) Example of sequence program settings

(Setting conditions)

(a) Resolution of the AnS series module: 1/8000 (Only one channel is used.)

(b) L series module: L60AD4

(Example of scaling settings and scaling values (digital operation values) read program)

(Buffer memory areas of L60AD4 used by the scaling function ^{*1)})

Address		Description	Default	Read/write
Hexadecimal	Decimal			
35 _H	53	Scaling enable/disable setting	00FF _H	R/W
36 _H	54	CH1 Scaling value (digital operation value)	0	R
37 _H	55	CH2 Scaling value (digital operation value)	0	
38 _H	56	CH3 Scaling value (digital operation value)	0	
39 _H	57	CH4 Scaling value (digital operation value)	0	
to	to	System area (Use prohibited)		-
3E _H	62	CH1 Scaling lower limit value	0	R/W
3F _H	63	CH1 Scaling upper limit value	0	
40 _H	64	CH2 Scaling lower limit value	0	
41 _H	65	CH2 Scaling upper limit value	0	
42 _H	66	CH3 Scaling lower limit value	0	
43 _H	67	CH3 Scaling upper limit value	0	
44 _H	68	CH4 Scaling lower limit value	0	
45 _H	69	CH4 Scaling upper limit value	0	

*1 For details of the scaling function, refer to the user's manual for the module used.

Appendix 4.3 Adding the scaling operation function to sequence program

Adding a scaling operation program to the L series sequence program can change a resolution.

(1) Example of scaling operation sequence program

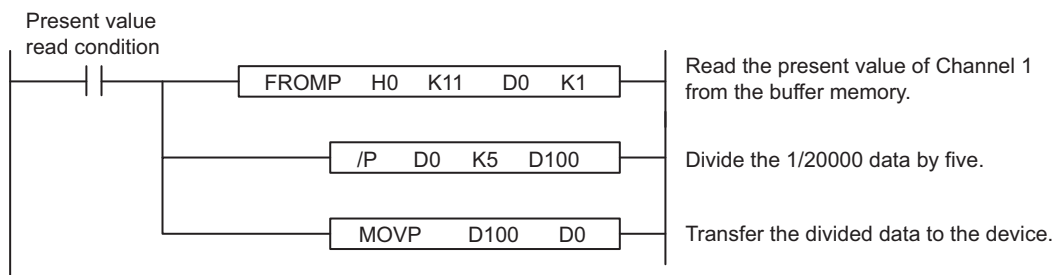

(Sample program conditions)

(a) Resolution of the AnS series module: 1/4000

(b) Device that stores the present value read from the analog I/O module: D0

(c) Devices used for resolution change operation*: D100 and D101

* Two-/four-word data is used in the four arithmetic operations instruction. Use unused device areas so that existing device data are not affected by this operation.

☒ Point

The scan time is longer by the addition to the sequence program.

When the scaling function described in Appendix 4.2 is used, however, because the scaling operation is performed in the analog module, the scan time is not affected.

WARRANTY

Please confirm the following product warranty details before using this product.

1. Gratis Warranty Term and Gratis Warranty Range

If any faults or defects (hereinafter "Failure") found to be the responsibility of Mitsubishi occurs during use of the product within the gratis warranty term, the product shall be repaired at no cost via the sales representative or Mitsubishi Service Company.

However, if repairs are required onsite at domestic or overseas location, expenses to send an engineer will be solely at the customer's discretion. Mitsubishi shall not be held responsible for any re-commissioning, maintenance, or testing on-site that involves replacement of the failed module.

[Gratis Warranty Term]

The gratis warranty term of the product shall be for one year after the date of purchase or delivery to a designated place. Note that after manufacture and shipment from Mitsubishi, the maximum distribution period shall be six (6) months, and the longest gratis warranty term after manufacturing shall be eighteen (18) months. The gratis warranty term of repair parts shall not exceed the gratis warranty term before repairs.

[Gratis Warranty Range]

- (1) The range shall be limited to normal use within the usage state, usage methods and usage environment, etc., which follow the conditions and precautions, etc., given in the instruction manual, user's manual and caution labels on the product.
- (2) Even within the gratis warranty term, repairs shall be charged for in the following cases.
 1. Failure occurring from inappropriate storage or handling, carelessness or negligence by the user. Failure caused by the user's hardware or software design.
 2. Failure caused by unapproved modifications, etc., to the product by the user.
 3. When the Mitsubishi product is assembled into a user's device, Failure that could have been avoided if functions or structures, judged as necessary in the legal safety measures the user's device is subject to or as necessary by industry standards, had been provided.
 4. Failure that could have been avoided if consumable parts (battery, backlight, fuse, etc.) designated in the instruction manual had been correctly serviced or replaced.
 5. Failure caused by external irresistible forces such as fires or abnormal voltages, and Failure caused by force majeure such as earthquakes, lightning, wind and water damage.
 6. Failure caused by reasons unpredictable by scientific technology standards at time of shipment from Mitsubishi.
 7. Any other failure found not to be the responsibility of Mitsubishi or that admitted not to be so by the user.

2. Onerous repair term after discontinuation of production

- (1) Mitsubishi shall accept onerous product repairs for seven (7) years after production of the product is discontinued. Discontinuation of production shall be notified with Mitsubishi Technical Bulletins, etc.
- (2) Product supply (including repair parts) is not available after production is discontinued.

3. Overseas service

Overseas, repairs shall be accepted by Mitsubishi's local overseas FA Center. Note that the repair conditions at each FA Center may differ.

4. Exclusion of loss in opportunity and secondary loss from warranty liability

Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to:

- (1) Damages caused by any cause found not to be the responsibility of Mitsubishi.
- (2) Loss in opportunity, lost profits incurred to the user by Failures of Mitsubishi products.
- (3) Special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than Mitsubishi products.
- (4) Replacement by the user, maintenance of on-site equipment, start-up test run and other tasks.

5. Changes in product specifications

The specifications given in the catalogs, manuals or technical documents are subject to change without prior notice.

Microsoft and Windows are either registered trademarks or trademarks of Microsoft Corporation in the United States and/or other countries.

Unicode is either a registered trademark or a trademark of Unicode, Inc. in the United States and other countries.

The company names, system names and product names mentioned in this manual are either registered trademarks or trademarks of their respective companies.

In some cases, trademark symbols such as [™] or [®] are not specified in this manual.
