

Programmable Controller

**MELSEC iQ-R**  
series

# MELSEC iQ-R CC-Link IE TSN User's Manual (Application)

---

-RJ71GN11-T2  
-RJ71GN11-SX

# SAFETY PRECAUTIONS

---

(Read these precautions before using this product.)

Before using this product, please read this manual and the relevant manuals carefully and pay full attention to safety to handle the product correctly.

The precautions given in this manual are concerned with this product only. For the safety precautions of the programmable controller system, refer to the MELSEC iQ-R Module Configuration Manual.

In this manual, the safety precautions are classified into two levels: "⚠ WARNING" and "⚠ CAUTION".

---

|  |   |
|--|---|
|  <b>WARNING</b> | Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.                      |
|  <b>CAUTION</b> | Indicates that incorrect handling may cause hazardous conditions, resulting in minor or moderate injury or property damage. |

---

Under some circumstances, failure to observe the precautions given under "⚠ CAUTION" may lead to serious consequences.

Observe the precautions of both levels because they are important for personal and system safety.

Make sure that the end users read this manual and then keep the manual in a safe place for future reference.

## [Design Precautions]

---

### **WARNING**

---

- Configure safety circuits external to the programmable controller to ensure that the entire system operates safely even when a fault occurs in the external power supply or the programmable controller. Failure to do so may result in an accident due to an incorrect output or malfunction.
    - (1) Emergency stop circuits, protection circuits, and protective interlock circuits for conflicting operations (such as forward/reverse rotations or upper/lower limit positioning) must be configured external to the programmable controller.
    - (2) When the programmable controller detects an abnormal condition, it stops the operation and all outputs are:
      - Turned off if the overcurrent or overvoltage protection of the power supply module is activated.
      - Held or turned off according to the parameter setting if the self-diagnostic function of the CPU module detects an error such as a watchdog timer error.
    - (3) All outputs may be turned on if an error occurs in a part, such as an I/O control part, where the CPU module cannot detect any error. To ensure safety operation in such a case, provide a safety mechanism or a fail-safe circuit external to the programmable controller. For a fail-safe circuit example, refer to "General Safety Requirements" in the MELSEC iQ-R Module Configuration Manual.
    - (4) Outputs may remain on or off due to a failure of a component such as a relay and transistor in an output circuit. Configure an external circuit for monitoring output signals that could cause a serious accident.
-

## [Design Precautions]

---

### **WARNING**

- In an output circuit, when a load current exceeding the rated current or an overcurrent caused by a load short-circuit flows for a long time, it may cause smoke and fire. To prevent this, configure an external safety circuit, such as a fuse.
  - Configure a circuit so that the programmable controller is turned on first and then the external power supply. If the external power supply is turned on first, an accident may occur due to an incorrect output or malfunction.
  - Configure a circuit so that the external power supply is turned off first and then the programmable controller. If the programmable controller is turned off first, an accident may occur due to an incorrect output or malfunction.
  - For the operating status of each station after a communication failure, refer to manuals for the network used. For the manuals, please consult your local Mitsubishi representative. Incorrect output or malfunction due to a communication failure may result in an accident.
  - When connecting an external device with a CPU module or intelligent function module to modify data of a running programmable controller, configure an interlock circuit in the program to ensure that the entire system will always operate safely. For other forms of control (such as program modification, parameter change, forced output, or operating status change) of a running programmable controller, read the relevant manuals carefully and ensure that the operation is safe before proceeding. Improper operation may damage machines or cause accidents. When a Safety CPU is used, data cannot be modified while the Safety CPU is in SAFETY MODE.
  - Especially, when a remote programmable controller is controlled by an external device, immediate action cannot be taken if a problem occurs in the programmable controller due to a communication failure. To prevent this, configure an interlock circuit in the program, and determine corrective actions to be taken between the external device and CPU module in case of a communication failure.
  - Do not write any data to the "system area" and "write-protect area" of the buffer memory in the module. Also, do not use any "use prohibited" signals as an output signal from the CPU module to each module. Doing so may cause malfunction of the programmable controller system. For the "system area", "write-protect area", and the "use prohibited" signals, refer to the user's manual for the module used. For areas used for safety communications, they are protected from being written by users, and thus safety communications failure caused by data writing does not occur.
  - If a communication cable is disconnected, the network may be unstable, resulting in a communication failure of multiple stations. Configure an interlock circuit in the program to ensure that the entire system will always operate safely even if communications fail. Incorrect output or malfunction due to a communication failure may result in an accident. When safety communications are used, an interlock by the safety station interlock function protects the system from an incorrect output or malfunction.
  - To maintain the safety of the programmable controller system against unauthorized access from external devices via the network, take appropriate measures. To maintain the safety against unauthorized access via the Internet, take measures such as installing a firewall.
-

## [Design Precautions]

---

### **CAUTION**

- Do not install the control lines or communication cables together with the main circuit lines or power cables. Doing so may result in malfunction due to electromagnetic interference. Keep a distance of 100mm or more between those cables.
  - During control of an inductive load such as a lamp, heater, or solenoid valve, a large current (approximately ten times greater than normal) may flow when the output is turned from off to on. Therefore, use a module that has a sufficient current rating.
  - After the CPU module is powered on or is reset, the time taken to enter the RUN status varies depending on the system configuration, parameter settings, and/or program size. Design circuits so that the entire system will always operate safely, regardless of the time.
  - Do not power off the programmable controller or reset the CPU module while the settings are being written. Doing so will make the data in the flash ROM and SD memory card undefined. The values need to be set in the buffer memory and written to the flash ROM and SD memory card again. Doing so also may cause malfunction or failure of the module.
  - When changing the operating status of the CPU module from external devices (such as the remote RUN/STOP functions), select "Do Not Open by Program" for "Opening Method" of "Module Parameter". If "Open by Program" is selected, an execution of the remote STOP function causes the communication line to close. Consequently, the CPU module cannot reopen the line, and external devices cannot execute the remote RUN function.
- 

## [Security Precautions]

---

### **WARNING**

- To maintain the security (confidentiality, integrity, and availability) of the programmable controller and the system against unauthorized access, denial-of-service (DoS) attacks, computer viruses, and other cyberattacks from external devices via the network, take appropriate measures such as firewalls, virtual private networks (VPNs), and antivirus solutions.
- 

## [Installation Precautions]

---

### **WARNING**

- Shut off the external power supply (all phases) used in the system before mounting or removing the module. Failure to do so may result in electric shock or cause the module to fail or malfunction.
-

## [Installation Precautions]

---

### CAUTION

- Use the programmable controller in an environment that meets the general specifications in the Safety Guidelines included with the base unit. Failure to do so may result in electric shock, fire, malfunction, or damage to or deterioration of the product.
  - To mount a module, place the concave part(s) located at the bottom onto the guide(s) of the base unit, and push in the module until the hook(s) located at the top snaps into place. Incorrect interconnection may cause malfunction, failure, or drop of the module.
  - To mount a module with no module fixing hook, place the concave part(s) located at the bottom onto the guide(s) of the base unit, push in the module, and fix it with screw(s). Incorrect interconnection may cause malfunction, failure, or drop of the module.
  - When using the programmable controller in an environment of frequent vibrations, fix the module with a screw.
  - Tighten the screws within the specified torque range. Undertightening can cause drop of the component or wire, short circuit, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction. For the specified torque range, refer to the MELSEC iQ-R Module Configuration Manual.
  - When using an extension cable, connect it to the extension cable connector of the base unit securely. Check the connection for looseness. Poor contact may cause malfunction.
  - When using an SD memory card, fully insert it into the SD memory card slot. Check that it is inserted completely. Poor contact may cause malfunction.
  - Securely insert an extended SRAM cassette or a battery-less option cassette into the cassette connector of the CPU module. After insertion, close the cassette cover and check that the cassette is inserted completely. Poor contact may cause malfunction.
  - Do not directly touch any conductive parts and electronic components of the module, SD memory card, extended SRAM cassette, battery-less option cassette, or connector. Doing so can cause malfunction or failure of the module.
-

## [Wiring Precautions]

---

### **WARNING**

- Shut off the external power supply (all phases) used in the system before installation and wiring. Failure to do so may result in electric shock or cause the module to fail or malfunction.
- After installation and wiring, attach a blank cover module (RG60) to each empty slot before powering on the system for operation. Also, attach an extension connector protective cover<sup>\*1</sup> to each unused extension cable connector as necessary. Directly touching any conductive parts of the connectors while power is on may result in electric shock.

\*1 For details, please consult your local Mitsubishi Electric representative.

#### [Precautions for using CC-Link IE TSN (when optical fiber cables are used)]

- The optical transmitter and receiver of the CC-Link IE TSN master/local module (1000BASE-SX model) use laser diodes (class 1 in accordance with IEC 60825-1/JIS C6802). Do not look directly at a laser beam. Doing so may harm your eyes.
- 

## [Wiring Precautions]

---

### **CAUTION**

- Individually ground the FG and LG terminals of the programmable controller with a ground resistance of 100 ohms or less. Failure to do so may result in electric shock or malfunction.
  - Use applicable solderless terminals and tighten them within the specified torque range. If any spade solderless terminal is used, it may be disconnected when the terminal screw comes loose, resulting in failure.
  - Check the rated voltage and signal layout before wiring to the module, and connect the cables correctly. Connecting a power supply with a different voltage rating or incorrect wiring may cause fire or failure.
  - Connectors for external devices must be crimped or pressed with the tool specified by the manufacturer, or must be correctly soldered. Incomplete connections may cause short circuit, fire, or malfunction.
  - Securely connect the connector to the module. Poor contact may cause malfunction.
  - Do not install the control lines or communication cables together with the main circuit lines or power cables. Failure to do so may result in malfunction due to noise. Keep a distance of 100mm or more between those cables. (Only for the RJ71GN11-T2)
  - Place the cables in a duct or clamp them. If not, dangling cables may swing or inadvertently be pulled, resulting in malfunction or damage to modules or cables.  
In addition, the weight of the cables may put stress on modules in an environment of strong vibrations and shocks.  
Do not clamp the extension cables with the jacket stripped. Doing so may change the characteristics of the cables, resulting in malfunction.
  - Check the interface type and correctly connect the cable. Incorrect wiring (connecting the cable to an incorrect interface) may cause failure of the module and external device.
-

## [Wiring Precautions]

---

### CAUTION

- Tighten the terminal screws or connector screws within the specified torque range. Undertightening can cause drop of the screw, short circuit, fire, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, fire, or malfunction.
- When disconnecting the cable from the module, do not pull the cable by the cable part. For the cable with connector, hold the connector part of the cable. For the cable connected to the terminal block, loosen the terminal screw. Pulling the cable connected to the module may result in malfunction or damage to the module or cable.
- Prevent foreign matter such as dust or wire chips from entering the module. Such foreign matter can cause a fire, failure, or malfunction.
- When a protective film is attached to the top of the module, remove it before system operation. If not, inadequate heat dissipation of the module may cause a fire, failure, or malfunction.
- Programmable controllers must be installed in control panels. Connect the main power supply to the power supply module in the control panel through a relay terminal block. Wiring and replacement of a power supply module must be performed by qualified maintenance personnel with knowledge of protection against electric shock. For wiring, refer to the MELSEC iQ-R Module Configuration Manual.
- For Ethernet cables to be used in the system, select the ones that meet the specifications in the user's manual for the module used. If not, normal data transmission is not guaranteed.

#### [Precautions for using CC-Link IE TSN (when optical fiber cables are used)]

- For optical fiber cables to be used in the system, select the ones that meet the specifications in the MELSEC iQ-R CC-Link IE TSN User's Manual (Startup). If not, normal data transmission is not guaranteed.
- 

## [Startup and Maintenance Precautions]

---

### WARNING

- Do not touch any terminal while power is on. Doing so will cause electric shock or malfunction.
  - Correctly connect the battery connector. Do not charge, disassemble, heat, short-circuit, solder, or throw the battery into the fire. Also, do not expose it to liquid or strong shock. Doing so will cause the battery to produce heat, explode, ignite, or leak, resulting in injury and fire.
  - Shut off the external power supply (all phases) used in the system before cleaning the module or retightening the terminal screws, connector screws, or module fixing screws. Failure to do so may result in electric shock.
-

## [Startup and Maintenance Precautions]

---

### CAUTION

- When connecting an external device with a CPU module or intelligent function module to modify data of a running programmable controller, configure an interlock circuit in the program to ensure that the entire system will always operate safely. For other forms of control (such as program modification, parameter change, forced output, or operating status change) of a running programmable controller, read the relevant manuals carefully and ensure that the operation is safe before proceeding. Improper operation may damage machines or cause accidents.
  - Especially, when a remote programmable controller is controlled by an external device, immediate action cannot be taken if a problem occurs in the programmable controller due to a communication failure. To prevent this, configure an interlock circuit in the program, and determine corrective actions to be taken between the external device and CPU module in case of a communication failure.
  - Do not disassemble or modify the modules. Doing so may cause failure, malfunction, injury, or a fire.
  - Use any radio communication device such as a cellular phone or PHS (Personal Handy-phone System) 25cm or more away in all directions from the programmable controller. Failure to do so may cause malfunction.
  - Shut off the external power supply (all phases) used in the system before mounting or removing the module. Failure to do so may cause the module to fail or malfunction.
  - Tighten the screws within the specified torque range. Undertightening can cause drop of the component or wire, short circuit, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction.
  - After the first use of the product, do not perform each of the following operations more than 50 times (IEC 61131-2/JIS B 3502 compliant).  
Exceeding the limit may cause malfunction.
    - Mounting/removing the module to/from the base unit
    - Inserting/removing the extended SRAM cassette or battery-less option cassette to/from the CPU module
    - Mounting/removing the terminal block to/from the module
  - After the first use of the product, do not insert/remove the SD memory card to/from the CPU module more than 500 times. Exceeding the limit may cause malfunction.
  - Do not touch the metal terminals on the back side of the SD memory card. Doing so may cause malfunction or failure of the module.
-

## [Startup and Maintenance Precautions]

---

### CAUTION

- Do not touch the integrated circuits on the circuit board of an extended SRAM cassette or a battery-less option cassette. Doing so may cause malfunction or failure of the module.
  - Do not drop or apply shock to the battery to be installed in the module. Doing so may damage the battery, causing the battery fluid to leak inside the battery. If the battery is dropped or any shock is applied to it, dispose of it without using.
  - Startup and maintenance of a control panel must be performed by qualified maintenance personnel with knowledge of protection against electric shock. Lock the control panel so that only qualified maintenance personnel can operate it.
  - Before handling the module, touch a conducting object such as a grounded metal to discharge the static electricity from the human body. Wearing a grounded antistatic wrist strap is recommended. Failure to discharge the static electricity may cause the module to fail or malfunction.
  - After unpacking, eliminate static electricity from the module to prevent electrostatic discharge from affecting the module. If an electrostatically charged module comes in contact with a grounded metal object, a sudden electrostatic discharge of the module may cause failure.  
For details on how to eliminate static electricity from the module, refer to the following. Antistatic Precautions Before Using MELSEC iQ-R Series Products (FA-A-0368)
  - Use a clean and dry cloth to wipe off dirt on the module.
- 

## [Operating Precautions]

---

### CAUTION

- When changing data and operating status, and modifying program of the running programmable controller from an external device such as a personal computer connected to an intelligent function module, read relevant manuals carefully and ensure the safety before operation. Incorrect change or modification may cause system malfunction, damage to the machines, or accidents.
  - Do not power off the programmable controller or reset the CPU module while the setting values in the buffer memory are being written to the flash ROM in the module. Doing so will make the data in the flash ROM and SD memory card undefined. The values need to be set in the buffer memory and written to the flash ROM and SD memory card again. Doing so can cause malfunction or failure of the module.
- 

## [Disposal Precautions]

---

### CAUTION

- When disposing of this product, treat it as industrial waste.
  - When disposing of batteries, separate them from other wastes according to the local regulations. For details on battery regulations in EU member states, refer to the MELSEC iQ-R Module Configuration Manual.
-

## [Transportation Precautions]

---

### **CAUTION**

---

- When transporting lithium batteries, follow the transportation regulations. For details on the regulated models, refer to the MELSEC iQ-R Module Configuration Manual.
  - The halogens (such as fluorine, chlorine, bromine, and iodine), which are contained in a fumigant used for disinfection and pest control of wood packaging materials, may cause failure of the product. Prevent the entry of fumigant residues into the product or consider other methods (such as heat treatment) instead of fumigation. The disinfection and pest control measures must be applied to unprocessed raw wood.
-

# CONDITIONS OF USE FOR THE PRODUCT

---

- (1) MELSEC programmable controller ("the PRODUCT") shall be used in conditions;
- i) where any problem, fault or failure occurring in the PRODUCT, if any, shall not lead to any major or serious accident; and
  - ii) where the backup and fail-safe function are systematically or automatically provided outside of the PRODUCT for the case of any problem, fault or failure occurring in the PRODUCT.
- (2) The PRODUCT has been designed and manufactured for the purpose of being used in general industries. MITSUBISHI ELECTRIC SHALL HAVE NO RESPONSIBILITY OR LIABILITY (INCLUDING, BUT NOT LIMITED TO ANY AND ALL RESPONSIBILITY OR LIABILITY BASED ON CONTRACT, WARRANTY, TORT, PRODUCT LIABILITY) FOR ANY INJURY OR DEATH TO PERSONS OR LOSS OR DAMAGE TO PROPERTY CAUSED BY the PRODUCT THAT ARE OPERATED OR USED IN APPLICATION NOT INTENDED OR EXCLUDED BY INSTRUCTIONS, PRECAUTIONS, OR WARNING CONTAINED IN MITSUBISHI ELECTRIC USER'S, INSTRUCTION AND/OR SAFETY MANUALS, TECHNICAL BULLETINS AND GUIDELINES FOR the PRODUCT.
- ("Prohibited Application")
- Prohibited Applications include, but not limited to, the use of the PRODUCT in;
- Nuclear Power Plants and any other power plants operated by Power companies, and/or any other cases in which the public could be affected if any problem or fault occurs in the PRODUCT.
  - Railway companies or Public service purposes, and/or any other cases in which establishment of a special quality assurance system is required by the Purchaser or End User.
  - Aircraft or Aerospace, Medical applications, Train equipment, transport equipment such as Elevator and Escalator, Incineration and Fuel devices, Vehicles, Manned transportation, Equipment for Recreation and Amusement, and Safety devices, handling of Nuclear or Hazardous Materials or Chemicals, Mining and Drilling, and/or other applications where there is a significant risk of injury to the public or property.
- Notwithstanding the above restrictions, Mitsubishi Electric may in its sole discretion, authorize use of the PRODUCT in one or more of the Prohibited Applications, provided that the usage of the PRODUCT is limited only for the specific applications agreed to by Mitsubishi Electric and provided further that no special quality assurance or fail-safe, redundant or other safety features which exceed the general specifications of the PRODUCTS are required. For details, please contact the Mitsubishi Electric representative in your region.
- (3) Mitsubishi Electric shall have no responsibility or liability for any problems involving programmable controller trouble and system trouble caused by DoS attacks, unauthorized access, computer viruses, and other cyberattacks.

## INTRODUCTION

---

Thank you for purchasing the Mitsubishi Electric MELSEC iQ-R series programmable controllers.

This manual describes the functions, programming, and troubleshooting of the relevant product listed below.

Before using this product, please read this manual and the relevant manuals carefully and develop familiarity with the functions and performance of the MELSEC iQ-R series programmable controller to handle the product correctly.

When applying the program examples provided in this manual to an actual system, ensure the applicability and confirm that it will not cause system control problems.

Note that the menu names and operating procedures may differ depending on an operating system in use and its version.

When reading this manual, replace the names and procedures with the applicable ones as necessary.

Please make sure that the end users read this manual.

# RELEVANT MANUALS

| Manual name [manual number]   | Description   | Available form             |
|---|---|----------------------------|
| MELSEC iQ-R CC-Link IE TSN User's Manual (Application) [SH-082129ENG] (this manual)         | Functions, parameter settings, troubleshooting, I/O signals, and buffer memory of CC-Link IE TSN  | Print book<br>e-Manual PDF |
| MELSEC iQ-R Module Configuration Manual [SH-081262ENG]                                      | The combination of the MELSEC iQ-R series modules, common information on the installation/wiring in the system, and specifications of the power supply module, base unit, SD memory card, and battery                                       | Print book<br>e-Manual PDF |
| MELSEC iQ-R CC-Link IE TSN User's Manual (Startup) [SH-082127ENG]                           | Specifications, procedures before operation, system configuration, wiring, and communication examples of CC-Link IE TSN   | Print book<br>e-Manual PDF |
| MELSEC iQ-R Programming Manual (Module Dedicated Instructions) [SH-081976ENG]               | Dedicated instructions for the intelligent function modules   | e-Manual PDF               |
| MELSEC iQ-R Ethernet, CC-Link IE, and MELSECNET/H Function Block Reference [BCN-P5999-0381] | Specifications of the following MELSEC iQ-R series module FBs: Ethernet-equipped module FBs, CC-Link IE TSN module FBs, CC-Link IE Controller Network module FBs, CC-Link IE Field Network module FBs, and MELSECNET/H network module FBs   | e-Manual PDF               |
| GX Works3 Operating Manual [SH-081215ENG]   | System configuration, parameter settings, and online operations of GX Works3  | e-Manual PDF               |
| SLMP Reference Manual [SH-080956ENG]  | A protocol used to access an SLMP-compatible device from an external device (such as a personal computer or HMI (Human Machine Interface)) or an SLMP-compatible module (such as the Ethernet-equipped module or modules on CC-Link IE TSN) | Print book<br>e-Manual PDF |
| MELSEC iQ-R System Recorder Co-recording Function Reference Manual [SH-082553ENG]           | Function, system configuration, parameter settings, and troubleshooting for co-recording  | e-Manual PDF               |

e-Manual refers to the Mitsubishi Electric FA electronic book manuals that can be browsed using a dedicated tool.

e-Manual has the following features:

- Required information can be cross-searched in multiple manuals.
- Other manuals can be accessed from the links in the manual.
- The hardware specifications of each part can be found from the product figures.
- Pages that users often browse can be bookmarked.
- Sample programs can be copied to an engineering tool.

# TERMS

Unless otherwise specified, this manual uses the following terms.

| Term                                     | Description  |
|--|--|
| Buffer memory                            | Memory in an intelligent function module to store data such as setting values and monitor values.<br>For CPU modules, it refers to memory to store data such as setting values and monitor values of the Ethernet function, or data used for data communication of the multiple CPU system function.   |
| CC-Link IE TSN Class <sup>*1</sup>       | A group of devices and switching hubs compatible with CC-Link IE TSN, classified according to the functions and performance by the CC-Link Partner Association.<br>For CC-Link IE TSN Class, refer to the CC-Link IE TSN Installation Manual (BAP-C3007ENG-001) published by the CC-Link Partner Association.  |
| CC-Link IE TSN protocol version 1.0      | This protocol is used to perform communications by using the time sharing method defined by IEEE 802.1AS or IEEE 1588 for time synchronization.  |
| CC-Link IE TSN protocol version 2.0      | This protocol is used to perform communications by using the time sharing method defined by IEEE 802.1AS and time-managed polling method for time synchronization.<br>Supporting this protocol version mitigates restrictions when "Mixture of CC-Link IE TSN Class B/A or CC-Link IE TSN Class A Only" is set in the system configuration, and increases the number of connectable devices. |
| Conformance test                         | Test performed for communications of a CC-Link or CC-Link IE product to ensure their high reliability.<br>For details, refer to the CC-Link Partner Association website ( <a href="http://www.cc-link.org">www.cc-link.org</a> ).  |
| Control CPU                              | A CPU module that controls connected I/O modules and intelligent function modules. The multiple CPU system allows the user to assign the control CPU on a module-by-module basis.  |
| CPU module (built-in Ethernet port part) | A built-in Ethernet port part of the CPU module (CPU part for the RnENCPU)   |
| Cyclic data transfer processing          | Processing of a cyclic transmission from its start to finish, performed by all the stations on a single network. The processing is performed asynchronously with the sequence scan of the CPU module.<br>The cyclic data transfer processing time varies depending on data volume and the number of transient transmission requests.   |
| Dedicated instruction                    | An instruction that simplifies programming for using functions of intelligent function modules   |
| Device                                   | A memory of a CPU module to store data. Devices such as X, Y, M, D, and others are provided depending on the intended use.   |
| Device station                           | A station other than a master station: a local station, a remote station   |
| Engineering tool                         | A tool used for setting up programmable controllers, programming, debugging, and maintenance   |
| General-purpose hub                      | A CC-Link IE TSN Class A switching hub authorized by CC-Link Partner Association. (📖 MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup))  |
| Global label                             | A label that is enabled for all program data when creating multiple program data in the project. There are two types of global label: a module specific label (module label), which is generated automatically by GX Works3, and an optional label, which can be created for any specified device.   |
| Grandmaster                              | A source device or station to synchronize clocks in the time synchronization via PTP (Precision Time Protocol)   |
| Group No.                                | Number that is assigned for transient transmission to any given stations. By specifying a group of stations as transient transmission target, data can be sent to the stations of the same group No.   |
| Intelligent function module              | A module that has functions other than input and output, such as an A/D converter module and D/A converter module  |
| Link device                              | A device (RX, RY, RWr, RWw, LB, or LW) in a module on CC-Link IE TSN   |
| Link refresh                             | Processing of data transfer between link devices of the network module and CPU module devices.<br>Link refresh is performed in "END processing" of the sequence scan of the CPU module.  |
| Local station                            | A station that performs cyclic transmission and transient transmission with the master station and other local stations  |
| Master station                           | A station that controls the entire network. This station can perform cyclic transmission and transient transmission with all stations. Only one master station can be used in a network.   |
| Module label                             | A label that represents one of memory areas (I/O signals and buffer memory areas) specific to each module in a given character string. For the module used, GX Works3 automatically generates this label, which can be used as a global label.   |
| Multicast filter                         | A filter function that selects whether to send cyclic data of multicast mode received by the own station to the subsequent stations.<br>Setting parameters for this function are not required because the master station automatically sets the parameters according to the system configuration.  |
| Multicast mode                           | A communication mode used to send cyclic data to multiple stations   |
| Relay station                            | A station that relays data link to other station with mounting more than one network modules on one programmable controller.   |
| Remote station                           | A station that exchanges I/O signals (bit data) and I/O data (word data) with another station by cyclic transmission. This station can perform transient transmission.   |
| Reserved address                         | An IP address reserved for special purposes, defined by RFC 6890. This IP address cannot be used when the programmable controller is connected via the global IP network.  |
| RnENCPU (network part)                   | A module on the right-hand side of the RnENCPU (📖 MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup))   |

| Term                    | Description  |
|-------------------------|--|
| Safety communications   | A function to exchange safety data between safety stations on the same network   |
| Safety connection       | A connection established for safety communication  |
| Safety data             | Data exchanged through safety communication  |
| SLMP                    | A SeamLess Message Protocol.<br>This protocol is used to access an SLMP-compatible device or a programmable controller connected to an SLMP-compatible device from an external device. |
| Standard communications | Communications other than safety communications, such as cyclic transmission and transient transmission of CC-Link IE TSN  |
| TSN hub                 | A CC-Link IE TSN Class B switching hub authorized by CC-Link Partner Association (📖 MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup))   |
| Unicast mode            | A communication mode used to send cyclic data to one station   |

\*1 The term has been changed for standardization among manuals and software applications related to CC-Link IE TSN. However, the term used in some CC-Link IE TSN related software windows may remain unchanged and may be different from the term used in this manual.

In case of inconsistency, refer to the following.

| Term used in software window | Term after change    |
|------------------------------|----------------------|
| Authentication Class         | CC-Link IE TSN Class |

# GENERIC TERMS AND ABBREVIATIONS

Unless otherwise specified, this manual uses the following generic terms and abbreviations.

| Generic term/abbreviation                             | Description  |
|---|--|
| CC-Link IE  | A generic term for the following items: <ul style="list-style-type: none"> <li>• CC-Link IE TSN</li> <li>• CC-Link IE Controller Network (📖 MELSEC iQ-R CC-Link IE Controller Network User's Manual (Application))</li> <li>• CC-Link IE Field Network (📖 MELSEC iQ-R CC-Link IE Field Network User's Manual (Application))</li> </ul>   |
| CC-Link IE Field Network-equipped master/local module | A generic term for the RJ71GF11-T2 CC-Link IE Field Network master/local module and the following modules when the CC-Link IE Field Network function is used: <ul style="list-style-type: none"> <li>• RJ71EN71</li> <li>• RnENCPU</li> </ul>  |
| CC-Link IE TSN-equipped module                        | A generic term for the RJ71GN11-T2, RJ71GN11-SX, and RJ71GN11-EIP  |
| CCPASET   | A generic term for the G.CCPASET and GP.CCPASET  |
| CCPASET X   | A generic term for the G.CCPASET X and GP.CCPASET X  |
| CR800-R   | An abbreviation for a set of the robot CPU (R16RTCPU) and the CR800 controller (CR800)   |
| Data link   | A generic term for cyclic transmission and transient transmission  |
| Ethernet device                                       | A generic term for the devices supporting IP communication (such as a personal computer, a vision sensor, and a bar code reader)   |
| Ethernet-equipped module                              | A generic term for the following modules when the Ethernet function is used: <ul style="list-style-type: none"> <li>• RJ71EN71</li> <li>• CPU module</li> </ul>  |
| LB  | An abbreviation for a link relay of a link device. Bit data send from each station of the network.   |
| LW  | An abbreviation for a link register of a link device. Word data send from each station of the network.   |
| Network module  | A generic term for the following modules: <ul style="list-style-type: none"> <li>• Ethernet interface module</li> <li>• A module on CC-Link IE TSN (a CC-Link IE TSN master/local module, a CC-Link IE TSN master/local module (1000BASE-SX model), a CC-Link IE TSN Plus master/local module, and a module on a remote station)</li> <li>• CC-Link IE Controller Network module</li> <li>• A module on CC-Link IE Field Network (a master/local module, and a module on a remote I/O station, a remote device station, and an intelligent device station)</li> <li>• MELSECNET/H network module</li> <li>• MELSECNET/10 network module</li> <li>• RnENCPU (network part)</li> </ul> |
| PDO   | An abbreviation for Process Data Object. Aggregation of application objects transferred periodically between multiple CANopen nodes.   |
| Protocol version                                      | An abbreviation for CC-Link IE TSN Protocol version  |
| PTP   | An abbreviation for Precision Time Protocol. A predefined protocol for time synchronization between devices on a network.  |
| READ  | A generic term for the JP.READ and GP.READ   |
| RECV  | A generic term for the JP.RECV and GP.RECV   |
| REMFR   | A generic term for the JP.REMFR and ZP.REMFR   |
| REMFRD  | An abbreviation for the JP.REMFRD  |
| REMFRDIP  | An abbreviation for the GP.REMFRDIP  |
| REMFRIP   | An abbreviation for the GP.REMFRIP   |
| REMTO   | A generic term for the JP.REMTO and ZP.REMTO   |
| REMTOD  | An abbreviation for the JP.REMTOD  |
| REMTODIP  | An abbreviation for the GP.REMTODIP  |
| REMTOIP   | An abbreviation for the GP.REMTOIP   |
| REQ   | A generic term for the J.REQ, JP.REQ, G.REQ, and GP.REQ  |
| RJ71GN11  | A generic term for the RJ71GN11-T2 and RJ71GN11-SX   |
| RW <sub>r</sub>                                       | An abbreviation for a remote register of a link device. Word data (16-bit data) input from a device station to the master station. (For some areas in a local station, data are input in the opposite direction.)  |
| RW <sub>w</sub>                                       | An abbreviation for a remote register of a link device. Word data (16-bit data) output from the master station to a device station (For some areas in a local station, data are output in the opposite direction.)   |
| RX  | An abbreviation for remote input of a link device. Bit data input from a device station to the master station. (For some areas in a local station, data are input in the opposite direction.)  |
| RY  | An abbreviation for remote output of a link device. Bit data output from the master station to a device station (For some areas in a local station, data are output in the opposite direction.)  |

| Generic term/abbreviation | Description  |
|---------------------------|--|
| Safety CPU                | A generic term for the R08SFPCPU, R16SFPCPU, R32SFPCPU, and R120SFPCPU   |
| Safety station            | A generic term for a station that performs safety communications and standard communications   |
| SB                        | An abbreviation for a link special relay. Bit data that indicates the operating status and data link status of a module on CC-Link IE.   |
| SDO                       | An abbreviation for Service Data Object. A message to access an object entry in the object dictionary of a CANopen node. Data is sent/received between the stations aperiodically. |
| SEND                      | A generic term for the JP.SEND and GP.SEND   |
| SLMPSND                   | A generic term for the J.SLMPSND, JP.SLMPSND, G.SLMPSND, and GP.SLMPSND  |
| SREAD                     | A generic term for the JP.SREAD and GP.SREAD   |
| SW                        | An abbreviation for a link special register. Word data that indicates the operating status and data link status of a module on CC-Link IE.   |
| SWRITE                    | A generic term for the JP.SWRITE and GP.SWRITE   |
| UINI                      | A generic term for the G.UINI, GP.UINI, Z.UINI, and ZP.UINI  |
| WRITE                     | A generic term for the JP.WRITE and GP.WRITE   |

# 1 FUNCTIONS

## 1.1 Cyclic Transmission

This section describes periodic data communications among stations on the network using link devices.

- The link device is assigned in the "CC-Link IE TSN Configuration" window. (  Page 132 "CC-Link IE TSN Configuration" Window)
- The link refresh is assigned in "Refresh Settings" under "Basic Settings". (  Page 115 Refresh Settings)

### Unicast mode and multicast mode

Cyclic transmission operates as follows with the communication mode set by the module parameter of the master station.

| Communication mode | Description   |
|--------------------|---|
| Unicast mode       | <ul style="list-style-type: none"><li>• Cyclic data is sent to one station.</li><li>• When this communication mode is used, the local station cannot receive cyclic data from another station. Use this mode when there is no local station or when it is not required for the local station to receive cyclic data from another station.</li><li>• The cyclic transmission time of this mode is shorter than the cyclic transmission time of multicast mode. (  Page 322 Communication cycle intervals)</li></ul> |
| Multicast mode     | <ul style="list-style-type: none"><li>• Cyclic data is sent to multiple stations.</li><li>• When this mode is used, the local station can receive cyclic data from another station. Use this mode when it is required for the local station to receive cyclic data from another station.</li><li>• The cyclic transmission time of this mode is longer than the cyclic transmission time of unicast mode. (  Page 322 Communication cycle intervals)</li></ul>   |

#### Point

- When cyclic transmission is performed in multicast mode, the local station cannot receive RX and RWr sent by the CC-Link IE TSN Class A remote station. (  Page 25 Multicast mode)
- To allow the local station to obtain RX and RWr sent by the CC-Link IE TSN Class A remote station, use the program to send RX and RWr from the master station to the local station. (  Page 152 Communication Example with CC-Link IE TSN Class A Remote Station (RJ71GN11-T2))
- In multicast mode, set "Communication Period Setting" for the local station to "Basic Period" in the "CC-Link IE TSN Configuration" window. However, when extending the number of link points on the RJ71GN11-SX, the "Communication Period Setting LB/LW" of the local station can also be set to "Normal-Speed" or "Low-Speed". (  Page 33 Setting method)
- If a data link error occurs in multicast mode, ERR LED at the local station flashes. However, even if a data link error occurs at the CC-Link IE TSN Class A remote station during data link, ERR LED at the local station does not flash. (The LED remains off.)
- In multicast mode, 'Data link error status of each station' (SB00B0) and 'Total number of device stations present value' (SW0059) at the local station can be checked by SB and SW. However, the information on the CC-Link IE TSN Class A remote station may not be checked by some SB and SW.

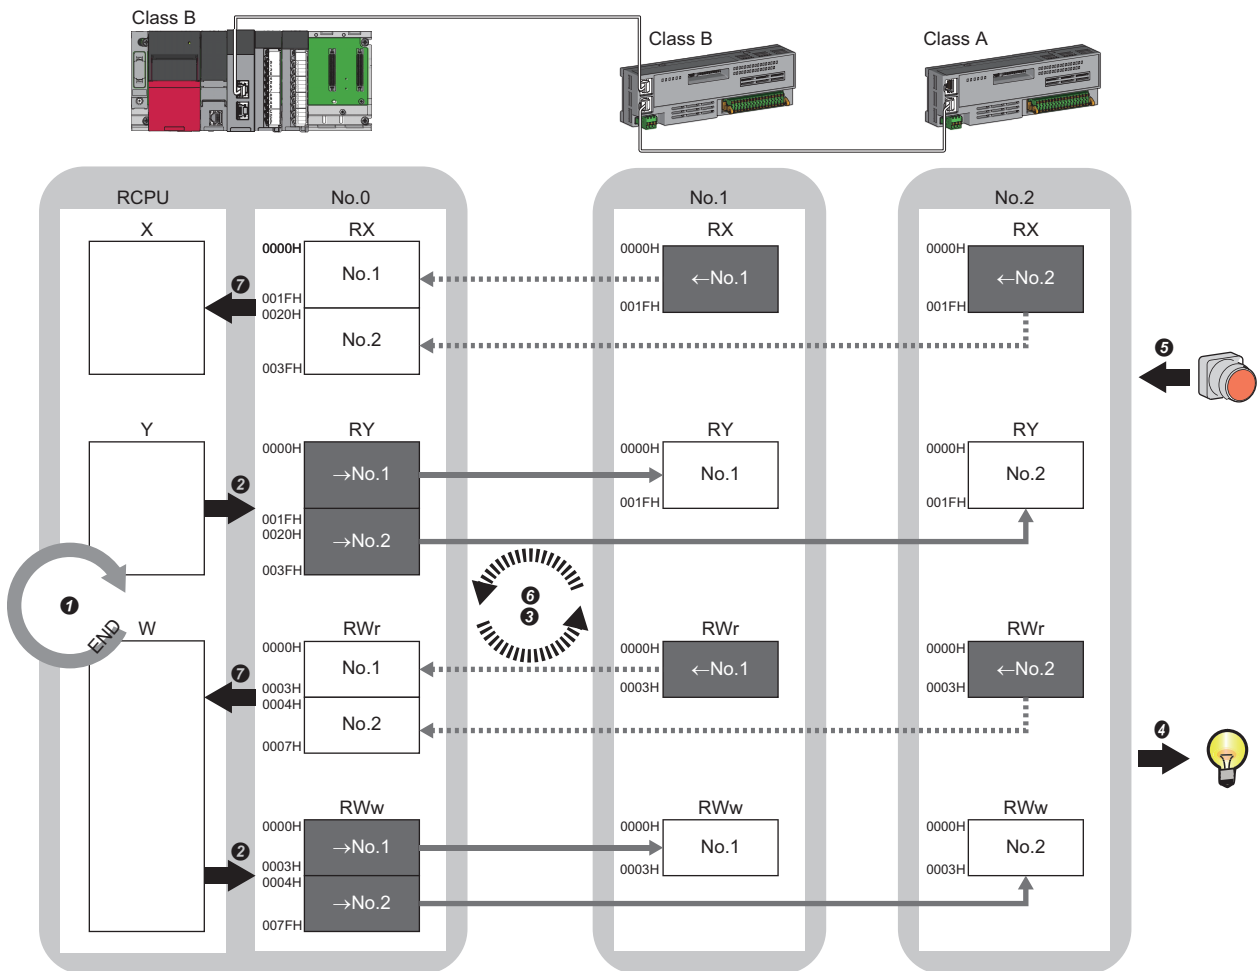

# Communications using RX, RY, RWr, and RWw

This allows data to be exchanged in units of bits and units of words between the master station and the device station.

## Master station and remote stations (RJ71GN11-T2 only)

### ■ Unicast mode

1:1 communications between the master station and each remote station. Remote stations do not communicate with each other.

No.0, No.1, No.2: Station No.0 (master station), station No.1, station No.2  
 →No.1, →No.2: Send range: to station No.1, send range: to station No.2  
 ←No.1, ←No.2: Send range: from station No.1, send range: from station No.2  
 Class A: CC-Link IE TSN Class A device  
 Class B: CC-Link IE TSN Class B device

#### • Output from the master station

- ① The device of the CPU module turns on.
- ② The device status of the CPU module is stored in the link devices (RY, RWw) of the master station by link refresh.
- ③ The status of the link devices (RY, RWw) of the master station is stored in the link devices (RY, RWw) of each remote station by cyclic data transfer processing.
- ④ The status of the link devices (RY, RWw) of the remote station is output to the external device.

#### • Input from the remote station

- ⑤ The status of the external device is stored in the link devices (RX, RWr) of the remote station.
- ⑥ The status of the link devices (RX, RWr) of the remote station is stored in the link devices (RX, RWr) of the master station by cyclic data transfer processing.
- ⑦ The status of the link devices (RX, RWr) of the master station is stored in the devices of the CPU module by link refresh.

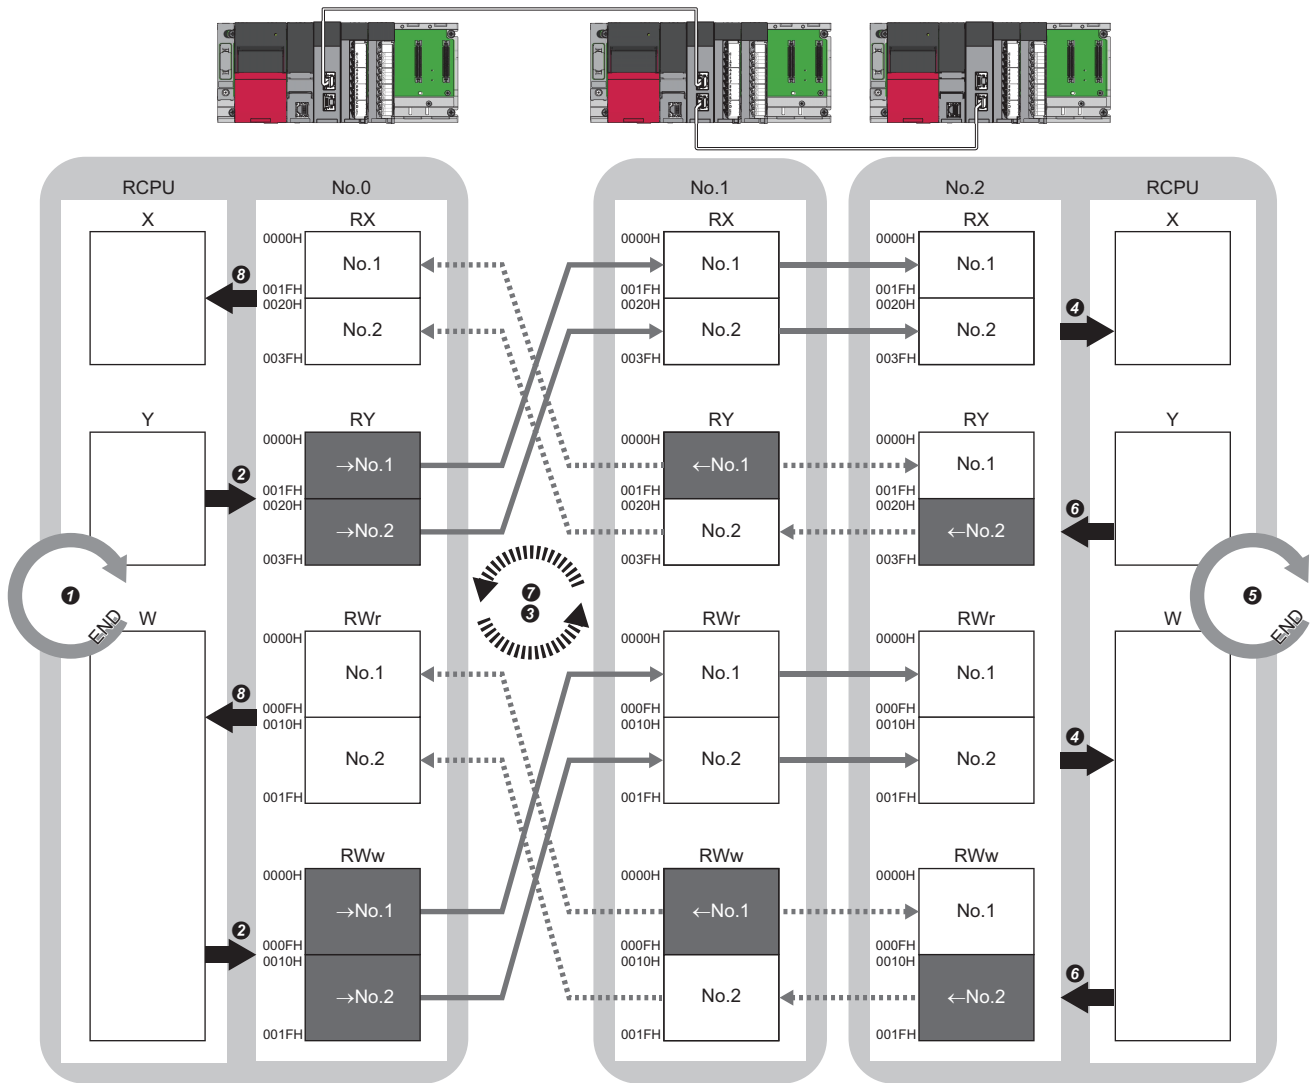

### ■ Multicast mode

- The master station and remote station send data on the line in multicast mode in each send range.
- The master station receives all data, but the remote station discards the data of another remote station. Therefore, communication at each station is performed in the same manner as unicast mode. (👉 Page 21 Unicast mode)

**■ Multicast mode**

The master station and local station send data on the line in multicast mode in each send range.  
Only ring topology is supported for the RJ71GN11-SX.

No.0, No.1, No.2: Station No.0 (master station), station No.1, station No.2  
 →No.1, →No.2: Send range: to station No.1, send range: to station No.2  
 ←No.1, ←No.2: Send range: from station No.1, send range: from station No.2

• Output from the master station

- ① The device is turned on by the sequence scan of the CPU module in the master station, and END processing is performed.
- ② The device status of the CPU module is stored in the link devices (RY, RWw) of the master station by link refresh.
- ③ The status of the link devices (RY, RWw) of the master station is stored in the link devices (RX, RWr) of the local station on the same network by cyclic data transfer processing.
- ④ The status of the link devices (RX, RWr) of the local station is stored in the devices of the CPU module by link refresh.

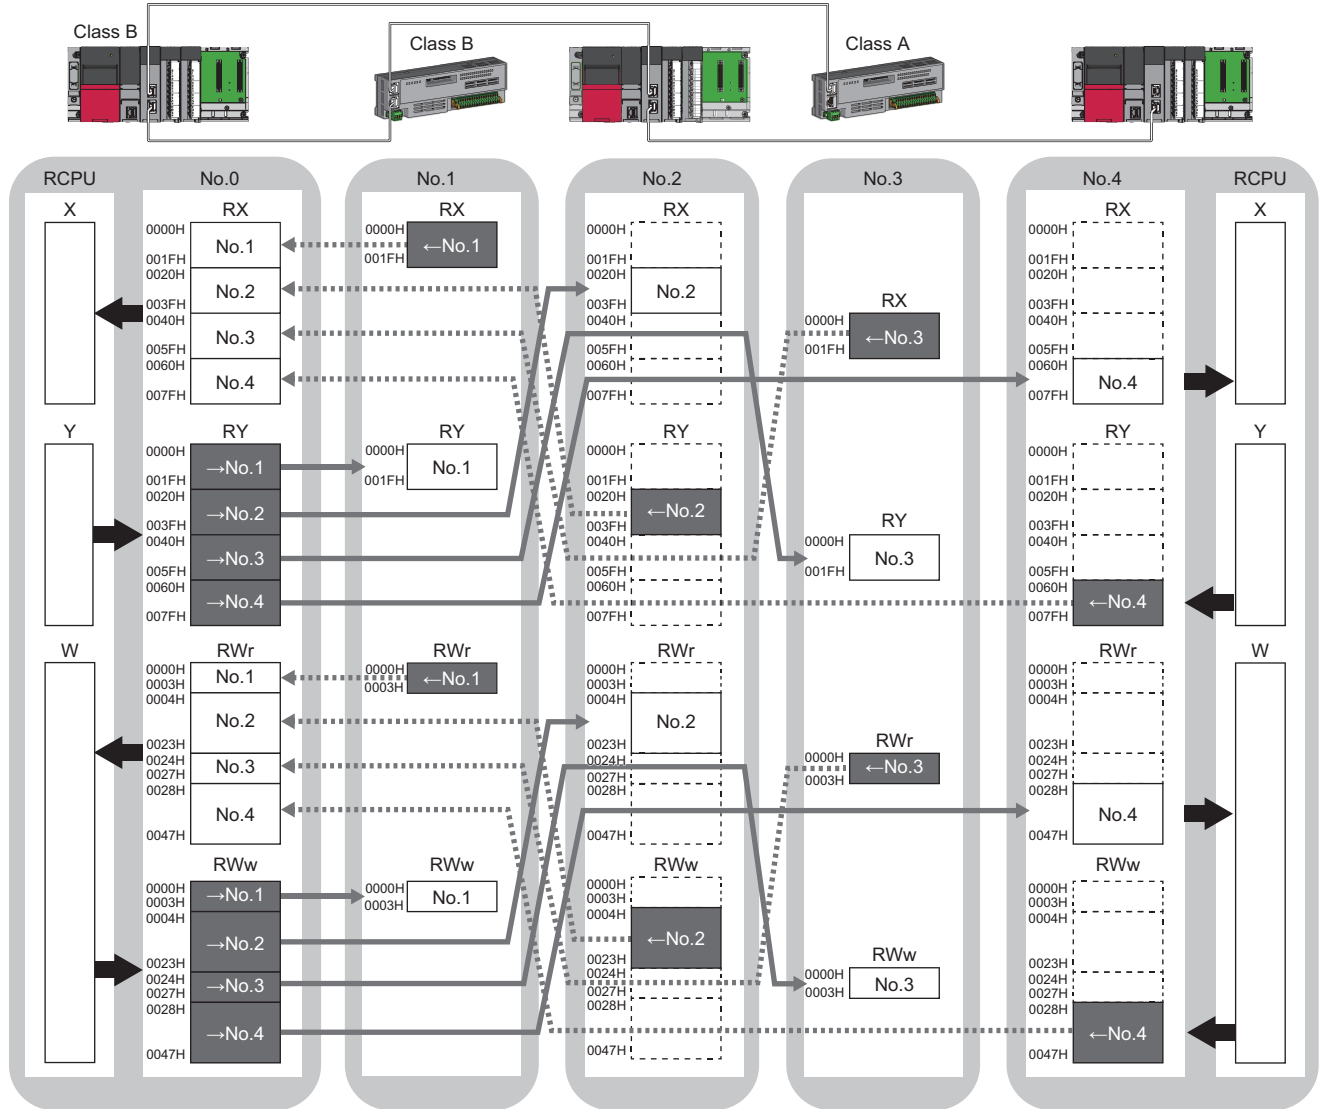

• Input from the local station

- ⑤ The device is turned on by the sequence scan of the CPU module in the local station, and END processing is performed.
- ⑥ The status of the device of the CPU module is stored in the link devices (RY, RWw) of the local station by link refresh.
- ⑦ The status of the link devices (RY, RWw) of the local station (station No.2) is stored in the link devices (RX, RWr) of the master station on the same network and the link devices (RY, RWw) of the local station (station No.1) by cyclic data transfer processing.
- ⑧ The status of the link devices (RX, RWr) of the master station is stored in the devices of the CPU module by link refresh.

## Coexistence of remote stations and local stations (RJ71GN11-T2 only)

### ■ Unicast mode

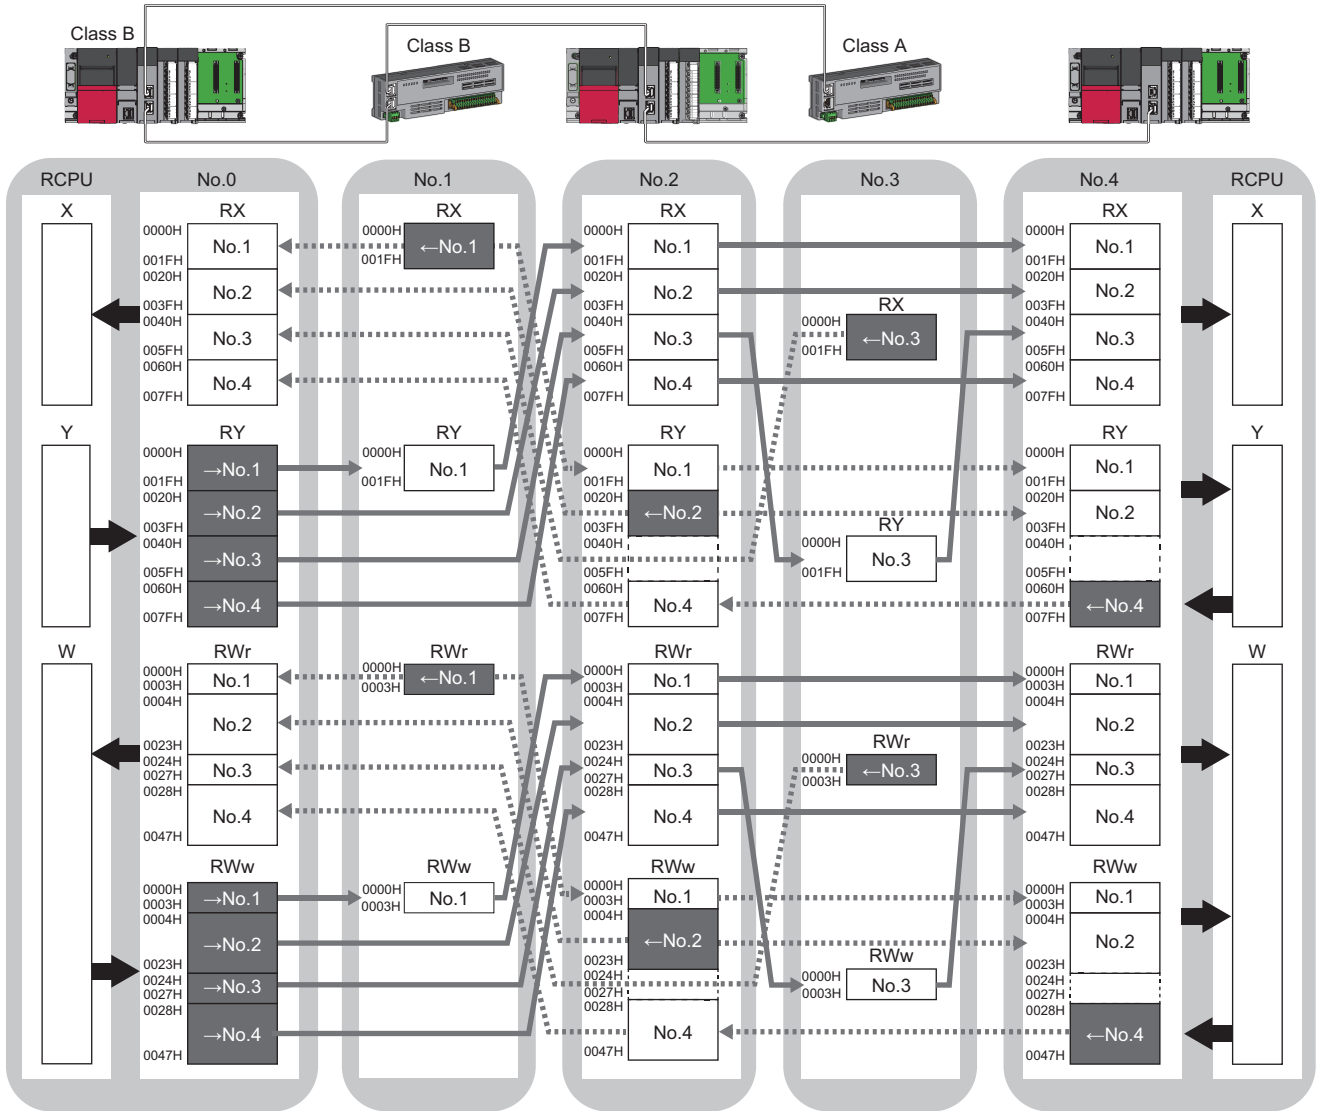

- 1:1 communications between the master station and each remote station, and between the master station and each local station.
- Communications are not performed between remote stations, between local stations, and between a remote station and a local station.

### ■ Multicast mode

The master station and each local station can obtain data of all device stations.

No.0, No.1, No.2, No.3, No.4: station No.0 (master station), station No.1, station No.2, station No.3, station No.4

→No.1, →No.2, →No.3, →No.4: Send range: to station No.1, send range: to station No.2, send range: to station No.3, send range: to station No.4

←No.1, ←No.2, ←No.3, ←No.4: Send range: from station No.1, send range: from station No.2, send range: from station No.3, send range: from station No.4

Class A: CC-Link IE TSN Class A device

Class B: CC-Link IE TSN Class B device

# Communications using LB and LW

This allows data to be communicated in units of bits and words between the master station and local stations.

## Master station and local stations, or between local stations

### ■ Unicast mode

1:1 communications between the master station and each local station. Local stations do not communicate with each other. Only ring topology is supported for the RJ71GN11-SX.

No.0, No.1, No.2, No.3: Station No.0 (master station), station No.1, station No.2, station No.3

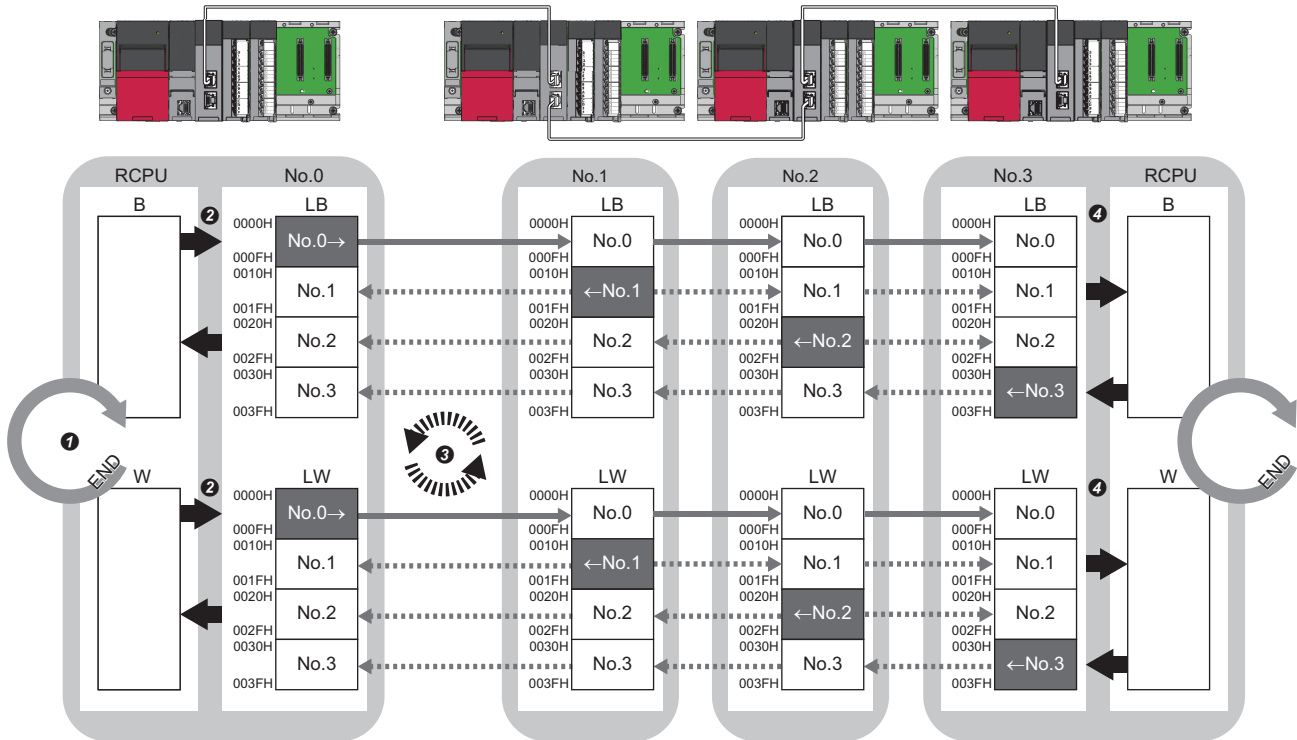

No.0→: Send range: to station No.1, station No.2, and station No.3

←No.1, ←No.2, ←No.3: Send range: from station No.1, send range: from station No.2, send range: from station No.3

- ❶ The device of the CPU module on the sending side turns on.
- ❷ The device status of the CPU module on the sending side is stored in the link devices (LB, LW) of the master station by link refresh.
- ❸ The status of the link devices (LB, LW) is stored in the link devices (LB, LW) of the RJ71GN11 on the receiving side by cyclic data transfer processing.
- ❹ The status of the link devices (LB, LW) is stored in the devices of the CPU module on the receiving side.

### ■ Multicast mode

This allows link device data to be exchanged between local stations as well as between the master station and local stations. Only ring topology is supported for the RJ71GN11-SX.

No.0, No.1, No.2, No.3: Station No.0 (master station), station No.1, station No.2, station No.3

No.0→: Send range: to station No.1, station No.2, and station No.3

←No.1, ←No.2, ←No.3: Send range: from station No.1, send range: from station No.2, send range: from station No.3

- ❶ The device of the CPU module on the sending side turns on.
- ❷ The device status of the CPU module on the sending side is stored in the link devices (LB, LW) of the master station by link refresh.
- ❸ The status of the link devices (LB, LW) is stored in the link devices (LB, LW) of each local station on the receiving side by cyclic data transfer processing.
- ❹ The status of the link devices (LB, LW) is stored in the devices of the CPU module on the receiving side.

## Communications using RX, RY, RWr, RWw, LB, and LW

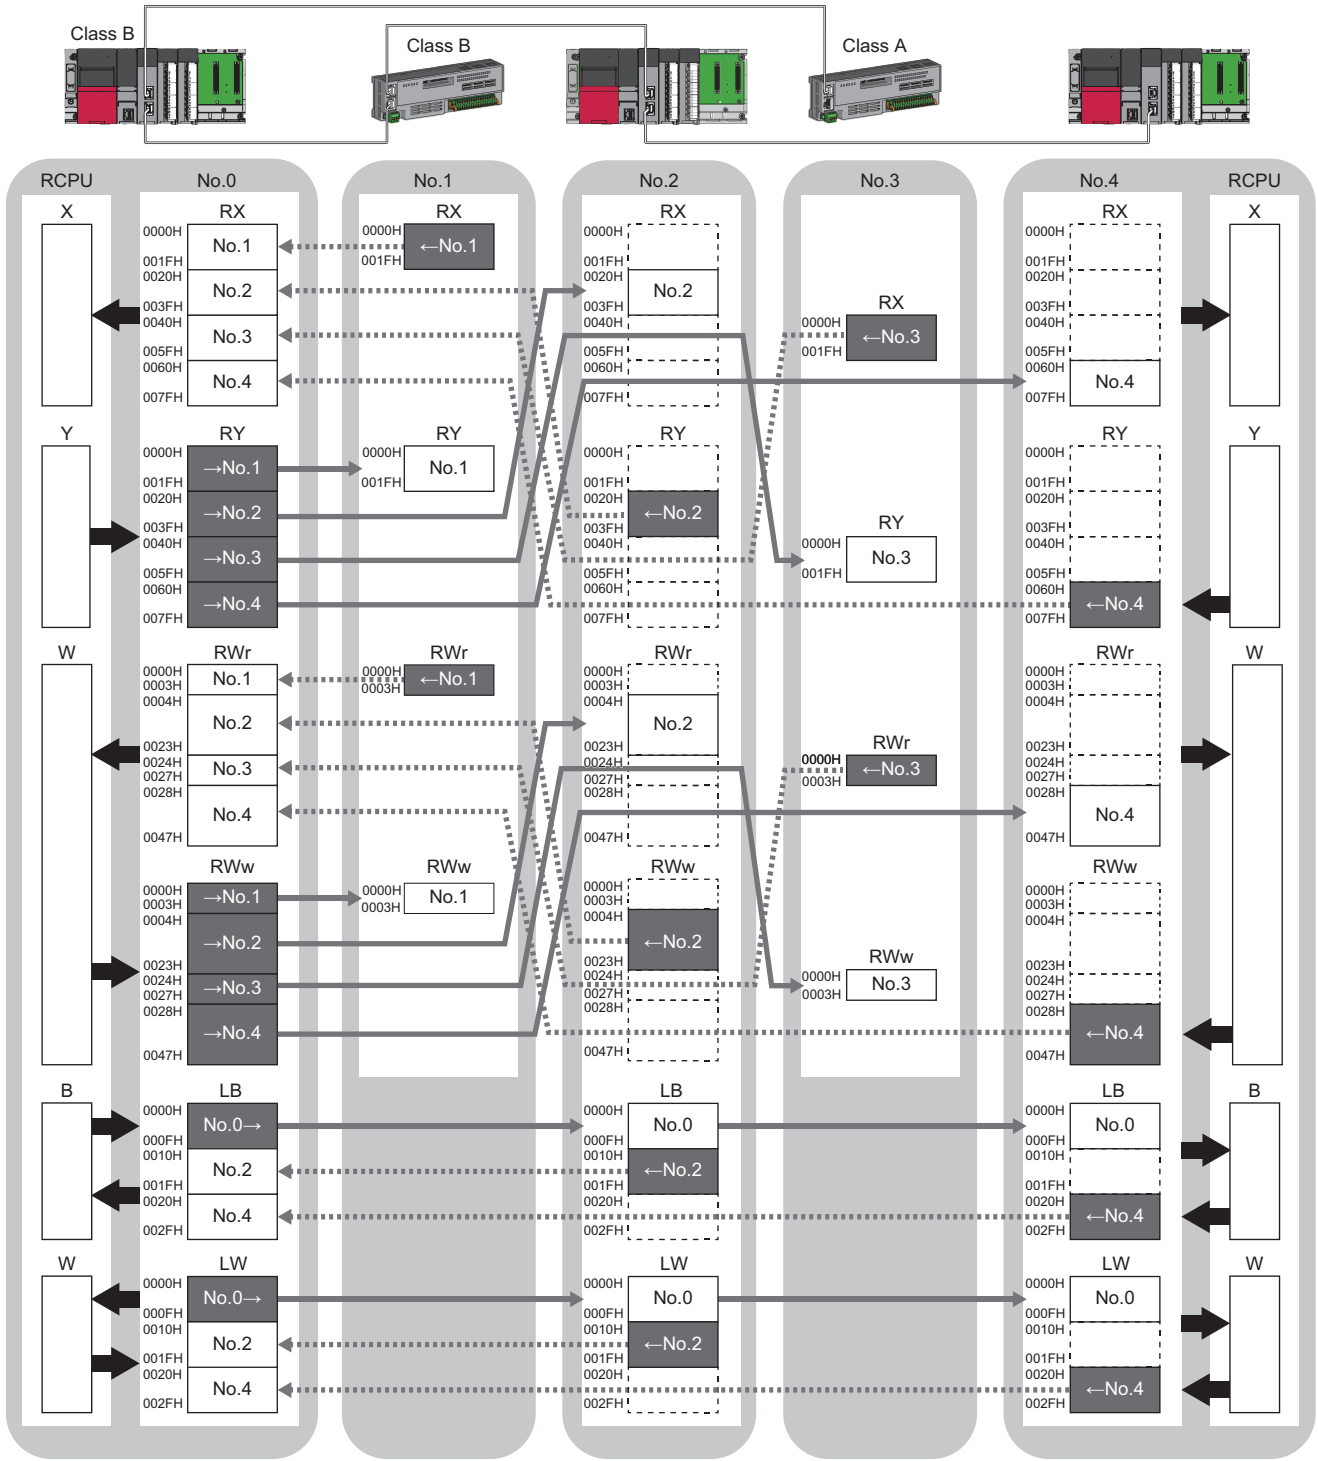

---

The RJ71GN11 performs communications using RX, RY, RWr, and RWw and communications using LB and LW simultaneously.

### Coexistence of the master station and device stations

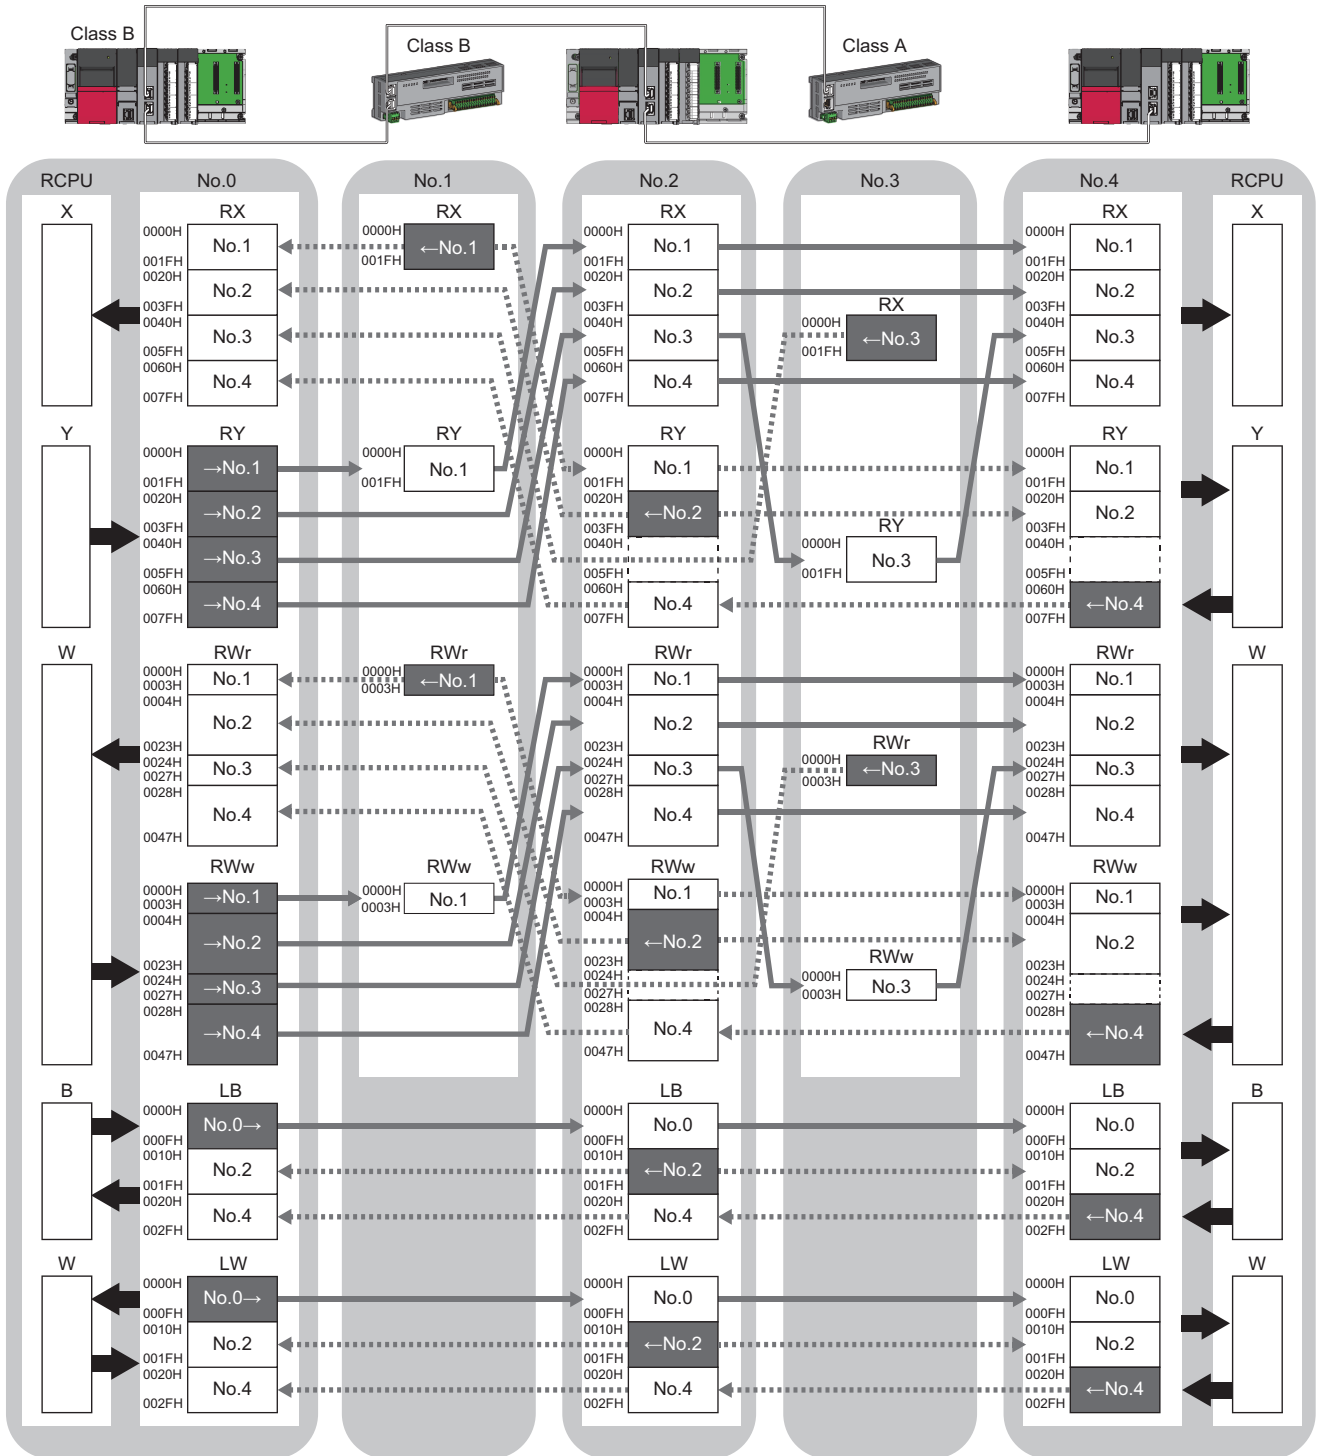

While the RJ71GN11-SX can perform communications using RX, RY, RWr, RWw, LB, and LW, the remote station cannot be connected as it only uses ring topology.

# Unicast mode

No.0, No.1, No.2, No.3, No.4: station No.0 (master station), station No.1, station No.2, station No.3, station No.4

Class A: CC-Link IE TSN Class A device

Class B: CC-Link IE TSN Class B device

## Extending the number of link points (RJ71GN11-SX only)

The maximum number of link points can be extended by setting the parameters as follows.

| Station type                    | Number of link points | Link device | Maximum number of link points per network | Maximum number of link points per station |
|---------------------------------|-----------------------|-------------|---|---|
| Master station<br>Local station | Not to extend         | LB          | 32K points (32768 points, 4K bytes)       | 32K points (32768 points, 4K bytes)       |
|                                 |                       | LW          | 16K points (16384 points, 32K bytes)      | 16K points (16384 points, 32K bytes)      |
|                                 | Extend                | LB          | 128K points (131072 points, 16K bytes)    | 128K points (131072 points, 16K bytes)    |
|                                 |                       | LW          | 512K points (524288 points, 1024K bytes)  | 512K points (524288 points, 1024K bytes)  |

Extending the number of link points allows cost reductions as it enables running systems on a single network that originally required multiple networks due to an insufficient number of LB/LW points. This can be especially useful for networks between devices with a large amount of communications data.

The reduced number of networks has fewer devices, which simplifies maintenance and inspection work.

### Restriction

- Only multicast mode is supported for the communication mode.
- Connection is only possible when the "LB/LW Points Extended Setting" is set to "Extend" for all mater and local stations and they have the same settings. If the settings are not the same, the master station will generate Another station: Parameter error occurrence (event code: 00C75H), or the local station will generate a network parameter error (error code: 2221H).
- The cyclic data size must be 556K bytes or less, which is the sum of the RX/Ry/RWr/RWw assignment range and the number of LB/LW points used for each station ÷ communication period setting LB/LW.

### Precautions

Extending the number of link points changes the address of the buffer memory link device area. If a link device area is referenced by something such as a program, it is necessary to take action such as changing the reference depending on the SB0063 (link points extended setting) setting details.

## Changing the communication cycle

If the number of link points becomes too large by the link points extension, all data cannot be sent in one basic cycle.

Therefore, the data is sent over a communication cycle that is multiple times longer than the basic cycle. (Sending over a communication cycle that is multiple times longer than the basic cycle is only performed when extending the number of link points.)

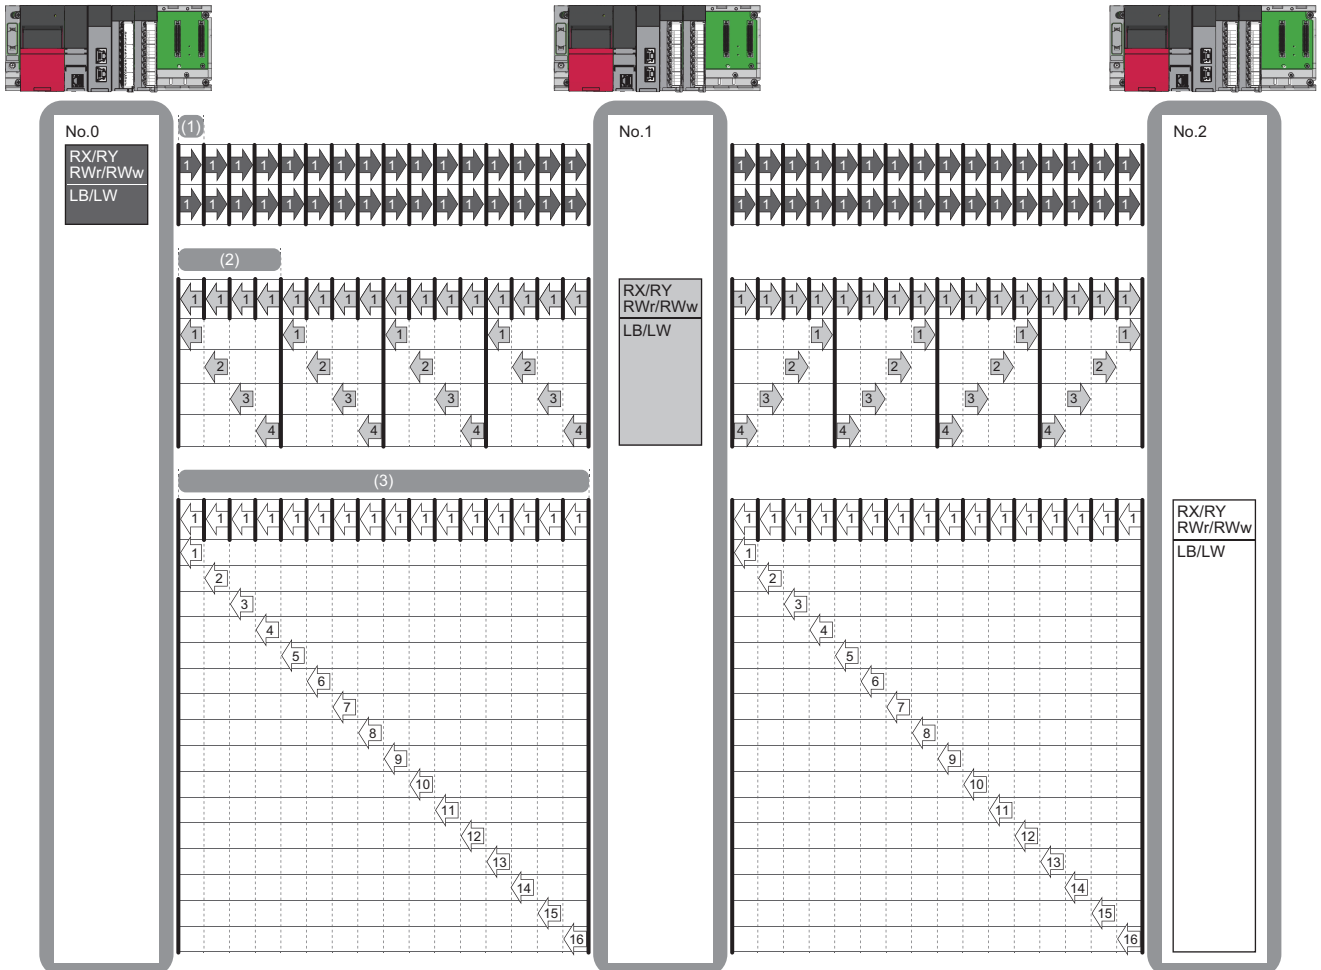

The length of the communication cycle is set in "Communication Period Setting LB/LW". (  Page 33 Setting method)

When extending the number of link points, it is necessary to set "Communication Mode" to "Multicast" and "Communication Period Setting RX/Ry/RWr/RWw" to "Basic Period". This causes RX/Ry/RWr/RWw data to be sent in each basic cycle from all stations.

### Ex.

The following figure shows an example of when a link device sends data over a communication cycle that is multiple times longer than the basic cycle.

- No.0: When "Communication period setting LB/LW" on the master station is set to "Basic Period", the LB/LW data is sent every basic cycle.
- No.1: When "Communication Period Setting LB/LW" on the local station 1 is set to "Normal-Speed" ( $\times 4$ ), the LB/LW data is sent in one-quarter increments over a communication cycle that is four times longer than the basic cycle.
- No.2: When "Communication Period Setting LB/LW" on the local station 2 is set to "Low-Speed" ( $\times 16$ ), the LB/LW data is sent in 1/16th increments over a communication cycle that is 16 times longer than the basic cycle.

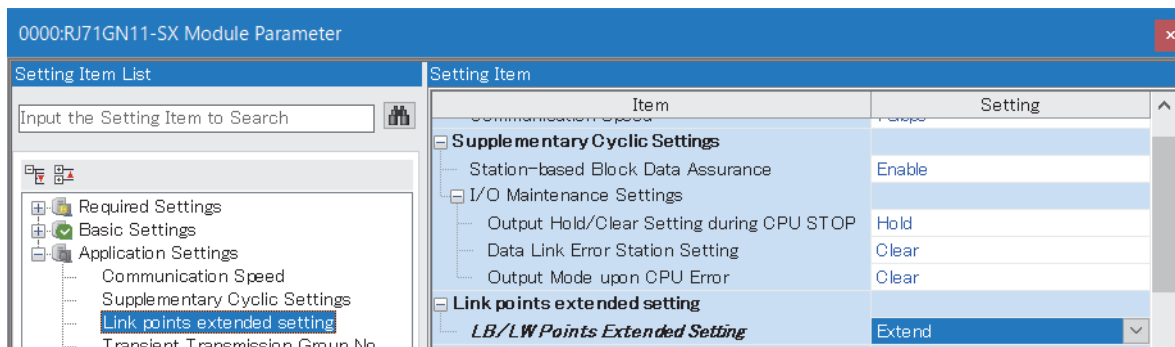

- (1) Basic cycle  
 (2) Normal speed ( $\times 4$ )  
 (3) Low speed ( $\times 16$ )

## Setting method

1. Apply the following settings to the master station and local station.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-SX] ⇒ [Application Settings] ⇒ [Link points extended setting]

2. On the master station, set "Normal-Speed" and "Low-Speed" to appropriate multiples.

[RJ71GN11-SX] ⇒ [Basic Settings] ⇒ [Communication Period Setting] ⇒ [Multiple Period Setting]

3. On the master station "CC-Link IE TSN Configuration" window, assign the number of points to "LB Setting" and "LW Setting".

[RJ71GN11-SX] ⇒ [Basic Settings] ⇒ [Network Configuration Settings]

| No. | Model Name   | RWw Setting |       |      | Communication Period Setting (LB/LW): |       |       |            |       |       | PDO Mapping Setting |
|-----|--------------|-------------|-------|------|---------------------------------------|-------|-------|------------|-------|-------|---------------------|
|     |              | Point/Start |       |      | LB Setting                            |       |       | LW Setting |       |       |                     |
|     |              | Points      | Start | End  | Points                                | Start | End   | Points     | Start | End   |                     |
| 0   | Host Station |             |       |      | 12288                                 | 00000 | 02FFF | 8192       | 00000 | 01FFF |                     |
| 1   | RJ71GN11-SX  | 16          | 0000  | 000F | 12288                                 | 03000 | 05FFF | 8192       | 02000 | 03FFF |                     |
| 2   | RJ71GN11-SX  | 16          | 0100  | 010F | 12288                                 | 06000 | 08FFF | 8192       | 04000 | 05FFF |                     |

4. Set the "Communication Period Setting (LB/LW)"

- If "Link with Master Station" is selected from the drop-down menu, the local station "Communication Period Setting LB/LW" will be interlocked with the master station.

| Assignment Method: |              | Point/Start                       |                              | Communication Period Setting (LB/LW): |                     | Link with Master Station |                         |  |
|--------------------|--------------|-----------------------------------|------------------------------|---------------------------------------|---------------------|--------------------------|-------------------------|--|

| 0                  | Host Station |                                   |                              |                                       | Basic Period        |                      |                         |  |
| 1                  | RJ71GN11-SX  | Asynchronous                      | Basic Period                 |                                       | Normal-Speed        |                      |                         |  |
| 2                  | RJ71GN11-SX  | Asynchronous                      | Basic Period                 |                                       | Low-Speed           |                      |                         |  |

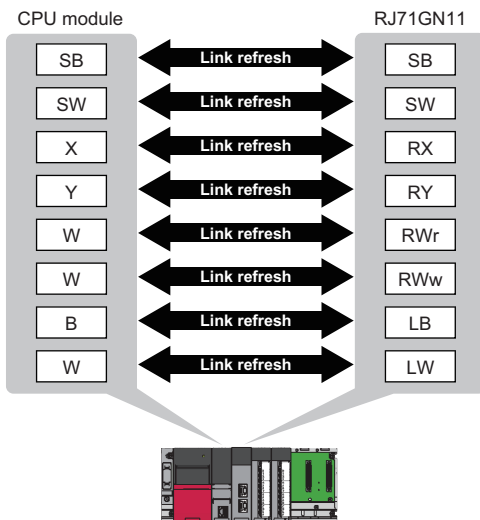

For a communication example, refer to the following.

MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

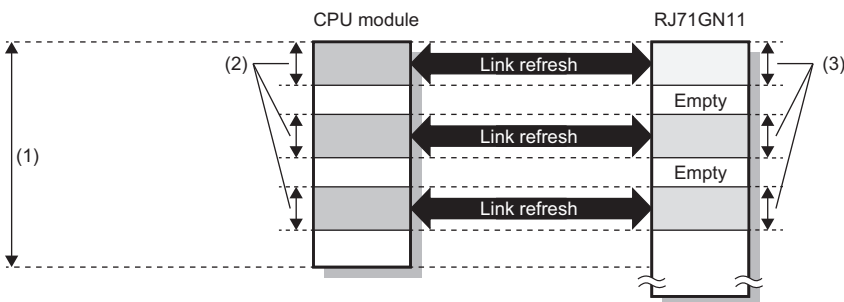

## Link refresh

This function automatically transfers data between the devices of the RJ71GN11 and the devices of the CPU module.

### Concept of the link refresh range (number of points)

The link refresh is performed to the area set in "Refresh Settings" under "Basic Settings" and also set in the "CC-Link IE TSN Configuration" window.

- (1) Range set in "Refresh Settings" under "Basic Settings"  
 (2) Actual link refresh range  
 (3) Range set in the "CC-Link IE TSN Configuration" window

### Shortening the transmission delay time

The transmission delay time can be shortened by reducing the number of link refresh points and shortening a communication cycle interval. (☞ Page 322 Communication cycle intervals)

The following methods can be used to reduce the number of the link refresh points.

- In "Refresh Settings" under "Basic Settings", set only the link devices frequently used in the CPU module as the link refresh range. (☞ Page 115 Refresh Settings)
- Remove infrequently used link devices in the CPU module from the link refresh range, and directly read or write the corresponding data from the program by direct access. (☞ Page 37 Direct access to link devices)

#### Point

Link refresh is performed in END processing of the sequence scan of the CPU module.

## Setting method

The link refresh is assigned in "Refresh Settings" under "Basic Settings". (📖 Page 115 Refresh Settings)

## Precautions

### ■ Latched devices of the CPU module

If data in latched devices of the CPU module are cleared to 0 on a program when the CPU module is powered off and on or reset, the data may be output without being cleared to 0, depending on the timing of the cyclic data transfer processing and link refresh.

| CPU module device                        | How to disable the device data   |
|--|--|
| Latch relay (L), file register (R, ZR)   | The device value is cleared to 0 by using the initial device value of the CPU module.*1  |
| CPU module device within the latch range | Delete all the latch range settings specified in "Latch Interval Operation Setting" under "Device Latch Interval Setting" in "Memory/Device Setting" of "CPU Parameter". |

\*1 For the initial device value setting of the CPU module, refer to the following.

📖 GX Works3 Operating Manual

# Direct access to link devices

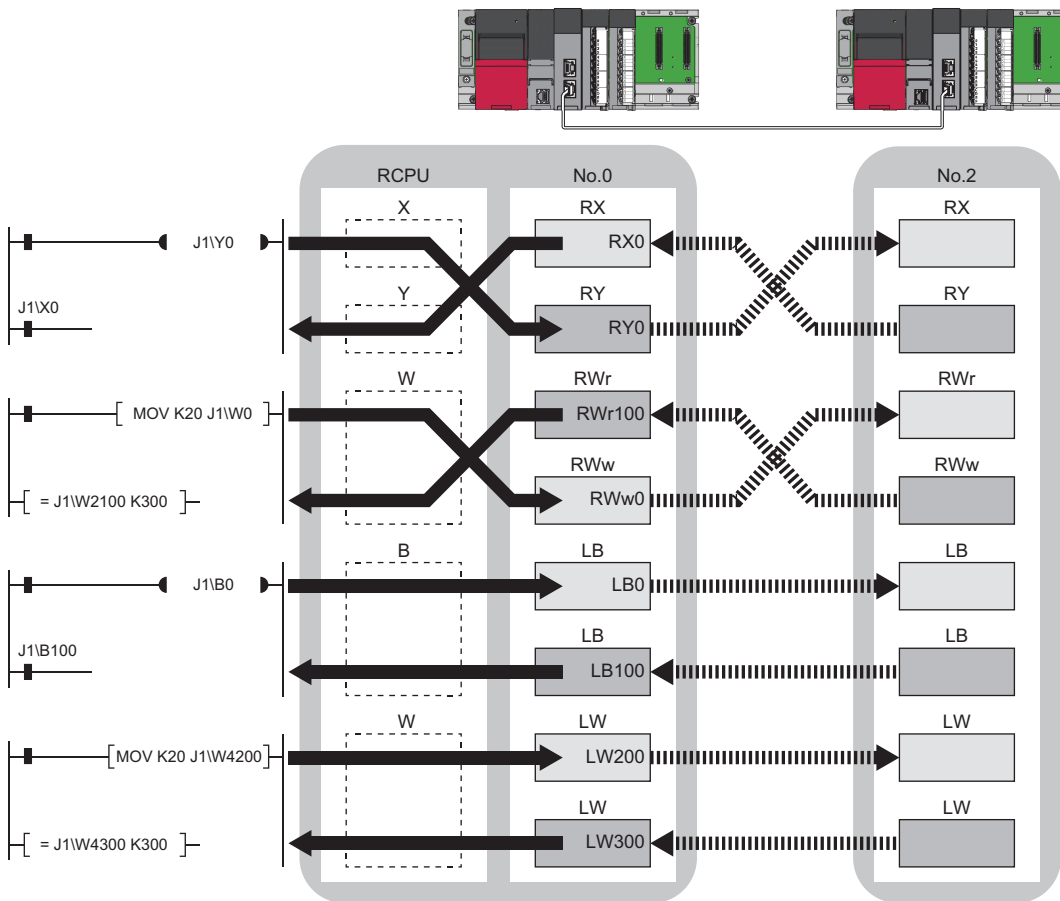

The corresponding data is directly read or written from/to link devices of the RJ71GN11 using the program.  
 Specify a link device as the link direct device (J□\□) for direct access.  
 The link special relay (SB) and link special register (SW) can be set using module label. (☞ Page 263 \_D)

## Specification method

Specify the network number and the link devices of the RJ71GN11 for reading or writing data.

- J□\□  
 ↑ ↑  
 (1) (2)
- (1) Network number: 1 to 239
  - (2) Remote input (RX): X0 to X3FFF  
 Remote output (RY): Y0 to Y3FFF  
 Remote register (RWw): W0 to W1FFF  
 Remote register (RWr): W2000 to W3FFF
  - Link relay (LB): B0 to B7FFF, B0 to B1FFFF when extending the number of link points (☞ Page 31 Extending the number of link points (RJ71GN11-SX only))
  - Link register (LW): W4000 to W7FFF, W4000 to W83FFF when extending the number of link points (☞ Page 31 Extending the number of link points (RJ71GN11-SX only))
  - Link special relay (SB): SB0 to SBFFF
  - Link special register (SW): SW0 to SWFFF

Ex.

## Readable and writable range

Data can be read or written from/to the RJ71GN11 on the base unit where the CPU module is mounted.

### ■Read

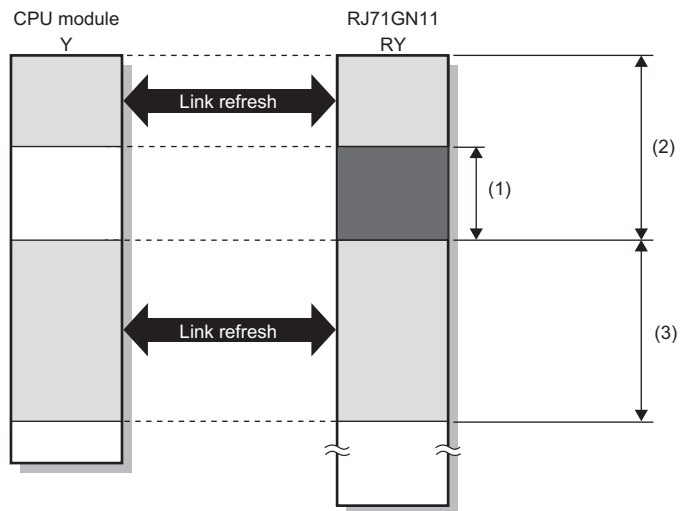

All link devices of the RJ71GN11 can be specified. (☞ Page 37 Specification method)

### ■Write

The range that satisfies all of the following conditions can be specified.

- Area where data is sent to other stations and outside the link refresh range (☞ Page 28 Communications using RX, RY, RWr, RWw, LB, and LW)
- Within the link device range of the RJ71GN11 (☞ Page 37 Specification method)

Ex.

- (1) Out of the link refresh range (Data can be written here.)  
(2) Area where data is sent to other stations  
(3) Area for receiving data from other stations

When writing data to the area in the link refresh range, directly access the link device and write the same data in the device of the CPU module.

- Bad example (Directly accessing the link refresh target only)

Link refresh overwrites the value.

- Good example (Directly accessing the link device as well as writing the same data to the device of the CPU module)

The value written by the direct access is reflected.

## Differences from link refresh

| Item                  | Access method |                         |
|-----------------------|---------------|-------------------------|
|                       | Link refresh  | Direct access           |
| Number of steps       | 1 step        | 2 steps                 |
| Processing speed      | High speed    | Low speed <sup>*1</sup> |
| Cyclic data assurance | Available     | Not available           |

\*1 For the instruction processing time when the link direct device (J□\□) is used, refer to the following.

📖 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

## Shortening the transmission delay time

The transmission delay time can be shortened by reducing the number of link refresh points and shortening a communication cycle interval. (  Page 322 Communication cycle intervals)

The following methods can be used to reduce the number of the link refresh points.

- In "Refresh Settings" under "Basic Settings", set only the link devices frequently used in the CPU module as the link refresh range. (  Page 115 Refresh Settings)
- Remove infrequently used link devices in the CPU module from the link refresh range, and directly read or write the corresponding data from the program by direct access.

### Point

---

Link refresh is performed in END processing of the sequence scan of the CPU module.

---

## Precautions

### ■Cyclic data assurance

The direct access to link devices does not provide station-based block data assurance. Use 32-bit data assurance, or if cyclic data of more than 32 bits needs to be assured, use interlock programs. (  Page 41 Cyclic data assurance)

### ■Mounting multiple modules of the same network number

When multiple RJ71GN11s of the same network number are mounted, the target of the direct access to link devices is the module that has the smallest slot number in the base unit.

### ■Link direct device in a multiple CPU system

In a multiple CPU system, link direct devices cannot be used for the CC-Link IE Controller Network-equipped module controlled by another CPU module.

# Cyclic data assurance

This function assures the cyclic data assurance in units of 32 bits or station-based units.

○: Assured, ×: Not assured

| Method                             | Description  | Link refresh | Direct access to link devices | Access to buffer memory |
|------------------------------------|--|--------------|-------------------------------|-------------------------|
| 32-bit data assurance              | Assures data in 32-bit units.<br>Data is automatically assured by satisfying assignment conditions of link devices.                  | ○            | ○                             | ○                       |
| Station-based block data assurance | Assures data in station-based units.<br>Data is assured by enabling the station-based block data assurance in the parameter setting. | ○            | ×                             | ×                       |
| Interlock program                  | Assures data of more than 32 bits.<br>Data is assured by configuring interlocks on programs.   | ○            | ○                             | ○                       |

## Point

When a remote station is in the network, use station-based block data assurance. If it is disabled, the functions of the remote station cannot be assured.

## 32-bit data assurance

RWr, RWw, and LW data can be assured in 32-bit units.

### ■Data assurance at the time of direct access to link devices

When link refresh target devices are accessed, the 32-bit data can be assured by satisfying the following conditions:

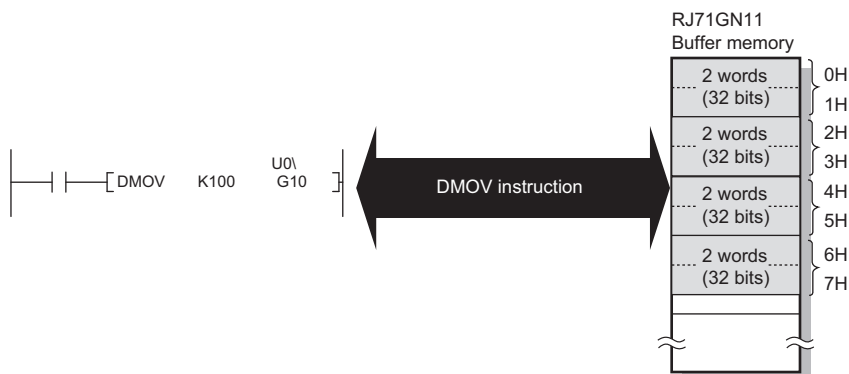

- The start device number of RWr, RWw, and LW is a multiple of 2
- The number of points assigned to RWr, RWw, and LW is a multiple of 2.

### ■Data assurance at the time of access to buffer memory

The 32-bit data can be assured by satisfying the following conditions:

- Access using the DMOV instruction
- The start address of the buffer memory is a multiple of 2.

## Station-based block data assurance

Cyclic data is assured for each station by a handshake between the CPU module and the RJ71GN11 for a link refresh. The link device is assured as follows.

- RX, RY, RWw, and RWr data are assured for each station
- LB and LW data are assured for each station

### ■Setting

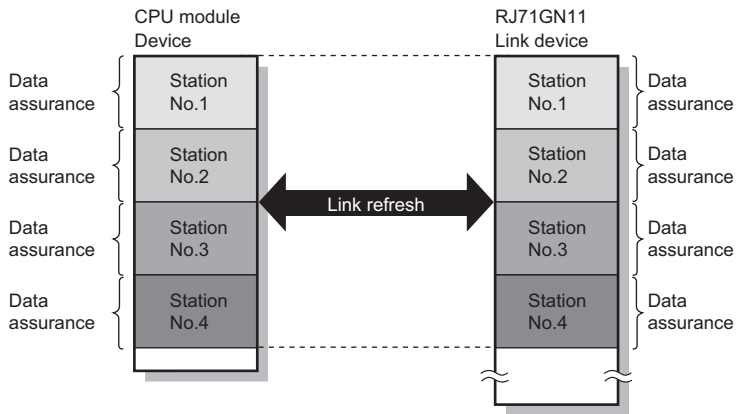

Set station-based block data assurance under "Supplementary Cyclic Settings" in "Application Settings" of the master station.

( Page 124 Application Settings)

Once this setting is enabled on the master station, the data for all stations is assured for each station.

### ■Access to link devices

During a link refresh, data is assured for each station as shown below.

### ■Precautions

RX, RY, RWw, and RWr data cannot be assured for each station with LB and LW data.

## Interlock program

Data of more than 32 bits can be assured without using the station-based block data assurance setting. Use either of the following methods:

- Data assurance by handshake of the remote I/O
- Data assurance by handshake of the remote register
- Data assurance by handshake of the link relay

### ■Data assurance by handshake of the remote I/O

An example of sending data in W0 to W3 of the master station (station No.0) to W1000 to W1003 of the local station (station No.1) is shown below. (X1000 and Y1000 are used for a handshake to the CPU module.)

- ❺ The master station checks that B1000 is turned on, and turns off B0.
- ❻ The local station checks that B1000 is turned off, and turns off B0.

## ■Data assurance by handshake of the link relay

In communications using LB and LW, the link relay (LB) is sent after the link register (LW). Therefore, data inconsistency of the link register (LW) can be prevented by handshake in the data of the link relay (LB).

The following shows the program example when 'Cyclic data (station No.0)' (W0 to W3) of the master station is sent to 'Cyclic data (station No.1)' (W0 to W3) of the local station.

A handshake is established by turning on 'Handshake (station No.0)' (B0) of the master station and turning on 'Handshake (station No.1)' (B100) of the local station after the send data has been stored.

| Label to be defined | Define global labels as shown below:   |               |            |            |                       |       |                       |   |            |               |     |            |      |
|                     | <table border="1"> <thead> <tr> <th></th> <th>Label Name</th> <th>Data Type</th> <th>...</th> <th>Class</th> <th>Assign (Device/Label)</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>uInputData</td> <td>Word [Signed]</td> <td>...</td> <td>VAR_GLOBAL</td> <td>D100</td> </tr> </tbody> </table> |               | Label Name | Data Type  | ...                   | Class | Assign (Device/Label) | 1 | uInputData | Word [Signed] | ... | VAR_GLOBAL | D100 |
|                     | Label Name   | Data Type     | ...        | Class      | Assign (Device/Label) |       |                       |   |            |               |     |            |      |
| 1                   | uInputData   | Word [Signed] | ...        | VAR_GLOBAL | D100                  |       |                       |   |            |               |     |            |      |

• Program flow

- ① The master station checks that the send request bStartDirection (M0) is turned on, and transfers contents of uOutputData [0] to [3] to the send data W0 to W3.
- ② When the transfer is completed, the master station turns on B0.
- ③ The local station checks that B0 is turned on, and transfers contents of the receive data W0 to W3 to uInputData [0] to [3] (D100 to D103).
- ④ When the transfer is completed, the local station turns on B100.
- ⑤ The master station checks that B100 is turned on, and turns off B0.
- ⑥ The local station checks that B0 is turned off, and turns off B100.

# Communication cycles coexistence

When device stations with different communication cycles are included in the network, multiple communication cycles according to each device station are used for communications.

The time for each communication cycle is the total time of cyclic transmission, transient transmission, and system reservation time.

Even if device stations with different communication cycles are connected to a network, a device station with a high-speed communication cycle is not affected by a device station with a low speed.

- (1) Basic cycle
- (2) Normal speed
- (3) Low speed (for "x16")

## Setting method

The master station communicates with device stations by using three communication cycles consisting of the basic cycle under "Basic Period Setting", as well as "Normal-Speed" and "Low-Speed" under "Multiple Period Setting". (Page 118 Communication Period Setting)

The communication cycle of each device station can be selected from "Basic Period", "Normal-Speed", or "Low-Speed" in "Communication Period Setting" in the "CC-Link IE TSN Configuration" window.

## Precautions

The available communication cycle to be set to the local station varies depending on the settings of "Communication Mode" and "Link points extended setting" under "Application Settings".

### ■ Unicast mode

The setting value of "Communication Period Setting LB/LW" of the local station in the "CC-Link IE TSN Configuration" window becomes the same setting as that of "Communication Period Setting RX/Ry/RWr/RWw", and the setting can be set to "Basic Period", "Normal-Speed", or "Low-Speed".

### ■ Multicast mode

- When not extending the number of link points: Set "Basic Period" in "Communication Period Setting" of the local station in the "CC-Link IE TSN Configuration" window.
- When extending the number of link points: Set "Basic Period" in "Communication Period Setting RX/Ry/RWr/RWw" of the local station in the "CC-Link IE TSN Configuration" window. "Communication Period Setting LB/LW" can be set to "Basic Period", "Normal-Speed", or "Low-Speed".

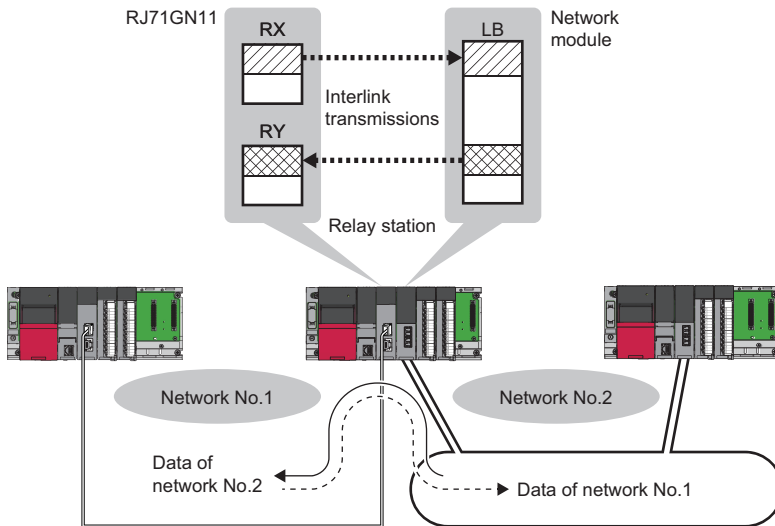

## Interlink transmission

This function transfers data in the link devices of the master station to another network module on a relay station.

Modules that can support interlink transmission are as follows.

- RJ71GN11-T2 (master station)
- RJ71GN11-SX (master station and local station)
- CC-Link IE Controller Network-equipped module (control station and normal station)
- CC-Link IE Field Network-equipped module (master station and submaster station)
- RJ71LP21-25 (control station and normal station)

### Setting method

Set interlink transmission in "Interlink Transmission Settings" in "Application Settings". (☞ Page 128 Interlink Transmission Settings)

#### ■Setting 65 or more interlink transmission ranges

Use link direct devices in a program to perform interlink transmission.

```

| MO |-----[ BMOV K4X1200 J2\ K4B780 K8 ]

```

A link direct device cannot be specified for both the first and second arguments. Either one of them must use link refresh and specify the CPU device.

#### ■Performing interlink transmission in a multiple CPU system

When different control CPUs are set for the network modules, interlink transmission cannot be performed using interlink transmission parameters or a program. Perform interlink transmission using data communication by the CPU buffer memory.

(☞ MELSEC iQ-R CPU Module User's Manual (Application))

## I/O maintenance settings

When using cyclic transmission, set whether to hold or clear output on the sending side or input on the receiving side by using the following setting of (A), (B), or (C). (Page 125 Supplementary Cyclic Settings)

- Setting on sending side (A): "Output Mode upon CPU Error" for if a stop error occurred in the CPU module on the sending side
- Setting on sending side (B): "Output Hold/Clear Setting during CPU STOP" for if the status of the CPU module on the sending side changed from RUN to STOP
- Setting on receiving side (C): "Data Link Faulty Station Setting" for if the sending side disconnected

[Application Settings] ⇒ [Supplementary Cyclic Settings] ⇒ [I/O Maintenance Settings]

### Input data hold/clear operation on the receiving side

#### ■ If a CPU module stop error occurred on the sending side

- If both settings (A) and (B) on the sending side are "Hold", input data on the receiving side is held.
- If setting (A) or (B) on the sending side is "Clear", input data on the receiving side is cleared. (The sending side sends the data cleared to 0.)

#### ■ If the CPU module on the sending side changed from RUN to STOP

- If setting (B) on the sending side is "Hold", input data on the receiving side is held.
- If setting (B) on the sending side is "Clear", input data on the receiving side is cleared. (The sending side sends the data cleared to 0.)

#### ■ If the sending side disconnected

- If setting (C) on the receiving side is "Hold", input data from before disconnection is held on the receiving side.
- If setting (C) on the receiving side is "Clear", input data on the receiving side is cleared.

### Devices where hold/clear settings are enabled

The following table and figure show devices for which the settings on the sending side (A)(B) and the setting on the receiving side (C) are enabled.

| Setting to                    | Setting items                             | Hold/clear settings are enabled  | Hold regardless of setting   | Clear regardless of setting  |
|-------------------------------|---|--|--|--|
| Setting on sending side (A)   | Output mode upon CPU error                | <ul style="list-style-type: none"> <li>• Master station RY</li> <li>• Local station RY (only the output data from the own station)</li> </ul>  | —  | —  |
| Setting on sending side (B)   | Output hold/clear setting during CPU STOP | <ul style="list-style-type: none"> <li>• Master station RY (if the link refresh source device is other than Y)</li> <li>• Local station RY (only the output data from the own station, and if the link refresh source device is other than Y)</li> </ul> | <ul style="list-style-type: none"> <li>• Master station RWw</li> <li>• Local station RWw (only the output data from the own station)</li> <li>• LB (only the output data from the own station)</li> <li>• LW (only the output data from the own station)</li> </ul>                        | <ul style="list-style-type: none"> <li>• Master station RY (if the link refresh source device is Y)</li> <li>• Local station RY (only the output data from the own station, and if the link refresh source device is Y)</li> </ul> |
| Setting on receiving side (C) | Data link faulty station setting          | <ul style="list-style-type: none"> <li>• Master station RX</li> <li>• Local station RX</li> <li>• Local station RY (only the input data from other stations)</li> </ul>  | <ul style="list-style-type: none"> <li>• Master station RWr</li> <li>• Local station RWr</li> <li>• Local station RWw (only the input data from other stations)</li> <li>• LB (only the input data from other stations)</li> <li>• LW (only the input data from other stations)</li> </ul> | —  |

## Precautions

### ■When "Output Hold/Clear Setting during CPU STOP" is set to "Clear"

When the CPU module is in the STOP state, the forced output to device stations cannot be executed using the engineering tool.

### ■When the direct access to link devices

The output varies according to the setting of "Output Hold/Clear Setting during CPU STOP".

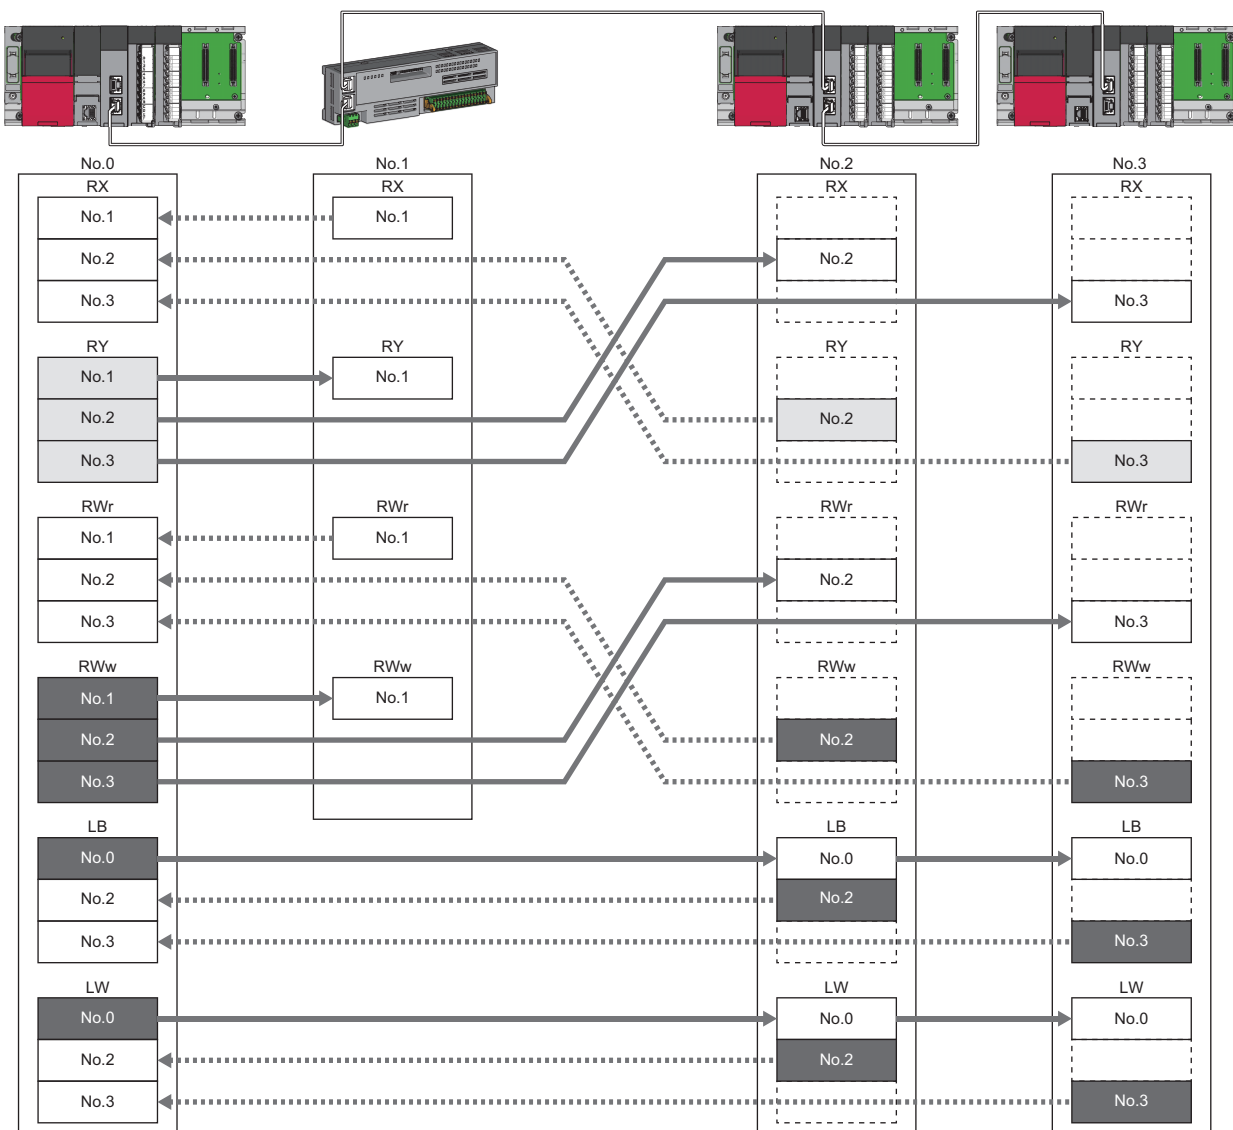

### ■When the Safety CPU is used

When the safety operation mode is in the safety mode, output of safety communications will be cleared even if "Hold" is set in "Output Hold/Clear Setting during CPU STOP".

## Output data hold/clear operation during CPU STOP

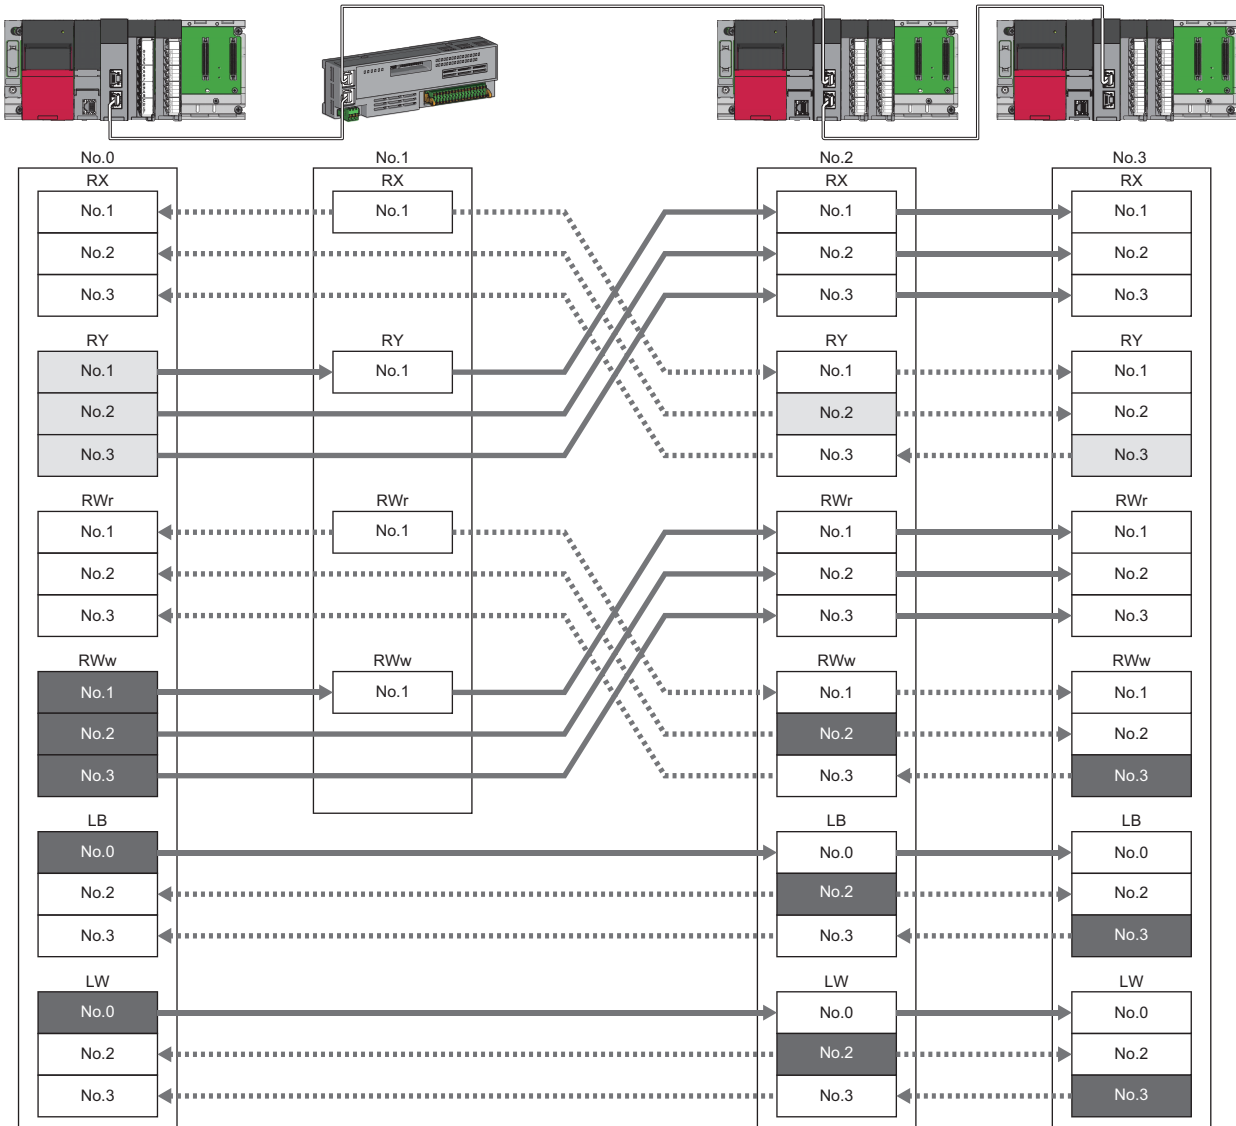

The following shows the devices where the setting of "Output Hold/Clear Setting during CPU STOP" is enabled when the CPU module on the sending side changes from RUN to STOP.

### ■Unicast mode

- : When the link refresh source is set to other than Y, data is held or cleared according to the parameter setting. When the link refresh source is set to Y, data is cleared regardless of the parameter setting.
- : Data is held regardless of the parameter setting.

## ■ Multicast mode

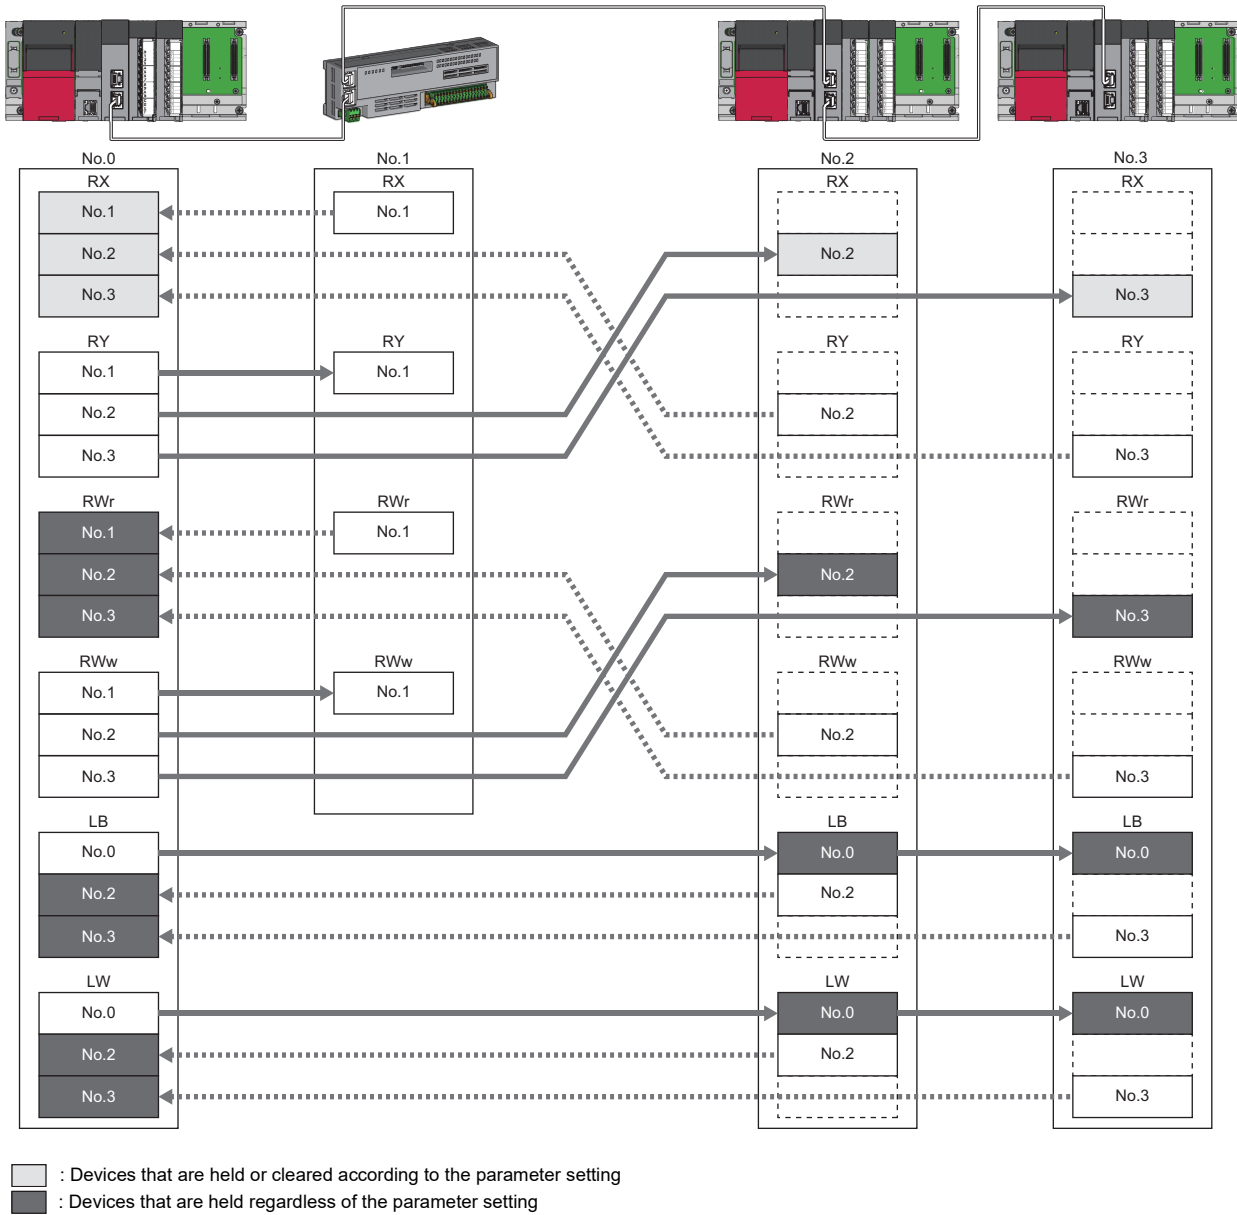

: When the link refresh source is set to other than Y, data is held or cleared according to the parameter setting. When the link refresh source is set to Y, data is cleared regardless of the parameter setting.  
 : Data is held regardless of the parameter setting.

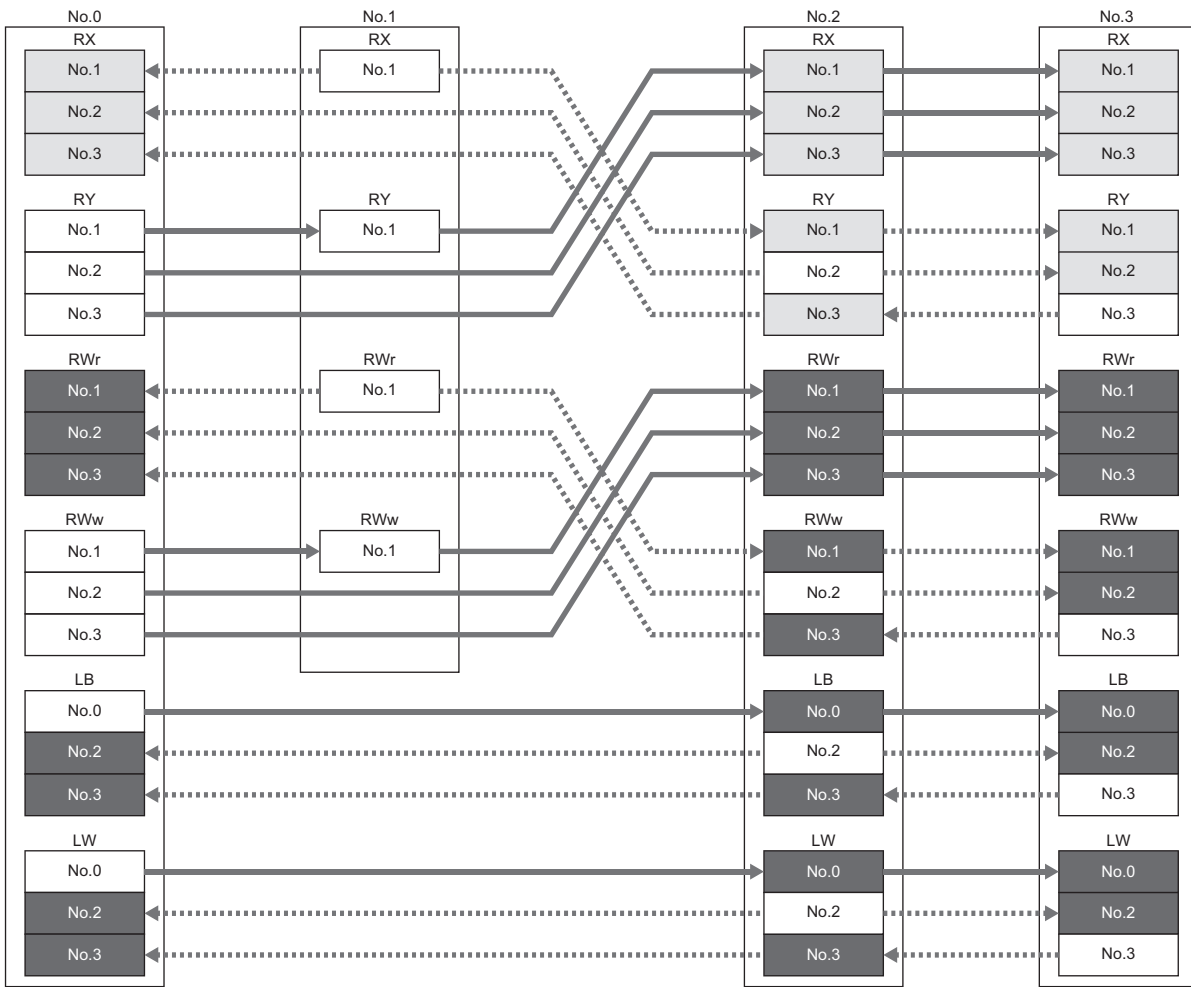

# Input data hold/clear operation from the data link faulty station

The following shows the devices where "Data Link Error Station Setting" is enabled when each station becomes faulty.

## ■ Unicast mode

## ■ Multicast mode

- : Devices that are held or cleared according to the parameter setting
- : Devices that are held regardless of the parameter setting

## Remote device test (RJ71GN11-T2 only)

The output of the remote station can be turned on or off when the CPU module is in STOP state.

Ordinarily, the output of the remote station with the output HOLD/CLEAR setting function cannot be turned on or off. In that case, use the remote device test function.

When checking the connection between the remote station and the external device by turning the remote output on or off, the connection can be checked during CPU STOP (without using a program) if the remote device test is used.

For the output HOLD/CLEAR setting function, refer to the following.

 Manual for the remote station used

### Restriction

Before using this function, check the firmware version of the RJ71GN11. ( Page 350 Added and Enhanced Functions)

### Output hold/clear setting during CPU STOP

The following shows the current value of RY when "Output Hold/Clear Setting during CPU STOP" is set to "Clear".

- When the remote device test is disabled ('Remote device forced output request' (SB0016) is off): The current value of RY is cleared.
- When the remote device test is enabled ('Remote device forced output request' (SB0016) is on): The current value of RY is output and can be checked.

### Output value in the remote station when the remote device test is enabled

The following table lists outputs in the remote station according to the operating status of the CPU module.

| Operating status of the CPU module on the master station | Output Hold/Clear Setting during CPU STOP of the CPU module on the master station | Setting of the output HOLD/CLEAR setting function on the remote station | Remote station output <sup>*1</sup> |
|--|---|---|-------------------------------------|
| RUN or PAUSE   | Hold  | Hold  | Current value of RY                 |
|  |   | Clear   |                                     |
|  | Clear   | Hold  |                                     |
|  |   | Clear   |                                     |
| RUN→STOP   | Hold  | Hold  |                                     |
|  |   | Clear   |                                     |
|  | Clear   | Hold  |                                     |
|  |   | Clear   |                                     |
| When a stop error occurs                                 | Hold  | Hold  | Fixed to the value prior to STOP    |
|  |   | Clear   | Fixed to 0                          |
|  | Clear   | Hold  | Fixed to the value prior to STOP    |
|  |   | Clear   | Fixed to 0                          |

\*1 The output of the remote station is R<sub>W</sub> for the CC-Link IE TSN digital-analog converter module. R<sub>W</sub> is also not fixed to 0, but output with an offset value.

### Setting method

Execute the remote device test according to the following procedure.

1. Set the RUN/STOP/RESET switch to the STOP position of the CPU module.
2. Turn off and on the 'Remote device forced output request' (SB0016) to start the remote device test.
3. Check that the 'Remote device forced output request accept' (SB0086) and 'Remote device forced output status' (SB0087) are on. (In addition, check that the 'Remote device forced output result' (SW025A) is 0 (no error).)
4. Check by turning on or off the output of the remote station.
5. Turn on and off the 'Remote device forced output request' (SB0016) to end the remote device test.

---

After starting the remote device test, errors can be checked by the 'Remote device forced output result' (SW025A).

If an error has occurred, the error code is stored. Take actions according to the error code. ( Page 226 List of Error Codes)

When this function is used for the RJ71GN11-T2 with a firmware version earlier than "10", the value stored in 'Remote device forced output result' (SW025A) is 0.

---

## Precautions

### ■ Conditions

- The remote device test does not start even if the 'Remote device forced output request' (SB0016) is turned off and on while the CPU module is in RUN or PAUSE state.
- Even if the CPU module is changed to STOP state after the 'Remote device forced output request' (SB0016) is turned off and on, the remote device test does not start.
- If the CPU module is changed to RUN or PAUSE state during the remote device test, the remote device test ends.

### ■ Output HOLD/CLEAR setting function

- During the remote device test, the output HOLD/CLEAR setting function of the remote station is disabled, and the output of the remote station is turned on or off by the master station. The output HOLD/CLEAR setting function is also disabled for all remote stations including the remote station whose output is to be turned on or off.
- If a stop error occurs in the CPU module during the remote device test, the test ends and the data is output from the remote station according to the output HOLD/CLEAR setting function.

## CANopen communications (RJ71GN11-T2 only)

CANopen communications are used for controlling a device that supports the CANopen profile.

CANopen communications have SDO communication using transient transmission and PDO communication using cyclic transmission for devices that support the CANopen profile. SDO communication is performed using the SLMPSND instruction. For details on the SLMPSND instruction, refer to the following.

📖 MELSEC iQ-R Programming Manual (Module Dedicated Instructions)

Parameters for PDO communications are defined by the PDO mapping and the settings are specified in "Batch Setting of PDO Mapping" or "PDO Mapping Setting".

- (1) Engineering tool
- (2) HMI (Human Machine Interface)
- (3) RJ71GN11
- (4) Servo amplifier
- ① Writing PDO mapping settings
- ② PDO communications

### Restriction

Before using this function, check the firmware version of the RJ71GN11. (📖 Page 350 Added and Enhanced Functions)

If the firmware version does not support CANopen communications, a network parameter error (error code: 2221H) or Initialization failure (event code: 00C54) occurs and data link cannot be performed.

## Setting method

Set the parameter of "Batch Setting of PDO Mapping" or "PDO Mapping Setting" in the "CC-Link IE TSN Configuration" window. (📖 Page 146 PDO mapping setting (RJ71GN11-T2 only))

## Precautions

### ■Motion control station

Do not set a device station as the motion control station. Doing so results in Parameter error (motion control station setting) (error code: D64EH).

### ■PDO mapping setting

When a servo amplifier is added to the device station in the "CC-Link IE TSN Configuration" window, set the parameter of "PDO Mapping Setting".

### ■Multi-axis servo amplifier

For a multi-axis servo amplifier, single module can use up to eight axes.

## 1.2 Transient Transmission

Transient transmission is used for communications at any timing and has the following three types.

☞ Page 58 Communications using a dedicated instruction

☞ Page 58 Communications using the SLMP

☞ Page 59 Communications using the engineering tool

### Communications using a dedicated instruction

Data is read/written from the master station or local station to devices in a CPU module of the local station or the buffer memory areas of a remote station using the dedicated instructions.

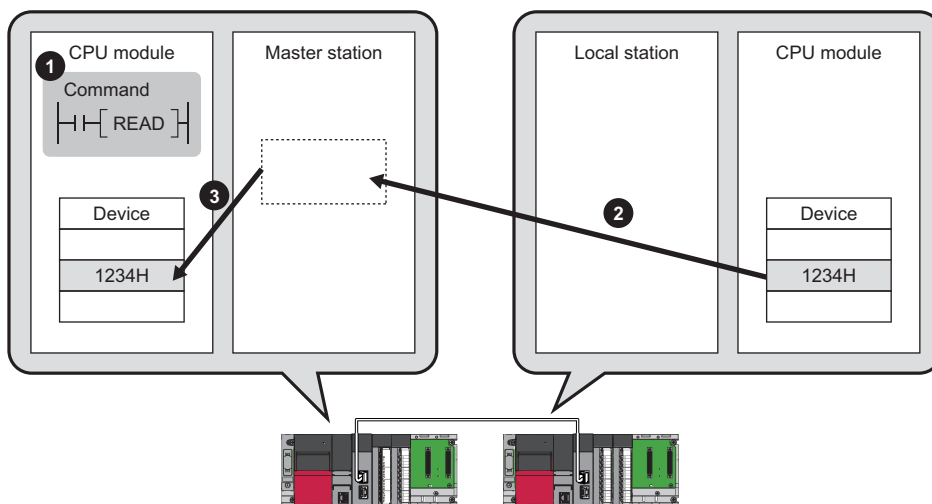

For dedicated instructions that can be used and details on dedicated instructions, refer to the following.

☞ Page 314 Dedicated Instruction

📖 MELSEC iQ-R Programming Manual (Module Dedicated Instructions)

**Ex.**

Accessing a local station using the dedicated instruction (READ instruction)

### Communications using the SLMP

Data is read/written from the RJ71GN11 and the external device such as a personal computer or HMI (Human Machine Interface) to devices in the CPU module of the master station and local station and the buffer memory areas of the remote station via an SLMP.

This function allows seamless communications with stations on different types networks.

The RJ71GN11 sends and receives (1), and relays (2) SLMP messages. For details on an SLMP, refer to the following.

📖 SLMP Reference Manual

#### Precautions

For SLMP communications, set the same communication speed for the connected station and access destination. When different communication speeds are set for the connected station and access destination, SLMP communication may not be possible.

## Communications using the engineering tool

This type of communications are used to configure the settings of or monitor each station using the engineering tool. It allows seamless communications with stations on different types networks.

### Point

Communications can be made with stations up to eight networks apart (number of relay stations: 7).

### When the networks consist of only MELSEC iQ-R series

Communication paths are automatically set for communications with the following networks of MELSEC iQ-R series.

- Ethernet
- CC-Link IE TSN
- CC-Link IE Controller Network
- CC-Link IE Field Network

#### ■Setting method

Check that "Dynamic Routing" in "Application Settings" is set to "Enable".

### Point

- Communication paths are automatically set, but they can also be manually set. (☞ Page 59 When the networks consist of MELSEC iQ-R series and other series)
- The communication path cannot be set automatically for Ethernet-equipped modules connected via a router. Set the communication path manually. (☞ Page 59 When the networks consist of MELSEC iQ-R series and other series)

### When the networks consist of MELSEC iQ-R series and other series

Setting communication paths allow communications with the following networks configured with modules other than MELSEC iQ-R series.

- Ethernet
- CC-Link IE Controller Network
- CC-Link IE Field Network
- MELSECNET/H
- MELSECNET/10

#### ■Setting method

Set communication paths in "Routing Setting" of "CPU Parameter". (📖 MELSEC iQ-R CPU Module User's Manual (Application))

## Communication test

This test checks if transient transmission data can be properly routed from the own station to the communication target. (  Page 201 Communication Test)

# 1.3 Ethernet Connection (RJ71GN11-T2 Only)

This type of connection allows one module to be connected to an Ethernet device without interfering with CC-Link IE TSN.

## Connection with MELSOFT products and a GOT

Programming and monitoring of the programmable controller using the engineering tool, and monitoring and testing of the programmable controller from the GOT are performed via Ethernet. This function enables remote control using long-distance connectivity and high-speed communications via Ethernet.

This section describes the methods of connecting the RJ71GN11 to MELSOFT products (such as engineering tool and MX Component) and a GOT.

○: Connection available, ×: Connection not available

| Connection method  | Purpose                                       | Availability    |     | Reference                     |
|--|---|-----------------|-----|-------------------------------|
|  |   | MELSOFT product | GOT |                               |
| Connection via HUB<br>(Connection by specifying the IP address)                        | To connect multiple MELSOFT products          | ○               | ×   | Page 61<br>Connection via HUB |
| Connection via HUB<br>(Connection by specifying the network number and station number) | To connect multiple MELSOFT products and GOTs | ○               | ○   |                               |

### Point

For the procedures to connect the RJ71GN11 and a GOT, refer to the following.

 Manual for the GOT used

### Restriction

- The station with a communication speed different from the station connected to the engineering tool cannot be connected by specifying other station. The online and debug function of the engineering tool may not be used.
- When a MELSOFT product or GOT is connected via the RJ71GN11, a connection cannot be established if another RJ71GN11 to which the same network number is set is mounted on the same base unit (main base unit and extension base unit) as the RJ71GN11 used for the connection.

## Connection to use

The system dedicated connection used is a MELSOFT communications port (UDP/IP) or a MELSOFT communications port (TCP/IP).

For the port number used and the number of simultaneous open connections (maximum number of connections), refer to the following.

- Port number:  Page 348 Port Number
- Number of simultaneous open connections (maximum number of connections):  MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

## Connection via HUB

### ■ Settings on the RJ71GN11 side

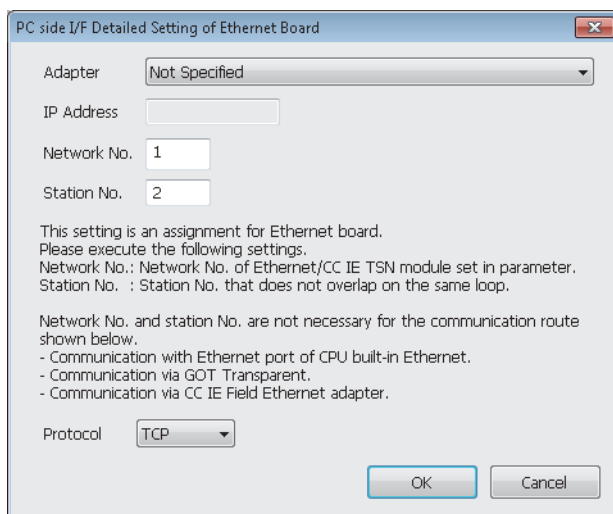

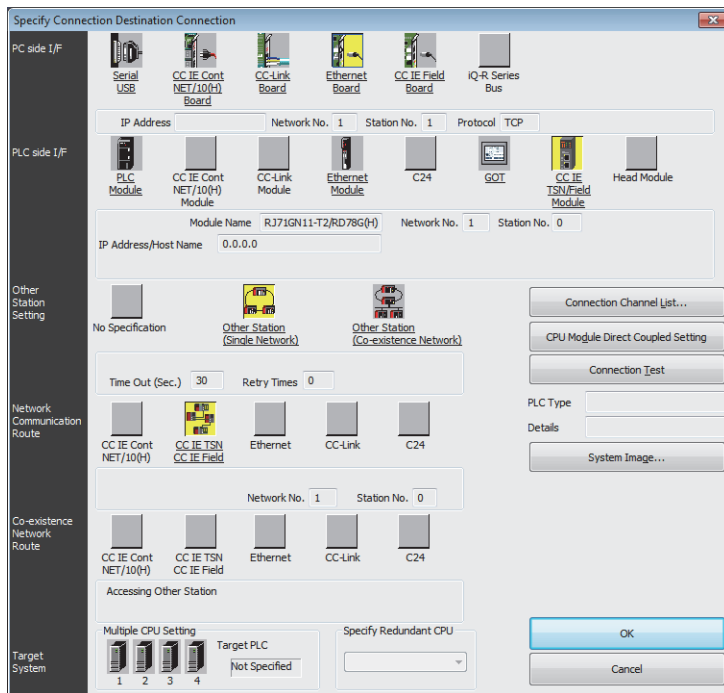

- For connection by specifying the IP address, set the IP address using "Required Settings". ( Page 112 Station No./IP Address Setting)
- For connection by specifying the network number and station number, set the network number and station number in "Required Settings".

Neither of the connections require the settings in the "CC-Link IE TSN Configuration" window.

## ■ Settings on the engineering tool side

Set in the "Specify Connection Destination Connection" window.

 [Online] ⇔ [Current Connection Destination]

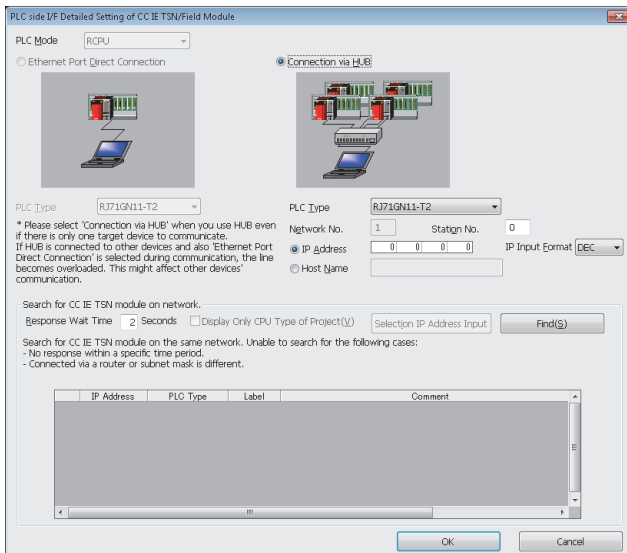

1. Set "PC side I/F" to "Ethernet Board".
2. Double-click "Ethernet Board", and open the "PC side I/F Detailed Setting of Ethernet Board" window.
3. Set the network number, station number, and protocol of the personal computer.

TCP: A connection is established during communication.

Since data is exchanged while checking that the data has correctly reached the communication destination, the data reliability can be ensured. Note that the line load is larger than UDP/IP communications.

UDP: Since a connection is not established during communication and whether the communication destination has correctly received the data is not checked, the line load is lower. Note that the data reliability is lower than TCP/IP communications.

4. Set the "PLC side I/F" to the module to be connected.

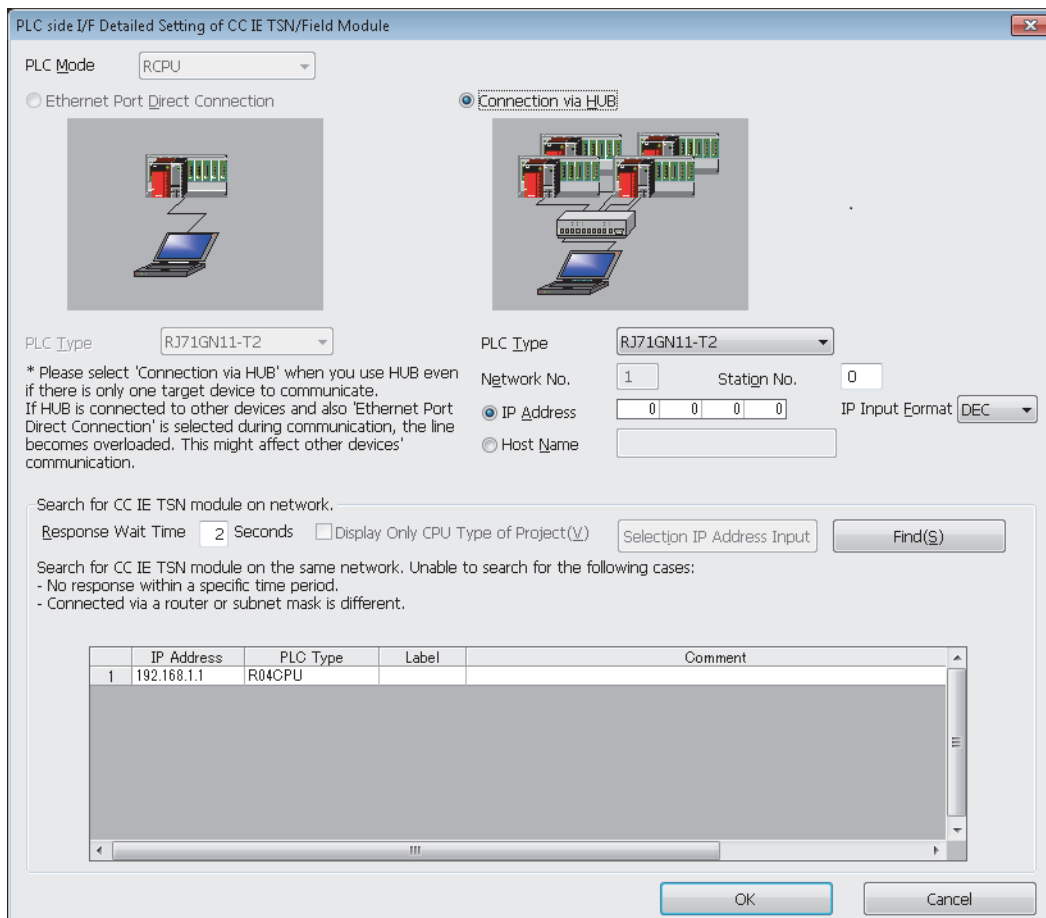

5. Double-click the icon set in step 4, and open the "PLC side I/F Detailed Setting of CC IE TSN/Field Module" window.
6. Select "Connection via HUB" for the connection method, and enter the station number and IP address or host name of the RJ71GN11.
7. Specify "Other Station Setting" or "Network Communication Route" if necessary.

# Searching modules on the network

Search for RJ71GN11 control CPUs on the same network.

For a connection using an industrial switch, a list of modules that can be searched for will appear by clicking the "Search" button on the "PLC side I/F Detailed Setting of CC IE TSN/Field Module" window.

Search target modules are as follows.

- The control CPU of the RJ71GN11 connected to the same industrial switch as the engineering tool
- The control CPU of the RJ71GN11 connected to a cascade-connected industrial switch

## Precautions

If the connected RJ71GN11 does not appear in the list after searching the modules on the network, check the following items.

- Search cannot be performed if it is disabled with the IP filter.
- Modules connected via a router cannot be searched.
- If modules with the same IP address are listed, correct the setting of the IP address in the "CC-Link IE TSN" window of the master station.
- If the service processing load of the search-target CPU module is high, it may not be possible to search for the corresponding module. If the search cannot be performed, increase the response waiting time in the search dialog, and execute the search again.

## Connection with SLMP-compatible devices

---

This type of connection allows SLMP-compatible devices (such as a personal computer or a vision sensor) to be connected to the RJ71GN11.

For details on an SLMP, refer to the following.

 SLMP Reference Manual

### **Restriction**

---

- For SLMP communication in the structure where communication speeds of 1Gbps and 100Mbps exist, set the same communication speed for the connected station and access destination. When different communication speeds are set for the connected station and access destination, SLMP communication may not be possible.
  - When the system structure is mixed with an Ethernet device, there are restrictions for the network topology and connection destination of the Ethernet device. ( MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))
-

# 1.4 Security

This function ensures security according to the network environment by restricting access for each communication path to the CPU module. The following two access restriction methods can be used.

☞ Page 66 IP filter

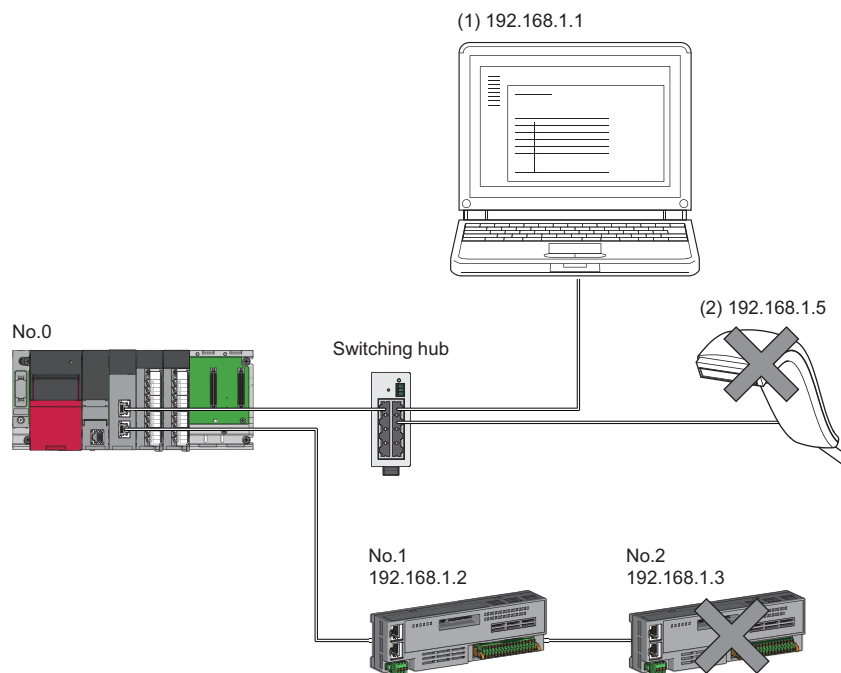

☞ Page 69 Remote password

## IP filter

This function identifies the IP address of the access source, and prevents unauthorized access.

By setting the IP address of the access source using the engineering tool, IP packets are allowed or blocked. (The IP packets received from the access source are allowed or blocked. IP packets sent from the own station are ignored.)

Use of this function is recommended when using in an environment connected to a LAN line.

When the "Allow" IP addresses are set to 192.168.1.1 and 192.168.1.2 using the IP filter of the master station No.0:

Only the Ethernet device (1) and device station No.1 can access the master station, and the Ethernet device (2) and device station No.2 cannot access the master station.

This function cannot be used when accessing via a network other than Ethernet or CC-Link IE TSN.

---

The IP filter is one method of preventing unauthorized access (such as a program or data destruction) from an external device. It does not completely prevent unauthorized access. To maintain the security (confidentiality, integrity, and availability) of the programmable controller and the system against unauthorized access, denial-of-service (DoS) attacks, computer viruses, and other cyberattacks from external devices, take appropriate measures such as firewalls, virtual private networks (VPNs), and antivirus solutions.

Our company is not responsible for any problems that occur in the programmable controller and system due to a DoS attack, unauthorized access, computer virus, or other cyberattacks.

Examples of measures for unauthorized access are given below.

- Install a firewall or VPN.
  - Install a personal computer as a relay station, and control the relay of send/receive data with an application program
  - Install an external device for which the access rights can be controlled as a relay station (Contact the network service provider or equipment dealer for details on the external devices for which access rights can be controlled.)
-

## Setting method

1. Set the IP address to be allowed or blocked in the "IP Filter Settings" window of "Security" under "Application Settings".  
([Page 127 Security](#)) A warning is displayed in the following cases.
  - When blocking the IP address of the device station set in the "CC-Link IE TSN Configuration" window was attempted
  - When a device station is not set in the "CC-Link IE TSN Configuration" window, and "IP Address" allowed to access is not set in the "IP Filter Settings" window (because the IP filter blocks every IP address)
2. Write the module parameters to the CPU module.
3. The IP filter is enabled when power is turned off and on or the CPU module is reset.

### Point

Even if the connection was specified in the "CC-Link IE TSN Configuration" window or by a program, access from the external device is either allowed or blocked according to the setting in the "IP Filter Settings" window.

## Setting target

Allow or block should be set to all IP addresses that connect to the same network. Also, set allow or block to the IP address of the device station that is registered in the "CC-Link IE TSN Configuration" window.

Register the setting details to the master station or the local station, and allow or block the IP packets received from the device station of the registered IP address.

## Operation

Even for the device station registered in the "CC-Link IE TSN Configuration" window, a station with an IP address set as blocked can become a disconnected station. As a result, cyclic transmission and transient transmission are not performed. Such a station is also displayed as a disconnected station on the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window. However, Ethernet devices are not displayed on the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window. ([Page 189 CC-Link IE TSN/CC-Link IE Field Diagnostics](#))

When an IP packet is received from an IP address that is set as blocked, the denial is registered in the event history.  
([Page 260 Event List](#))

## Precautions

- Do not set the IP addresses of the master station or device stations as blocked. When a device station using line topology is set as blocked, cyclic and transient transmissions cannot be performed on the device stations that are connected after the device station is set as blocked.

When the "Deny" IP address is set to 192.168.1.2 using the IP filter of the master station No.0:

Only device station No.1 can access the master station, and device station No.2 and device station No.3 cannot access the master station.

- If there is a proxy server in the LAN line, block the IP address for the proxy server. If the IP address is allowed, it will not be possible to prevent access from personal computers that access the proxy server.
- To block access from an external device to another station, block access to the connected station (station connected directly to an external device) by using the IP filter.

## Remote password

This function permits or prohibits access from the external device to the CPU module via the RJ71GN11. This prevents unauthorized access to the CPU module from a remote location.

### Restriction

A C Controller module and a MELSECWinCPU module cannot use this function.

### Point

The remote password is one method of preventing unauthorized access (such as program or data destruction) from an external device. It does not completely prevent unauthorized access. To maintain the security (confidentiality, integrity, and availability) of the programmable controller and the system against unauthorized access, denial-of-service (DoS) attacks, computer viruses, and other cyberattacks from external devices, take appropriate measures such as firewalls, virtual private networks (VPNs), and antivirus solutions.

Our company is not responsible for any problems that occur in the programmable controller and system due to a DoS attack, unauthorized access, computer virus, or other cyberattacks.

Examples of measures for unauthorized access are given below.

- Install a firewall or VPN.
- Install a personal computer as a relay station, and control the relay of send/receive data with an application program
- Install an external device for which the access rights can be controlled as a relay station (Contact the network service provider or equipment dealer for details on the external devices for which access rights can be controlled.)

## Number of settable modules

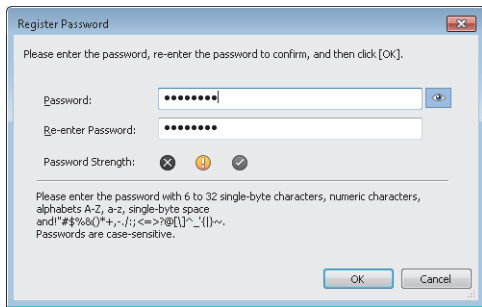

Up to eight modules can be set for remote passwords.

When using the multiple CPU system configuration, up to eight modules can be set for each CPU module.

## Setting method

Set on the "Remote Password Setting" window.

[Navigation window] ⇒ [Parameter] ⇒ [Remote Password]

Register Password

Please enter the password, re-enter the password to confirm, and then click [OK].

Password: [password field]

Re-enter Password: [password field]

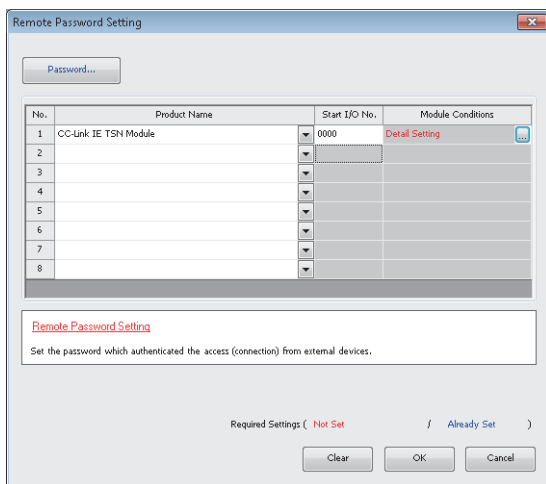

Password Strength: [Progress indicator]

Please enter the password with 6 to 32 single-byte characters, numeric characters, alphabets A-Z, a-z, single-byte space and !"#%&'()\*+,-./:;<=>?@[ ]^\_`{|}~. Passwords are case-sensitive.

[OK] [Cancel]

1. Click the [Password] button, and register the remote password on the "Register Password" window.

[Password] button

Remote Password Setting

Password...

| No. | Product Name          | Start I/O No. | Module Conditions |
|-----|-----------------------|---------------|-------------------|

Remote Password Setting

Set the password which authenticated the access (connection) from external devices.

Required Settings ( Not Set / Already Set )

[Clear] [OK] [Cancel]

2. Select the module for which the remote password is to be applied, and set the start I/O number.

Remote Password Detail Setting

Select the connection to enable.

System Connection Valid Setting

Port 1Enable All  Port 2Enable All

Connection

- Port 1 : Auto-open UDP Port
- Port 1 : MELSOFT Transmission Port (TCP/IP)
- Port 1 : MELSOFT Transmission Port (UDP/IP)
- Port 1 : SLMP Transmission Port (TCP/IP)
- Port 1 : SLMP Transmission Port (UDP/IP)

Auto-open UDP Port, MELSOFT Transmission Port (TCP/IP), MELSOFT Transmission Port (UDP/IP), SLMP Transmission Port (TCP/IP), SLMP Transmission Port (UDP/IP): If the remote password of the port is enabled, the existence confirmation function will be valid automatically.

MELSOFT Transmission Port (UDP/IP), SLMP Transmission Port (UDP/IP): Dedicated Instruction, CC-Link IE TSN, CC-Link IE Field, CC-Link IE Controller, MNET/10(-) relay transmission port are also the target of this operation. When remote password is enabled, unable to use relay function.

[OK] [Cancel]

3. Set the target connection on the "Remote Password Detail Setting" window.

"Detail Setting" for the target module

4. Write the remote password to the CPU module.
5. The remote password is enabled when the CPU module is reset or powered off and on.

## ■PING

This function uses the PING command to perform an alive check of external devices whose access is permitted in UDP communications. Therefore, if external devices do not respond to PING, Alive check error (event code: 00906) occurs. When this function is used for UDP communications, check if the security setting of external devices (such as a firewall) is set to respond to PING.

## Access permitted/prohibited processing operation

This section describes the processing for permitting or prohibiting access of the CPU module with remote password by the external device.

### ■Access permit processing (Unlock processing)

The external device trying to communicate unlocks the remote password set for the connected RJ71GN11.

If the password is not unlocked, the RJ71GN11 to which the external device is connected prohibits access, so an error occurs in the external device.

The unlocking methods are shown below.

- SLMP dedicated command (Remote Password Unlock)
- Input password from engineering tool

### ■Access processing

Access to the specified station is possible when the remote password is correctly unlocked. Execute any access.

### ■Access prohibit processing (Lock processing)

When access to the specified station ends, lock the remote password from the external device to disable subsequent access.

The locking methods are shown below.

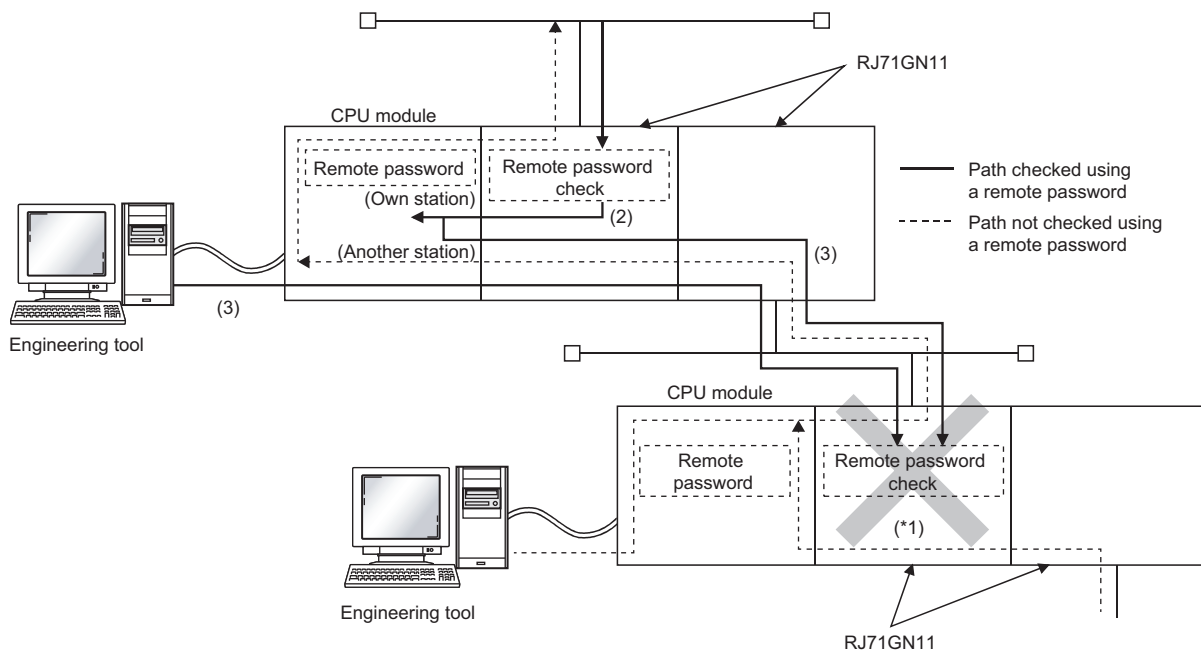

- SLMP dedicated command (Remote Password Lock)
- Lock with engineering tool (executed automatically)

## Remote password check operation

### ■Communications that are checked

The RJ71GN11 checks the remote password for a communication request made to the own station or another station received from the external device.

When checking a remote password for modules with multiple connections, the connection for which the remote password is set is the target.

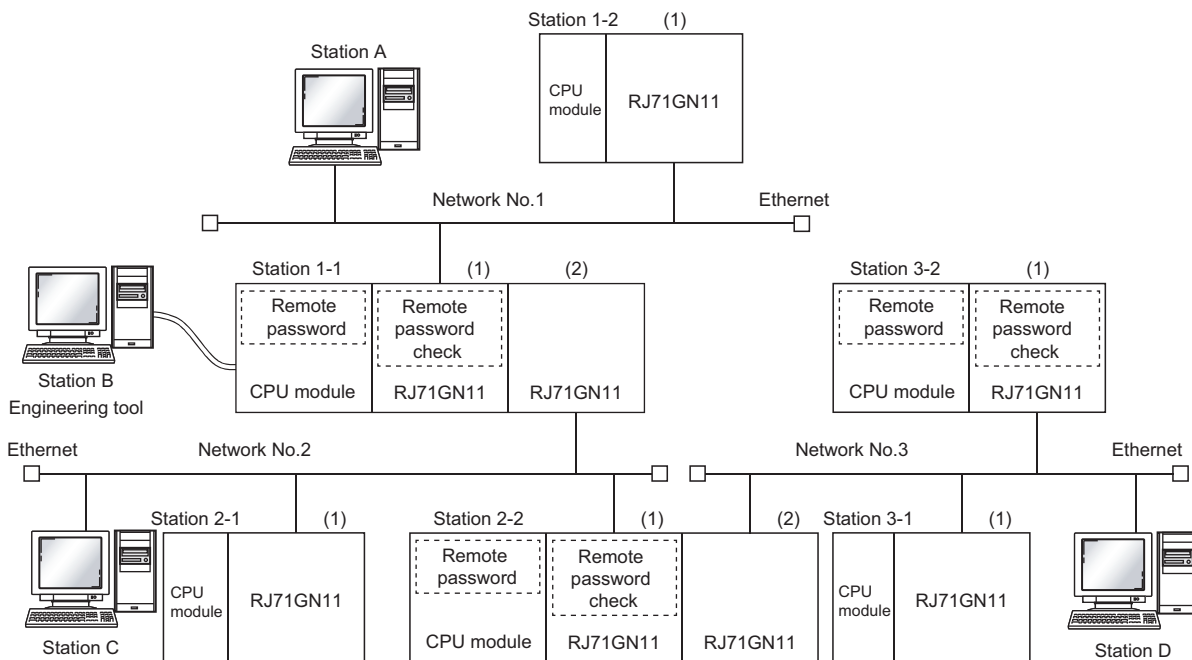

\*1 Since the remote password check is set, the communication request from the external device is not accepted. If the remote password check is not set, the communication request can be accepted and data communication from the external device can be performed.

## ■ Accessible station

The station accessible from the external device when a remote password is set for the CPU module and the station that can unlock/lock the remote password are limited to those in the same network number.

The following figure shows an example of when the remote password is set for multiple stations in the system.

Ex.

The password can be unlocked and locked by the following external devices.

- 1-1 station (1): A station only
- 2-2 station (1): C station only
- 3-2 station (1): D station only

The A station can access the ○ station after the remote password for 1-1 station (1) is unlocked. The △ station can be accessed if the communication line is open.

The B station can access the △ station if the communication line is open.

The C station can access the ○ station after the remote password for 2-2 station (1) is unlocked. The △ station can be accessed if the communication line is open.

The D station can access the ○ station after the remote password for 3-2 station (1) is unlocked. The △ station can be accessed if the communication line is open.

○: Station accessible from external device after remote password is unlocked

△: Station accessible from external device even if remote password is not unlocked

×: Station that cannot be accessed from external device

| External device<br>(Request source) | Target programmable controller (request destination) |                 |                 |                 |                 |                 |
|-------------------------------------|--|-----------------|-----------------|-----------------|-----------------|-----------------|
|                                     | 1-1 station CPU                                      | 1-2 station CPU | 2-1 station CPU | 2-2 station CPU | 3-1 station CPU | 3-2 station CPU |
| A station                           | ○  | △               | ○               | ×               | ×               | ×               |
| B station                           | △  | △               | △               | ×               | ×               | ×               |
| C station                           | △  | △               | △               | ○               | ○               | ×               |
| D station                           | △  | △               | △               | △               | △               | ○               |

## Precautions

The following section describes the precautions for using remote password.

### ■Set connection

Set the remote password for the connection used for data communication with an external device that can execute the unlock/lock processing.

#### ■When remote password is set for UDP/IP connection

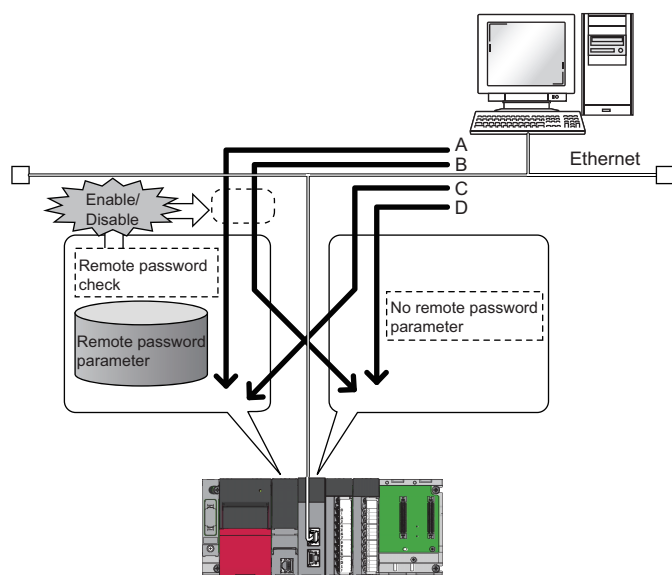

- Determine the external device to communicate with and perform data communication. (With UDP/IP, after the remote password is unlocked, data can be exchanged with devices other than the unlocked external device too. Determine the communication destination before starting use.)
- Always lock the remote password after data communication is finished. (If the remote password is not locked, the unlocked state is held until timeout occurs.)

#### ■TCP/IP close processing

If the TCP/IP is closed before the TCP/IP is locked, the CPU module will automatically start the lock processing.

#### ■Remote password valid range

The remote password is valid only for access from the RJ71GN11 for which the parameters are set. When using multiple CPU modules in a multiple CPU system, set a remote password for each CPU module for requiring a remote password.

The remote password is checked when accessing with path A or B.

The remote password is not checked when accessing with path C or D.

#### ■Accessing the programmable controller of another station

When the external device is accessing another station's programmable controller via the RJ71GN11, it may not be possible to access the programmable controller if a remote password is set for the CPU module at the relay station or station to be accessed.

# 1.5 RAS

---

RAS stands for Reliability, Availability, and Serviceability. This function improves overall usability of automated equipment.

## Device station disconnection

---

Data link of the station where an error occurred is stopped, and the data link continues only for stations that are operating normally.

## Automatic return

---

The data link is automatically restarted when the device station that was disconnected due to an error becomes normal again.

### Precautions

- When removing a device station while the system is operating, check that the device station is either performing cyclic transmission or is disconnected.
- When removing the RJ71GN11, check that the D LINK LED is either on or off.

# Loopback Function

This function continues data link with normal stations even if a cable disconnection or faulty station occurs in a ring topology network configuration. All stations after the cable disconnection point or faulty station are disconnected in a line topology. By using this function with ring topology, data link continues with normal stations.

## Restriction

Before using this function, check the firmware version of the RJ71GN11. (☞ Page 350 Added and Enhanced Functions)

## Cable disconnection

### Ring topology

Even if a cable disconnection occurs, the system automatically performs a loopback to continue the data link.

### Line topology

Stations connected after the cable disconnection point are disconnected.

## Occurrence of faulty stations

### Ring topology

The system disconnects faulty stations and automatically performs a loopback to continue the data link.

### Line topology

Stations connected after the faulty station are disconnected.

## Setting method

1. Configure the network in ring topology.
2. Set "Network Topology" to "Ring" in "Basic Settings" of the master station.

## Parameter setting and network configuration operation

| Network topology setting<br>(  Page 118 Network Topology) | Actual connection status   |  |  |
|--|--|--|--|
|  | Ring topology  | Line topology  | Star topology or coexistence of line and star topologies   |
| Ring topology  | Normal operation   | Start cyclic transmission. <ul style="list-style-type: none"> <li>• For the RJ71GN11-T2, the LED indicator of the link-down port in the loopback station, the SD/RD LED is turned off and the L ER LED is turned on.</li> <li>• For the RJ71GN11-SX, the LED indicator of the link-down port in the loopback station, the SD/RD LED is turned off and the L ERR LED is turned on.</li> <li>• 'Loopback status' (SB0065) turns on in the master station.</li> <li>• The station number of the loopback station is stored in 'Loopback station number 1' (SW0070) and 'Loopback station number 2' (SW0071).</li> <li>• In the network map of the CC-Link IE TSN/CC-Link IE Field diagnostics, the topology is displayed as line topology.</li> </ul> | Data link error <ul style="list-style-type: none"> <li>• The ERR LED on the master station turns on.</li> <li>• "60H: Illegal ring connection (master station only)" is stored in 'Cause of data link stop' (SW0049).</li> </ul> |
| Line/Star  | Data link error <ul style="list-style-type: none"> <li>• The ERR LED on the master station turns on.</li> <li>• "60H: Illegal ring connection (master station only)" is stored in 'Cause of data link stop' (SW0049).</li> </ul> | Normal operation   | Normal operation   |

### Point

If a station for which no parameters are set exists in a ring topology, the station does not perform a data link. In such a case, a loopback occurs at the adjacent station.

## Program that detects loopback station numbers (master operating station only)

By detecting loopback station numbers, a faulty station can be found. Whether loopback is being performed or not can be checked using 'Network topology setting' (SB0078) and 'Loopback status' (SB0065) of the master operating station.

**Ex.**

Program that stores loopback station numbers to 'wLoopbackStationNumber\_1' (D1000) and 'wLoopbackStationNumber\_2' (D1001)

| Classification      | Label name   | Description                           | Device     |                       |       |                       |   |                     |     |            |       |   |                          |               |            |       |   |                          |               |            |       |  |  |

|                     | Label Name   | Data Type                             | Class      | Assign (Device/Label) |       |                       |   |                     |     |            |       |   |                          |               |            |       |   |                          |               |            |       |  |  |
| 1                   | bStartCheckLoopback  | Bit                                   | VAR_GLOBAL | M1000                 |       |                       |   |                     |     |            |       |   |                          |               |            |       |   |                          |               |            |       |  |  |
| 2                   | wLoopbackStationNumber_1   | Word [Signed]                         | VAR_GLOBAL | D1000                 |       |                       |   |                     |     |            |       |   |                          |               |            |       |   |                          |               |            |       |  |  |
| 3                   | wLoopbackStationNumber_2   | Word [Signed]                         | VAR_GLOBAL | D1001                 |       |                       |   |                     |     |            |       |   |                          |               |            |       |   |                          |               |            |       |  |  |

(3) When 'Network topology setting' (SB0078) and 'Loopback status' (SB0065) are on, 'Loopback station number 1' (SW0070) and 'Loopback station number 2' (SW0071) are saved.

## Precautions

### Supported version

To use the loopback function, check that all stations support ring topology. (Page 350 Added and Enhanced Functions)

### Loopback function setting and network configuration

To use the loopback function, configure the network in ring topology and set "Network Topology" to "Ring" in "Basic Settings" of the master station. If "Network Topology" and the network configuration are inconsistent, an error may occur in all stations and data link cannot be performed.

### When a loopback occurs or a loopback is resolved

Due to the occurrence or resolution of a loopback, transient transmission may become temporarily impossible. The following shows the periods of time until transient transmission becomes possible again.

- A period of time until transient transmission becomes possible after the occurrence of a loopback: Maximum 1.1 seconds
  - A period of time until transient transmission becomes possible after the resolution of a loopback: Maximum 1.3 seconds
- Transient transmission executed at the time of the occurrence or resolution of a loopback may be completed with an error. In such a case, execute transient transmission again. For a dedicated instruction, set transient transmission so that it will not be completed with an error by increasing the number of resends or extending the monitoring time.

## ■ Loopback detection

In any of the following cases, a loopback may not be detected correctly.

- The master station has detected an overlapping IP address.
- Ring topology is incorrectly configured.
- A device station is reset.
- A device station on another network is connected.
- A device station detects Time synchronization error (event code: 00C62) or Grandmaster switching (CC-Link IE TSN device) (event code: 00C63).
- For the device station parameter automatic setting, the process is completed with an error (  Page 107 Device station parameter automatic setting (RJ71GN11-T2 only)).

If a loopback cannot be detected correctly, any of the following information may not be correctly displayed or stored.

- Icon indication in the network map of "CC-Link IE TSN/CC-Link IE Field Diagnostics"
- Indication of Loopback occurrence (event code: 00C23)
- Values of 'Loopback status' (SB0065), 'Loopback station number 1' (SW0070), and 'Loopback station number 2' (SW0071)

## Master station duplication detection

If one network has multiple master stations, an overlap is detected.

- When multiple master stations are simultaneously powered on, or when multiple master stations are simultaneously connected, Master station duplication detection (error code: 300FH) is detected in all master stations and cyclic transmission cannot be performed in all stations. (Transient transmission available)

- If another master station is added to the network during data link, Master station duplication detection (error code: 300FH) is detected in the added master station and cyclic transmission cannot be performed. (Transient transmission available)  
Other stations continue data link.

- If two networks are connected during data link, Master station duplication detection (error code: 300FH) is detected in master stations on both networks and cyclic transmission cannot be performed in all stations. (Transient transmission with IP address specification is available)

# IP address duplication detection

If one network has stations with the same IP address, an overlap is detected.

- When adding a device station, if a station with the same IP address already exists, IP address duplication detection (error code: 2160H) is detected in a station to be added and data link cannot be performed. Other stations continue data link.

## Precautions

When adding a device station, which has already been connected (linked up) with a TSN hub and the TSN hub is added to the network, an overlapping IP address is not detected in a station to be added. If IP address duplication detection (error code: 1802H) is detected in the master station, disconnect the relevant device station from the network. Otherwise, multiple stations with the same IP address will exist on the same network, possibly leading to transient transmission being sent to an unintended station.

- If the startup processing of cyclic transmission is executed by powering off and on the master station, when a station with the same IP address is in the network, IP address duplication detection (error code: 1802H) is detected in the master station. The master station where the error was detected performs cyclic transmission with the device station that joined the network among the duplicate stations.

- During cyclic transmission, overlapping IP addresses of device stations are regularly checked in the master station. When there are overlapping IP addresses, IP address duplication detection (error code: 1802H) is detected in the master station and cyclic transmission cannot be performed with the relevant device station. Other stations continue data link.

## Restriction

- An overlapping IP address between an Ethernet device and a CC-Link IE TSN device, and an overlapping IP address between Ethernet devices are not detected at cyclic transmission startup of the master station.
- Station number duplication is not detected.

## Methods of recovery from an overlapping IP address

If IP address duplication detection (error code: 1802H) is detected on the master station, change the IP address of the relevant station, and power off and on or reset the device station.

## Time synchronization

This function synchronizes the time of device stations with the time synchronization source (CPU module of the master station).

### Restriction

The MELSECWinCPU module cannot use this function.

## Setting method

The setting is made in Time distribution interval setting of the CPU module (Un\G1275136) and Time reflection setting to the CPU module (Un\G1275137). (☞ Page 284 Time synchronization)

Set the same time zone and daylight savings time to the CPU modules of the master and local stations.

### Point

When the RJ71GN11 is used as the master station, do not connect time synchronization devices whose time synchronization priority is 0 to 15.

A priority is a value that is assigned to a time synchronization device from the devices in a network to determine the grandmaster. The smaller the value, the higher the priority.

For the priority verification method and setting method, refer to the manual of the time synchronization device.

## Precautions

- If this function is used, the time setting function (SNTP client) of the Ethernet-equipped module cannot be used. (☞ MELSEC iQ-R Ethernet User's Manual (Application))
- If multiple RJ71GN11s are mounted to a CPU module on the same base unit, set time synchronization for only one RJ71GN11. If time synchronization is set for multiple, they are overwritten by the time that is synchronized later.
- When using the multiple CPU system configuration, the CPU module No.1 becomes the time synchronization source, even if the control CPU of the master station and local stations is a module other than CPU No.1.

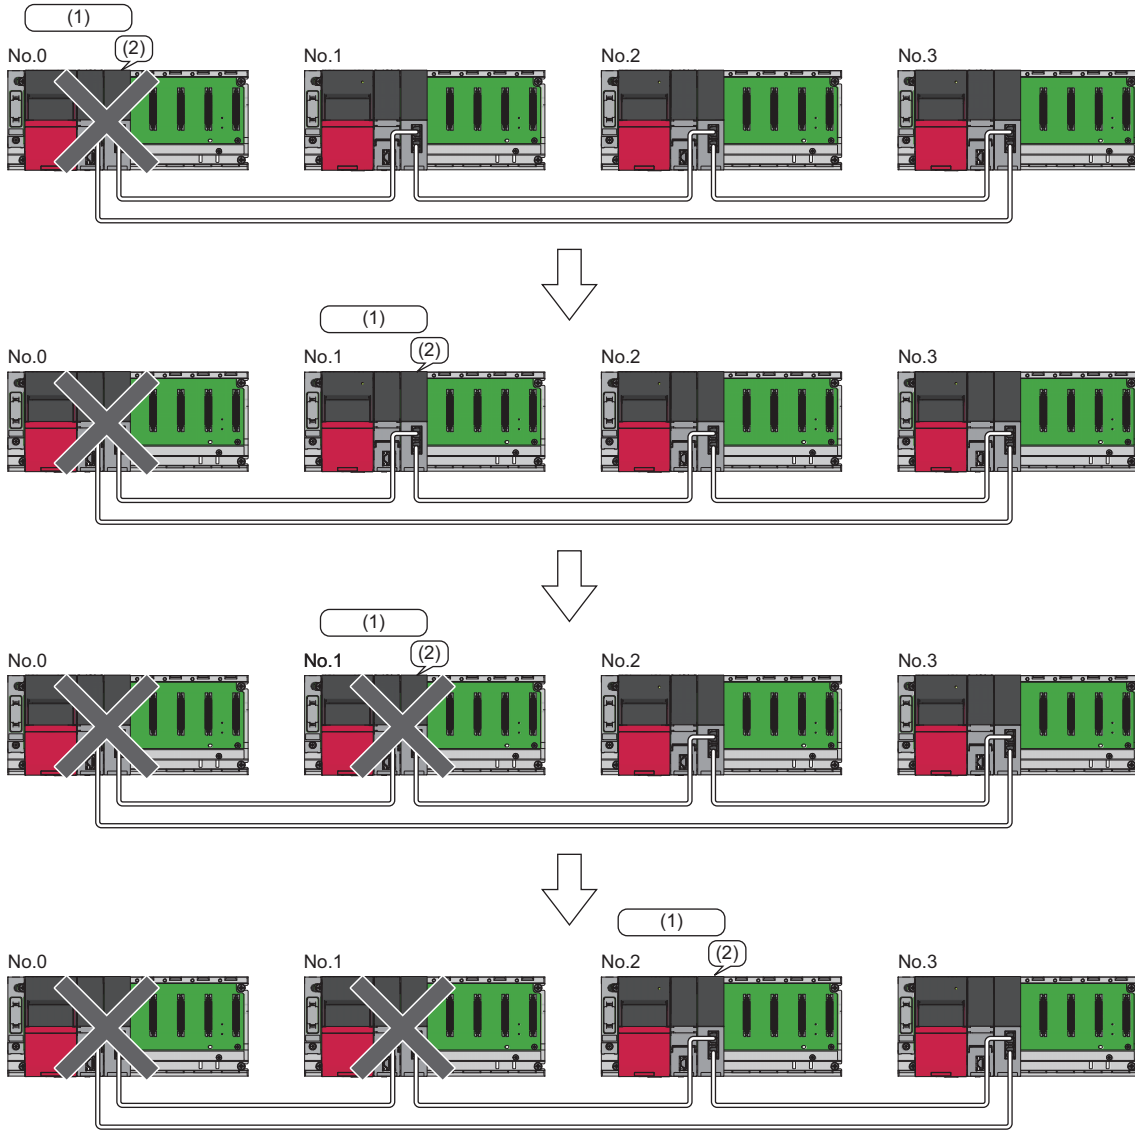

# Master station switch function (RJ71GN11-SX only)

Even if the master station is disconnected, the local station continues to control the entire network in place of the master station. This function prevents the entire network from going down due to disconnection of the master station.

**Restriction**

Before using this function, check the following.

- RJ71GN11-SX (  Page 350 Added and Enhanced Functions)
- Engineering tool: Version 1.100E or later

No.0: Master station  
 No.1, No.2, No.3: Local station  
 (1) Current master station  
 (2) Controls the entire network.

Even if the system is split into two systems due to a station going down, if there are multiple stations in the system, the local station will become the current master station and continue to control the network.

- No.0: Master station
- No.1, No.2, No.3, No.4, No.5: Local station
- (1) Current master station
- (2) Controls the entire network.
- (3) Controls the network.

## Operation upon return

### ■When a disconnected master station returns

The master station becomes the current master station. At this time, the local station continues cyclic transmission.

No.0: Master station  
No.1, No.2, No.3: Local station  
(1) Current master station  
(2) Controls the entire network.

### ■When a disconnected master station and location station return

The master station becomes the current master station. The returned local station performs data link with the master station. Other local stations continue cyclic transmission.

No.0: Master station  
No.1, No.2, No.3: Local station  
(1) Current master station  
(2) Controls the entire network.

## System configuration

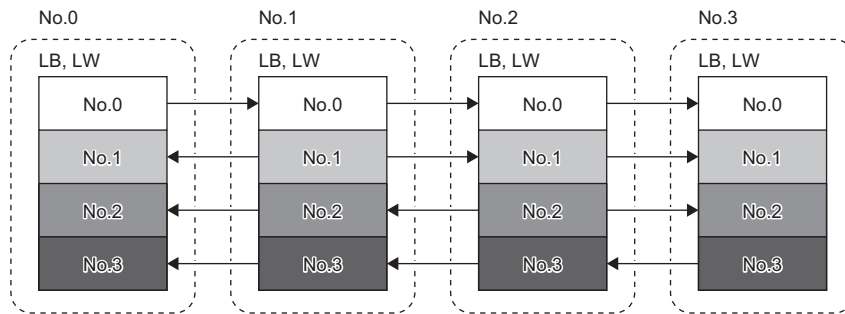

The system configuration when using this function is a ring topology of up to 120 local stations and one master station, configured in a network with a communication speed of 1Gbps. The conditions for using this function are listed below.

- Connectable devices: Devices that support the master station switch function
- Cyclic transmission: Link relay (LB), link register (LW) only
- Communication mode: Multicast mode only

## Cyclic transmission

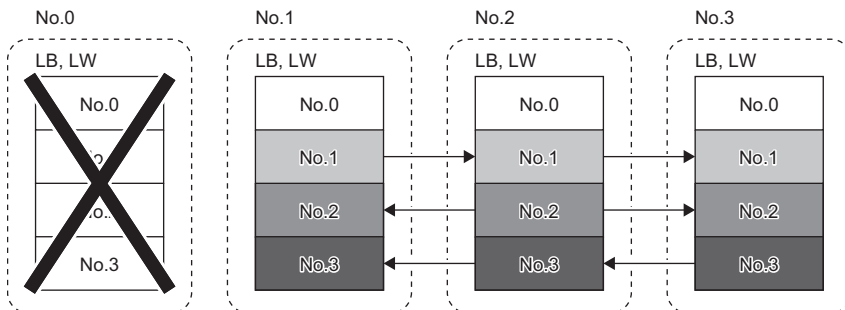

The following figure shows an example of cyclic transmission when this function is used. If the master station goes down, cyclic transmission continues between local stations.

### Normal operation

No.0: Master station  
No.1, No.2, No.3: Local station

### When the master station goes down

No.0: Master station  
No.1, No.2, No.3: Local station

## Current master station switching

Switching is performed under one of the conditions below.

| Switching condition  | Description  |
|--|--|
| When the master station is disconnected due to cable disconnection, power off, or module operation stoppage  | The local station becomes the current master station.  |
| When the local station is the current master station, and disconnection occurs due to cable disconnection, power off, or module operation stoppage in the master station | Another local station becomes the current master station. Cyclic transmission continues during switching.        |
| When the master station returns  | The returning master station becomes the current master station. Cyclic transmission continues during switching. |

## Setting method

The master station switch function is set in "Master Station Shift Setting" under "Application Settings". (  Page 131 Master Station Shift Setting (RJ71GN11-SX only))

## Precautions

- Transient transmission executed at the time of switching of the current master station or return of the master station may be completed with an error. In such a case, execute transient transmission again.
- If a parameter error occurs in the master station, switching of the current master station is not performed.
- A local station where a parameter error has occurred cannot become the current master station.
- If a CPU stop error is detected before the master station starts the data link, switching of the current master station is not performed.
- At the time of switching the current master station, the network map of the CC-Link IE TSN/CC-Link IE Field diagnostics is reconstructed. Therefore, if a station that exists in the parameter settings is disconnected at the same time as the master station, the disconnected stations are indicated with the "Disconnected Station" icon in the network map. Also, stations that do not exist in the parameter settings stop being displayed.
- When two systems resulting from splitting of a system due to a disconnection are connected to form one system, the data link on the system side where the master station is absent will temporarily stop and then restart.

- No.0: Master station  
 No.1, No.2, No.3: Local station  
 (1) Current master station  
 (2) Temporary data links stop.  
 (3) Controls the network.  
 (4) Controls the entire network.

- When two systems without a master station are connected to form one system, the data link of the system whose current master station has a larger IP address will temporarily stop and then restart.

No.1, No.2, No.3, No.4: Local station

- (1) Current master station
- (2) Temporary data links stop. (IP address of the master station < IP address of the local station (No.2))
- (3) Controls the network.
- (4) Controls the entire network.

- When two systems resulting from splitting of a system are connected to form one system due to the return of the disconnected local station, the stations in the system with the master station continue to perform data link, and the returned local station performs data link with the master station. The stations in the system without a master station temporarily stop the data link and then restart it.

- No.0: Master station  
 No.1, No.2, No.3, No.4, No.5: Local station  
 (1) Current master station  
 (2) Controls the entire network.  
 (3) Data link temporarily stops.

- If power-on occurs while CC-Link IE TSN devices other than connectable devices are connected to the network, an error occurs in all stations and data link is not performed.
- If a CC-Link IE TSN device other than a connectable device enters the network, that device will not perform data link.
- If a system with this function enabled and a system with this function disabled are connected to form a single system, duplication of master stations will occur and the network will stop. The same applies when a system where this function is enabled and the local station is the current master station and a system where this function is disabled are connected to form a single system.
- When a master station with parameters different from those of the current master station enters a system in which the local station is the current master station, the local station in the system temporarily stops data link and then restarts it with the parameters of the master station that has entered the system.
- When this function is enabled and the co-recording function is used, the co-recording trigger cannot be relayed while the master station is in a disconnected state. While the master station is disconnected, recording cannot be performed in conjunction with recording devices on the network system.
- When this function is enabled, do not connect a local station whose "Reserved/Error Invalid Station" is set to "Reserved Station" in "Network Configuration Settings" under "Basic Settings" to the network.

## Time synchronization when the master station switch function is enabled

When the master station is disconnected, the time of the CPU module on the same base unit as the local station (current master station) is distributed from the local station (current master station) to the local station. The local station (current master station) can set the interval for distributing the CPU module time using 'Time distribution interval setting of the CPU module' (Un\G1275136). (Page 284 Time synchronization)

No.0: Master station

No.1: Local station (current master station)

No.2: Local station

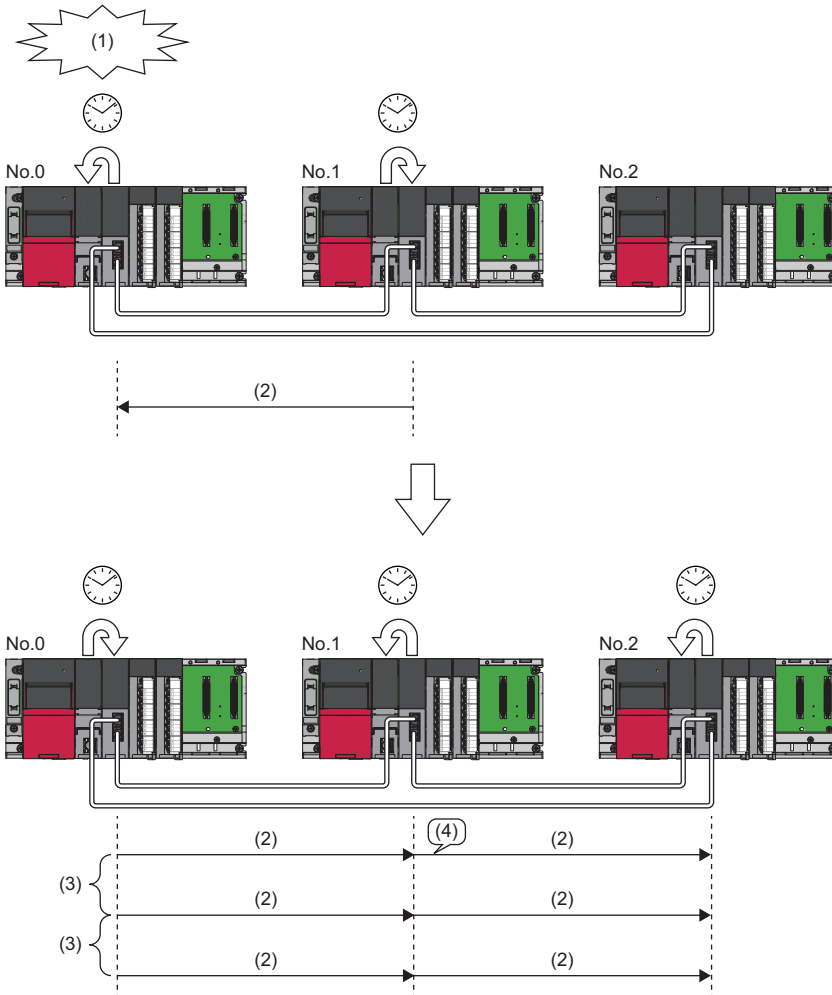

(1) Disconnection

(2) Value set in 'Time distribution interval setting of the CPU module' (Un\G1275136) of the local station (current master station)

(3) Time of the CPU module

## ■ Master station time distribution start

- When a master station with 'Master station time distribution start setting' (Un\G1275138) set to 1H returns, the master station reflects the CPU module time distributed by the local station to the CPU module on the same base unit as the master station. After that, the CPU module time is distributed at the interval set in 'Time distribution interval setting of the CPU module' (Un\G1275136). The local station that is distributing time will stop doing so when it receives the time distribution from the master station, regardless of the setting value of 'Master station time distribution start setting' (Un\G1275138).

No.0: Master station

No.1: Local station (current master station)

No.2: Local station

(1) Return

(2) Time of the CPU module

(3) Value set in 'Time distribution interval setting of the CPU module' (Un\G1275136) of the master station

(4) Stopping of time distribution from the local station

- When a master station with 'Master station time distribution start setting' (Un\G1275138) set to 0H returns, the master station does not wait for the CPU module time to be distributed from the local station, but instead distributes the CPU module time at the interval set in 'Time distribution interval setting of the CPU module' (Un\G1275136). The local station that is distributing time will stop doing so when it receives the time distribution from the master station, regardless of the setting value of 'Master station time distribution start setting' (Un\G1275138).

No.0: Master station

No.1: Local station (current master station)

No.2: Local station

(1) Return

(2) Time of the CPU module

(3) Value set in 'Time distribution interval setting of the CPU module' (Un\G1275136) of the master station

(4) Stopping of time distribution from the local station

## ■Precautions

- When 'Time distribution interval setting of the CPU module' (Un\G1275136) of the local station (current master station) is FFFFH and 'Master station time distribution start setting' (Un\G1275138) of the returning master station is 1H, the returning master station does not start time distribution. To start time distribution, set 'Master station time distribution start setting' (Un\G1275138) of the master station to 0H.
- To perform time synchronization, set 'Time reflection setting to the CPU module' (Un\G1275137) of all local stations to 1H.

# 1.6 CC-Link IE TSN Network Synchronous Communication Function (RJ71GN11-T2 Only)

This section describes the CC-Link IE TSN network synchronous communication function.

For details, refer to the following.

📖 MELSEC iQ-R Inter-Module Synchronization Function Reference Manual

## Restriction

For the firmware versions of the CPU module and RJ71GN11 compatible with the CC-Link IE TSN network synchronous communication function, refer to the following.

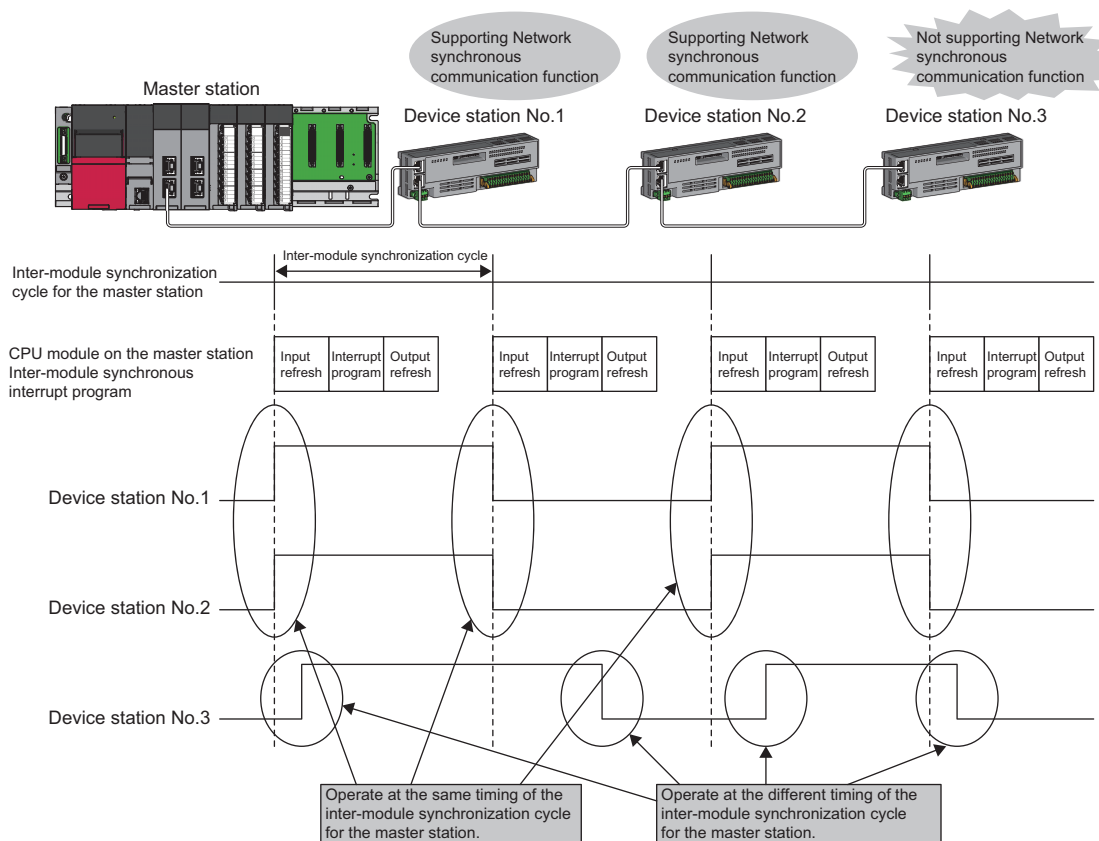

- CPU module (📖 MELSEC iQ-R CPU Module User's Manual (Application))
- RJ71GN11 (👉 Page 350 Added and Enhanced Functions)

## Overview

This function synchronizes the control cycle of a device station according to the inter-module synchronization cycle specified in the master station via CC-Link IE TSN. This adjusts the operation timing with the operation timing of other device stations connected to the same network.

## Point

The following device stations can be connected: device stations not supporting the CC-Link IE TSN network synchronous communication function and device stations in which the network synchronous communication setting is not set. However, they cannot synchronize with the inter-module synchronization cycle.

## Setting method

For the setting method, refer to the following manual.

 MELSEC iQ-R Inter-Module Synchronization Function Reference Manual

### ■Inter-module synchronization cycle

To use the CC-Link IE TSN network synchronous communication function, set the same cycle for the following two items.

- "Fixed Scan Interval Setting" under "Inter-module Synchronization Setting" in "System Parameter".
- "Communication Period Interval Setting" under "Basic Settings" of the module parameter

Set the cycle in the following range.

0.25 to 10.0ms (in units of 0.05ms)

### ■How to calculate an inter-module synchronization cycle

For the cycle to be set, set a value greater than a value obtained by one of the following formulas.

| Condition   | Calculation formula <sup>*1</sup>   |
|---|---|
| Execution time of the inter-module synchronous interrupt program (I44) > cyclic transmission time | Execution time of the inter-module synchronous interrupt program (I44) + cyclic processing time |
| Execution time of the inter-module synchronous interrupt program (I44) ≤ cyclic transmission time | Cyclic transmission time + cyclic processing time   |

\*1 For the values obtained by the calculation formulas, refer to the following.

Execution time of the inter-module synchronous interrupt program (I44) ( User's manual of the CPU module used)  
Cyclic transmission time and cyclic processing time ( Page 322 Communication cycle intervals)

## Precautions

To use the CC-Link IE TSN network synchronous communication function, do not set "Not Set" for "0.05ms Unit Setting" of "Fixed Scan Interval Setting of Inter-module Synchronization" in "System parameter".

None of the inter-module synchronization cycles 0.222ms, 0.444ms, 0.888ms, 1.777ms, 3.555ms, and 7.111ms can be used by the CC-Link IE TSN network synchronous communication function. Therefore, neither the SSCNET/H supported Simple Motion module nor Motion CPU can synchronize with the inter-module synchronization cycle.

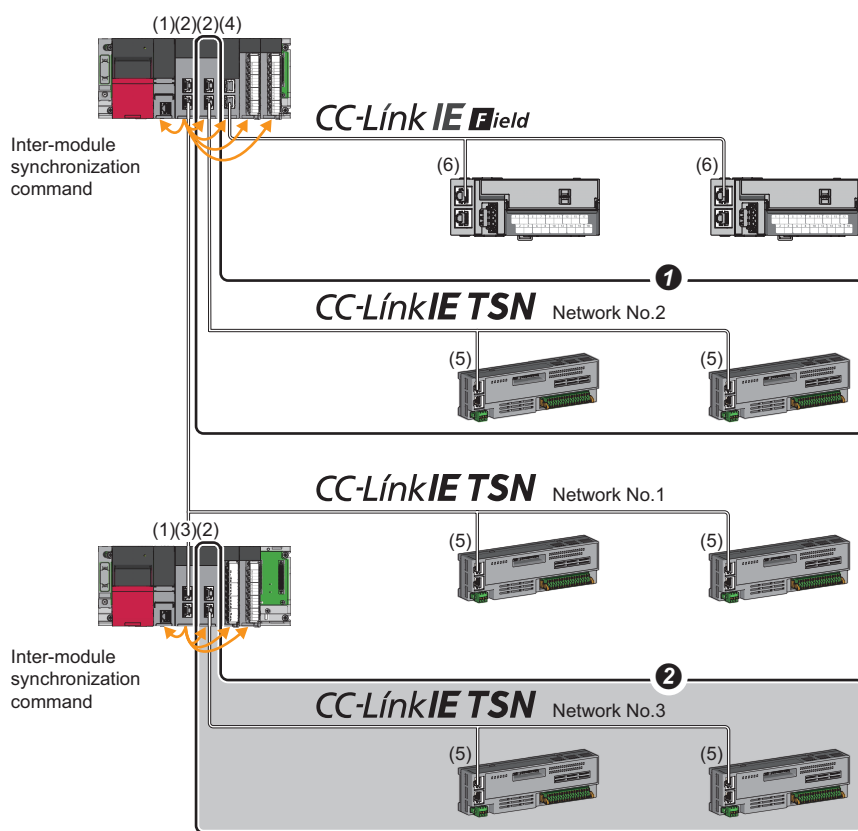

## Synchronizable range

To use this function, set the master station as an inter-module synchronous master.

The communication cycles match based on time synchronization between the master station and device stations. This allows a device supporting the CC-Link IE TSN network synchronous communication function to operate in synchronization with the inter-module synchronization cycle of the programmable controllers of the master station.

The following shows the synchronizable ranges.

- Operation can be performed by synchronizing a module supporting the inter-module synchronization function on the same base unit as the master station with device stations.
- The local station sends an inter-module synchronization command to the module mounted on the base unit of the local station at the start timing of the communication cycle. Operation can be performed in synchronization with a module supporting the inter-module synchronization function mounted on the base unit of the local station.
- When a CC-Link IE Field Network-equipped master/local module (master station) exists on the same base unit as the master station, operation can be performed in synchronization with device stations supporting the CC-Link IE Field Network synchronous communication function.

- (1) CPU module
- (2) CC-Link IE TSN master/local module (master station)
- (3) CC-Link IE TSN master/local module (local station)
- (4) CC-Link IE Field Network-equipped master/local module (master station)
- (5) Device station on CC-Link IE TSN
- (6) Device station on CC-Link IE Field Network

- ① When the firmware version "11" or later is used on the RJ71GN11-T2, multiple CC-Link IE TSN master/local modules (master stations) on the same base unit can be synchronized with the inter-module synchronization cycle. Set the leftmost CC-Link IE TSN master/local module (master station) on the same base unit as the inter-module synchronous master.
- ② Networks after the first local station cannot be synchronized.

## Compatible device

The following table shows the devices that can be synchronized by the CC-Link IE TSN network synchronous communication function.

○: Synchronizable, ×: Not synchronizable

| Support of the CC-Link IE TSN Network synchronous communication function | CC-Link IE TSN Class          | Communication speed | Communication cycle setting | Synchronizability |
|--|-------------------------------|---------------------|-----------------------------|-------------------|
| Not supported  | —                             | —                   | —                           | ×                 |
| Supported  | CC-Link IE TSN Class A device | —                   | —                           | ×                 |
|  | CC-Link IE TSN Class B device | 1Gbps               | Basic Period                | ○                 |
|  |                               |                     | Normal-Speed                | ○                 |
|  |                               |                     | Low-Speed                   | ○                 |
|  |                               | 100Mbps             | Basic Period                | ○                 |
|  |                               |                     | Normal-Speed                | ○                 |
| Low-Speed  |                               |                     | ○                           |                   |

### ■Setting for a station not synchronizable

- When the network synchronous communication setting is set for a device station that is not synchronizable, Initialization failure (parameter mismatch between master and device stations) (event code: 00C71) is displayed in the event history in the master station. (Network synchronous communication and cyclic transmission with other device stations are continued.)
- In the local station for which "Network Synchronous Communication" in the "CC-Link IE TSN Configuration" window of the master station is set to "Synchronous", if "Select Inter-module Synchronization Target Module" in "System Parameter" on the local station side is set to "Asynchronous", Inter-module synchronization target mismatch (error code: 3601H) occurs.

## Available range of network synchronous communication

### ■ Structure with CC-Link IE TSN Class B only

Class B: CC-Link IE TSN Class B device

No.0: Master station

No.1 and No.2: Local station (device where the network synchronous communication setting is set to "Synchronous")

No.3 and No.4: Local station (device where the network synchronous communication setting is set to "Asynchronous")

No.5, No.6, No.7, and No.8: Remote station (device where the network synchronous communication setting is set to "Synchronous")

No.9, No.10, and No.11: Remote station (device where the network synchronous communication setting is set to "Asynchronous")

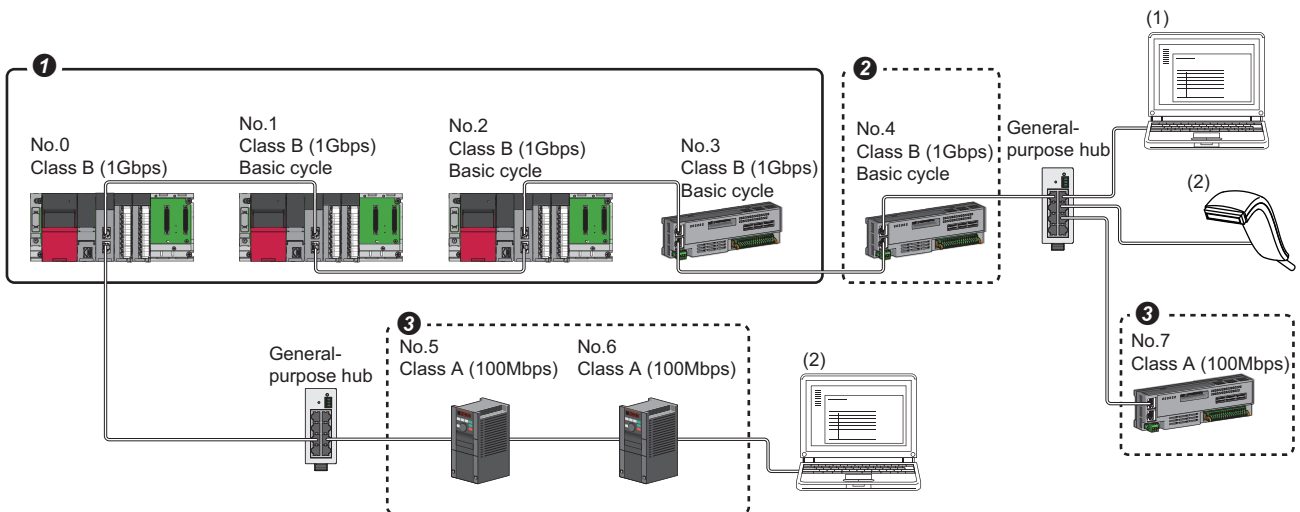

(1) Ethernet device (1Gbps)

① Synchronization is possible using network synchronous communication.

② Even for a CC-Link IE TSN Class B device, synchronization is not possible if the network synchronous communication setting is set to "Asynchronous".

## ■ Structure with mixed CC-Link IE TSN Class B/A

Class A: CC-Link IE TSN Class A device

Class B: CC-Link IE TSN Class B device

No.0: Master station

No.1 and No.2: Local station (device where the network synchronous communication setting is set to "Synchronous")

No.3: Remote station (device where the network synchronous communication setting is set to "Synchronous")

No.4: Remote station (device where the network synchronous communication setting is set to "Asynchronous")

No.5, No.6, and No.7: Remote station

(1) Ethernet device (1Gbps)

(2) Ethernet device (100Mbps)

❶ Synchronization is possible using network synchronous communication.

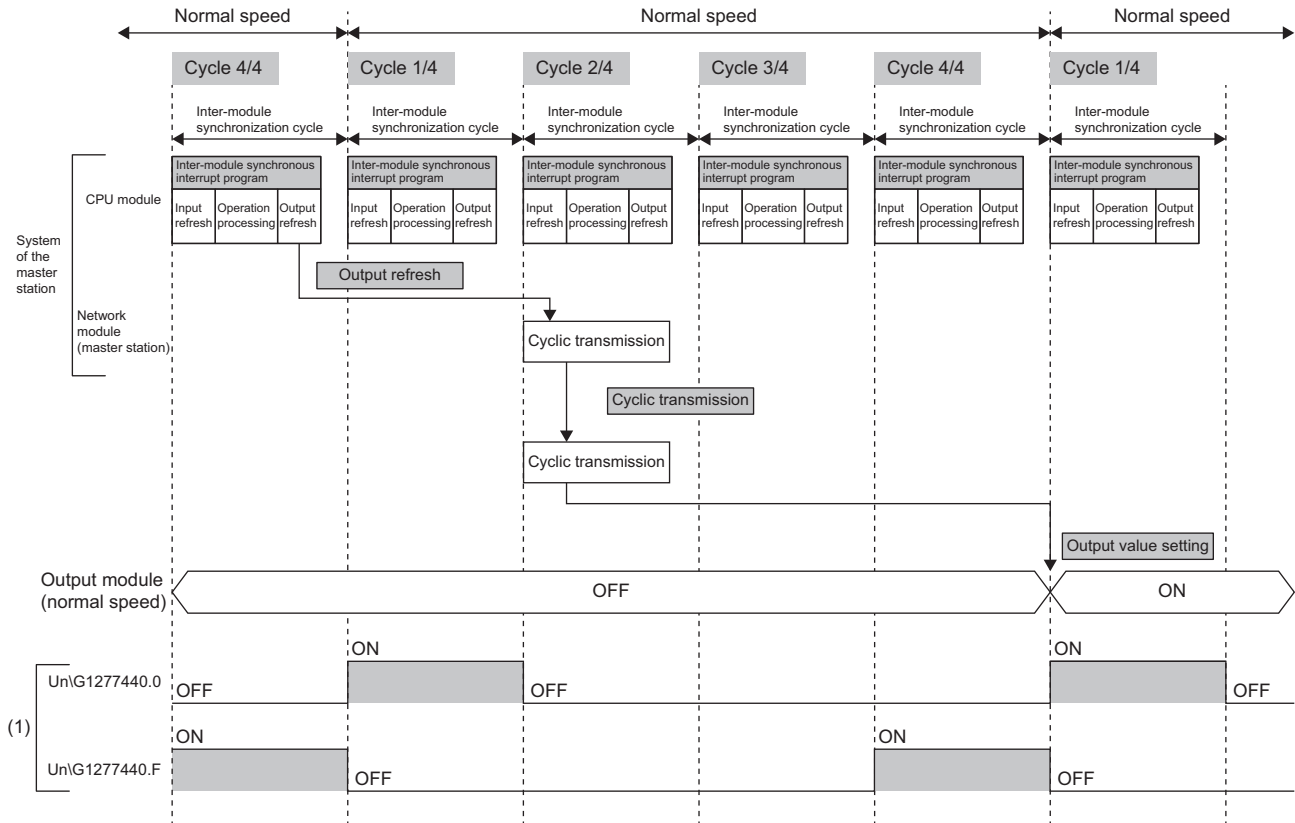

❷ Even for a CC-Link IE TSN Class B device, synchronization is not possible if the network synchronous communication setting is set to "Asynchronous".

❸ For CC-Link IE TSN Class A device, synchronization is not possible using network synchronous communication.

## Network synchronous communication with multiple cycles

When device stations with different communication cycles (excluding local stations) coexist, cyclic transmission between stations is performed according to the communication cycle. For the cyclic transmission of the master station and a remote station, data can be transmitted to other stations after two cycles.

The following figure shows the cyclic transmission timing when "Communication Period Setting" in the "CC-Link IE TSN Configuration" window is set to "Normal-Speed".

(1) The communication cycle timing can be checked with 'Communication cycle timing' (UnG1277440 to UnG1277441) of the buffer memory. The timing of data refreshed in the CPU module can also be checked with this buffer memory area. The 0th bit in this buffer memory area is turned on during the first (1/4) cycle for normal speed. In addition, the 15th bit in this buffer memory area is turned on during the last (4/4) cycle for normal speed. (Page 285 Communication cycle timing (RJ71GN11-T2 only))

### Point

- To perform network synchronous communication when multiple cycles coexist, set "Basic Period" in "Communication Period Setting" of the local station in the "CC-Link IE TSN Configuration" window.
- For low speed in the communication cycle, synchronization is possible only when "×16" is set. Set "Low-Speed" in "Communication Period Setting" in the "CC-Link IE TSN Configuration" window to "×16".

## Cyclic transmission assurance by watchdog counter

The watchdog counter is a function used to assure that normal cyclic transmission between stations on CC-Link IE TSN. Using the watchdog counter, the master station and a device station mutually monitor the data to be updated every communication cycle; the master station monitors data received from a device station and a device station monitors data received from the master station.

### Point

Whether the device station is using the watchdog counter during a data link with the master station can be checked with 'Watchdog counter operation status of each station' (SW01D0 to SW01D7).

### Restriction

Before using this function, check the firmware version of the RJ71GN11. (📖 Page 350 Added and Enhanced Functions)

## ■Operation

When the master station is powered off and on (when the CPU module is reset) or a device station is disconnected and returned, the master station stores insufficient time for the transient transmission time in 'Transient transmission additional time (calculation value)' (SW007A).

If a value has been stored in 'Transient transmission additional time (calculation value)' (SW007A), add the value to the setting values for "Communication Period Interval Setting" and "Transient transmission time" of "Communication Period Setting" under "Basic Settings" for "System Parameter" of the master station.

## ■Setting method

The settings of the master station are not required to use the watchdog counter. However, the settings may be required depending on the device station used. (📖 Manual for the device station used)

## Precautions

- When the RJ71GN11 is used as a local station, the watchdog counter cannot be used.
- When the RJ71GN11-T2 with the firmware version "10" or earlier is used or a device station does not use the watchdog counter, 0 is stored in 'Transient transmission additional time (calculation value)' (SW007A).

## Network synchronous communication with a local station

A local station can link network synchronous communication and the inter-module synchronization function, so the local station can operate in synchronization with the inter-module synchronization cycle of the master station. For details, refer to the following.

📖 MELSEC iQ-R Inter-Module Synchronization Function Reference Manual

## Program example

For program examples using the CC-Link IE TSN network synchronous communication function, refer to the following.

📖 MELSEC iQ-R Inter-Module Synchronization Function Reference Manual

### Point

- The operating status of each station can be checked with 'Information of CC-Link IE TSN network synchronous communication function of each station' (SW01C0 to SW01C7) or 'Synchronous/asynchronous operating status information of each station' (SW01C8 to SW01CF). To perform I/O control, configure an interlock by using the corresponding bit of the special register (SW).
- When the CPU operating status of the relevant stations are currently STOP or PAUSE state, an inter-module synchronous interrupt program is not executed. At this time, the operating status of the network synchronous communication of each station ('Synchronous/asynchronous operating status information of each station' (SW01C8 to SW01CF)) stores an asynchronous setting (0) in bits of the relevant stations and bits of other stations are not changed.

## Precautions

- CC-Link IE TSN Class A devices cannot synchronize using network synchronous communication. (☞ Page 95 Compatible device)
- For the number of connectable modules or order of connection for CC-Link IE TSN supported devices to be connected, refer to the following.

☞ MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

- To specify the RJ71GN11 as the target module for the inter-module synchronization, mount it to the main base unit.
- When a local station is specified as the target module for the inter-module synchronization, the master station cannot be set as the target module.
- When multiple CC-Link IE TSN master/local modules (master stations) are specified as the target modules for synchronization on the same base unit, set the slot number of the leftmost one for "Mounting Slot No" under "Inter-module Synchronization Master Setting" in "System parameter".
- In a multiple CPU system configuration, only the RJ71GN11 controlled by CPU No.1 can be specified as the target for the inter-module synchronization.
- Set the same cycle for "Fixed Scan Interval Setting of Inter-module Synchronization" in "System Parameter" and "Communication Period Interval Setting" in "Basic Settings" of the module parameter.
- As shown in the figure below, networks after the first local station cannot be synchronized.

- To use a switching hub, refer to the CC-Link Partner Association website ([www.cc-link.org](http://www.cc-link.org)) for the models and usage methods of supported switching hubs.
- Network synchronous communication cannot be performed when "Network Topology" is set to "Ring". Select "Line/Star". (☞ Page 118 Network Topology)
- Do not set "Not set" for "0.05ms Unit Setting" of "Inter-module Synchronization Setting" in "System Parameter". Select "Set" for "0.05ms Unit Setting", and set a value in the range 0.25 to 10.0ms (in units of 0.05ms).
- When a switching hub is used, the local station may detect an error at start-up the system. In such a case, take corrective actions according to the error code.
- Do not perform the online change in the CPU module. If the online change is used in the CPU module, there may be a delay in the start of the inter-module synchronous interrupt program (I44) in the interrupt program. In this case, the total value of the execution time of the inter-module synchronous interrupt program (I44) and the cyclic processing time exceeds the next inter-module synchronization cycle (next communication cycle), and the inter-module synchronous transmission omission occurs. The watchdog counter also detects an error because cyclic transmission cannot be performed within the communication cycle.
- When multiple cycles coexist and when the communication cycle is low speed, synchronization is possible only when "×16" is set. Set "Low-Speed" in "Communication Period Setting" in the "CC-Link IE TSN Configuration" window to "×16".

## Restriction of firmware version

### ■Number of settable modules

The following table lists the number of settable modules in "Select Inter-module Synchronization Target Module" of the "Inter-module Synchronization Setting" tab under "System parameter".

| Firmware version of the RJ71GN11-T2 | Number of settable modules |               |
|-------------------------------------|----------------------------|---------------|
|                                     | Master station             | Local station |
| Firmware version "10"               | 1                          | 1             |
| Firmware version "11" or later      | 8                          |               |

### ■Combination of the firmware versions

- To specify the multiple RJ71GN11-T2s as the target modules for the inter-module synchronization, use the RJ71GN11-T2 with the firmware version "11" or later. Do not use the RJ71GN11-T2 with the firmware version "10" and the RJ71GN11-T2 with the firmware version "11" or later together. Doing so results in Inter-module synchronization parameter mismatch (error code: 3018H) or Inter-module synchronization abnormal error (error code: 360DH).

# 1.7 Safety Communications (RJ71GN11-T2 Only)

This section describes the safety communication function.

## Restriction

The following modules are required to use the safety communications.

- Safety CPU and safety function module with a firmware version of "20" or later
- The RJ71GN11-T2 with a firmware version of "10" or later

## Communications with safety stations

This function establishes a safety connection and performs one-on-one safety communications periodically between safety stations in the same network.

Safety data is exchanged by using the safety device of the Safety CPU set by "Safety Communication Setting" under "Basic Settings" from a program.

Whether a safety connection is established or not can be checked in 'Safety refresh communication status of each safety connection (1st module)' (SA\SD1008 to SA\SD1015) of the Safety CPU.\*<sup>1</sup>

\*<sup>1</sup> Safety special register areas for the first RJ71GN11. For safety special register areas for the second or later RJ71GN11, refer to the following.

📖 MELSEC iQ-R CPU Module User's Manual (Application)

## Stations supporting safety communications

Safety communications can be performed between the following stations (safety stations).

- Master station (safety station) (1) ↔ local station (safety station) (2) (4)
- Master station (safety station) (1) ↔ remote station (safety station) (3)

## Restriction

Standard station (5) (6) can be mixed in one network for system configuration. However, safety communications (7) cannot be performed with standard stations (5) (6). Only standard communications (8) can be performed.

## Safety communications flow

### ■ Master station (safety station) and local station (safety station)

The safety device status of the sending station is stored in the safety device of the receiving station.

1

Output from the master station (safety station)

❶ The safety device of the Safety CPU on the master station (safety station) turns on.

❷ The safety device status of the Safety CPU on the master station (safety station) is stored in the Safety CPU on the local station (safety station) by safety data transfer.

Output from the local station (safety station)

❸ The safety device of the Safety CPU on the local station (safety station) turns on.

❹ The data in a safety device of the Safety CPU on the local station (safety station) is stored in the Safety CPU on the master station (safety station) by safety data transfer.

## ■ Master station (safety station) and remote station (safety station)

The safety device status of the Safety CPU on the master station (safety station) is reflected to the safety output of the remote station (safety station). The safety input status of the remote station (safety station) is stored in the Safety CPU on the master station (safety station).

Output from the master station (safety station)

- ❶ The safety device of the Safety CPU on the master station (safety station) turns on.
- ❷ The safety device status of the Safety CPU on the master station (safety station) is stored in the Safety output on the remote station (safety station) by safety data transfer.
- ❸ The safety output status of the remote station (safety station) is output to an external device.

Input from the remote station (safety station)

- ❹ The status of the external device is stored in the safety input of the remote station (safety station).
- ❺ The safety device status of the Safety input on the remote station (safety station) is stored in the Safety CPU on the master station (safety station) by safety data transfer.

## Setting method

Set safety communications in "Safety Communication Setting" under "Basic Settings". (Page 119 Safety Communication Setting (RJ71GN11-T2 only))

## Precautions

- If an error occurs in safety communications, safety data from the faulty station is cleared.
- A safety connection with the safety station can be established only while data link is performed after configuring the "Safety Communication Setting" under "Basic Settings" of the master station. The data link status can be checked in 'Data link status of each station' (SW00B0 to SW00B7).
- Note that stations not set in the "CC-Link IE TSN Configuration" window of the master station (safety station) and reserved stations cannot perform safety communications.
- Safety communications cannot be performed among the RJ71GN11s set in the same control CPU.
- This function may detect an error and stop safety communications if a parameter is written to the control CPU of the RJ71GN11 during safety communications.
- Safety communications cannot be performed among the safety stations when the IP address and model name of the communication destination set to the safety station are different from the actual system configuration.
- Safety communications cannot be performed with a remote station (safety station) if the safety approval code set in the master station (safety station) and it in the remote station (safety station) are not match.
- An error occurs when a parameter is written to the Safety CPU because the Safety CPU does not support the inter-module synchronization function.
- A remote device test cannot be used for a safety remote I/O module.

## Safety station interlock function

If a communication error has occurred between safety stations, communication is automatically disconnected to prevent incorrect input or output from the faulty station. Safety communications between the stations become safety station interlock state at this time, and the safety communications do not resume until the safety interlock is released.

Create a program which releases the interlock by using Interlock release request for each safety connection to release the safety station interlock state.

Note that standard communication automatically resumes if the communication error cause is eliminated even in the safety station interlock state.

The safety station interlock function prevents equipment stopped by a communication error from suddenly resuming its operation after it recovers from the error.

### ■Checking method

Check the status with the safety special register 'Interlock status of each safety connection (1st module)' (SA\SD1232 to SA\SD1239).

For the safety special register for the second or later modules and its operation details, refer to the following.

 MELSEC iQ-R CPU Module User's Manual (Application)

### ■Release method

Release the interlock using the safety special register 'Interlock release request for each safety connection (1st module)' (SA\SD1240 to SA\SD1247).

For the safety special register for the second or later modules and its operation details, refer to the following.

 MELSEC iQ-R CPU Module User's Manual (Application)

## 1.8 Others

---

### Reserved station setting

---

A reserved station is a device station that is set in the parameters and included as a station in the network when its number is counted. This station is reserved for future network expansion and is not actually connected. Therefore, it is not detected as a faulty station despite being not connected. (☞ Page 132 "CC-Link IE TSN Configuration" Window)

By setting a reserved station, link device assignment will not change even if the device station is connected (or the reservation is cleared). Therefore, modification of the program is not required.

### Error invalid station setting

---

An error invalid station is a device station that is set to be not detected as a faulty station by the master station. It is also set when a device station is to be replaced during data link. (☞ Page 132 "CC-Link IE TSN Configuration" Window)

## Device station parameter automatic setting (RJ71GN11-T2 only)

Parameters of the device station are saved in the master station, and the parameters will be automatically set when the device station is connected/returned.

### Device station parameter automatic setting from the master station

- Parameters of the device station set using the engineering tool are saved in the memory of the CPU module in the master station or the SD memory card by writing.
- When the device station is connected/returned by power-on, saved parameters are automatically set from the master station.

- Save parameter (A) of the device station to the CPU module on the master station.
- When the device station is returned/connected, saved parameter (A) is automatically set from the master station to the device station.

#### Point

- The master station starts data link with the device station after parameters of the device station are automatically set.
- The device station parameter automatic setting is also executed for device stations set as reserved stations.

### Setting method

Set in the "Parameter of Device Station" window. (☞ Page 139 Parameter processing of a device station (RJ71GN11-T2 only))

#### Precautions

- A device station whose device station parameter automatic setting abnormally ended does not start data link, and 'Execution result of device station parameter automatic setting function' (SW0160 to SW0167) turns on. Check 'Detailed execution result of device station parameter automatic setting' (SW0194) and the event history and perform corrective actions according to Action of the error codes list.
- Check if the checkbox of "Parameter Automatic Setting" of the device station is selected in the "CC-Link IE TSN Configuration" window.
- Check if the IP address of the device station in the "CC-Link IE TSN Configuration" window matches the actual IP address of the device station.
- When different communication speeds are set for the master station and the station where device station parameter automatic setting is performed, the device station parameter automatic setting may end abnormally. If the setting ends abnormally, check if the communication speed is matched.
- When the parameters of a device station are stored in the SD memory card, set "Use" of "Device Station Parameter" in "Setting of File/Data Use or Not in Memory Card" under "Memory Card Parameter" for CPU module.
- In the "CC-Link IE TSN Configuration" window in all master stations controlled by the CPU module, the total number of target modules for the device station parameter automatic setting including expansion modules must be set within 1024 modules.

# Data collection using the CC-Link IE TSN Communication Software (RJ71GN11-T2 Only)

The cyclic data of each CC-Link IE TSN station is received using the CC-Link IE TSN Communication Software.

For details on the CC-Link IE TSN Communication Software, refer to the following.

 CC-Link IE TSN Communication Software for Windows User's Manual

No.0: Master station

No.1, No.2: Local station

No.3: Remote station

(1) CC-Link IE TSN Communication Software (number of connectable modules: 2)

## Restriction

Before using this function, check the firmware version of the RJ71GN11. ( Page 350 Added and Enhanced Functions)

## System configuration

For system configuration, refer to the following.

 MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

## Setting method

When connecting the CC-Link IE TSN Communication Software, set multicast mode to the communication mode.

 [Module Parameter] ⇒ [Application Settings] ⇒ [Communication Mode] ⇒ [Multicast]

## Precautions

- The CC-Link IE TSN Communication Software information cannot be displayed using the CC-Link IE TSN/CC-Link IE Field diagnostics.
- CC-Link IE TSN Communication Software is not detected by the "Connected/Disconnected Module Detection" in the "CC-Link IE TSN Configuration" window.

## Co-recording

---

This function uses a recording device and saves data in the CPU module and video data captured by the network camera to a file at a specified time or the timing at which a trigger such as an error occurrence is satisfied.

The master station or the RJ71GN11 of the local station relays a co-recording trigger among the recording devices on the base unit of the own station and the recording devices of other stations, and performs co-recording on the network.

The co-recording function records, reproduces, and analyzes data in the entire system. For details, refer to the following.

 MELSEC iQ-R System Recorder Co-recording Function Reference Manual

---

### **Restriction**

Before using this function, check the firmware version of the RJ71GN11. ( Page 350 Added and Enhanced Functions)

---

# 2 PARAMETER SETTINGS

---

This chapter describes the parameter settings required for communications between the RJ71GN11 and other stations.

## 2.1 Setting Parameters

---

1. Add the RJ71GN11 in the engineering tool.  
 [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ Right-click ⇒ [Add New Module]
2. The required settings, basic settings, and application settings are included in the parameter settings. Select one of the settings from the tree on the window shown below.  
 [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ Target Module
3. After setting parameters, click the [Apply] button.
4. Write parameters to the CPU module using the engineering tool.  
 [Online] ⇒ [Write to PLC]
5. The parameters are reflected by resetting the CPU module or powering off and on the system.

---

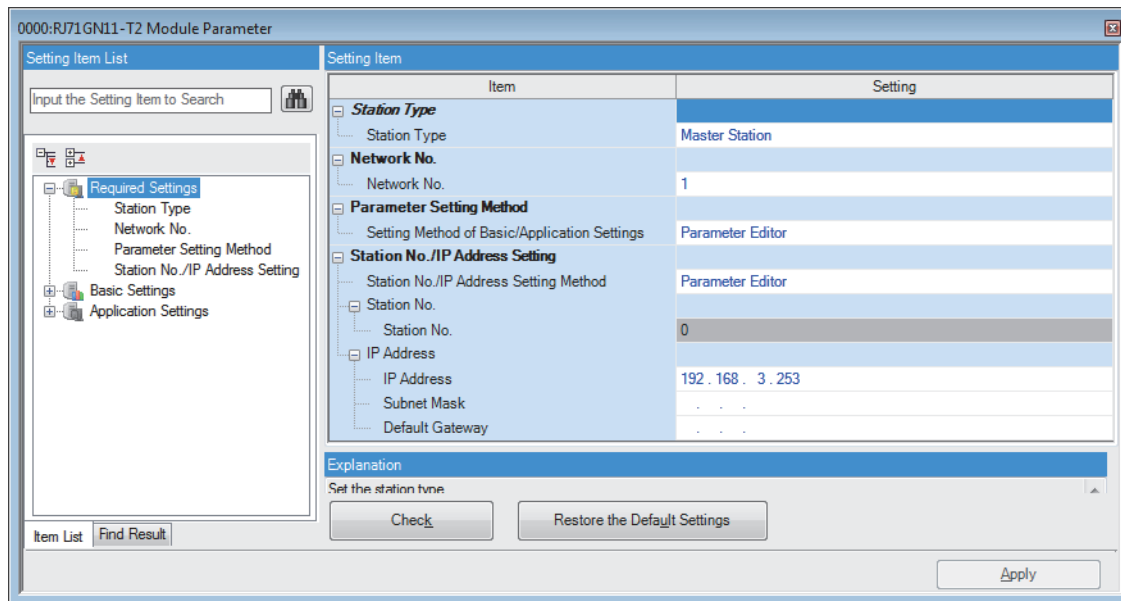

### Point

The settings displayed on the required settings, basic settings, and application settings pages (default: ) are the values that are displayed when the [Restore the Default Settings] button on each window of the engineering tool is clicked.

---

## 2.2 Required Settings

Set the station type or IP address of the RJ71GN11.

○: Can be set, ×: Cannot be set

| Item                            | Description   | Availability    |                 | Reference                               |
|---------------------------------|---|-----------------|-----------------|---|
|                                 |   | Master station  | Local station   |   |
| Station Type                    | Set the station type of the RJ71GN11.   | ○               | ○               | Page 111 Station Type                   |
| Network No.                     | Set the network number of the RJ71GN11.   | ○               | ○               | Page 112 Network No.                    |
| Parameter Setting Method        | Select whether to set "Basic Settings" and "Application Settings" items using the engineering tool or in program. | ○               | ○               | Page 113 Parameter Setting Method       |
| Station No./IP Address Settings | Set the station number or IP address of the RJ71GN11.   | ○ <sup>*1</sup> | ○ <sup>*2</sup> | Page 112 Station No./IP Address Setting |

\*1 Only "IP Address" can be set.

\*2 This item can be set when "Parameter Editor" in "Station No./IP Address Setting Method" is selected.

### Station Type

Set the station type of the RJ71GN11.

| Item         | Description  | Setting range   |
|--------------|--|---|
| Station Type | Select whether to use the RJ71GN11 as the master station or local station.<br>Only one master station can be set in a network. | <ul style="list-style-type: none"> <li>Master Station</li> <li>Local Station</li> </ul> (Default: Station type set in the "Add New Module" window.) |

## Network No.

Set the network number of the own station of the RJ71GN11.

| Item        | Description                             | Setting range            |
|-------------|---|--------------------------|
| Network No. | Set the network number of the RJ71GN11. | 1 to 239<br>(Default: 1) |

### Precautions

Set a network number that does not overlap any other network numbers.

In particular, when using an Ethernet-equipped module (CPU module) at default, the IP address is 192.168.3.39 and the network number is the third octet of the IP address, thus 3. Because setting the network number of the RJ71GN11 to 3 causes an overlap, set another network number.

## Station No./IP Address Setting

Set the station number and IP address of the own station of the RJ71GN11.

| Item                                  | Description  | Setting range  |
|---------------------------------------|--|--|
| Station No./IP Address Setting Method | Select whether to set the station number/IP address using the engineering tool or to set the station number/IP address using a program (UINI instruction).<br>When selecting "Program", use the UINI instruction to set the station number/IP address. (📖 MELSEC iQ-R Programming Manual (Module Dedicated Instructions))<br>If "Parameter Setting Method" under "Required Settings" is "Program", "Parameter Editor" cannot be selected.  | <ul style="list-style-type: none"> <li>Parameter Editor</li> <li>Program</li> </ul> (Default: Parameter Editor)              |
| Station No.                           | Set the station number of the RJ71GN11. This item can be set only for a local station.<br>To set the station number in this setting, set "Station No./IP Address Setting Method" to "Parameter Editor".<br>Set a station number different from those used in the same network.   | <ul style="list-style-type: none"> <li>Master station: Fixed to "0"</li> <li>Local station: 1 to 120</li> </ul> (Default: 1) |
| IP Address                            | Set the IP address of the own station.<br>Set an IP address different from those used in other stations. (📖 Page 80 IP address duplication detection)<br>Do not set the following values. <ul style="list-style-type: none"> <li>The third and fourth octets are all 0 or all 1.</li> <li>The host address bits are all 0 or all 1</li> <li>Reserved address</li> </ul>  | 0.0.0.1 to 223.255.255.254<br>(Default: Master station 192.168.3.253, other than the master station 192.168.3.1)             |
| Subnet Mask                           | Set the subnet mask.<br>Set the same value for the master station and device station.<br>If the subnet mask is empty, the address class (class A, class B, class C) is determined from the setting of "IP Address", and operation is done with the subnet mask according to the address class.<br>The subnet mask for each class is as follows. <ul style="list-style-type: none"> <li>Class A: 255.0.0.0</li> <li>Class B: 255.255.0.0</li> <li>Class C: 255.255.255.0</li> </ul> The IP address for each class is as follows. <ul style="list-style-type: none"> <li>Class A: 0.x.x.x to 127.x.x.x</li> <li>Class B: 128.x.x.x to 191.x.x.x</li> <li>Class C: 192.x.x.x to 223.x.x.x</li> </ul> The host address for each class is the 0 section shown below. <ul style="list-style-type: none"> <li>Class A: 255.0.0.0</li> <li>Class B: 255.255.0.0</li> <li>Class C: 255.255.255.0</li> </ul> | <ul style="list-style-type: none"> <li>Empty</li> <li>0.0.0.1 to 255.255.255.255</li> </ul> (Default: empty)                 |
| Default Gateway                       | Set the default gateway.   | <ul style="list-style-type: none"> <li>Empty</li> <li>0.0.0.1 to 223.255.255.254</li> </ul> (Default: empty)                 |

# Parameter Setting Method

Select whether to set "Basic Settings" and "Application Settings" items using the engineering tool or in program.

| Item   | Description  | Setting range   |
|--|--|---|
| Setting Method of Basic/<br>Application Settings | <p>■Parameter Editor<br/>Select this item to set the parameter using the engineering tool.<br/>The following are advantages.</p> <ul style="list-style-type: none"> <li>• All parameters can be easily set in the window without creating a program for setting.</li> <li>• The data will be automatically transferred from the link special relay (SB), link special register (SW), and link devices of the RJ71GN11 to the devices of the CPU module, the link special relay (SB), link special register (SW) of the RJ71GN11, and the module label of the CPU module.</li> </ul> <p>■Program (RJ71GN11-T2 only)<br/>Select this item to set the parameter using the dedicated instructions (UINI instruction and CCPASET instruction), or the dedicated instructions (UINI instruction and CCPASET instruction).</p> <ul style="list-style-type: none"> <li>• Only "Required Settings" parameters can be set using the engineering tool.</li> <li>• Also set "Station No./IP Address Setting Method" in "Required Settings" to "Program".</li> </ul> <p>The following are advantages.</p> <ul style="list-style-type: none"> <li>• Comparing with the number of modules that can be set in the engineering tool, larger numbers of the RJ71GN11-T2s can be actually mounted. (📖 MELSEC iQ-R Module Configuration Manual)</li> </ul> | <ul style="list-style-type: none"> <li>• Parameter Editor</li> <li>• Program*<sup>1</sup></li> </ul> <p>(Default: Parameter Editor)</p> |

\*1 When "Program" is selected, some parameters cannot be set using a dedicated instruction (CCPASET instruction).  
For parameters that can be set using a dedicated instruction (CCPASET instruction), refer to the following.  
📖 MELSEC iQ-R Programming Manual (Module Dedicated Instructions)

## Station number/IP address setting of a local station

The station number/IP address of a local station can be also set using the UINI instruction. This allows project data items other than the station number/IP address to be shared. (📖 MELSEC iQ-R Programming Manual (Module Dedicated Instructions))

### ■When using the engineering tool for the parameter setting

The procedure for setting the station number of a local station is shown below.

1. Set "Station No./IP Address Setting Method" under "Station No./IP Address Setting" in "Required Settings" to "Program".
2. Set "Setting Method of Basic/Application Settings" under "Parameter Setting Method" in "Required Settings" to "Parameter Editor".
3. Set the station number/IP address using the UINI instruction.

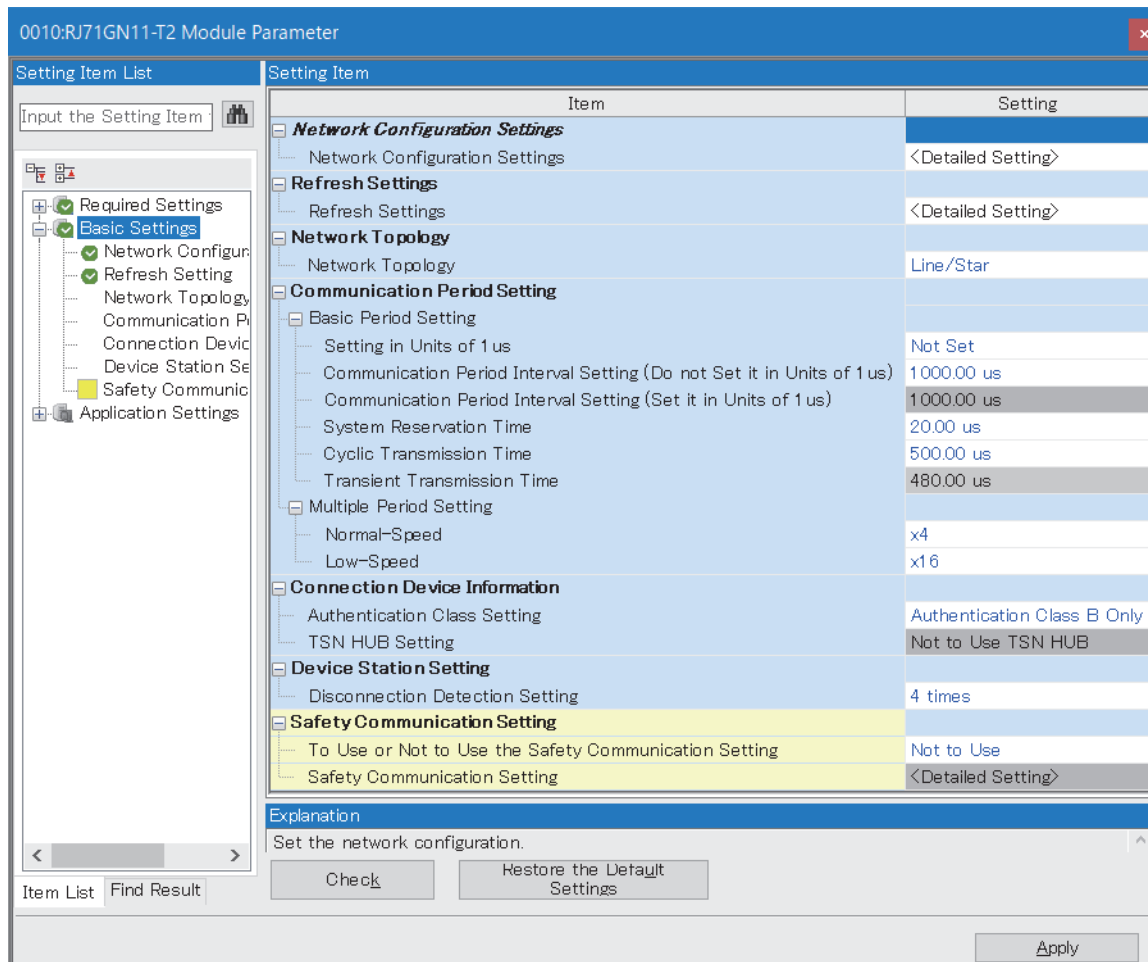

### ■When using the CCPASETX instruction or CCPASET instruction for the parameter setting

The procedure for setting the station number of a local station is shown below.

1. Set "Station Type" and "Network No." in "Required Settings".
2. Set "Station No./IP Address Setting Method" under "Station No./IP Address Setting" in "Required Settings" to "Program".
3. Set "Setting Method of Basic/Application Settings" under "Parameter Setting Method" in "Required Settings" to "Program".
4. Set the network parameters using the CCPASETX instruction or CCPASET instruction.
5. Set the station number/IP address using the UINI instruction.

## 2.3 Basic Settings

Set the network configurations, refresh settings, or other parameters for the RJ71GN11.

In this manual, "Authentication Class" is described as "CC-Link IE TSN Class".

○: Can be set, ×: Cannot be set

| Item  | Description   | Availability   |               | Reference  |
|---|---|----------------|---------------|--|
|   |   | Master station | Local station |  |
| Network Configuration Settings                                | Set parameters of device stations (the number of points and assignment of link devices) in the master station.  | ○              | ×             | Page 132 "CC-Link IE TSN Configuration" Window           |

\*1 This item can be set only in a project of the Safety CPU.

# Refresh Settings

Assign link refresh ranges between the devices described below.

- SB, SW of the RJ71GN11 ↔ Module label of the CPU module
- SB, SW, link devices (RX, RY, RWr, RWw, LB, LW) of the RJ71GN11 ↔ Devices of the CPU module

## Setting method

The procedure for the refresh settings is shown below.

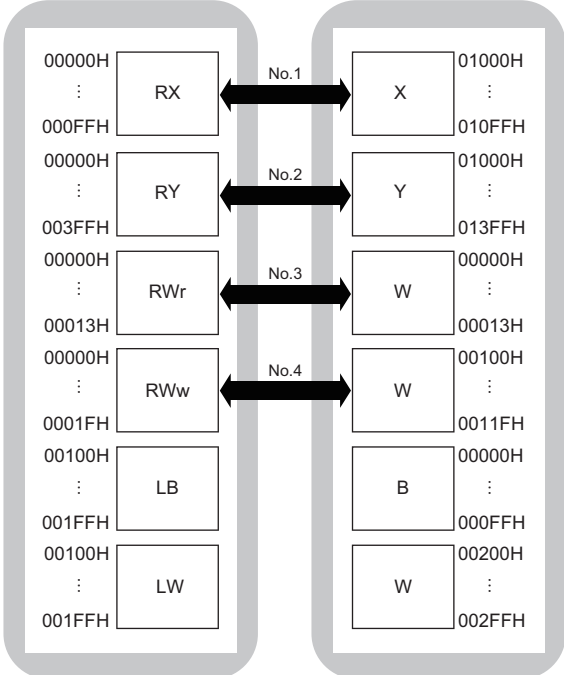

### 1. Set the required items.

| No. | Link Side   |        |       |       |   | CPU Side       |             |        |       |       |
|-----|-------------|--------|-------|-------|---|----------------|-------------|--------|-------|-------|
|     | Device Name | Points | Start | End   |   | Target         | Device Name | Points | Start | End   |
| -   | SB          | 4096   | 00000 | 00FFF | ↔ | Module Label   |             |        |       |       |
| -   | SW          | 512    | 00000 | 001FF | ↔ | Specify Device | SW          | 512    | 00000 | 001FF |
| 1   | RX          | 256    | 00000 | 000FF | ↔ | Specify Device | X           | 256    | 01000 | 010FF |
| 2   | RY          | 1024   | 00000 | 003FF | ↔ | Specify Device | Y           | 1024   | 01000 | 013FF |
| 3   | RWr         | 20     | 00000 | 00013 | ↔ | Specify Device | W           | 20     | 00000 | 00013 |
| 4   | RWw         | 32     | 00000 | 0001F | ↔ | Specify Device | W           | 32     | 01000 | 0101F |
| 5   | LB          | 256    | 00100 | 001FF | ↔ | Specify Device | B           | 256    | 00000 | 000FF |
| 6   | LW          | 32     | 00100 | 0011F | ↔ | Specify Device | W           | 32     | 00200 | 0021F |
| 7   |             |        |       |       |   |                |             |        |       |       |

### 2. Click the [Apply] button to finish the refresh settings.

## Setting items

| Item                     | Description  | Setting range  |
|--------------------------|--|--|
| Device Assignment Method | Right-click in the setting window and select a link device assignment method from the "Device Assignment Method" menu. <ul style="list-style-type: none"> <li>• Start/End: Enter the start and end numbers of link devices.</li> <li>• Points/Start: Enter the numbers of points and start numbers of link devices.</li> </ul> | <ul style="list-style-type: none"> <li>• Start/End</li> <li>• Points/Start</li> </ul> (Default: Start/End)   |
| —                        | <p>Link Side</p> <p>Set the link refresh ranges of the link special relay (SB) and link special register (SW). One range can be set for each SB and SW. (☞ Page 35 Link refresh)</p> <p><b>Ex.</b></p> <p>RJ71GN11</p> <p>RCPU</p> <p>(1) Module label</p>   | <ul style="list-style-type: none"> <li>■ Device Name <ul style="list-style-type: none"> <li>• SB (fixed)</li> <li>• SW (fixed)</li> </ul> </li> <li>■ Points <ul style="list-style-type: none"> <li>• SB: 16 to 4096</li> <li>• SW: 1 to 4096</li> </ul> (Default: 4096)</li> <li>■ Start <ul style="list-style-type: none"> <li>• SB: 0H to FF0H (set in increments of 16 points)</li> <li>• SW: 0H to FFFH (set in increments of 1 point)</li> </ul> (Default: 00000H)</li> <li>■ End <ul style="list-style-type: none"> <li>• SB: FH to FFFH (set in increments of 16 points)</li> <li>• SW: 0H to FFFH (set in increments of 1 point)</li> </ul> (Default: 00FFFH)</li> <li>■ Target <ul style="list-style-type: none"> <li>• Module Label</li> <li>• Specify Device</li> </ul> (Default: Module Label)</li> <li>■ Device Name <ul style="list-style-type: none"> <li>• Module Label: —</li> <li>• Specify Device (link side is SB): SB, M, L, B, D, R, ZR, RD</li> <li>• Specify Device (link side is SW): SW, M, L, B, D, R, ZR, RD</li> </ul> (Default: Grayout)</li> <li>■ Points, End <ul style="list-style-type: none"> <li>• Module Label: —</li> <li>• Specify Device: Displayed according to setting of "Start".</li> </ul> (Default: Grayout)</li> <li>■ Start <ul style="list-style-type: none"> <li>• Module Label: —</li> <li>• Specify Device: Device range of CPU modules (Bit devices in increments of 16 points and word devices in increments of 4 points.)</li> </ul> (Default: Grayout)</li> </ul> |

| Item     | Description   | Setting range  |
|----------|---|--|
| 1 to 256 | <p>Link Side</p> <p>Set the link refresh ranges of link devices (RX, RY, RWr, RWw, LB, LW). Up to 256 ranges can be set. (📄 Page 35 Link refresh)</p> <p><b>Ex.</b></p>  <p>The diagram illustrates the mapping of link refresh ranges from the CPU side to the Link Side. On the CPU side, there are six link device types: RX, RY, RWr, RWw, LB, and LW. On the Link Side, there are four corresponding device types: X, Y, W, and B. Arrows labeled No.1 to No.4 indicate the refresh ranges for each device type. For example, No.1 shows the range for RX (00000H to 000FFH) on the CPU side and X (01000H to 010FFH) on the Link Side.</p> | <p>■Device Name</p> <ul style="list-style-type: none"> <li>• RX, RY, RWr, RWw, LB, LW (Default: empty)</li> </ul> <p>■Points</p> <ul style="list-style-type: none"> <li>• RX, RY: 16 to 16384</li> <li>• RWr, RWw: 4 to 8192</li> <li>• LB: 16 to 32768/6 to 131072 when extending the number of link points</li> <li>• LW: 1 to 16384/1 to 524288 when extending the number of link points (Default: Grayout)</li> </ul> <p>■Start</p> <ul style="list-style-type: none"> <li>• RX, RY: 0H to 3FF0H (set in increments of 16 points)</li> <li>• RWr, RWw: 0H to 1FFCH (set in increments of 4 points)</li> <li>• LB: 0H to 7FF0H (set in increments of 16 points)/0H to 1FFF0H (set in increments of 16 points) when extending the number of link points</li> <li>• LW: 0H to 3FFFH/0H to 7FFFFH when extending the number of link points (Default: Grayout)</li> </ul> <p>■End</p> <ul style="list-style-type: none"> <li>• RX, RY: FH to 3FFFH (set in increments of 16 points)</li> <li>• RWr, RWw: 3H to 1FFFH (set in increments of 4 points)</li> <li>• LB: FH to 7FFFH (set in increments of 16 points)/FH to 1FFFFH (set in increments of 16 points) when extending the number of link points</li> <li>• LW: 0H to 3FFFH/0H to 7FFFFH (set in increments of 16 points) when extending the number of link points (Default: Grayout)</li> </ul> |
|          | <p>CPU Side</p>  <p>RJ71GN11 RCPU</p>   | <p>■Target</p> <ul style="list-style-type: none"> <li>• Module Label</li> <li>• Specify Device (Default: Grayout)</li> </ul> <p>■Device Name</p> <ul style="list-style-type: none"> <li>• Specify Device (link side is RX): X, M, L, B, D, W, R, ZR, RD</li> <li>• Specify Device (link side is RY): Y, M, L, B, D, W, R, ZR, RD</li> <li>• Specify Device (link side is RWr, RWw): M, L, B, D, W, R, ZR, RD</li> <li>• Specify Device (link side is LB, LW): X, Y, M, L, B, D, W, R, ZR, RD (Default: Grayout)</li> </ul> <p>■Points, End</p> <ul style="list-style-type: none"> <li>• Module Label: —</li> <li>• Specify Device: Displayed according to setting of "Start". (Default: Grayout)</li> </ul> <p>■Start</p> <ul style="list-style-type: none"> <li>• Module Label: —</li> <li>• Specify Device: Device range of CPU modules (Bit devices in increments of 16 points and word devices in increments of 4 points.) (Default: Grayout)</li> </ul>   |

**Point**

The link devices of the RJ71GN11 can be accessed from a program. (📄 Page 37 Direct access to link devices)

## Precautions

### ■Device set to "CPU Side"

Set a device range not to overlap the one used for the following:

- "Refresh Setting" in "Basic Settings" of other network modules
- "Link Refresh Settings" in "Basic Settings" of a CC-Link master/local module
- I/O numbers used for I/O modules and intelligent function modules
- "Refresh settings" of intelligent function modules
- Module label being used (when performing refresh settings in "Refresh Settings" under "Basic Settings")
- "Refresh Setting between Multiple CPUs" of "CPU Parameter" for a multiple CPU system

### ■Link refresh range

Set only link devices used in the CPU module for link refresh range. Doing so will reduce the number of excess points, resulting in a shorter link refresh time.

### ■Changing link device assignment in "Network Configuration Settings" of "Basic Settings"

Correct the set range in "Refresh Setting" of "Basic Settings".

### ■Setting the parameter using the CCPASETX or CCPASET instruction

The RJ71GN11-T2 operates without setting the refresh. Access directly a link device using direct access because the link refresh cannot be executed.

# Network Topology

Select the network topology type according to the actual network configuration.

| Item             | Description  | Setting range   |
|------------------|--|---|
| Network Topology | Select the network topology type according to the actual network configuration.<br>To use the loopback function, select "Ring". (  Page 75 Loopback Function) | <ul style="list-style-type: none"> <li>Line/Star (RJ71GN11-T2 only)</li> <li>Ring</li> </ul> (Default: Line/Star) |

Network synchronous communication cannot be performed when "Network Topology" is set to "Ring". Select "Line/Star".

## Communication Period Setting

Set the basic cycle setting and multiple cycle setting.

- Basic cycle setting requires calculation of the communication cycle interval and cyclic transmission time. (  Page 322 Communication cycle intervals)
- Multiple cycle setting is used when communication cycles coexist. (  Page 48 Communication cycles coexistence)

| Item                   | Description   | Setting range  |   |
|------------------------|---|--|---|
| Basic Period Setting   | Setting in Units of 1μs   | Select whether to set the basic cycle in increments of 1μs.  | <ul style="list-style-type: none"> <li>Set</li> <li>Not set</li> </ul> (Default: Not set)   |
|                        | Communication Period Interval Setting (Do Not Set it in Units of 1μs) <sup>*5</sup> | Select the setting range of the communication cycle interval.  | <ul style="list-style-type: none"> <li>125.00μs</li> <li>250.00μs</li> <li>500.00μs</li> <li>1000.00μs</li> <li>2000.00μs</li> <li>4000.00μs</li> <li>8000.00μs<sup>*1</sup></li> </ul> (Default: 1000.00μs for the RJ71GN11-T2, 4000.00μs for the RJ71GN11-SX) |
|                        | Communication Period Interval Setting (Set it in Units of 1μs) <sup>*5</sup>        | Enter a value of the communication cycle interval.   | 125.00μs to 10000.00μs (in increments of 1μs) <sup>*2</sup><br>(Default: 1000.00μs for the RJ71GN11-T2, 4000.00μs for the RJ71GN11-SX)  |
|                        | System Reservation Time   | Necessary time for the system to guarantee the communication cycle interval.<br>For the RJ71GN11-T2, when "Communication Speed" of the master station is set to 100Mbps, select 200μs. | <ul style="list-style-type: none"> <li>20.00μs</li> <li>200.00μs</li> </ul> (Default: 20.00μs)  |
|                        | Cyclic Transmission Time  | Set the time to be allocated to cyclic transmission in communication cycle intervals.  | 5.00μs to 9966.00μs (in increments of 1μs) <sup>*3</sup><br>(Default: 500.00μs for the RJ71GN11-T2, 3500.00μs for the RJ71GN11-SX)  |
|                        | Transient Transmission Time   | The value of "Communication Period Interval Setting" minus "Cyclic Transmission Time" and "System Reservation Time" is displayed.  | 14.00μs to 9975.00μs (in increments of 1μs) <sup>*4</sup><br>(Default: 480.00μs)  |
| Multiple Cycle Setting | Normal-Speed  | Select the "Normal-Speed" cycle for a basic cycle.<br>For the RJ71GN11-T2, setting is not required and can be left as "x4".  | <ul style="list-style-type: none"> <li>x2 (RJ71GN11-SX only)</li> <li>x4</li> <li>x8 (RJ71GN11-SX only)</li> </ul> (Default: x4)  |
|                        | Low-Speed   | Select the "Low-Speed" cycle for a basic cycle.<br>x32, x64, and x128 can be set for the RJ71GN11-T2 or RJ71GN11-SX with a firmware version of "14" or later.                          | <ul style="list-style-type: none"> <li>x16</li> <li>x32</li> <li>x64</li> <li>x128</li> </ul> (Default: x16)  |

\*1 This can be used for the RJ71GN11-T2 or RJ71GN11-SX with a firmware version "04" or later.

\*2 The setting range of the RJ71GN11-T2 with a firmware version "03" or earlier is from 125.00μs to 4000.00μs.

\*3 The setting range of the RJ71GN11-T2 with a firmware version "03" or earlier is from 5.00μs to 3966.00μs.

\*4 The setting range of the RJ71GN11-T2 with a firmware version "03" or earlier is from 14.00μs to 3975.00μs.

\*5 To use the CC-Link IE TSN network synchronous communication function, set the same value as the value set in "Fixed Scan Interval Setting" of "Fixed Scan Interval Setting of Inter-module Synchronization" under "Inter-module Synchronization Setting" in the "Inter-module Synchronization Setting" tab of "System Parameter".

**Point** 

- When the TSN hub is used, set the timeslot information from the setting values in "Basic Period Setting". The timeslot information can be checked with the buffer memory. ( Page 280 Timeslot information (RJ71GN11-T2 only))
- Set "Communication Period Setting" according to the communication cycle supported by the device stations.

## Connection Device Information

Set the information of the connected device.

| Item                          | Description  | Setting range   |
|-------------------------------|--|---|
| CC-Link IE TSN Class Settings | Set the CC-Link IE TSN Class of the connected device.  | <ul style="list-style-type: none"> <li>• CC-Link IE TSN Class B Only</li> <li>• Mixture of CC-Link IE TSN Class B/A or CC-Link IE TSN Class A only (RJ71GN11-T2 only)</li> </ul> (Default: CC-Link IE TSN Class B Only) |
| TSN HUB Setting               | Set whether to use a TSN hub or not when using a structure of mixed CC-Link IE TSN Class B devices and CC-Link IE TSN Class A devices.<br>Set "Use TSN HUB" when connecting a TSN hub. | <ul style="list-style-type: none"> <li>• Not to Use TSN HUB</li> <li>• Use TSN HUB (RJ71GN11-T2 only)</li> </ul> (Default: Not to Use TSN HUB)  |

### Precautions

- For a structure with mixed CC-Link IE TSN Class B devices and CC-Link IE TSN Class A devices, set "TSN HUB Setting" to "Use TSN HUB" when connecting a TSN hub.
- When "Network Topology" is set to "Ring", set "CC-Link IE TSN Class Setting" of "Connection Device Information" to "CC-Link IE TSN Class B Only". If "Mixture of CC-Link IE TSN Class B/A or CC-Link IE TSN Class A Only" is set, an error code (3016H) is output.
- When "TSN HUB Setting" is set to "Not to Use TSN HUB" and a TSN hub is connected, the device station may not perform data link. ( Page 224 CC-Link IE TSN Class A device does not perform data link (RJ71GN11-T2 only))

## Device Station Setting

Set items related to the device station.

| Item                            | Description   | Setting range  |
|---------------------------------|---|--|
| Disconnection Detection Setting | Set the number of consecutive communication failures until a device station is considered disconnected. | <ul style="list-style-type: none"> <li>• 2 times</li> <li>• 4 times</li> <li>• 8 times</li> </ul> (Default: 4 times) |

## Safety Communication Setting (RJ71GN11-T2 only)

Set whether to use the safety communication or not and set safety connections.

| Item  | Description  | Setting range   |
|---|--|---|
| To Use or Not to Use the Safety Communication Setting | Set whether to use the safety communication or not.  | <ul style="list-style-type: none"> <li>• Not Use</li> <li>• Use</li> </ul> (Default: Not Use) |
| Safety Communication Setting                          | Set the safety connections and transfer ranges of safety devices required for safety communications. | Page 120 Setting method   |

**Restriction** 

Set the following items before configuring the safety communication setting.

- "Network Configuration Settings" in "Basic Settings" ( Page 132 "CC-Link IE TSN Configuration" Window)

If the above items are not set, the device station is not displayed as the target module in the "Select the target module for the Safety Communication Setting" window, and safety communications cannot be set.

## Setting method

The procedure for the safety communication setting is shown below.

1. Set "Communication Destination" to "Local Network".
2. For the master station, select the target module of safety communications in the "Select the target module for the Safety Communication Setting" window and click the [Add] button.

Select the target module for the Safety Communication Setting

Select the target module for the safety communication setting in the local network.  
(Caution)  
- The value will be overwritten if the setting for the same IP address and station No. have already existed.  
- Please set the Network Configuration Settings to set safety communication setting for the local network.

Select All Reset All(Y)

| Station No. | IP Address  | Station Type  | Number of Connections | Model Name |
|-------------|-------------|---------------|-----------------------|------------|
| 1           | 192.168.3.1 | Local Station | 1                     |            |
| 2           | 192.168.3.2 | Local Station | 1                     |            |

Add Cancel

3. Set the required items.

Safety Communication Setting

Check Restore the Default Settings Output to File (for Setting Confirmation)... OK Cancel

4. Click the [OK] button to finish the safety communication setting.
5. For a local station, click the [Import Setting] button in the "Select the target module for the Safety Communication Setting" window.

Select the target module for the Safety Communication Setting

Select the target module for the safety communication setting in the local network.  
(Caution)  
- The value will be overwritten if the setting for the same IP address and station No. have already existed.

Import Setting... Manual Input... Select All Reset All(Y)

| Station No. | IP Address | Station Type | Number of Connections | Model Name |
|-------------|------------|--------------|-----------------------|------------|
|-------------|------------|--------------|-----------------------|------------|

Add Cancel

Click the [Manual Input] button to manually configure the safety communication setting.

6. Select the project of the master station, and the safety communication setting can be imported from the master station.

The data to be imported by the [Import Setting] button covers the station numbers and IP addresses in the project of the master station.

## Setting items

| Item   | Description   | Setting range |
|--|---|---------------|
| Cyclic Transmission Time<br>(Minimum value)      | <p>The cyclic transmission time that is calculated by the number of device stations and the number of points of link devices, or the values set for standard communications and safety communications is displayed. Use the displayed value as a guide.*1</p> <p>The displayed value differs depending on "TSN HUB Setting" of "Connection Device Information" under "Basic Settings" even when the number of device stations and link device points are the same. For details, refer to the following.</p> <p>☞ Page 322 Communication cycle intervals</p> <p>The displayed value can be used for "Cyclic Transmission Time" in "Communication Period Setting" under "Basic Settings" of the module parameter.</p> <p>If the cyclic transmission is not performed while the displayed value is set, set a value obtained by the following formula: Value displayed in Cyclic Transmission Time (Min.) + Greatest value among the two values shown below.</p> <ul style="list-style-type: none"> <li>• 10% of the minimum value of the calculated cyclic transmission time</li> <li>• When the communication speed of the master station is set to 1Gbps:<br/>Number of device stations × 2μs</li> <li>• When the communication speed of the master station is set to 100Mbps:<br/>Number of device stations × 20μs</li> </ul> <p>This cannot be checked when the communication speed of the master station is 1Gbps with version 1.085P or earlier of the engineering tool, and a CC-Link IE TSN Class A device station set to "Basic Period" or "Normal-Speed" exists. Check it with 'Cyclic transmission time (calculation value)' (SW0073). (☞ Page 302 List of link special register (SW))</p> | —             |
| Communication Period Interval<br>(Minimum value) | <p>The communication cycle intervals that are calculated by the number of device stations and the number of points of link devices by using the values set for standard communications and safety communications are displayed. Use the displayed value as a guide.*1</p> <p>The displayed value differs depending on "TSN HUB Setting" of "Connection Device Information" under "Basic Settings" even when the number of device stations and link device points are the same. Check it with 'Communication cycle interval (calculation value)' (SW0072). (☞ Page 302 List of link special register (SW))</p>   | —             |

| Item                                  |                           | Description  | Setting range   |
|---------------------------------------|---------------------------|--|---|
| Setting Method                        |                           | Right-click in the "Safety Communication Setting" window and select an assignment method in "Safety Data Transfer Device Setting".<br><ul style="list-style-type: none"> <li>Start/End: Enter the start and end numbers of safety devices.</li> <li>Points/Start: Enter the points and start numbers of safety devices.</li> </ul> | <ul style="list-style-type: none"> <li>Start/End</li> <li>Points/Start</li> </ul> (Default: Start/End)  |
| No.                                   |                           | Safety connection number for distinguishing settings for each safety connection.   | 1 to 120 <sup>2</sup>   |
| Communication Destination             |                           | Set a network of the communication destination.  | Local Network<br>(Default: empty)   |
| Network Configuration                 | Network No.               | The network number of the communication destination is displayed.  | —   |
|                                       | Station No.               | When the own station is the master station: The station number of communication destination selected in the "Select the target module for the Safety Communication Setting" window is displayed.   | —   |
|                                       | IP Address                | When the own station is the master station: The IP address of communication destination selected in the "Select the target module for the Safety Communication Setting" window is displayed.   | 0.0.0.1 to 223.255.255.254<br>(Default: empty)  |
|                                       | Station Type              | When the own station is the master station: The station type of the communication destination selected in the "Select the target module for the Safety Communication Setting" window is displayed.   | —   |
| Configured Module                     | Model Name                | When the own station is the master station: The module model name of the communication destination selected in the "Select the target module for the Safety Communication Setting" window is displayed. (Only a device station other than the local station)   | —   |
|                                       | Communication Destination | When the communication destination is a local station: Set the CPU model name of communication destination.  | <ul style="list-style-type: none"> <li>R08SF CPU</li> <li>R16SF CPU</li> <li>R32SF CPU</li> <li>R120SF CPU</li> <li>R16NCC CPU</li> <li>CR800-R</li> </ul> (Default: empty)                     |
|                                       | PLC No.                   | When the own station is the master station: Set the CPU number of the communication destination when the CPU module of the communication destination is set to CPU module other than the Safety CPU.   | 2 to 4<br>(Default: empty)  |
| Open System                           |                           | Open system of the own station is displayed.   | <ul style="list-style-type: none"> <li>When the own station is the master station: Active (Fixed)</li> <li>When the own station is a local station: Passive (Fixed)</li> </ul> (Default: empty) |
| Sending Interval Monitoring Time [ms] |                           | In each safety connection, set sending interval monitoring time for a receiving station to detect safety communication errors.   | 3.0 to 1000.0 (Default: empty)  |
| Safety Refresh Monitoring Time [ms]   |                           | In each safety connection, set safety refresh monitoring time for a receiving station to detect safety communication errors.   | 4.0 to 2000.0 (Default: empty)  |

| Item   |                             | Description  | Setting range  |
|--|-----------------------------|--|--|
| Safety Data Transfer Device Setting                | Receive Data Storage Device | Set a safety device of the Safety CPU where safety data are received.  | <ul style="list-style-type: none"> <li>■Device name <ul style="list-style-type: none"> <li>• SAIX</li> <li>• SAIM</li> <li>• SAIB</li> <li>• SAID</li> <li>• SAIW</li> </ul> </li> <li>(Default: empty)</li> <li>■Points <ul style="list-style-type: none"> <li>• Bit device: 16 to 128 (set in increments of 16 points)<sup>*3</sup></li> <li>• Word device: 1 to 8 (set in increments of 1 point)</li> </ul> </li> <li>(Default: empty)</li> <li>■Start/End <ul style="list-style-type: none"> <li>Range of a safety device in the Safety CPU</li> </ul> </li> <li>(Default: empty)</li> </ul> |
|  | Send Data Storage Device    | Set a safety device of the Safety CPU where safety data are sent.  | <ul style="list-style-type: none"> <li>■Device name <ul style="list-style-type: none"> <li>• SAIX</li> <li>• SAIM</li> <li>• SAIB</li> <li>• SAID</li> <li>• SAIW</li> </ul> </li> <li>(Default: empty)</li> <li>■Points <ul style="list-style-type: none"> <li>• Bit device: 16 to 128 (set in increments of 16 points)<sup>*3</sup></li> <li>• Word device: 1 to 8 (set in increments of 1 point)</li> </ul> </li> <li>(Default: empty)</li> <li>■Start/End <ul style="list-style-type: none"> <li>Range of a safety device in the Safety CPU</li> </ul> </li> <li>(Default: empty)</li> </ul> |
| Safety Authentication Code                         |                             | This code is used to identify the communication destination when safety communications perform. Set the same value in the master station and device station to perform the safety communications.<br>When the communication destination is set to a local station, the safety approval code is masked with blank.                                  | 0 to FFFFFFFFH<br>(Default: empty)   |
| [Output to File (for Setting Confirmation)] button |                             | Outputs the contents of the safety communication setting to a CSV file. The file is used to check whether there is no discrepancy between the safety communication setting written to the Safety CPU and that of the project.<br>(  GX Works3 Operating Manual) | —  |

\*1 When the settings cannot be determined with the module parameter and "Network Configuration Settings", a hyphen or incorrect calculation result may be displayed.

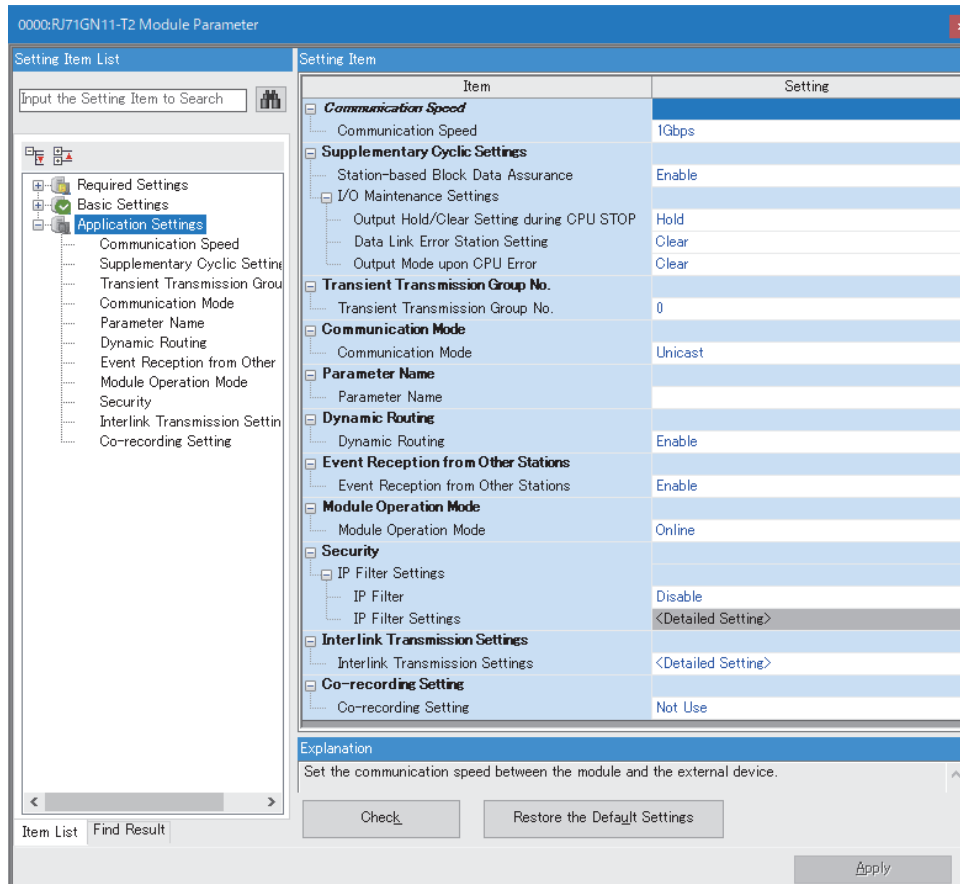

\*2 Set the safety connection number starting with 1.

Even if the safety connection is set in a random line, the unset line is deleted and the number is set starting with 1 when the [OK] button is clicked.

\*3 Safety communications are sent/received in increments of 32 points, however a safety data transfer device setting can be set in increments of 16 points.

## 2.4 Application Settings

Set the supplementary cyclic settings, transient transmission group number, and other settings for the RJ71GN11.

○: Can be set, ×: Cannot be set

## Communication speed setting

Set the communication speed.

| Item                | Description                     | Setting range   |
|---------------------|---------------------------------|---|
| Communication Speed | Select the communication speed. | <ul style="list-style-type: none"> <li>• 1Gbps</li> <li>• 100Mbps*1</li> </ul> (Default: 1Gbps) |

\*1 This speed can be used for the RJ71GN11-T2 with a firmware version of "04" or later.

For details on the connection of modules or devices based on the communication speed setting, refer to the following.

📖 MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

## Supplementary Cyclic Settings

Set the station-based block data assurance and I/O maintenance settings.

| Item                               | Description  | Setting range   |
|------------------------------------|--|---|
| Station-based Block Data Assurance | Select whether to ensure integrity of the data blocks being refreshed between the CPU module and the RJ71GN11. (📖 Page 41 Cyclic data assurance) | <ul style="list-style-type: none"> <li>• Enable</li> <li>• Disable</li> </ul> (Default: Enable)   |
| I/O Maintenance Settings           | Output Hold/Clear Setting during CPU STOP  | Select whether to hold or clear output when the status of the CPU module changes from RUN to STOP. Set it on the sending side. (📖 Page 50 I/O maintenance settings) |
|                                    | Data Link Error Station Setting  | Select whether to clear or hold input from a disconnected station. Set it on the receiving side. (📖 Page 50 I/O maintenance settings)                               |
|                                    | Output Mode upon CPU Error   | Select whether to hold or clear output when a stop error occurs in the CPU module. Set it on the sending side. (📖 Page 50 I/O maintenance settings)                 |

## Link points extended setting (RJ71GN11-SX only)

Set whether to extend the maximum number of link points per network.

| Item                          | Description   | Setting range   |
|-------------------------------|---|---|
| LB/LW Points Extended Setting | Select whether to extend the maximum number of link points per LB/LW network. This setting must be the same for the master station and the local station. If "Communication Mode" has been set to "Unicast", set it to "Not to Extend". | <ul style="list-style-type: none"> <li>• Extend</li> <li>• Not to Extend</li> </ul> (Default: Extend) |

## Transient Transmission Group No. Setting

Set the transient transmission group number.

| Item                                     | Description   | Setting range                                       |
|--|---|---|
| Transient Transmission Group No. Setting | Set the group number to perform transient transmission using group specification. | 0 to 32 (0: No group specification)<br>(Default: 0) |

## Communication Mode

Set the communication mode.

| Item               | Description                 | Setting range   |
|--------------------|-----------------------------|---|
| Communication Mode | Set the communication mode. | <ul style="list-style-type: none"><li>• Unicast</li><li>• Multicast<sup>*1</sup></li></ul> (Default: Unicast) |

\*1 This can be used for the RJ71GN11-T2 or RJ71GN11-SX with a firmware version "04" or later.

## Parameter Name

Set a name for the module parameter if desired.

| Item           | Description                                     | Setting range   |
|----------------|---|---|
| Parameter Name | Set a name for the module parameter if desired. | Up to 8 one-byte or two-byte characters<br>(Default: empty) |

## Dynamic Routing

Select whether to enable the dynamic routing function. (🔍 Page 59 Communications using the engineering tool)

| Item            | Description  | Setting range  |
|-----------------|--|--|
| Dynamic Routing | When communicating with different networks, select whether to enable the dynamic routing function. | <ul style="list-style-type: none"><li>• Enable</li><li>• Disable</li></ul> (Default: Enable) |

### Point

When enabling dynamic routing, do not connect the CPU module (built-in Ethernet port part) and the RJ71GN11 on the same Ethernet using a switching hub or other means.

## Event Reception from Other Stations

Select whether to obtain the events occurring in the other stations.

| Item                                | Description  | Setting range  |
|-------------------------------------|--|--|
| Event Reception from Other Stations | Select whether to obtain the events occurring in the other stations. | <ul style="list-style-type: none"><li>• Enable</li><li>• Disable</li></ul> (Default: Enable) |

# Module Operation Mode

Set the module operation mode of the RJ71GN11.

| Item                  | Description  | Setting range  |
|-----------------------|--|--|
| Module Operation Mode | <p>Online</p> <ul style="list-style-type: none"> <li>Select this mode to connect the RJ71GN11 to the network for performing data link with other stations.</li> </ul> <p>Offline</p> <ul style="list-style-type: none"> <li>Select this mode to disconnect the RJ71GN11 from the network and not perform data link with other stations.</li> </ul> <p>Module Communication Test</p> <ul style="list-style-type: none"> <li>Select this mode to check the hardware of the RJ71GN11. Select this mode to check the module hardware when communication is unstable. (☞ Page 188 Module Communication Test)</li> </ul> | <ul style="list-style-type: none"> <li>Online</li> <li>Offline</li> <li>Module Communication Test (Default: Online)</li> </ul> |

## Restriction

The following functions are disabled when "Module Operation Mode" is set to "Offline" or "Module Communication Test". (☞ Page 20 FUNCTIONS)

- Cyclic transmission
- Transient transmission
- RAS (device station disconnection, automatic return)
- Safety communications

In line topology, data link is not performed for stations connected after a station in offline mode.

# Security

Set the security measures for access to the Ethernet device.

| Item               | Description        | Setting range   |
|--------------------|--------------------|---|
| IP Filter Settings | IP Filter          | Set whether to use the IP filter. <ul style="list-style-type: none"> <li>• Not Use</li> <li>• Use (Default: Not Use)</li> </ul> |
|                    | IP Filter Settings | Set the IP addresses to be allowed or denied.<br>—  |

## IP Filter Settings

Up to 32 IP addresses can be set as an IP address to be allowed or denied by the IP filter.

Range specification and specification of the IP addresses to be excluded from the set range as a single setting are possible.

| Item                           | Description   | Setting range  |
|--------------------------------|---|--|
| Access from IP address below   | Select whether to allow or deny the access from the specified IP addresses.   | <ul style="list-style-type: none"> <li>• Allow</li> <li>• Deny (Default: Allow)</li> </ul> |
| Range Setting                  | Select this item when specifying the IP addresses by range.   | (Default: Clear)   |
| IP Address                     | Set the IP addresses to be allowed or denied.<br>When selecting "Range Setting", enter the start IP address (left field) and end IP address (right field) of the range. | 0.0.0.1 to 223.255.255.254<br>(Default: empty)   |
| IP Address Excluded from Range | When selecting "Range Setting", set the IP address to be excluded from the set range.<br>Up to 32 IP addresses can be set.  | 0.0.0.1 to 223.255.255.254<br>(Default: empty)   |

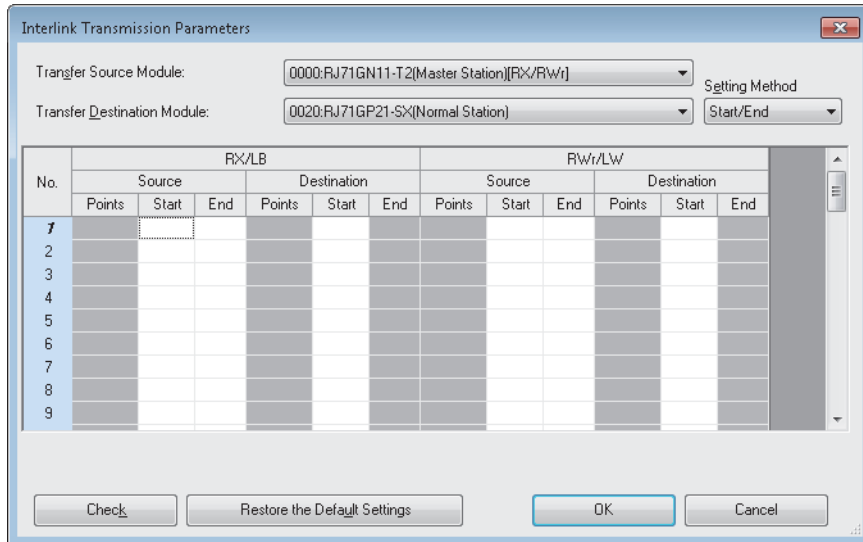

# Interlink Transmission Settings

Set link device ranges when cyclic data are transferred from a station in the own network to a station in a different network.

## Setting method

The procedure for the interlink transmission settings is shown below.

1. Select combination of modules in the "Transfer Source Module" and "Transfer Destination Module" boxes and enter setting values.

2. Click the [OK] button to finish the interlink transmission settings.

| Item                        | Description   | Setting range   |
|-----------------------------|---|---|
| Transfer Source Module      | Select the combination of transfer source and transfer destination modules.   | The setting varies depending on the set module.   |
| Transfer Destination Module |   |   |
| Setting method              | Right-click in the "Interlink Transmission Parameters" window and select a link device setting method from the "Setting Method" menu. <ul style="list-style-type: none"> <li>• Start/End: Enter the start and end numbers of link devices.</li> <li>• Points/Start: Enter the numbers of points and start numbers of link devices.</li> </ul> | <ul style="list-style-type: none"> <li>• Start/End</li> <li>• Points/Start (Default: Start/End)</li> </ul>  |
| RX/LB<br>LB/RX<br>LB/LB     | Source<br>Destination<br>Enter the link device range of the transfer source and destination modules. Up to 64 ranges can be set. RX, RY, and LB points can be assigned in increments of 16 (Start: □□□□0H, End: □□□□FH). <div style="text-align: center;"> </div>   | <ul style="list-style-type: none"> <li>■When not extending the number of link points for the RJ71GN11-T2 and RJ71GN11-SX               <ul style="list-style-type: none"> <li>RX: 0H to 3FFFH</li> <li>RY: 0H to 3FFFH</li> <li>LB: 0H to 7FFFH (Default: empty)</li> </ul> </li> <li>■When link points are extended on the RJ71GN11-SX               <ul style="list-style-type: none"> <li>RX: 0H to 3FFFH</li> <li>RY: 0H to 3FFFH</li> <li>LB: 0H to 1FFFFH (Default: empty)</li> </ul> </li> </ul> |

| Item                      | Description   | Setting range   |
|---------------------------|---|---|
| RWr/LW<br>LW/RWw<br>LW/LW | <p>Source</p> <p>Destination</p> <p>Enter the link device range of the transfer source and destination modules. Up to 64 ranges can be set. RWr, RWw, and LW points can be assigned in increments of 4.</p> | <p>■When not extending the number of link points for the RJ71GN11-T2 and RJ71GN11-SX<br/>RWr: 0H to 1FFFFH<br/>RWw: 0H to 1FFFFH<br/>LW: 0H to 3FFFFH<br/>(Default: empty)</p> <p>■When link points are extended on the RJ71GN11-SX<br/>RWr: 0H to 1FFFFH<br/>RWw: 0H to 1FFFFH<br/>LW: 0H to 7FFFFH<br/>(Default: empty)</p> |

**Point**

Link devices set for "Source" can be overlapped. Doing so will allow transfer of the same link devices to multiple network modules.

**Precautions**

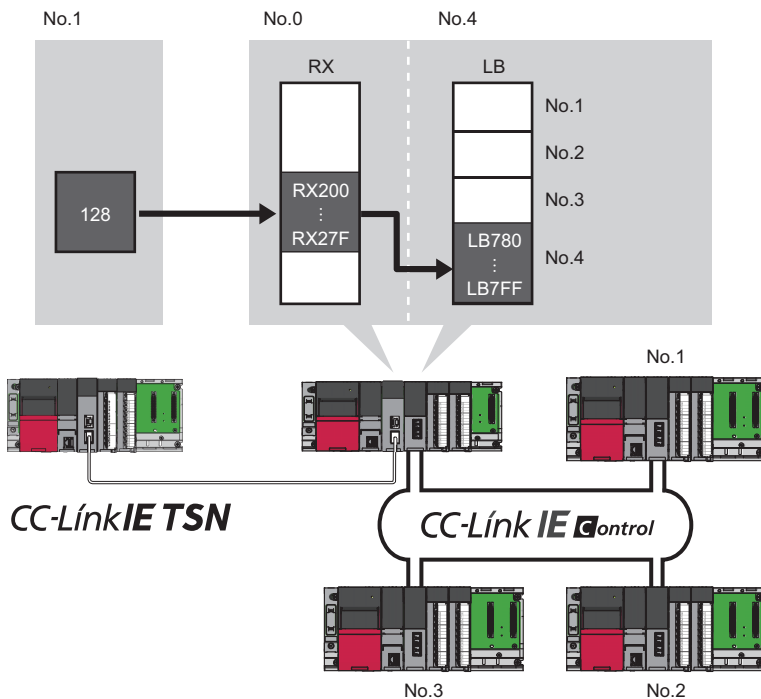

**Transfer destination link device setting**

Do not use link devices set for link refresh range as a transfer destination. If doing so, transfer destination link devices will be overwritten by link refresh. To use transfer destination link device data in the CPU module, set the transfer source link device as the link refresh range.

## Setting example

The following is a setting example to perform interlink transmission from the master station on CC-Link IE TSN to stations on CC-Link IE Controller Network. In this example, 128-point data input from the device station (station No.1) is transferred.

1. Select "0000:RJ71GN11-T2 (Master Station) [RX/RWr]" for "Transfer Source Module" and "0020:RJ71GP21-SX (Normal Station)" for "Transfer Destination Module", and enter the transfer ranges of link devices.

| No. | RX/LB  |       |      |        |       |      | RWr/LW |       |     |        |       |     |
|-----|--------|-------|------|--------|-------|------|--------|-------|-----|--------|-------|-----|
|     | Points | Start | End  | Points | Start | End  | Points | Start | End | Points | Start | End |
| 1   | 128    | 0200  | 027F | 128    | 0780  | 07FF |        |       |     |        |       |     |
| 2   |        |       |      |        |       |      |        |       |     |        |       |     |
| 3   |        |       |      |        |       |      |        |       |     |        |       |     |

2. Click the [OK] button.

### Point

If the transfer destination network module is on a network other than CC-Link IE TSN, set the transfer destination link devices within the own station send range of the network module. If the link devices are set within the send range of another station, the transferred data are overwritten with the send data of another station.

## Co-recording Setting

Set whether to relay a co-recording trigger.

By changing the co-recording setting of the master station or local stations, the range of co-recording on the network can be changed.

For details on the co-recording setting, refer to the following.

 MELSEC iQ-R System Recorder Co-recording Function Reference Manual

| Item                 | Description  | Setting range   |
|----------------------|--|---|
| Co-recording Setting | Set whether to send/receive a co-recording trigger among own station and other stations on the same network.<br>Even when the parameter is set to "Not Use", a co-recording trigger received from another station is sent to other stations. | <ul style="list-style-type: none"> <li>• Not Use</li> <li>• Use</li> </ul> (Default: Not Use) |

### Point

Setting the time synchronization is recommended to ensure that the reference time (JST) of the recording data among the multiple devices are the same. ( Page 81 Time synchronization)

## Master Station Shift Setting (RJ71GN11-SX only)

Set whether to enable or disable the master station switch function.

| Item                         | Description  | Setting range  |
|------------------------------|--|--|
| Master Station Shift Setting | Sets whether to enable or disable the master station switch function, which allows the local station to continue controlling the entire network in place of the master station even if the master station is disconnected. | <ul style="list-style-type: none"> <li>• Disable</li> <li>• Enable</li> </ul> (Default: Disable) |

### Precautions

To enable "Master Station Shift Setting", also set the parameter shown below. If "Master Station Shift Setting" is set to "Enable" and the parameter shown below is not set, a master station switch setting error (error code: 31B2H) will occur.

| Item  | Setting   | Reason  |
|---|-----------|---|
| "Communication Mode" in "Communication Mode" under "Application Settings" | Multicast | Due to the specifications of the master station switch function, only multicast is supported as the communication mode for sending cyclic data. |

## 2.5 "CC-Link IE TSN Configuration" Window

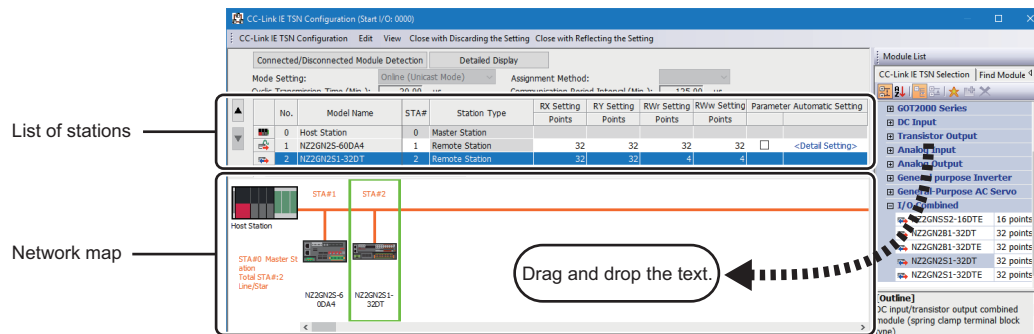

Perform the parameter setting of device stations, the detection of connected/disconnected devices, or others.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ Target module ⇒ [Basic Settings] ⇒ [Network Configuration Settings]

### Parameter setting of a device station

Set parameters of device stations (such as the number of points and assignment of link devices) in the master station.

1. Select the module in "Module List" and drag it to the list of stations or the network map.

2. Set the required items.
3. Check the system configuration.

[CC-Link IE TSN Configuration] ⇒ [Check] ⇒ [System Configuration]

An error or a warning message appears on the output window, refer to the following.

MELSOFT Navigator MessageNo.

4. Select [Close with Reflecting the Setting] and close the "CC-Link IE TSN Configuration" window.

### Precautions

In the system configuration check, the restrictions may not be checked.

Configure a network map after checking the system configuration details in the following.

MELSEC iQ-R CC-Link IE TSN User's Manual (Startup)

### Setting items

- Simple Display: Click the [Simple Display] button to display a narrow portion of items. Use for operation with default settings or the minimum required settings. (Default)
- Detailed Display: Click the [Detailed display] button to display all items.

| Item (Detailed display) | Description   | Setting range   |
|-------------------------|---|---|
| Mode Setting            | <p>■RJ71GN11-T2<br/>The settings for "Module Operation Mode" and "Communication Mode" is displayed.<br/>For details on the settings, refer to the following.</p> <ul style="list-style-type: none"> <li>• Module Operation Mode:  Page 127 Module Operation Mode</li> <li>• Communication Mode:  Page 126 Communication Mode</li> </ul> <p>■RJ71GN11-SX<br/>The same contents as the RJ71GN11-T2 are displayed in the title section of the "CC-Link IE TSN Configuration" window.</p> | —   |

| Parameter Automatic Setting (RJ71GN11-T2 only)  | Set whether to set the parameters of each device station automatically. This cannot be set for extension modules. However, the parameter automatic setting of extension modules is interlocked with the settings of the connected main module.   | <ul style="list-style-type: none"> <li>Checked: Distribute parameters</li> <li>Not checked: Do not distribute parameters</li> </ul> (Default: Not checked)   |
| PDO Mapping Setting                             | Set the PDO mapping to the station that supports CANopen communications. (☞ Page 146 PDO mapping setting (RJ71GN11-T2 only))   | —  |
| IP Address                                      | Set the IP address of a station that performs cyclic transmission.   | 0.0.0.1 to 223.255.255.254 (00.00.00.01 to DF.FF.FF.FE)<br>(Default: The first to third octets have the same values as the master station, the fourth octet has a serial number from 1 to 254)   |
| Subnet Mask                                     | Set a subnet mask to identify a network address.<br>Set the same value for the master station and device station. Even if a device station has a different subnet mask from the master station, it does not result in an input error.<br>If 255.255.255.255 is set, leave it empty.  | <ul style="list-style-type: none"> <li>0.0.0.1 to 255.255.255.255 (00.00.00.01 to FF.FF.FF.FF)</li> <li>Empty</li> </ul> (Default: empty <sup>*5</sup> )   |
| Default Gateway                                 | Set the default gateway address to connect to the external network.<br>If 223.255.255.255 is set, leave it empty.  | <ul style="list-style-type: none"> <li>0.0.0.1 to 223.255.255.254 (00.00.00.01 to DF.FF.FF.FE)</li> <li>Empty</li> </ul> (Default: empty)  |
| Reserved/Error Invalid Station                  | Set the device station as a reserved station or error invalid station. <ul style="list-style-type: none"> <li>No Setting: The device station is connected to the network.</li> <li>Reserved Station: The device station is reserved for future expansion. By using a reserved station, link device assignment will not change even if the device station is added (reservation is canceled). Therefore, modification of the program is not required. Physical connection of the device station is not required.</li> <li>Error Invalid Station: Even if a device station is disconnected during data link, the master station will not detect the device station as a faulty station.</li> </ul> | <ul style="list-style-type: none"> <li>No Setting</li> <li>Reserved Station</li> <li>Error Invalid Station</li> </ul> (Default: No setting, master station is fixed as empty)  |
| Network Synchronous Communication <sup>*2</sup> | Set whether to synchronize each device station with network synchronous communication.   | <ul style="list-style-type: none"> <li>Synchronous</li> <li>Asynchronous</li> </ul> (Default: Asynchronous)  |

| Item (Detailed display)                                       | Description  | Setting range   |
|---|--|---|
| Communication Period Setting (RJ71GN11-T2 only)               | When multiple communication cycles are set, set the communications cycle of each device station. (☞ Page 48 Communication cycles coexistence)  | <ul style="list-style-type: none"> <li>Basic Period</li> <li>Normal-Speed</li> <li>Low-Speed</li> </ul> (Default: Basic Period)   |
| Communication Period Setting RX/Ry/RWr/RWw (RJ71GN11-SX only) |  |   |
| Communication Period Setting LB/LW (RJ71GN11-SX only)         | <p>■When extending the number of link points<br/>Set the LB/LW communication period. (☞ Page 31 Extending the number of link points (RJ71GN11-SX only))</p> <p>■When not extending the number of link points<br/>Cannot be set. (☞ Page 31 Extending the number of link points (RJ71GN11-SX only))</p>                                   | <ul style="list-style-type: none"> <li>Master Station: Grayout</li> <li>Other than Master Station: Displays the same value as "Communication Period Setting RX/Ry/RWr/RWw".</li> </ul> (Default: Varies depending on the setting) |
| Station Information   | <p>■Alias<br/>Enter the name of a device if required.<br/>The name entered is displayed in "Network Status" of the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window.<br/>For the extension module of the remote station, the name is not displayed in the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window, even if entered.</p> | Up to 32 one-byte characters (one-byte or two-byte)<br>(Default: empty)   |
|   | <p>■Comment<br/>Information entered in "Comment1" on the "Properties" window displayed by right-clicking the module in the list of stations or the network map is displayed.</p>   | Up to 32 one-byte characters (one-byte or two-byte)<br>(Default: empty)   |
|   | <p>■Station-specific mode setting<br/>Set the station-specific mode of the device station. (Only when the device station supports the station-specific mode.)</p>  | The setting varies depending on the set module.   |
| CC-Link IE TSN Class  | Set whether each device station is a CC-Link IE TSN Class B device or a CC-Link IE TSN Class A device.*4   | <ul style="list-style-type: none"> <li>CC-Link IE TSN Class B</li> <li>CC-Link IE TSN Class A</li> </ul> (Default: Varies depending on the device)  |

\*1 When the settings cannot be determined with the module parameter and "Network Configuration Settings", a hyphen or incorrect calculation result may be displayed.

\*2 This speed can be used for the RJ71GN11-T2 with a firmware version of "10" or later. An error occurs if "Synchronous" is set for a module that does not support it.

\*3 When the "CC-Link IE TSN Class" of the general CC-Link IE TSN module added to the list of stations under network configuration setting is CC-Link IE TSN Class A, when the minimum value for the communication cycle interval and cyclic transmission time are set to "Communication Period Interval Setting" and "Cyclic Transmission Time", cyclic transmission may not be possible. In this case, select the actual devices to be used from "Module List" and add it to the list of stations, or check the maximum response time during time-managed polling using the manuals of the devices used, and calculate and set the communication cycle interval and cyclic transmission time.

\*4 If the number of points of the assigned link device exceeds the number of points that can be assigned to the CC-Link IE TSN Class A station, a link device number of points error occurs (error code: 3160H). For the number of points that can be assigned to CC-Link IE TSN Class A device stations, refer to the following.

☞ Page 135 Number of link devices that can be assigned to a CC-Link IE TSN Class A device station

\*5 If "Subnet Mask" is set in "Station No./IP Address Setting" of "Required Settings", the same value is set as default.

### Point

Because a portion of the setting items are not displayed in simple display, when there are deficiencies in setting items that are not displayed, the "Output" window may display a warning or error by selecting [Close with Reflecting the Setting].

If a warning is displayed, switch to detailed display and correct the items.

### ■Number of link devices that can be assigned to a CC-Link IE TSN Class A device station

The number of points of link devices assigned to a CC-Link IE TSN Class A device station must satisfy the following two conditional formulas.

- (Number of points of "RY Setting" ÷ 8) + (Number of points of "RWw Setting" × 2) ≤ 1912
- (Number of points of "RX Setting" ÷ 8) + (Number of points of "RWr Setting" × 2) ≤ 1872

# Connected/Disconnected Module Detection (RJ71GN11-T2 only)

Connected device stations are detected and displayed on the "CC-Link IE TSN Configuration" window.

When setting up a network system, it is easier to create parameters when changing the network system configuration.

If this function is performed immediately after a device station is connected, the information of the connected device may not be correctly read out. In this case, retry the operation.

1. Click the [Connected/Disconnected Module Detection] button.
2. When the [Execute] button is clicked according to the instruction on the window, connected device stations are detected and displayed on the "CC-Link IE TSN Configuration" window.

3. Check items in the list of stations and change them as necessary. (☞ Page 132 Setting items)
4. Select [Close with Reflecting the Setting] and close the "CC-Link IE TSN Configuration" window.

## Point

Detection of connected/disconnected devices cannot be executed in the following cases.

- The RJ71GN11-T2 is not in "Online". (☞ Page 127 Module Operation Mode)
- "Link Direct Device Setting" of the CPU parameter is not "Extended Mode (iQ-R Series Mode)".
- When multiple numbers of the RJ71GN11-T2 are mounted on the base unit, and the module that has the smallest slot number is a local station, the local station is not in the "Online", or that station is in data link error.
- The actual system configuration is incorrect. (An overlapping IP address or others)
- The version of the engineering tool is "1.082L" or earlier and the data link of the master station is incorrect.
- The firmware version of the RJ71GN11-T2 is "14" or earlier and the data link of the master station is incorrect.

## Connection/Disconnection/Replacement

When the [Connected/Disconnected Module Detection] button is clicked while the saved CC-Link IE TSN configuration is displayed, IP addresses of detected device stations are compared with the saved IP addresses of device stations and displayed as follows by connection/disconnection/replacement.

| IP address verification result  | Operation  | Display   | When station numbers of detected device stations are not set   |
|---|------------|---|--|
| Detected device stations are in the saved CC-Link IE TSN structure.     | Replace    | <p>When parameters between a detected device station and a saved CC-Link IE TSN structure mismatch, the parameters are replaced with the parameters of the detected device station.</p> <p>When the model name, model version, and station type are mismatched, the following settings are inherited.</p> <ul style="list-style-type: none"> <li>• "Motion Control Station"</li> <li>• "RX Setting", "RY Setting", "RWr Setting", "RWw Setting", "LB Setting", "LW Setting"</li> <li>• "IP Address" of the master station</li> <li>• "Subnet Mask"</li> <li>• "Default Gateway"</li> <li>• "Reserved/Error Invalid Station" (Note that if "Reserved Station" is set, the setting will change to the default.)</li> <li>• "Network Synchronous Communication"</li> <li>• "Communication Period Setting"</li> </ul> <p>When the model name and function version match and the station type does not match for devices with the following settings, the configuration set in the device is also inherited as well as the settings inherited when the model name, function version, and station type are mismatched.</p> <ul style="list-style-type: none"> <li>• Extension module configuration</li> <li>• AnyWireASLINK configuration under the bridge module</li> <li>• CC IE Field configuration under the bridge module</li> </ul> <p>The PDO mapping settings that were set on the device before replacement are cleared.</p> <p>The parameter information of "Parameter of Device Station" held by the device before replacement is cleared.</p> <p>If only the station number is mismatched, only the station number is reflected, and all the settings are inherited.</p> <p>(Note that if the station number of the detected device has not been set, the station number of the device before replacement is inherited.)</p> <p>The mode setting changes to the detected mode.</p> <p>If a device station that holds the following configuration is to be replaced, the configuration information held by the device before replacement will be cleared.</p> <ul style="list-style-type: none"> <li>• Extension module configuration</li> <li>• AnyWireASLINK configuration under the bridge module</li> <li>• CC IE Field configuration under the bridge module</li> </ul> | The station number takes over the station number of the saved CC-Link IE TSN structure.  |
| Device stations in the saved CC-Link IE TSN structure are not detected. | Disconnect | <ul style="list-style-type: none"> <li>• Modules other than extension modules: Setting of "Reserved/Error Invalid Station" is changed to "Reserved Station".</li> <li>• Extension modules: Are deleted.</li> </ul>  | —  |
| Detected device stations are not in the saved CC-Link IE TSN structure. | Connect    | <p>Detected device stations are added. (Settings other than "IP Address", "STA#", and "Station Type" are default)</p> <p>When adding a device, the defaults other than IP address, station number, and station type are set.</p> <p>(However, if the station number of the detected device has not been set, the station number is also set to the default.*1)</p> <p>The mode setting changes to the detected mode.</p>  | <p>A station number is automatically numbered as the youngest unused station number in the range from 1 to 120.</p> <p>The order of automatic numbering is the same as the displayed order in the list of stations (see left).</p> |

\*1 A station number is automatically numbered as the youngest unused station number in the range from 1 to 120. If the numbers do not match between the automatically numbered station and the station numbered by the detected device station, take either of the following actions.

- Change the station number in "Network Configuration Settings" of the master station to the same value as the station number set by the device station.
- Change the station number of the device station to the same value as the station number set in "Network Configuration Settings" of the master station.

## Precautions

- When the station number is set in the device station using the CC-Link IE TSN structure and parameters are written in CPU modules, the station number of the device station is held in the master station. When parameters are not to be written in CPU modules, they are saved in the CC-Link IE TSN structure as device stations with the station number not set.
- If the actual system configuration is incorrect, executing this function may not automatically set some or all device stations. Check that nothing is incorrect in the system configuration before executing.
- If automatic detection is performed while the CPU module is running, the scan time of the programmable controller may increase depending on the system configuration.

### Point

Register the profile of the device to be detected in advance.

If the profile is not registered, the following may be displayed.

- "Model Name" is "General Remote Station", "General Local Station", or "General Extension Module".
- "Station Type" is "Remote Station", "Local Station", or "Extension Module".

For how to register a profile, refer to the following.

 GX Works3 Operating Manual

### Restriction

- Even when the profile is registered, if modules that are not available for detection of connected/disconnected devices are used, "Model Name" and "Station Type" are not displayed correctly.
- This function is not available for local stations.

# Parameter processing of a device station (RJ71GN11-T2 only)

The processing is to read and save the parameters from the device station, and to write the saved parameters to the device station.

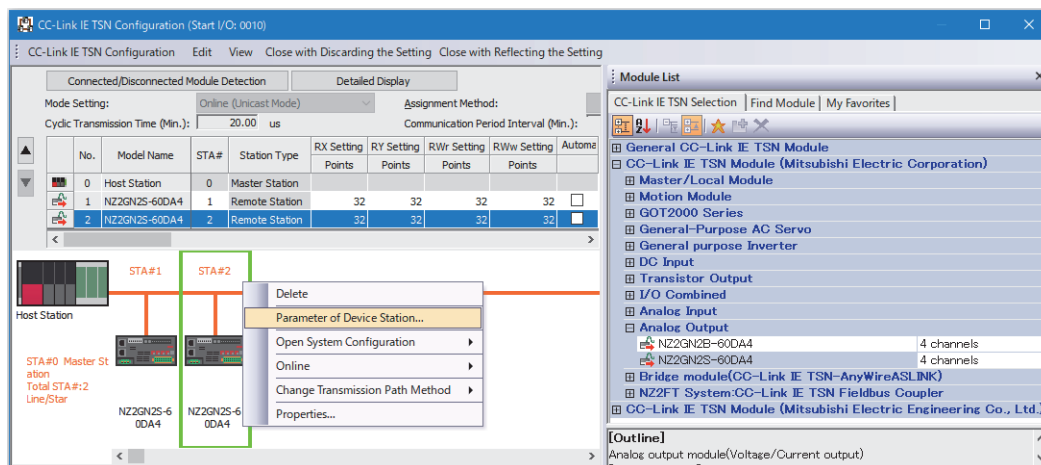

Also, it automatically sets parameters of the device station from the master station. (☞ Page 107 Device station parameter automatic setting (RJ71GN11-T2 only))

## Restriction

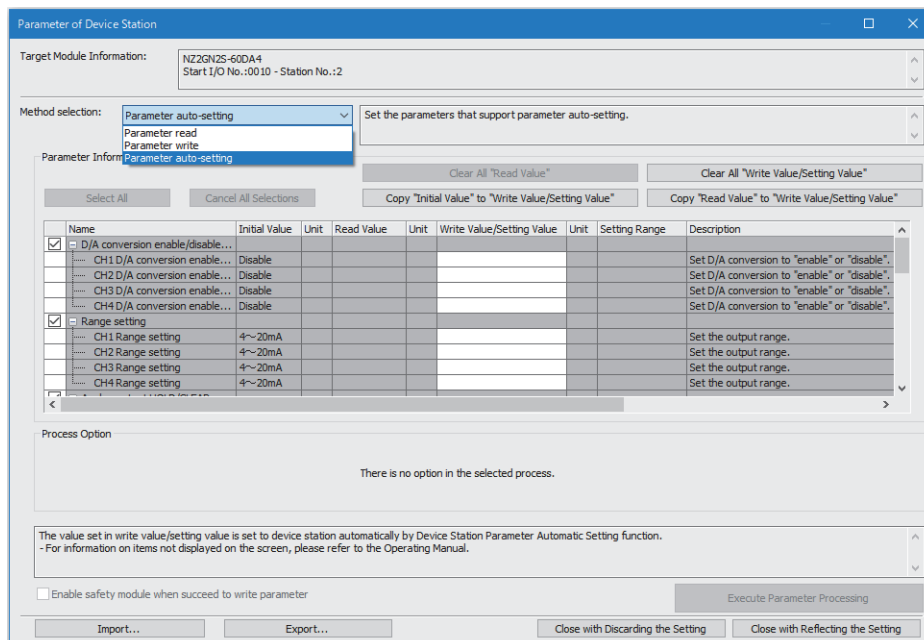

When performing parameter processing for the main module to which an extension module is connected, use the following module.

- The RJ71GN11-T2 with a firmware version of "12" or later

☞ [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ Target module ⇒ [Basic Settings] ⇒ [Network Configuration Settings] ⇒ [Detailed Setting]

Select and right-click the device station, and select "Parameter of Device Station" to display the "Parameter of Device Station" window.

| Item                      | Description  |  |
|---------------------------|--|--|
| Target Module Information | Information for the selected device stations is displayed.   |  |
| Method Selection          | Select processing to be executed for selected device stations. <ul style="list-style-type: none"> <li>Parameter auto-setting: Automatically set contents of "Write Value/Setting Value" to the device station. (☞ Page 107 Device station parameter automatic setting (RJ71GN11-T2 only))</li> <li>Parameter read: Read parameters from the selected device station.</li> <li>Parameter write: Write parameters to the selected device station.</li> </ul> |  |
| Parameter Information     | [Clear All "Read Value"] button  | Click to clear all setting details that were read using "Parameter read".    |
|                           | [Clear All "Write Value/Setting Value"] button   | Click to clear all setting details that are written using "Parameter write". |
| Processing option         | When there are options for processing selected by "Method Selection", setting items are displayed.   |  |
| [Import] button           | Read contents of parameter processing created in a CSV file.   |  |
| [Export] button           | Output contents of parameter processing set in this window to a CSV file.  |  |

## Procedure for clearing a saved parameter

When returning the saved parameters of a not-required device station to the not-set status, perform the following procedure.

1. If the saved parameters are to be saved, output them in a CSV file using the [Export] button.
2. Delete not-required device stations from the list of stations.
3. Select the same module as the deleted device station in "Module List", and drag it to the list of stations or the network map.

## Conditions for clearing a saved parameter

Saved parameters of a device station can be cleared under the following conditions.

When saved parameters are cleared, execute "Parameter auto-setting" or "Parameter read" in the "Parameter of Device Station" window and read the parameters of the device station.

| Item                                  | Operation   | Description   |
|---------------------------------------|---|---|
| "CC-Link IE TSN Configuration" window | Open the "CC-Link IE TSN Configuration" window.   | When there is no device station with a station number that matches the saved parameters in the "CC-Link IE TSN Configuration" window, the saved parameters of the relevant device station are skipped.<br>Skipped parameters of the device station are cleared. |
|                                       | Reflect setting and close the window.   | Saved parameters of a device station that is not in the actual system configuration are cleared.  |
|                                       | Execute detection of connected/disconnected devices.  | All saved parameters are cleared.   |
|                                       | Change the function version in the "Properties" window.   | When the "Properties" window is closed, saved parameters are cleared.   |
| "Parameter of Device Station" window  | Open the "Parameter of Device Station" window.  | Saved parameters that mismatch the relevant device station are skipped.<br>Clicking the [Close with Reflecting the Setting] button in the above state clears the skipped saved parameters.  |
| Module Parameter                      | Manually delete "Network Configuration Settings" to apply.  | Parameters of "Network Configuration Settings" return to default.   |
|                                       | Change the "Setting Method of Basic/Application Settings" under "Parameter Setting Method" in "Required Settings" from "Parameter Editor" to "Program". |   |
|                                       | Change "Station Type" or set parameters that do not exist.  |   |
| System Parameter                      | Divert system parameters from another project.  | Parameters of the device station are not diverted.  |
| Module Configuration                  | Delete a module and check.  | Parameters are deleted together with the module.  |
| Navigation window                     | Delete a module.  |   |
| Read from PLC                         | Read module parameters that have a different network configuration and the same start I/O number.   | Parameters are overwritten.   |
| Navigation window                     | Import the data of a simple motion module to take network settings.   |   |
| MELSOFT Navigator                     | Reflect the parameter.  | Saved parameters are cleared.   |

# Command execution to device stations (RJ71GN11-T2 only)

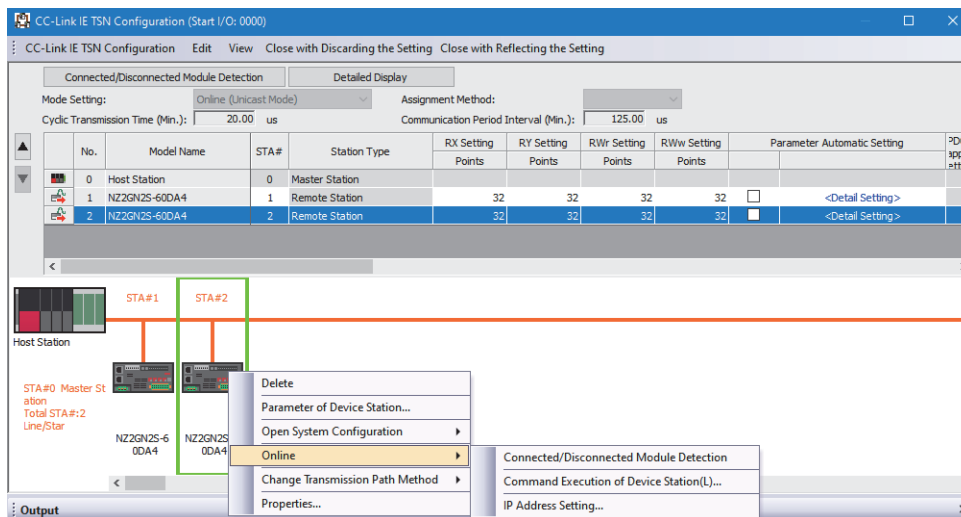

Commands to a device station (Error clear request, Error history clear request) are executed.

## Restriction

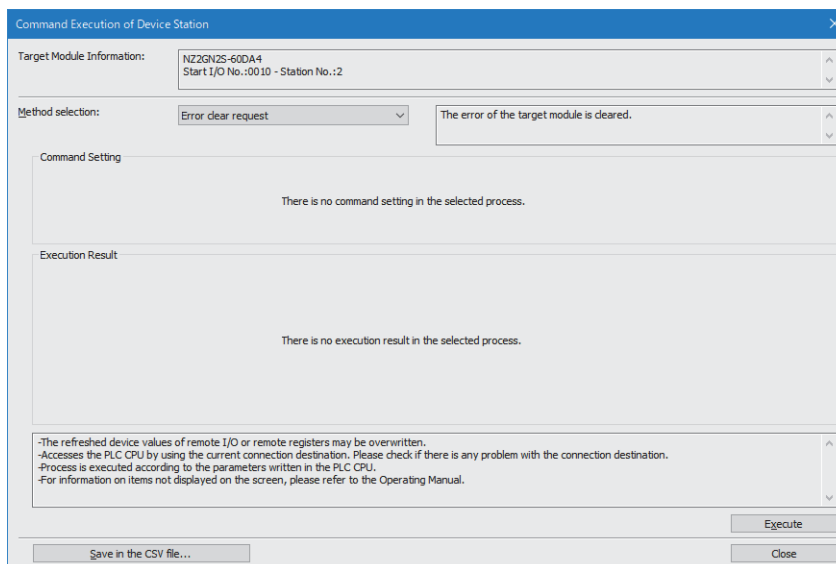

When performing command execution for the main module to which an extension module is connected, use the following module.

- The RJ71GN11-T2 with a firmware version of "12" or later

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ Target module ⇒ [Basic Settings] ⇒ [Network Configuration Settings] ⇒ [Detailed Setting]

Select and right-click the device station, and select "Command Execution of Device Station" from "Online" to display the "Command Execution of Device Station" window.

| Item                          | Description   |
|-------------------------------|---|
| Target Module Information     | Information for the selected device stations is displayed.  |
| Method Selection              | Select processing to be executed for selected device stations. <ul style="list-style-type: none"> <li>• Error clear request</li> <li>• Error history clear request</li> </ul> |
| Command setting               | When there are command settings for processing selected by "Method selection", setting items are displayed.   |
| Execution Result              | Execution results of the processing selected in "Method selection" are displayed.   |
| [Save in the CSV file] button | Outputs the contents of this window to a CSV file.  |

# IP address setting of a device station (RJ71GN11-T2 only)

Set the IP address of the device station connected to the master station.

## Restriction

When setting the IP address of the device station and performing indicator display, check the following.

- RJ71GN11-T2 (  Page 350 Added and Enhanced Functions)
- Engineering tool: Version 1.100E or later
- Device station (  User's manual for the device station used)

## Point

Register the profile of the device to be detected in advance.

If the profile is not registered, the following may be displayed.

- "Model Name" is "General Remote Station", "General Local Station", or "General Extension Module".
- "Station Type" is "Remote Station", "Local Station", or "Extension Module".

For how to register a profile, refer to the following.

 GX Works3 Operating Manual

Extension-side devices that do not have an IP address are not detected and are therefore not displayed.

## IP address setting

Set the IP address of the device station connected to the master station.

## Indicator display

This setting allows starting and stopping the indicator display of device stations connected to the master station.

The device station that started indicator display can be checked on the LED indicator. For the status of the LED indicator, refer to the user's manual for the device station used.

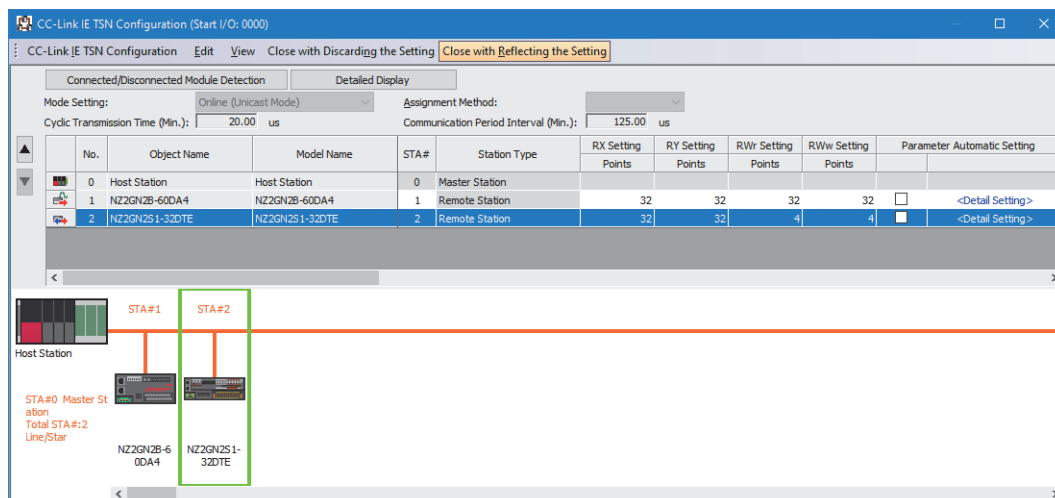

The indicator display allows checking which device station is in the actual network configuration.

## Setting method

### Operating procedure

1. Open the "CC-Link IE TSN Configuration" window.

 [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ Target module ⇒ [Basic Settings] ⇒ [Network Configuration Settings]

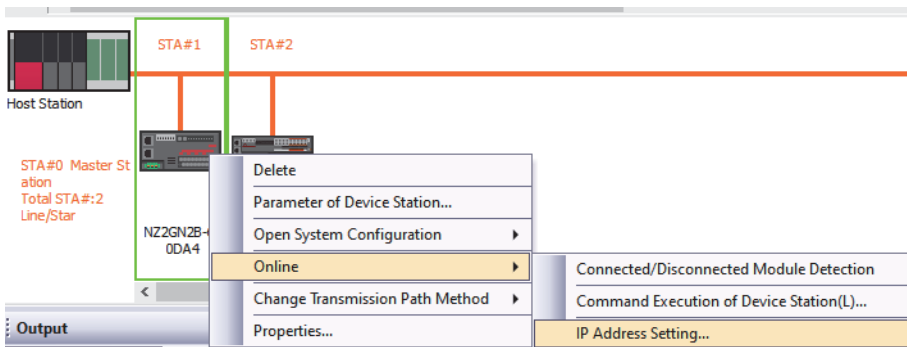

| No. | Object Name    | Model Name     | STA# | Station Type   | RX Setting Points | RY Setting Points | RW Setting Points | RWw Setting Points | Parameter Automatic Setting         |
|-----|----------------|----------------|------|----------------|-------------------|-------------------|-------------------|--------------------|-------------------------------------|
| 0   | Host Station   | Host Station   | 0    | Master Station |                   |                   |                   |                    |                                     |
| 1   | NZ2GN2B-60DA4  | NZ2GN2B-60DA4  | 1    | Remote Station | 32                | 32                | 32                | 32                 | <input type="checkbox"/>            |
| 2   | NZ2GN2S1-32DTE | NZ2GN2S1-32DTE | 2    | Remote Station | 32                | 32                | 4                 | 4                  | <input checked="" type="checkbox"/> |

Network Diagram: A Host Station is connected to two Remote Stations, STA#1 (NZ2GN2B-60DA4) and STA#2 (NZ2GN2S1-32DTE). STA#2 is highlighted with a green box. The diagram shows a red line representing the network backbone connecting the Host Station to both Remote Stations.

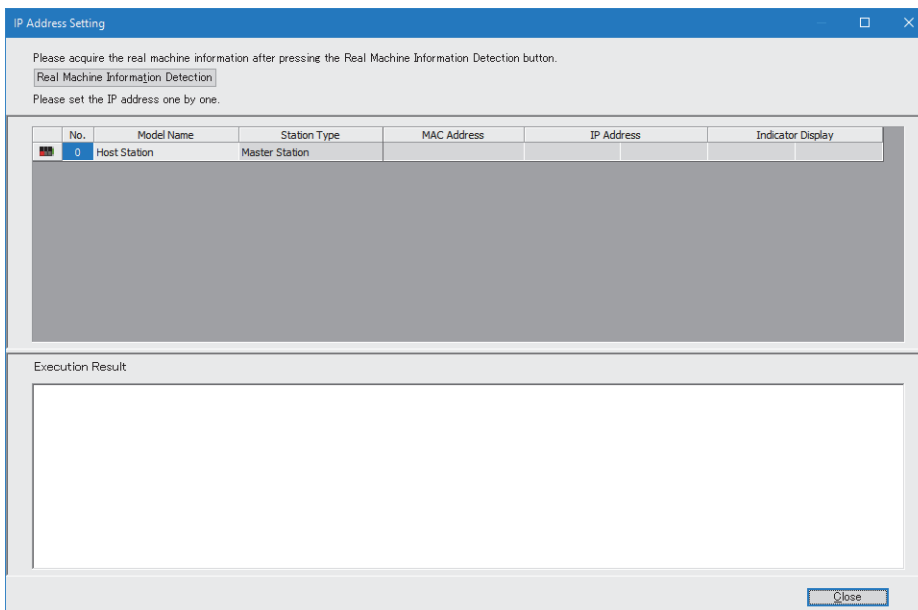

2. Open the "IP Address Setting" window.

Select the device station and right-click ⇒ [Online] ⇒ [IP Address Setting].

3. Click the [Real Machine Information Detection] button.

Check whether the device station is in a state where the IP address can be set or the indicator display can be started.

4. Follow the displayed message and click the [Execute] button.

#### Point

In the following cases, actual device information cannot be detected.

- "Module Operation Mode Setting" under "Application Settings" of the RJ71GN11-T2 is not in the online mode.
- In the CPU parameters of the CPU modules, "Link Direct Device Setting" of "Memory/Device Setting" is not "Extended Mode (iQ-R Series Mode)".
- When multiple numbers of the RJ71GN11-T2 are mounted on the base unit, and the module that has the smallest slot number is a local station, check whether "Module Operation Mode Setting" under "Application Settings" of that local station is set to online mode, or that station is in data link error.
- There is a problem with the actual system configuration, such as duplication of IP addresses between the master station and device stations.

5. Follow the displayed message and click the [OK] button.

6. The actual device information of the device station connected to the master station is displayed. The execution results are displayed at the bottom of the window.

7. Set the IP address and perform indicator display.

---

For the operation procedures for IP address setting and indicator display, refer to the following.

User's manual for the device station used

---

## Precautions

- If, after clicking the [Real Machine Information Detection] button, the system configuration is changed and IP address setting of device stations or indicator display is performed, normal completion may not occur. If the system configuration has been changed, click the [Real Machine Information Detection] button again and then perform device station IP address setting or indicator display.
- If indicator display has been started, be sure to stop indicator display or power off and on the device station. The LED indication on the device station will continue indicating that the indicator is running until indicator display is stopped or the device station is powered off and on.

## PDO mapping setting (RJ71GN11-T2 only)

Set the PDO mapping to the station that supports CANopen communications.

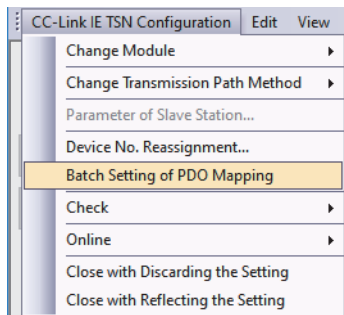

When an extension module such as the multi-axis servo amplifier having PDO mapping information is connected to the RJ71GN11-T2, the maximum number of connectable modules varies depending on the number of axes.

**Ex.**

When a multi-axis servo amplifier with three axes is connected, the RJ71GN11-T2 can connect up to 40 stations which is determined by divided 120 (the maximum number of connectable stations) by 3 (the number of axes).

### "Batch Setting of PDO Mapping"

Set the default PDO mapping to the target device stations at once.

1. Click "Batch Setting of PDO Mapping".

 [Basic Settings] ⇒ [Network Configuration Settings] ⇒ [CC-Link IE TSN Configuration] ⇒ [Batch Setting of PDO Mapping]

2. Check the confirmation message appeared, then click the [OK] button.

3. When the completion window of "Batch Setting of PDO Mapping" is appeared, click the [OK] button.

### ■Cases where the PDO mapping is not set

The PDO mapping is not set to the target device stations in the following cases:

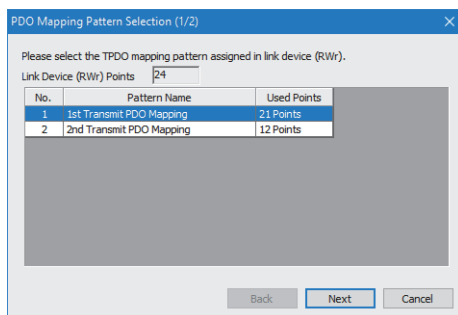

- A station that can be set the PDO mapping does not exist.
- The numbers of points of "RW<sub>r</sub> Setting" and "RW<sub>w</sub> Setting" are less than the points used in the default pattern.
- The setting is performed when "RW<sub>r</sub> Setting" and "RW<sub>w</sub> Setting" are blanks, and the checkbox of "Batch set default pattern only when PDO mapping is unset device station" is not selected.

### "PDO Mapping Setting"

Set the PDO mapping of the target device stations individually.

 [Basic Settings] ⇒ [Network Configuration Settings] ⇒ [PDO Mapping Setting] ⇒ Double-click [Detail Setting] of the target device station.

1. Select a PDO mapping pattern of TPDO assigned in the link device (RW<sub>r</sub>). Click the [Next] button.

2. Select a PDO mapping pattern of RPDO assigned in the link device (RW<sub>w</sub>). Click the [OK] button.

### 3. Check the selected PDO mapping pattern.

### 4. Click the [OK] button to close "PDO Mapping Setting".

#### ■Cases where the PDO mapping is not set

The PDO mapping is not set to the target device stations in the following cases:

- The number of points in "RWr Setting" is one or more points and an entry is not assigned in TPDO.
- The number of points in "RWw Setting" is one or more points and an entry is not assigned in RPDO.
- A line where "Sub-Index" is blank though a value has been entered in "Index" exists.
- Entries are assigned out of the link device range.
- The same entry is assigned to the multiple link devices.

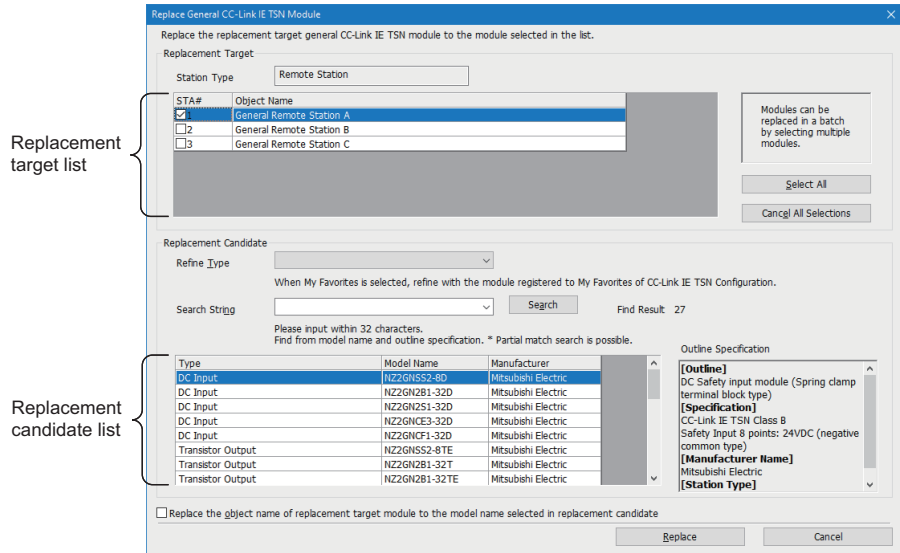

# Change of module

This section describes how to replace a general CC-Link IE TSN module with a module (device station) and vice versa.

## Replacement of CC-Link IE TSN module

Replace a general CC-Link IE TSN module with a module (device station).

- Right-click a general CC-Link IE TSN module from the list of stations on the "CC-Link IE TSN Configuration" window. ⇒ [Change Module] ⇒ Click [Replace General CC-Link IE TSN Module].

| Item                  |  | Description  |
|-----------------------|--|--|
| Replacement Target    | Station Type   | The station type of the general CC-Link IE TSN module selected from the list of stations on the "CC-Link IE TSN Configuration" window is displayed.  |
|                       | Replacement target list  | General CC-Link IE TSN modules whose station types are the same as the general CC-Link IE TSN modules selected from the list of stations on the "CC-Link IE TSN Configuration" window are displayed. By selecting the checkboxes, multiple general CC-Link IE TSN modules can be replaced. |
|                       | [Select All] button  | Selects all checkboxes in the replacement target list.   |
|                       | [Cancel All Selections] button   | Deselects all checkboxes in the replacement target list.   |
| Replacement Candidate | Refine Type  | Narrows the replacement candidates in the list by types.   |
|                       | Search String  | Searches the input character string from models and outline specifications.  |
|                       | [Search] button  | The replacement candidate list is displayed on conditions that set by "Refine Type" and "Search String".   |
|                       | Replacement candidate list   | The modules to be replaced are displayed.  |
|                       | Outline Specification  | The outline specifications of the module selected in the replacement candidate list are displayed.   |
|                       | Replace the object name of replacement target module with the model name selected from replacement candidate | By selecting the checkbox, the object name of the replacement target module is replaced with the module model name selected from the replacement candidate.  |
|                       | [Replace] button   | Replaces the module selected in the replacement target list with the module selected in the replacement candidate list.  |
|                       | [Cancel] button  | Cancel the replacement processing and close the window.  |

## Change of arbitrary device station

Replace a module (device station) with a general CC-Link IE TSN module of the same station type.

- Right-click a device station in the list of stations on the "CC-Link IE TSN Configuration" window. ⇒ [Change Module] ⇒ Click [Change to General CC-Link IE TSN Module].

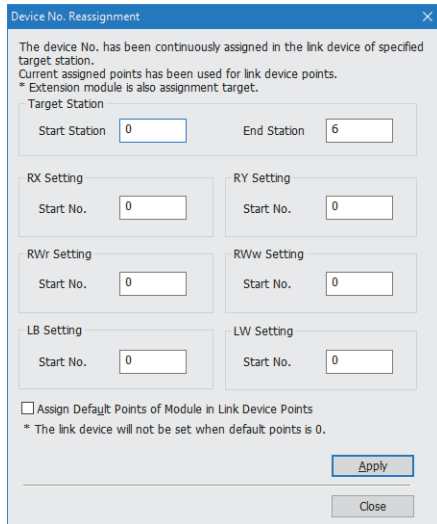

# Device number reassignment

Assign the device numbers successively to the link device of the specified target station.

For the number of link device points, the points assigned in the list of stations on the "CC-Link IE TSN Configuration" window are used.

## 1. Display "Device No. Reassignment".

 [CC-Link IE TSN Configuration] ⇒ [Device No. Reassignment]

## 2. Enter the values in the "Device No. Reassignment" and click the [Apply] button.

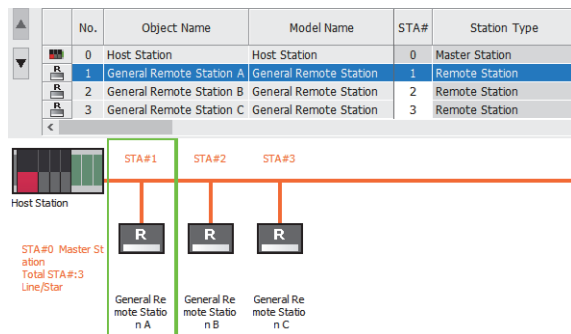

When the [Apply] button is clicked with the checkbox of "Assign Default Points of Module in Link Device Points" selected, the default points of each module are reassigned. However, if a default number of points is 0, the number of points of corresponding link device is not assigned.

# Object name display

The object name of the module displayed in the list of stations on the "CC-Link IE TSN Configuration" is displayed.

[View] ⇒ [Object Name Display]

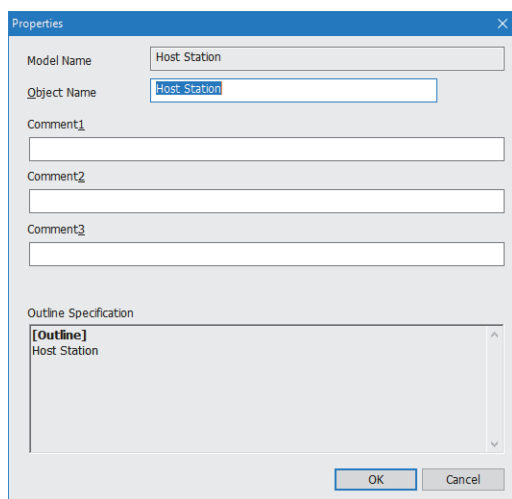

## Change of object name

Object names can be changed to any desired names.

Changing object names helps users to identify each module on the "CC-Link IE TSN Configuration" window.

1. In the network map on the "CC-Link IE TSN Configuration" window, right-click the module whose object name is changed and click "Properties".

2. Change "Object Name".
3. Click the [OK] button.

# 3 PROGRAMMING

This chapter describes programming and startup examples of CC-Link IE TSN.

## 3.1 Precautions for Programming

This section describes precautions to create CC-Link IE TSN programs.

### Cyclic transmission program

For a cyclic transmission program, configure an interlock with the following module labels (link special relay (SB), link special register (SW)).

- 'Data link error status of own station' (SB0049)
- 'Data link status of each station' (SW00B0 to SW00B7)

### Program using safety communications

For a program using safety communications, interlock with the safety special register described below. (For the 1st master/local module)

- 'Safety refresh communication status of each safety connection (1st module)' (SA\SD1008 to SA\SD1015)

For a communication example using the safety communications, refer to the following.

- Communication Example of Safety Communications (  Page 165 Communication Example of Safety Communication (RJ71GN11-T2))

## 3.2 Communication Example with CC-Link IE TSN Class A Remote Station (RJ71GN11-T2)

When "Communication Mode" is set to "Multicast", the local station cannot obtain data output by the CC-Link IE TSN Class A remote station. Use the following communication examples so that the local station can obtain data output by the CC-Link IE TSN Class A remote station.

### System configuration

The following is an example of communications between the CC-Link IE TSN Class B master station (station No.0), CC-Link IE TSN Class A remote station (station No.1), and local station (station No.2).

- Power supply module: R61P
- CPU module: R04CPU
- Master/local module: RJ71GN11-T2
- Remote module: CC-Link IE TSN Class A remote station

- No.0: CC-Link IE TSN Class B master station (station No.0)
- No.1: CC-Link IE TSN Class A remote station (station No.1)
- No.2: CC-Link IE TSN Class B local station (station No.2)

# Link device assignment

For RX and RWr, 256 points are assigned to each station.

For RY and Rww, 256 points are assigned to a remote station and 512 points are assigned to a local station.

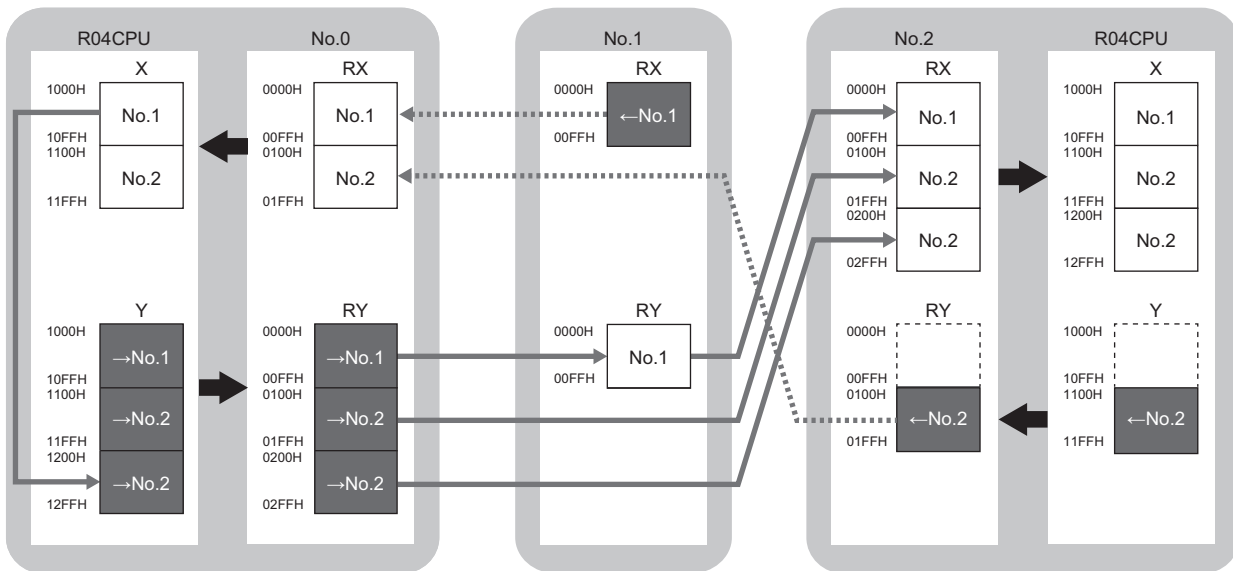

## Communication Mode

In "Communication Mode" under "Application Settings", set "Multicast" (Default).

### ■RX/RX assignment

Each of the following No.0 to No.2 represents a station number.

- No.0: Master station (station No.0)
- No.1: Remote station (station No.1)
- No.2: Local station (station No.2)

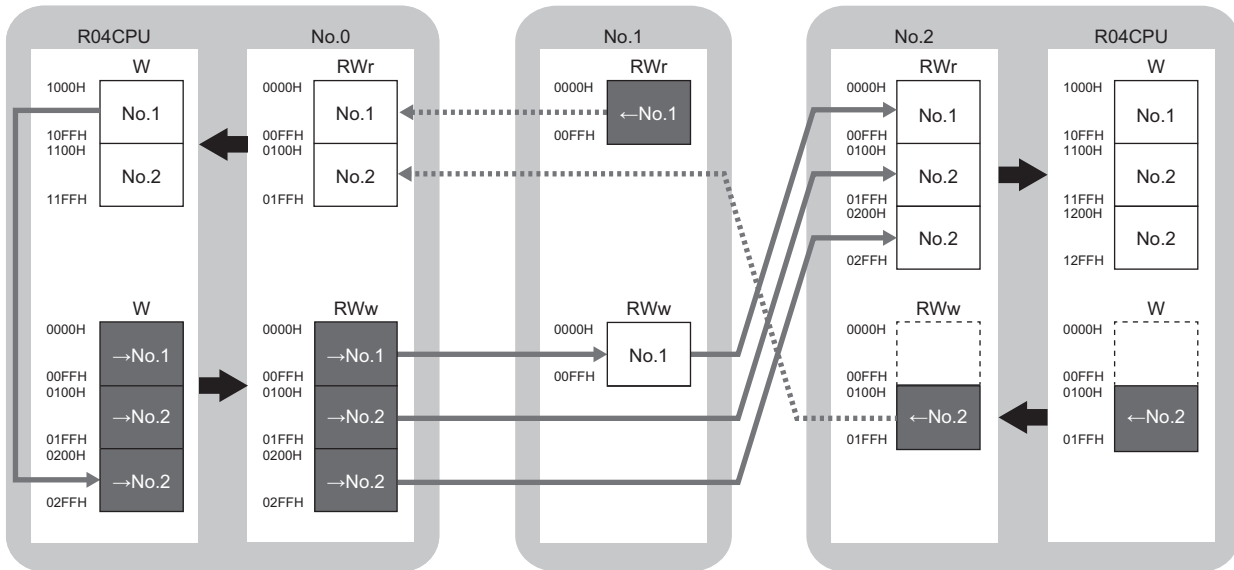

→No.1, →No.2: Send range: to station No.1, send range: to station No.2  
 ←No.1, ←No.2: Send range: from station No.1, send range: from station No.2

## ■RWr/RWw assignment

Each of the following No.0 to No.2 represents a station number.

- No.0: Master station (station No.0)
- No.1: Remote station (station No.1)
- No.2: Local station (station No.2)

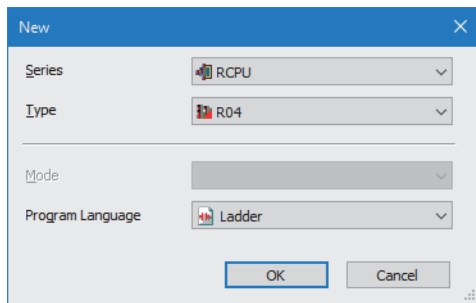

→No.1, →No.2: Send range: to station No.1, send range: to station No.2  
 ←No.1, ←No.2: Send range: from station No.1, send range: from station No.2

## Setting in the master station

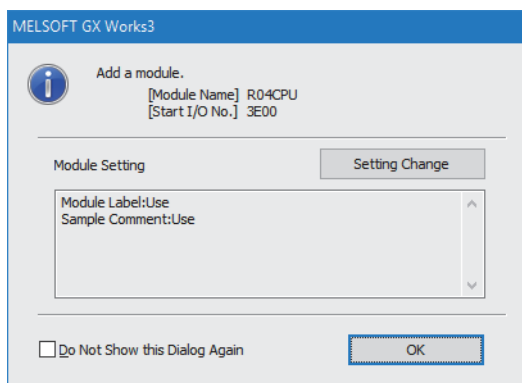

Connect the engineering tool to the CPU module on the master station and set the parameters.

1. Set the CPU module as follows.

 [Project] ⇒ [New]

2. Click the [Setting Change] button to use the module label.

3. Set "Link Direct Device Setting" in "CPU Parameter" to "Extended Mode (iQ-R Series Mode)".

 [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Link Direct Device Setting] ⇒ [Link Direct Device Setting]

| Item                       | Setting                          |
|----------------------------|----------------------------------|
| Link Direct Device Setting |                                  |
| Link Direct Device Setting | Extended Mode (iQ-R Series Mode) |

### Restriction

To write module parameters of the RJ71GN11-T2 on a CPU module using an engineering tool, set "Link Direct Device Setting" to "Extended Mode (iQ-R Series Mode)".

If "Link Direct Device Setting" is "Q Series Compatible Mode", "Write to PLC" cannot be executed.

**4.** Set the RJ71GN11-T2 as follows.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ Right-click ⇒ [Add New Module]

**5.** Click the [OK] button to add a module label of the RJ71GN11-T2.

**6.** Set the items in "Required Settings" as follows.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Required Settings]

| Item   | Setting             |
|--|---------------------|
| <b>Station Type</b>                          |                     |
| Station Type                                 | Master Station      |
| <b>Network No.</b>                           |                     |
| Network No.                                  | 1                   |
| <b>Parameter Setting Method</b>              |                     |
| Setting Method of Basic/Application Settings | Parameter Editor    |
| <b>Station No./IP Address Setting</b>        |                     |
| Station No./IP Address Setting Method        | Parameter Editor    |
| Station No.                                  |                     |
| Station No.                                  | 0                   |
| IP Address                                   |                     |
| IP Address                                   | 192 . 168 . 3 . 253 |
| Subnet Mask                                  | . . .               |
| Default Gateway                              | . . .               |

**7.** Set the items in "Basic Settings" as follows.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Basic Settings]

| Setting Item                   | Item  | Setting  |
|--------------------------------|---|--|
| Network Configuration Settings | Network Configuration Settings  | <Detailed Setting>   |
|                                | Refresh Settings  | <Detailed Setting>   |
| Network Topology               | Network Topology  | Line/Star  |
|                                | Communication Period Setting  |  |
| Basic Period Setting           | Setting in Units of 1us   | Not Set  |
|                                | Communication Period Interval Setting (Do not Set it in Units of 1us) | 4000.00 us   |
|                                | Communication Period Interval Setting (Set it in Units of 1us)        | 1000.00 us   |
|                                | System Reservation Time   | 200.00 us  |
|                                | Cyclic Transmission Time  | 3100.00 us   |
|                                | Transient Transmission Time   | 700.00 us  |
|                                | Multiple Period Setting   |  |
| Connection Device Information  | Authentication Class Setting  | Mixture of Authentication Class B/A or Authentication Class A Only |
|                                | TSN HUB Setting   | Not to Use TSN HUB   |
| Device Station Setting         | Disconnection Detection Setting                                       | 4 times  |

In this manual, "Authentication Class" is described as "CC-Link IE TSN Class".

**8.** Set the network configuration as follows. (Set the IP address for each station.)

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Basic Settings] ⇒ [Network Configuration Settings] ⇒ [Detailed Setting]

| No. | Model Name             | STA# | Station Type   | Motion Control Station   | RX Setting |       |      | RY Setting |       |      | RWr Setting |       |      | RWw Setting |       |      | LB Setting |       |      | LW Setting |       |      |  |
|-----|------------------------|------|----------------|--------------------------|------------|-------|------|------------|-------|------|-------------|-------|------|-------------|-------|------|------------|-------|------|------------|-------|------|--|
|     |                        |      |                |                          | Points     | Start | End  | Points     | Start | End  | Points      | Start | End  | Points      | Start | End  | Points     | Start | End  | Points     | Start | End  |  |
| 0   | Host Station           | 0    | Master Station |                          |            |       |      |            |       |      |             |       |      |             |       |      |            |       |      |            |       |      |  |
| 1   | General Remote Station | 1    | Remote Station | <input type="checkbox"/> | 256        | 0000  | 00FF | 256        | 0000  | 00FF | 256         | 0000  | 00FF | 256         | 0000  | 00FF | 512        | 0000  | 01FF | 512        | 0000  | 01FF |  |

| <b>IP Filter Settings</b>                  |                    |
| IP Filter                                  | Not Use            |
| IP Filter Settings                         | <Detailed Setting> |
| <b>Interlink Transmission Settings</b>     |                    |
| Interlink Transmission Settings            | <Detailed Setting> |

12. Click the [Apply] button.

13. Write the set parameters to the CPU module on the master station. Then, reset the CPU module or power off and on the system.

[Online] ⇒ [Write to PLC]

**Point**

In the program example, default values are used for parameters that are not shown above. For the parameters, refer to the following.

☞ Page 110 PARAMETER SETTINGS

## Settings in the remote stations

Set the setting of the IP address set in "Network Configuration Settings" of the master station.

# Settings in the local stations

Connect the engineering tool to the CPU module on the local station and set parameters.

1. Set the CPU module and add the module labels of the CPU module. The setting method of the CPU module and addition method of the module label are the same as those of the master station. (Page 155 Setting in the master station)
2. Set the RJ71GN11-T2 as follows.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ Right-click ⇒ [Add New Module]

3. Set to use the RJ71GN11-T2 module label. The addition method of the module label is the same as that of the master station. (Page 155 Setting in the master station)
4. Set the items in "Required Settings" as follows.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Required Settings]

| Setting Item             | Item   | Setting           |
|--------------------------|--|-------------------|
| Station Type             | Station Type                                 | Local Station     |
|                          | Network No.                                  | 1                 |
| Parameter Setting Method | Setting Method of Basic/Application Settings | Parameter Editor  |
|                          | Station No./IP Address Setting Method        | Parameter Editor  |
| Station No.              | Station No.                                  | 2                 |
|                          | IP Address                                   | 192 . 168 . 3 . 2 |
| Subnet Mask              | Subnet Mask                                  | . . .             |
|                          | Default Gateway                              | . . .             |

**5.** Set the refresh settings as follows.

 [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Basic Settings] ⇒ [Refresh Settings] ⇒ [Detailed Setting]

| No. | Link Side   |        |       |       |   | CPU Side       |             |        |       |       |
|-----|-------------|--------|-------|-------|---|----------------|-------------|--------|-------|-------|
|     | Device Name | Points | Start | End   |   | Target         | Device Name | Points | Start | End   |
| -   | SB          | 4096   | 00000 | 00FFF |  | Module Label   |             |        |       |       |

| IP Filter Settings                        | <Detailed Setting> |

**7.** Click the [Apply] button.

**8.** Write the set parameters to the CPU module on the local station. Then, reset the CPU module or power off and on the system.

 [Online] ⇒ [Write to PLC]

**Point** 

In the program example, default values are used for parameters that are not shown above. For the parameters, refer to the following.

 Page 110 PARAMETER SETTINGS

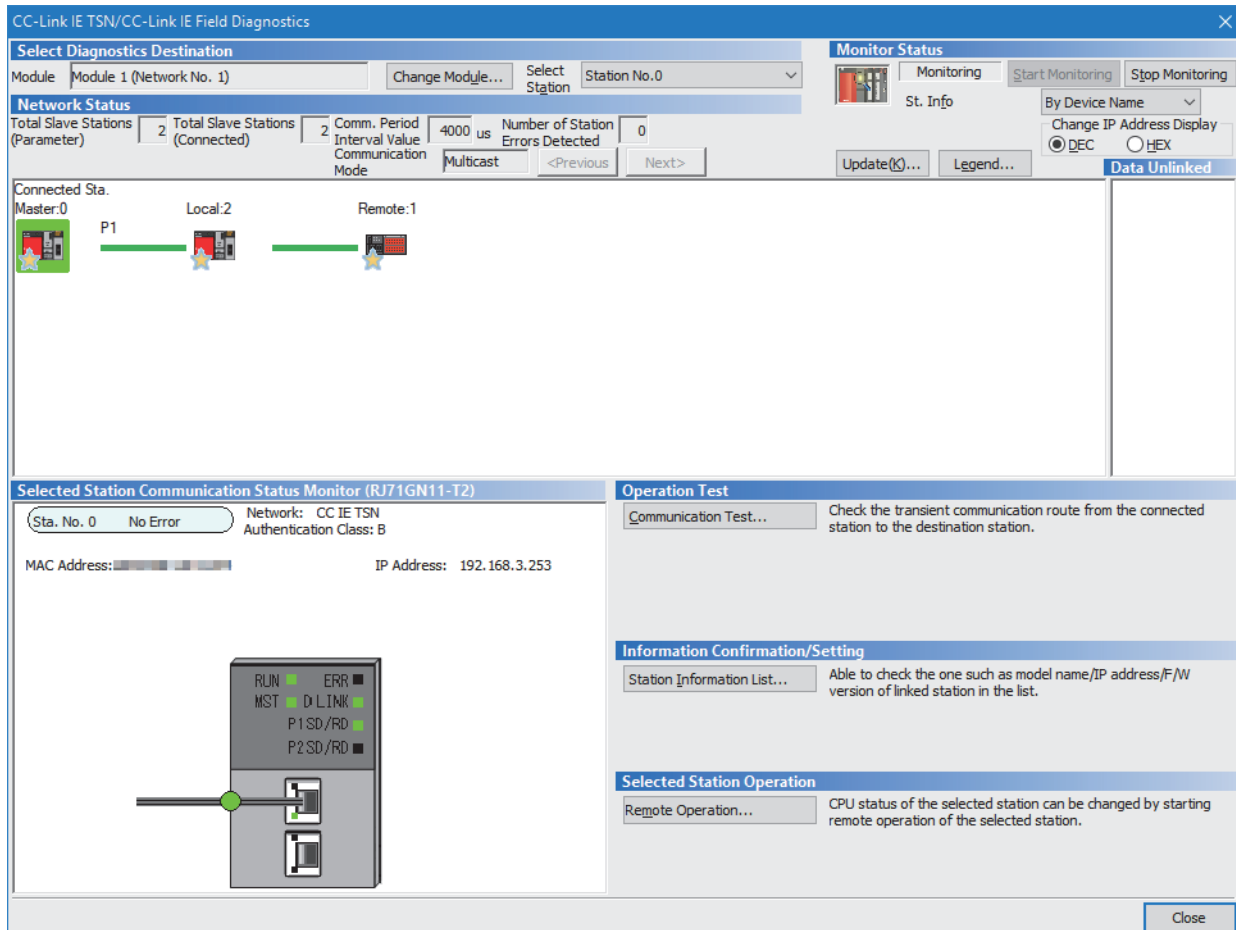

# Checking the network status

After starting up the system, check whether data link can be normally performed. Use the CC-Link IE TSN/CC-Link IE Field diagnostics of the engineering tool to check the status.

1. Connect the engineering tool to the CPU module on the master station.
2. Start the CC-Link IE TSN/CC-Link IE Field diagnostics.

 [Diagnostics] ⇒ [CC-Link IE TSN/CC-Link IE Field Diagnostics]

If the following display appears, a data link is normal.

In this manual, "Authentication Class" is described as "CC-Link IE TSN Class".

If an error icon appears in "Network Status" area, use the CC-Link IE TSN/CC-Link IE Field diagnostics to identify the cause of the error and take corrective actions. ( Page 189 Checking the Network Status)

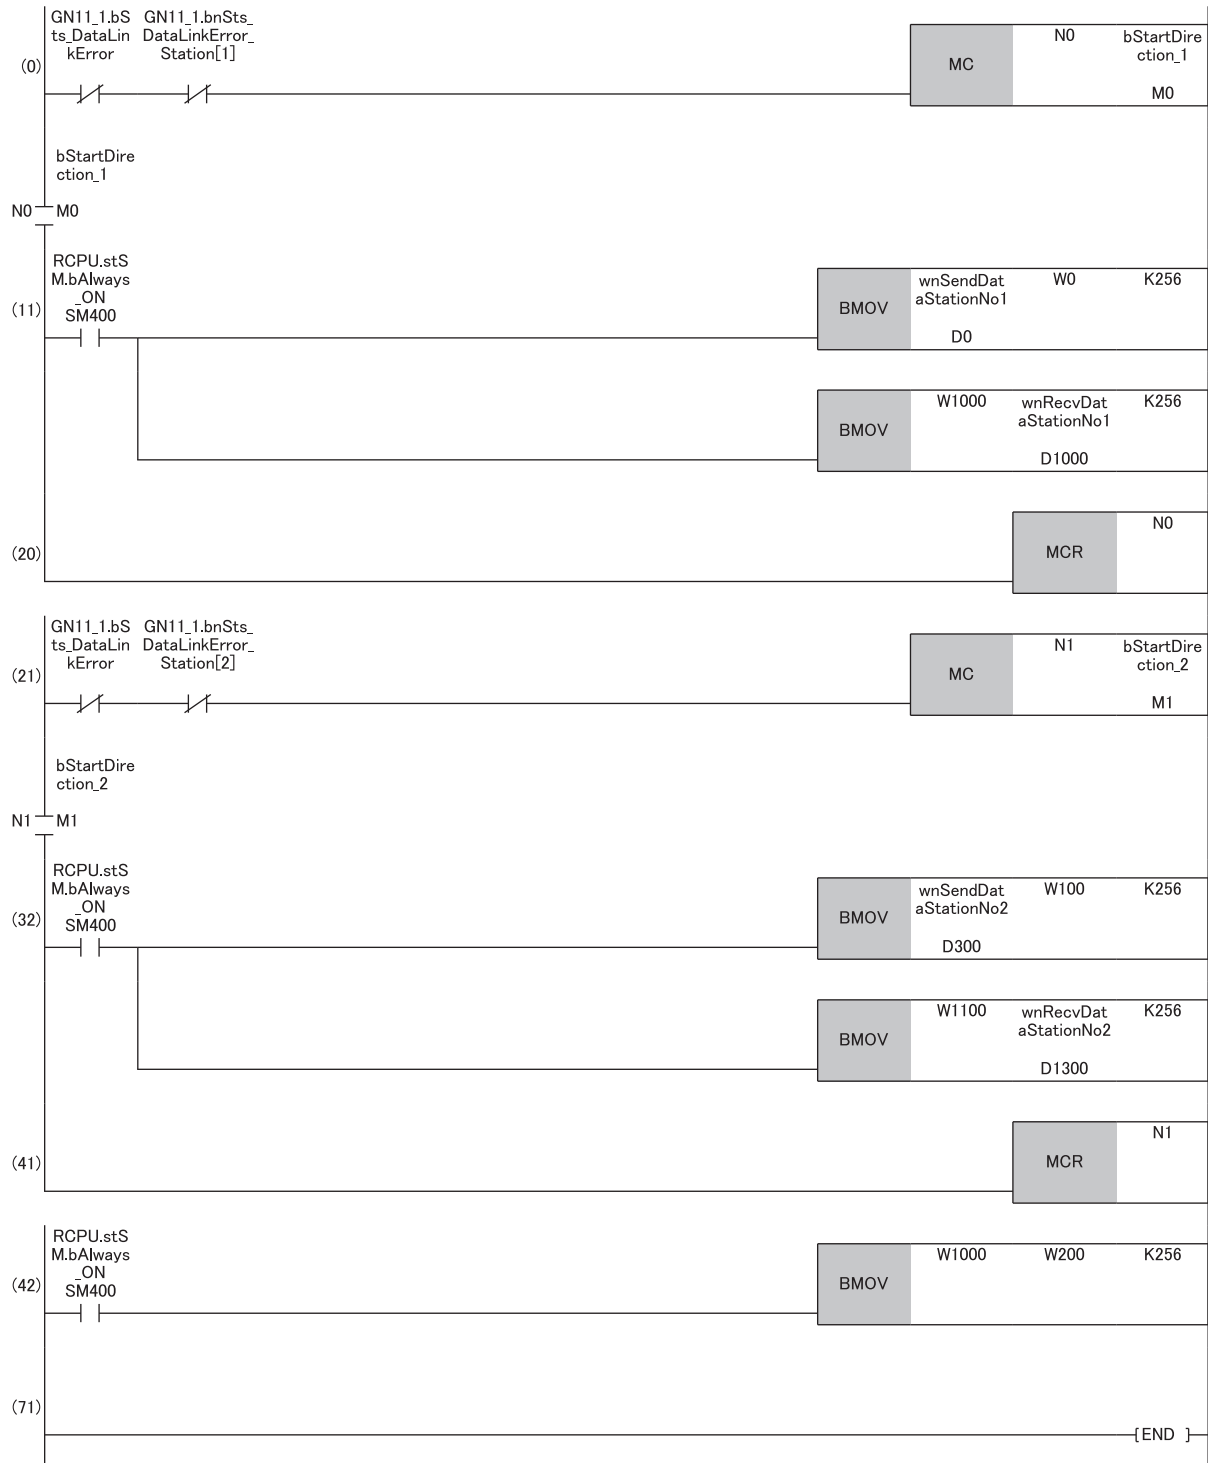

## Program examples

The following is a program example of communications between the CC-Link IE TSN Class B master station (station No.0), CC-Link IE TSN Class A remote station (station No.1), and local station (station No.2).

### Master station (station No.0)

| Classification       | Label name  | Description                                     | Device     |                       |                       |                   |     |            |    |                   |     |            |    |                      |               |            |    |                      |               |            |       |                      |               |            |      |                      |               |            |       |  |  |  |

### Local station (station No.2)

(4) Communication program with the master station (station No.0) and a remote station (station No.1)

# 3.3 Communication Example of Safety Communication (RJ71GN11-T2)

This section describes the communication example of the system using the Safety CPU.

## System configuration

The following system configuration is used to explain communications using the Safety CPU.

- Power supply module: R61P
- Safety CPU: R08SF CPU
- Safety function module: R6SFM
- Master/local module: RJ71GN11-T2
- Remote I/O module with safety functions: NZ2GNSS2-16DTE

In this program example, I/O devices are connected to X0, X1 (double input) and Y0, Y1 (double output) of the remote station.

## Safety device assignment

The following figure shows safety device assignment to be set in "Safety Communication Setting" under "Basic Settings".

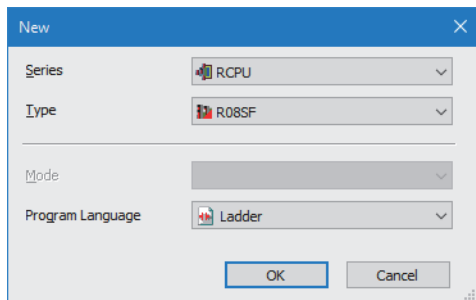

# Setting in the master station

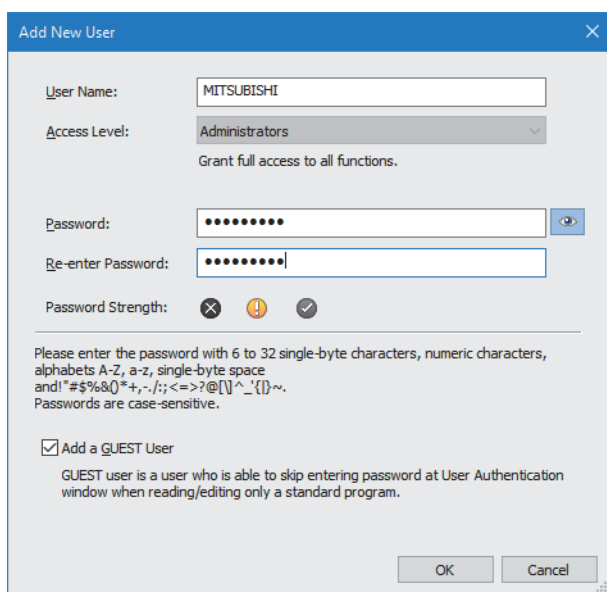

Connect the engineering tool to the Safety CPU of the master station and set parameters.

1. Set the Safety CPU as follows.

 [Project] ⇨ [New]

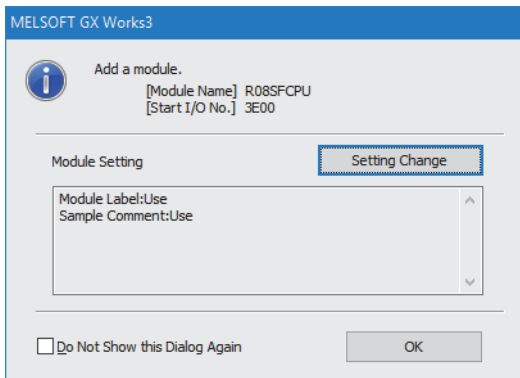

2. In the following window, enter a password and re-enter password, and click the [OK] button.

3. In the following window, enter a file name, and click the [Save] button.

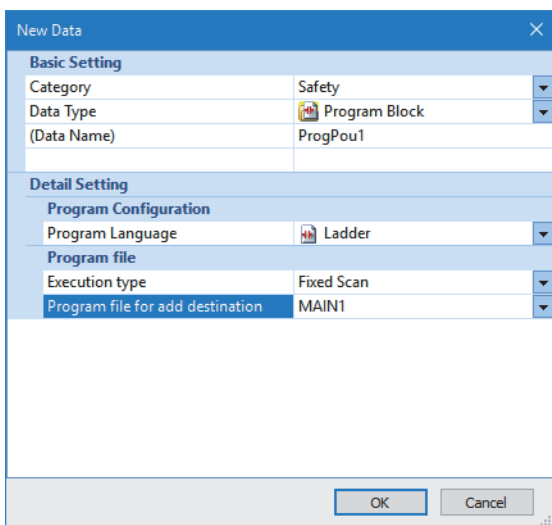

4. Click the [Setting Change] button to use the module labels of the CPU module.

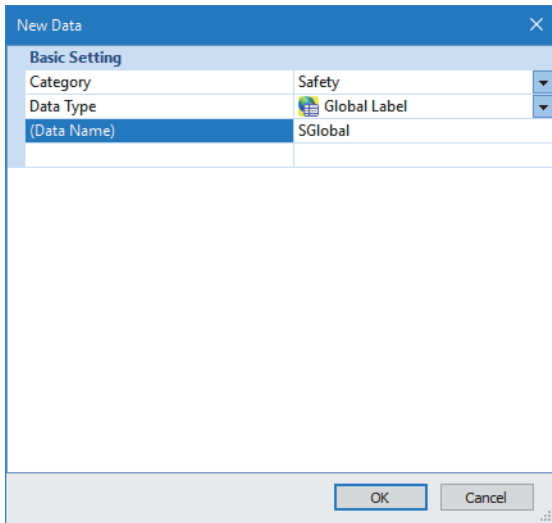

5. Add the safety program in the following.

[Navigation window] ⇒ [Program] ⇒ [Fixed Scan] ⇒ Right-click ⇒ [Add New Data]

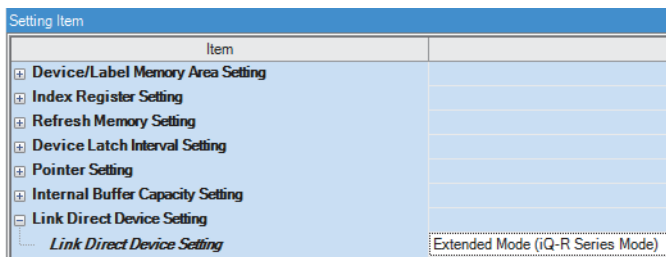

**6.** Add the safety global label in the following.

[Navigation window] ⇒ [Label] ⇒ [Global Label] ⇒ Right-click ⇒ [Add New Data]

**7.** Set "Link Direct Device Setting" in "CPU Parameter" to "Extended Mode (iQ-R Series Mode)".

[Navigation window] ⇒ [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Link Direct Device Setting] ⇒ [Link Direct Device Setting]

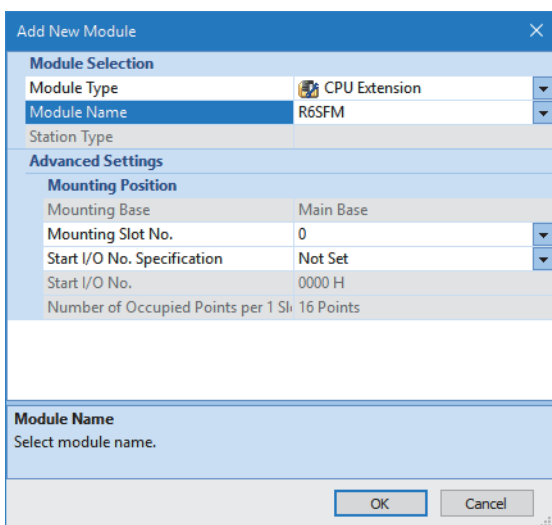

**Point**

To write module parameters of the RJ71GN11-T2 to a Safety CPU using an engineering tool, set "Link Direct Device Setting" to "Extended Mode (iQ-R Series Mode)".

If "Link Direct Device Setting" is "Q Series Compatible Mode", "Write to PLC" cannot be executed.

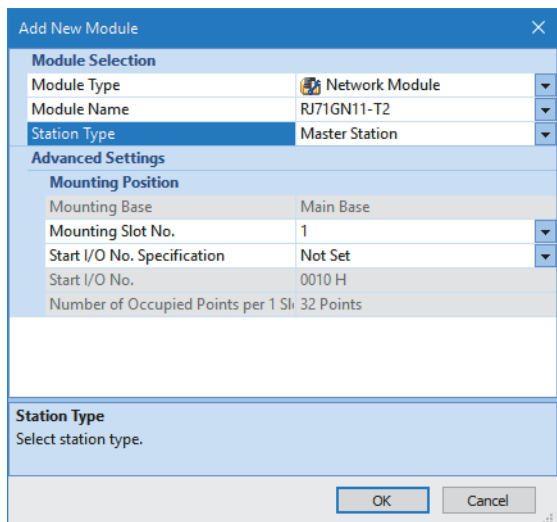

**8.** In the I/O assignment setting, set the safety function module for slot No.0.

[Navigation window] ⇒ [Parameter] ⇒ [System Parameter] ⇒ [I/O Assignment] tab ⇒ [I/O Assignment Setting]

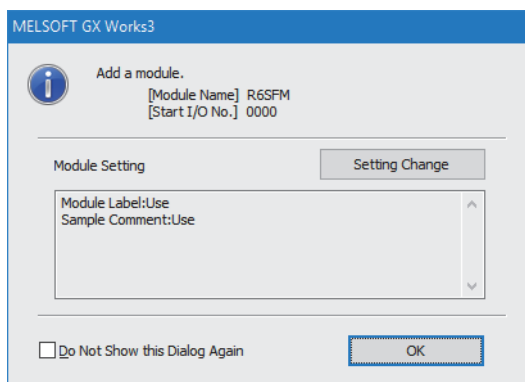

9. Set the master/local module for slot No.1.

10. Click the [OK] button to use the module labels of the safety function module.

11. Click the [OK] button to use the module labels of the master/local module.

**12.** Set the items in "Required Settings" as follows.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Required Settings]

| Item   | Setting          |
|--|------------------|
| <b>Station Type</b>                          |                  |
| Station Type                                 | Master Station   |
| <b>Network No.</b>                           |                  |
| Network No.                                  | 1                |
| <b>Parameter Setting Method</b>              |                  |
| Setting Method of Basic/Application Settings | Parameter Editor |
| <b>Station No./IP Address Setting</b>        |                  |
| Station No./IP Address Setting Method        | Parameter Editor |
| Station No.                                  |                  |
| Station No.                                  | 0                |
| <b>IP Address</b>                            |                  |
| IP Address                                   | 192.168.0.254    |
| Subnet Mask                                  | . . .            |
| Default Gateway                              | . . .            |

**13.** Set the network configuration as follows.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Basic Settings] ⇒ [Network Configuration Settings] ⇒ [Detailed Setting]

| No. | Model Name     | STA# | Station Type   | RX Setting Points | RY Setting Points | RW Setting Points | RWw Setting Points | Parameter Automatic Setting | PDO Mapping Setting | IP Address    | Subnet Mask | Default Gateway | Reserved/Error Invalid Station | Network Synchronous Communication | Communication Period Setting |
|-----|----------------|------|----------------|-------------------|-------------------|-------------------|--------------------|-----------------------------|---------------------|---------------|-------------|-----------------|--------------------------------|-----------------------------------|------------------------------|
| 0   | Host Station   | 0    | Master Station |                   |                   |                   |                    |                             |                     | 192.168.0.254 |             |                 |                                |                                   |                              |
| 1   | RJ71GN11-T2    | 1    | Local Station  | 32                | 32                | 16                | 16                 |                             |                     | 192.168.0.1   |             |                 | No Setting                     | Asynchronous                      | Basic Period                 |
| 2   | NZ2GNSS2-160TE | 2    | Remote Station | 16                | 16                | 4                 | 4                  |                             |                     | 192.168.0.2   |             |                 | No Setting                     | Asynchronous                      | Basic Period                 |

The diagram below shows a Host Station (STA#0) connected to two other stations: STA#1 (RJ71GN11-T2) and STA#2 (NZ2GNSS2-160TE). STA#1 is labeled as the Master Station and STA#2 as the Line/Star.

- RX/Ry and RWw/RW<sub>r</sub> settings of the local station are for standard communications.
- RX/Ry setting of the remote station is used as a remote control and monitor input signal in standard communications.

**14.** Click the [Close with Reflecting the Setting] button to close the "CC-Link IE TSN Configuration" window.

**15.** Set the refresh settings as follows.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Basic Settings] ⇒ [Refresh Settings] ⇒ [Detailed Setting]

| No. | Link Side       |        |       |       |   | CPU Side       |             |        |       |       |
|-----|-----------------|--------|-------|-------|---|----------------|-------------|--------|-------|-------|
|     | Device Name     | Points | Start | End   |   | Target         | Device Name | Points | Start | End   |

The refresh settings are for standard communications.

**16.** Log on to the programmable controller.

[Online] ⇒ [User Authentication] ⇒ [Log on to PLC]

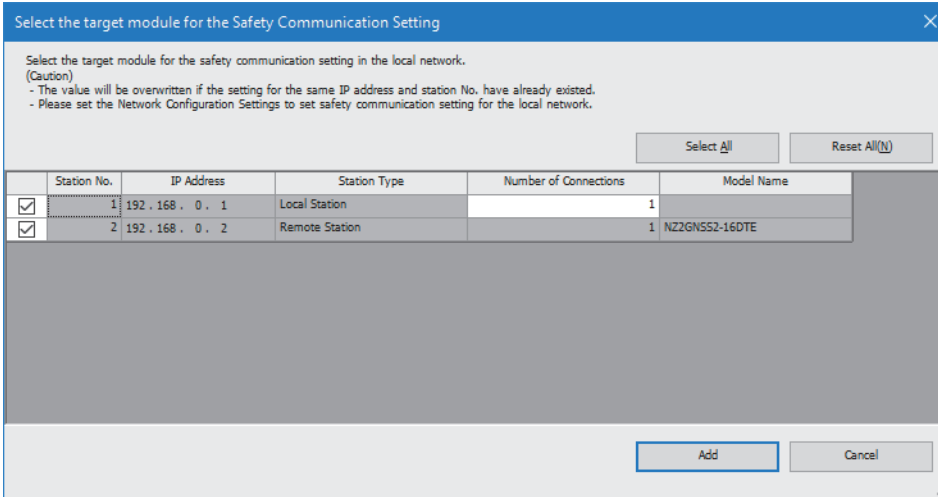

If logon fails, writing user information or initializing all information of the programmable controller is required. (GX Works3 Operating Manual)

17. Set "To Use or Not to Use the Safety Communication Setting" to "Use".

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Basic Settings] ⇒ [Safety Communication Setting] ⇒ [To Use or Not to Use the Safety Communication Setting]

18. Select "Local Network" from "Communication Destination" in "Safety Communication Setting" window and set the destination module in "Select the target module for the Safety Communication Setting" window.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Basic Settings] ⇒ [Safety Communication Setting] ⇒ [Safety Communication Setting] ⇒ [Detailed Setting]

19. Set the safety communication setting as follows.

20. Click the [Apply] button.

21. Write the set parameters to the Safety CPU on the master station.

[Online] ⇒ [Write to PLC]

22. Visually check if the safety communication setting is correctly written after writing parameters. For how to check the parameters, refer to the following.

📖 GX Works3 Operating Manual

23. Reset the CPU modules or power off and on the system.

# Settings in the local stations

Connect the engineering tool to the Safety CPU of the local station and set parameters.

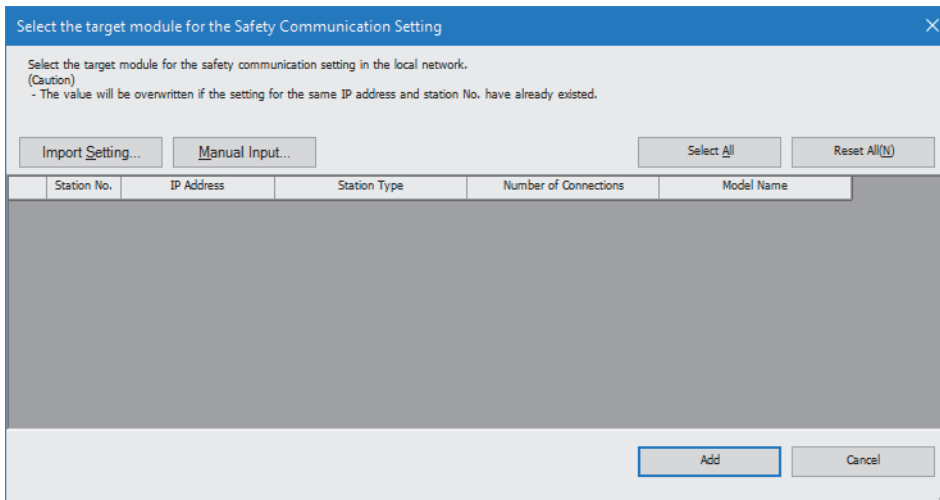

1. Set the Safety CPU and add the module label. Then, add the safety program and safety global label. The setting method is the same as that of the master station. (☞ Page 166 Setting in the master station)
2. Set "Link Direct Device Setting" in "CPU Parameter" to "Extended Mode (iQ-R Series Mode)". The setting method of "Extended Mode (iQ-R Series Mode)" is the same as that of the master station. (☞ Page 166 Setting in the master station)
3. Set the safety function module. Follow the same procedure as that for the master station. (☞ Page 166 Setting in the master station)
4. In the I/O assignment setting, set the master/local module for slot No.1.

5. Add the module labels of the safety function module and master/local module. The addition method of the module label is the same as that of the master station. (☞ Page 166 Setting in the master station)
6. Set the items in "Required Settings" as follows.

☞ [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Required Settings]

| Setting Item                   | Item   | Setting           |
|--------------------------------|--|-------------------|
| Station Type                   | Station Type                                 | Local Station     |
| Network No.                    | Network No.                                  | 1                 |
| Parameter Setting Method       | Setting Method of Basic/Application Settings | Parameter Editor  |
| Station No./IP Address Setting | Station No./IP Address Setting Method        | Parameter Editor  |
|                                | Station No.                                  | 1                 |
|                                | Station No.                                  | 1                 |
| IP Address                     | IP Address                                   | 192 . 168 . 0 . 1 |
|                                | Subnet Mask                                  | . . .             |
|                                | Default Gateway                              | . . .             |

7. Set the refresh parameters. Set the same refresh parameters as those set for the master station. (☞ Page 166 Setting in the master station)
8. Click the [Apply] button.
9. Set "To Use or Not to Use the Safety Communication Setting" to "Use".
- ☞ [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Basic Settings] ⇒ [Safety Communication Setting] ⇒ [To Use or Not to Use the Safety Communication Setting]
10. Select "Local Network" from "Communication Destination" in "Safety Communication Setting" window and click the [Import Setting] button in "Select the target module for the Safety Communication Setting" window.
- ☞ [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Basic Settings] ⇒ [Safety Communication Setting] ⇒ [Safety Communication Setting] ⇒ [Detailed Setting]

11. To select the project of the master station, the safety communication setting can be imported from the master station and the local station.

12. Log on to the programmable controller.
- ☞ [Online] ⇒ [User Authentication] ⇒ [Log on to PLC]
- If logon fails, writing user information or initializing all information of the programmable controller is required. (📖 GX Works3 Operating Manual)
13. Click the [Apply] button.
14. Write the set parameters to the Safety CPU on the local station.
- ☞ [Online] ⇒ [Write to PLC]
15. Visually check if the safety communication setting is correctly written after writing parameters. For how to check the parameters, refer to the following.
- 📖 GX Works3 Operating Manual
16. Reset the CPU modules or power off and on the system.

### Point

In the program example, default values are used for parameters that are not shown above. For the parameter setting, refer to the chapter explaining the parameters in this manual. (☞ Page 110 PARAMETER SETTINGS)

## Settings in the remote stations

Set the IP address set in "Network Configuration Settings" of the master station.

Connect the engineering tool to the Safety CPU of the master station and set parameters of the remote stations.

1. Set the parameters of the remote station in the "CC-Link IE TSN Configuration" window as shown below and write the parameters.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Basic Settings] ⇒ [Network Configuration Settings] ⇒ Select the NZ2GNSS2-16DTE in the list of stations ⇒ Right-click ⇒ [Parameter of Device Station]

| Name                         | Write value                     |
|------------------------------|---------------------------------|
| Wiring selection of input X0 | 1: Safety double wiring (NC/NC) |
| Wiring selection of input X1 | 1: Safety double wiring (NC/NC) |

- For items other than above, write the initial value.
- Select [Close with Reflecting the Setting] to close the "CC-Link IE TSN Configuration" window after writing parameters of the remote station.

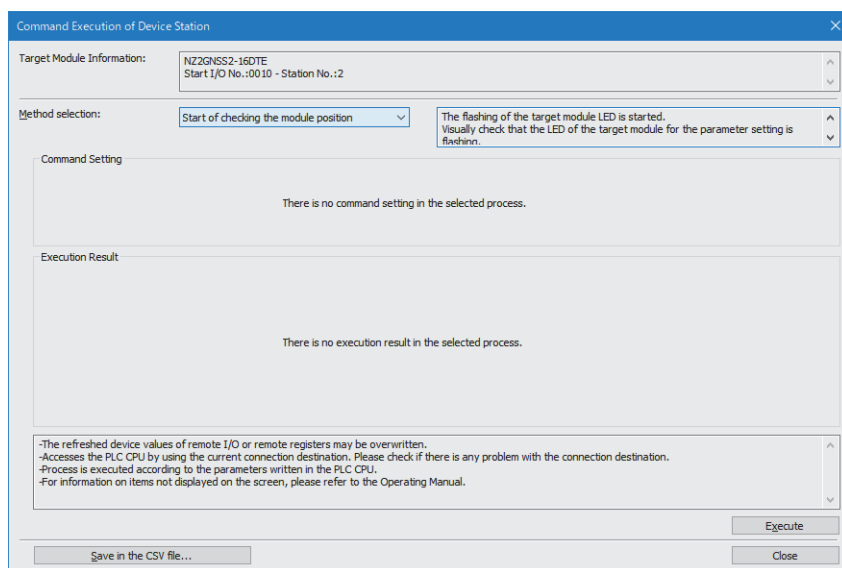

2. Visually check if the parameter of the remote station is correctly written after writing parameters. For how to check the parameters, refer to the following.

📖 GX Works3 Operating Manual

3. Open the "Command Execution of Device Station" window in the "CC-Link IE TSN Configuration" window.

[Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ71GN11-T2] ⇒ [Basic Settings] ⇒ [Network Configuration Settings] ⇒ Select the NZ2GNSS2-16DTE in the list of stations ⇒ Right-click ⇒ [Online] ⇒ [Command Execution of Device Station]

4. Select "Start of checking the module position" in "Method selection" and click the [Execute] button.

5. The SAFETY LED of the NZ2GNSS2-16DTE flashes. Check if the NZ2GNSS2-16DTE on which the SAFETY LED flashes has been installed on the desired position.

6. After checking the position of the module, select "Stop of checking the module position" in "Method selection" in the "Command Execution of Device Station" window and click the [Execute] button.
7. The flashing of the SAFETY LED of the NZ2GNSS2-16DTE stops.
8. Select "Safety module validation" in "Method selection" and click the [Execute] button.

**Point** 

- 
- In the program example, default values are used for parameters that are not shown above. For the parameter setting, refer to the chapter explaining the parameters in this manual. ( Page 110 PARAMETER SETTINGS)
  - Depending on the lapse of time after logon to the Safety CPU, user authentication may be required again.
-

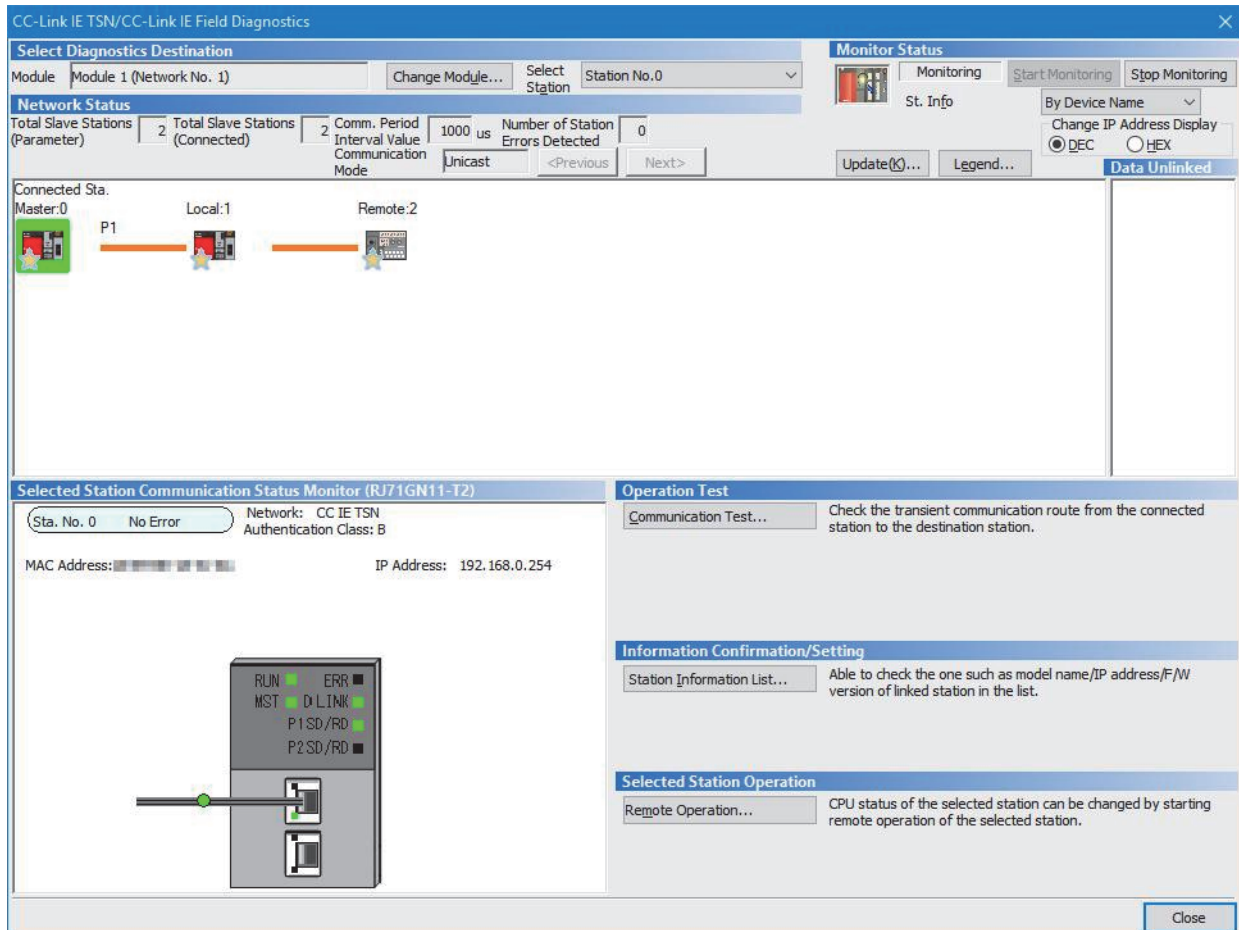

## Checking the network status

After starting up the system, check whether a data link can be normally performed. Use the CC-Link IE TSN/CC-Link IE Field diagnostics of the engineering tool to check the status.

1. Connect the engineering tool to the Safety CPU on the master station.
2. Start the CC-Link IE TSN/CC-Link IE Field diagnostics.

 [Diagnostics] ⇒ [CC-Link IE TSN/CC-Link IE Field Diagnostics]

If the following display appears, a data link is normal.

In this manual, "Authentication Class" is described as "CC-Link IE TSN Class".

If an error icon appears in "Network Status" area in the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window, use the CC-Link IE TSN/CC-Link IE Field diagnostics to identify the cause of the error and take corrective actions. ( Page 189 Checking the Network Status)

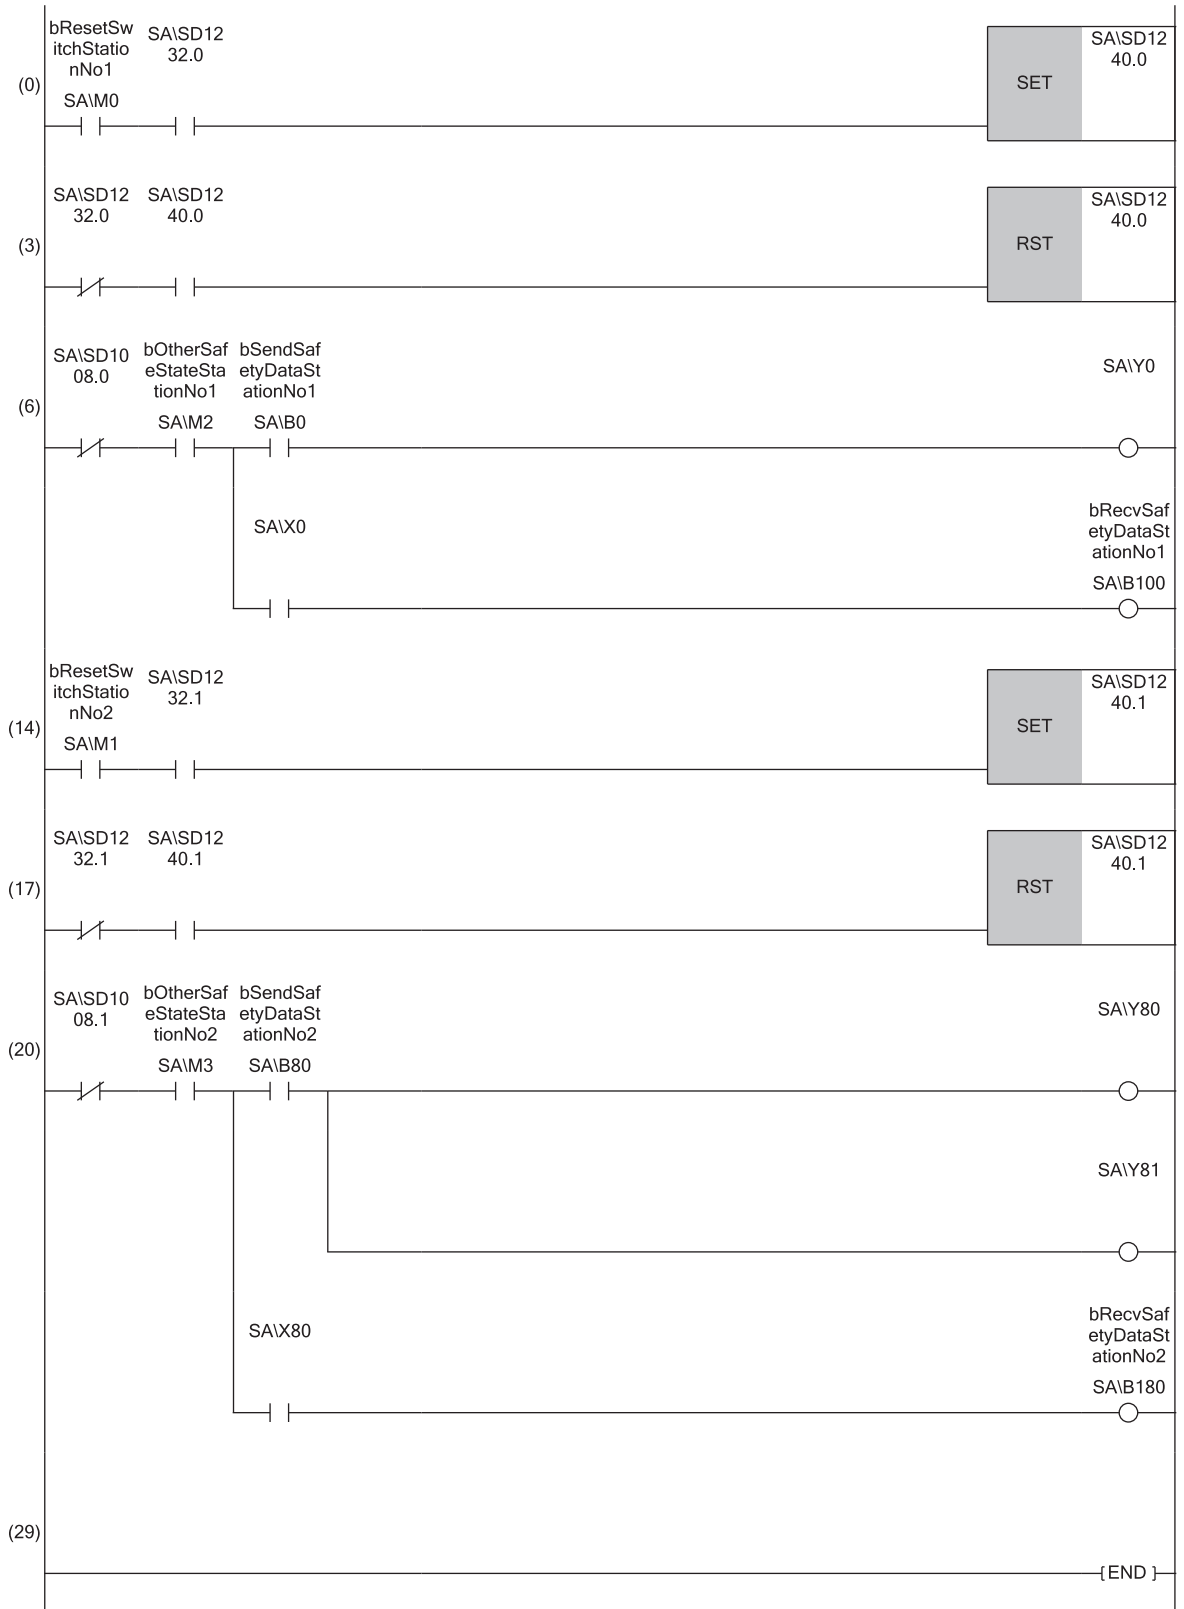

# Program examples

The following shows a program example of each station when the safety program and safety global device are used.

## Master station (station No.0)

| Classification          | Device   | Description   |            |                       |            |           |       |                       |   |                        |     |            |       |   |                        |     |            |       |   |                           |     |            |       |   |                           |     |            |       |   |                           |     |            |       |   |                           |     |            |         |   |                           |     |            |        |   |                           |     |            |         |
|-------------------------|--|---|------------|-----------------------|------------|-----------|-------|-----------------------|---|------------------------|-----|------------|-------|---|------------------------|-----|------------|-------|---|---------------------------|-----|------------|-------|---|---------------------------|-----|------------|-------|---|---------------------------|-----|------------|-------|---|---------------------------|-----|------------|---------|---|---------------------------|-----|------------|--------|---|---------------------------|-----|------------|---------|
| Safety special register | SA\SD1008.0  | Safety refresh communication status of each safety connection (1st module) (safety connection No.1) |            |                       |            |           |       |                       |   |                        |     |            |       |   |                        |     |            |       |   |                           |     |            |       |   |                           |     |            |       |   |                           |     |            |       |   |                           |     |            |         |   |                           |     |            |        |   |                           |     |            |         |
|                         | SA\SD1008.1  | Safety refresh communication status of each safety connection (1st module) (safety connection No.2) |            |                       |            |           |       |                       |   |                        |     |            |       |   |                        |     |            |       |   |                           |     |            |       |   |                           |     |            |       |   |                           |     |            |       |   |                           |     |            |         |   |                           |     |            |        |   |                           |     |            |         |

## ■ Master station (station No.0)

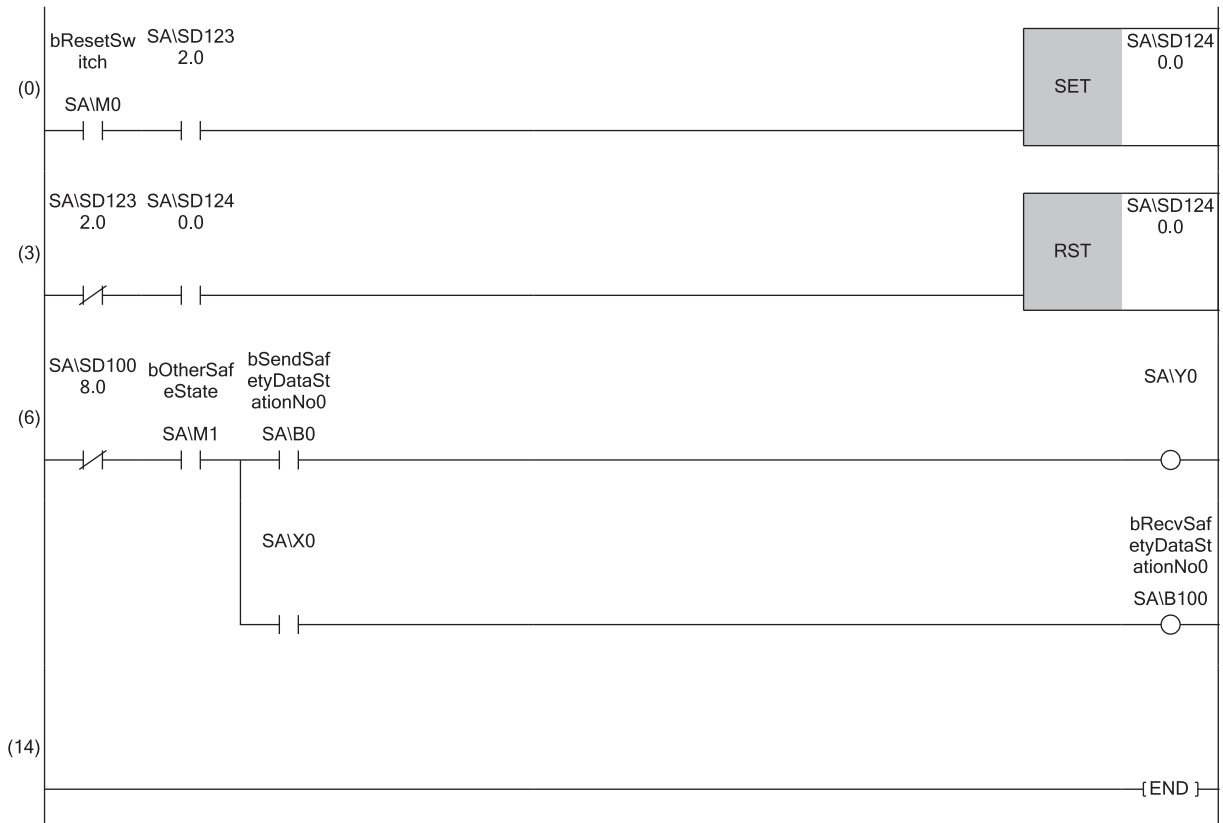

- (0) Processing to release the safety station interlock status in safety communications with station No.1 Turning on bResetSwitchStationNo1, the safety station interlock status with safety connection No.1 is released.
- (6) Communication program with station No.1 When the safety station interlock status with station No.1 is normal and bOtherSafeStateStationNo1 is on, safety output data is sent to the station No.1 by turning on bSendSafetyDataStationNo1. bRecvSafetyDataStationNo1 is also turned on when safety input data is received from the station No.1.
- (14) Processing to release the safety station interlock status in safety communications with station No.2 Turning on bResetSwitchStationNo2, the safety station interlock status with safety connection No.2 is released.
- (20) Communication program with station No.2 When the safety station interlock status with station No.2 is normal and bOtherSafeStateStationNo2 is on, safety output data is sent to the station No.2 by turning on bSendSafetyDataStationNo2. bRecvSafetyDataStationNo2 is also turned on when safety input data is received from the station No.2.

| 4  | bRecvSafetyDataStationNo0                   | Bit   | VAR_GLOBAL | SA\B100               |           |       |                       |   |              |     |            |       |   |                 |     |            |       |   |                           |     |            |       |   |                           |     |            |         |

### Local station (station No.1)

- (0) Processing to release the safety station interlock status in safety communications with station No.0 (master station) Turning on bResetSwitch, the safety station interlock status with safety connection No.1 is released.
- (6) Communication program with station No.0 (master station) When the safety station interlock status with station No.1 is normal and bOtherSafeState is on, safety output data is sent to the station No.0 by turning on bSendSafeDataStationNo0. bRecvSafeDataStationNo0 is also turned on when safety input data is received from the station No.0.

# 4 TROUBLESHOOTING

This chapter describes troubleshooting of CC-Link IE TSN.

## 4.1 Checking with LED

This section describes troubleshooting with the LEDs of the RJ71GN11.

### The RUN LED turns off

When the RUN LED turns off after powering on the RJ71GN11, check the following.

| Check item                         | Action  |
|------------------------------------|---|
| Is the RJ71GN11 mounted correctly? | Securely mount the RJ71GN11 on the base unit. |

If the above action does not solve the problem, perform the module communication test to check for hardware failure. (☞ Page 188 Module Communication Test)

### The ERR LED turns on or is flashing

Check the following.

| Check item   | Action  |
|--|---|
| Does any error occur in the module diagnostics?  | Take the actions displayed on the window.   |
| Is a data link faulty station displayed on the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window?   | <ul style="list-style-type: none"> <li>• Correct "Network Configuration Settings" and "Communication Period Setting" under "Basic Settings" of the master station in accordance with the device station actually connected.</li> <li>• Perform troubleshooting for when the D LINK LED turns off or is flashing in the data link faulty station. (☞ Page 183 The D LINK LED turns off or is flashing)</li> <li>• When the communication speed of the data link faulty station is 100Mbps, the communication speed of the master station is 1Gbps, and the data link faulty station is used under the multicast mode, connect the data link faulty station to the device supporting the multicast filter. (☞ Manual of the device used)</li> </ul> |
| (RJ71GN11-T2 only)<br>Is Initialization failure (parameter mismatch between master and device stations) (event code: 00C71) registered in the event history of the master station?<br>(A mismatch of the synchronization setting and inter-module synchronization cycle may occur between the master station and device stations.) | Take the following actions for the device station with the IP address displayed in the detailed information of the event. <ul style="list-style-type: none"> <li>• For a local station, match "Fixed Scan Interval Setting of Inter-module Synchronization" in "Inter-module Synchronization Setting" in "System Parameter" to the setting on the master side.</li> <li>• Replace the device with a device supporting CC-Link IE TSN Class B network synchronous communication.</li> <li>• Match "Network Synchronous Communication" in "Network Configuration Settings" under "Basic Settings" of the master station to the synchronization setting of the device station.</li> </ul>  |
| Is the event code 00C81 registered in the event history?   | Take the following actions for the device station with the IP address displayed in the detailed information of the event history. <ul style="list-style-type: none"> <li>• Match "CC-Link IE TSN Class Setting" in "Network Configuration Settings" under "Basic Settings" of the master station to the CC-Link IE TSN Class of the device station.</li> </ul>  |
| (RJ71GN11-T2 only)<br>Is the event code 00C72 registered in the master station event history?  | <ul style="list-style-type: none"> <li>• Update the engineering tool to the latest version.</li> <li>• Update the device station firmware with the IP address displayed in the detailed information of the event history to the latest version.</li> </ul>  |
| (RJ71GN11-T2 only)<br>Is the event code 00C80 registered in the event history when "Connection Device Information" under "Basic Settings" of the master station is set to "Mixture of CC-Link IE TSN Class B/A" or "CC-Link IE TSN Class A Only"?  | Take one of the following actions. <ul style="list-style-type: none"> <li>• Check 'Station protocol version 2.0 support status' (SW01A0 to SW01A7) and update the firmware of all device stations to a version that supports the protocol version 2.0. Alternatively, replace with device stations that support protocol version 2.0.</li> <li>• For RJ71GN11-T2 with firmware version "15" or later, set 'Protocol setting' (Un\G1294018) of the master station to '1: Protocol version 1.0 fixed'. (☞ Page 288 Protocol information (Un\G1294016 to Un\G1294031))</li> <li>• After powering on the device stations and the devices on the communication path, power on the master station.</li> </ul>   |
| (RJ71GN11-SX only)<br>When "Master Station Shift Setting" under "Application Settings" of the master station is set to "Enable", is event code 00C2A registered in the event history of the master station or the local station that is the current master station?  | Take one of the following actions. <ul style="list-style-type: none"> <li>• Update the firmware to the version corresponding to the master station switch function for the device station whose IP address is displayed in the detailed information of the event. Alternatively, replace with device stations that support protocol version 2.0.</li> <li>• Set "Master Station Shift Setting" under "Application Settings" of the master station to "Disable".</li> </ul>  |

| Check item   | Action  |
|--|---|
| (RJ71GN11-SX only)<br>When "Master Station Shift Setting" under "Application Settings" of the master station is set to "Enable", is a device station that does not support the master station switch function connected? | Take one of the following actions. <ul style="list-style-type: none"> <li>• Check 'Master station switch each station supporting information' (SW0530 to SW0537) of the master station and update the firmware of all device stations to a version that supports the master station switch function. Alternatively, replace with device stations that support protocol version 2.0.</li> <li>• Set "Master Station Shift Setting" under "Application Settings" of the master station to "Disable".</li> </ul> |

If the above action does not solve the problem, perform the following tests to check for an error.

- Module communication test (  Page 188 Module Communication Test)

**■If the RJ71GN11-T2 with a firmware version of "11" or earlier is used**

Also check the following:

| Check item   | Action   |
|--|--|
| Is a data link faulty station displayed on the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window? | ■When the communication speed of the data link faulty station is 100Mbps, and the communication speed of the master station is 1Gbps<br>Take either of the following actions for wiring and setting. <ul style="list-style-type: none"> <li>• Use either P1 or P2 of the master station.</li> <li>• Connect the data link faulty station to a multicast filter supported device and activate the multicast mode. (  Manual of the device used)</li> </ul> |

## The D LINK LED turns off or is flashing

Check the following.

| Check item   | Action   |
|--|--|
| Is the master station operating normally?  | <ul style="list-style-type: none"> <li>• If an error has occurred in the CPU module on the master station, eliminate the cause of the CPU module error. (📖 MELSEC iQ-R CPU Module User's Manual (Application))</li> <li>• If an error occurs in the RJ71GN11 in the master station, take action according to the module diagnosis procedure. (📖 Page 186 Checking the Module Status)</li> </ul>  |
| Is the master station connected to the network?  | Connect the master station to the network.   |
| Does the IP address of each station match the "Network Configuration Settings" under "Basic Settings" of the master station?   | Correct the setting of the IP address in "Network Configuration Settings" under "Basic Settings" of the master station.  |
| In the "Network Configuration Settings" under "Basic Settings", are the third and fourth octets of the IP address of the master station overlapped with those of any other stations? | <ul style="list-style-type: none"> <li>• Set IP addresses in a way that does not overlap the third to fourth octets of the IP address in all stations.</li> <li>• Set the IP address and subnet mask to match the network addresses of all stations.</li> <li>• Set the third and fourth octets of the IP address to values other than all 0 or all 1.</li> <li>• Set the host address of the IP address to values other than all 0 or all 1.</li> <li>• Set an IP address other than a reserved address.</li> </ul> |
| In the "Network Configuration Settings" under "Basic Settings", does the network address (subnet mask part) of the IP address of the master station match that of other stations?    |  |
| Are the third and fourth octets of the IP address set to all 0 or all 1?   |  |
| Is the host address of the IP address set to all 0 or all 1?   |  |
| Is a reserved address set to the IP address?   |  |
| Do the used Ethernet cables or optical fiber cables conform to the standard?   | Replace the cable with one conforming to the standard. (📖 MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))  |
| (RJ71GN11-T2 only)<br>Is the switching hub used operating normally?  | <ul style="list-style-type: none"> <li>• Use a switching hub that conforms to the standard. (📖 MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))</li> <li>• Power off and on the switching hub.</li> </ul>   |
| Does the station-to-station distance meet the specifications?  | Set the station-to-station distance within range. (📖 MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))   |
| Does the cabling condition (bending radius) meet the specifications?   | Refer to the manual for the cable, and correct the bending radius.   |
| Is any Ethernet cable or optical fiber cable disconnected?   | Replace the cable.   |
| Is the connection different from the one set for "Network Topology" under "Basic Settings" of the master station?  | Correct the wiring according to "Network Topology" under "Basic Settings" of the master station. (📖 Page 118 Network Topology)   |
| Has the time synchronization source station been reset?  | <ul style="list-style-type: none"> <li>• Since a station is temporarily disconnected after switching the time synchronization source, wait for it to return.</li> <li>• Avoid unnecessary disconnections or returns in a station that is the time synchronization source.</li> </ul>   |
| Is the time synchronization source station turned off?   |  |
| Is the time synchronization source station operating normally?   | Check the manual of the module used for the time synchronization source station.   |
| Has any other station been reset?  | <ul style="list-style-type: none"> <li>• Avoid unnecessary reset, since a station is disconnected while resetting.</li> <li>• Start other stations.</li> </ul>   |
| Are other stations turned off?   | Power on other stations.   |
| Are other connected stations operating normally?   | <ul style="list-style-type: none"> <li>• Check if the other stations are performing data link using CC-Link IE TSN/CC-Link IE Field diagnostics. (📖 Page 189 Checking the Network Status)</li> <li>• Check the operation status of modules on other stations. (📖 User's manual for the module used)</li> </ul>   |
| Is there any other station that has not set an IP address?   | Set the IP address for the device station for which the IP address is not set.   |
| Is there any other station that is not set in "Network Configuration Settings" under "Basic Settings" of the master station?   | Set the connected device station to "Network Configuration Settings" under "Basic Settings" of the master station.   |
| Is a network topology with restrictions used for connection?   | Correct the wiring. (📖 MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))   |
| Are station numbers unique?  | Change the overlapped station number.  |
| Is the IP address overlapped with another station?   | Change the IP address of the overlapped station.   |
| Are 121 or more device stations connected?   | Change the connection of the device stations to 120 stations or less.  |
| (RJ71GN11-T2 only)<br>Are Ethernet devices properly connected to a network line?   | Correct the mixed structure of the Ethernet device. (📖 MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))   |
| (RJ71GN11-SX only)<br>Are a CC-Link IE TSN device and an Ethernet device coexisted?  | Do not connect an Ethernet device.   |

| Check item  | Action   |
|---|--|
| Is the IP address of the device station blocked by the IP filter setting of the master station?   | Correct the "IP Filter Settings" under "Application Settings".   |
| Is the IP address of the master station blocked by the IP filter setting of the device station?   |  |
| Are time synchronization devices with time synchronization priority of 0 to 15 connected?   | Remove time synchronization devices with time synchronization priority of 0 to 15, or change the priority setting to between 16 and 255. (Manual for the time synchronization devices used)  |
| Is a switching hub connected in a ring topology?  | Do not connect a switching hub in a ring topology.   |
| (RJ71GN11-T2 only)<br>Is the TSN hub connected normally?  | Power off and on the TSN hub.<br><br>Set the TSN hub parameters as follows. <ul style="list-style-type: none"> <li>• Enable each port of the TSN hub.</li> <li>• Set the communication speed and port type to Auto.</li> <li>• Match the settings of the time synchronization and communication cycle of the TSN hub to those of the master station.</li> <li>• Match the VLAN setting of the master station to the VLAN setting of the device station.</li> </ul> For the setting method, refer to the manual for the TSN hub used. |
| (RJ71GN11-SX only)<br>When "Master Station Shift Setting" under "Application Settings" of the master station is set to "Enable", is event code 00C2A registered in the event history of the master station or the local station that is the current master station? | Take one of the following actions. <ul style="list-style-type: none"> <li>• Update the firmware to the version corresponding to the master station switch function for the device station whose IP address is displayed in the detailed information of the event. Alternatively, replace with device stations that support protocol version 2.0.</li> <li>• Set "Master Station Shift Setting" under "Application Settings" of the master station to "Disable".</li> </ul>   |
| (RJ71GN11-SX only)<br>When "Master Station Shift Setting" under "Application Settings" of the master station is set to "Enable", is a device station that does not support the master station switch function connected?  | Take one of the following actions. <ul style="list-style-type: none"> <li>• Check 'Master station switch each station supporting information' (SW0530 to SW0537) of the master station and update the firmware of all device stations to a version that supports the master station switch function. Alternatively, replace with device stations that support protocol version 2.0.</li> <li>• Set "Master Station Shift Setting" under "Application Settings" of the master station to "Disable".</li> </ul>                        |

## The L ER LED turns on (RJ71GN11-T2)

Check the following.

| Check item  | Action   |
|---|--|
| Do the used Ethernet cables conform to the Ethernet standard?                     | Replace the cable with one conforming to the standard. (MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))  |
| Does the station-to-station distance meet the specifications?                     | Set the station-to-station distance within range. (MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))   |
| Is any Ethernet cable disconnected?   | Replace the cable.   |
| Is the switching hub used operating normally?                                     | <ul style="list-style-type: none"> <li>• Use a switching hub that conforms to the standard. (MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))</li> <li>• Power off and on the switching hub.</li> </ul> |
| Is there any source of noise near the module or cables?                           | Change the location of the module or cables.   |
| Is "Network Topology" under "Basic Settings" in the master station set to "Ring"? | Correct the wiring to be a proper ring topology.   |

## The LINK LED turns off (RJ71GN11-T2)

Check the following.

| Check item  | Action   |
|---|--|
| Do the used Ethernet cables conform to the Ethernet standard?   | Replace the cables with Ethernet cables which conform to the standard. (📖 MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))  |
| Does the station-to-station distance meet the specifications?   | Set the station-to-station distance within range. (📖 MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))   |
| Does the cabling condition (bending radius) meet the specifications?  | Refer to the manual for the Ethernet cable, and correct the bending radius.  |
| Is any Ethernet cable disconnected?   | Replace the Ethernet cable.  |
| Is the switching hub used operating normally?   | <ul style="list-style-type: none"> <li>• Use a switching hub that conforms to the standard. (📖 MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))</li> <li>• Power off and on the switching hub.</li> </ul> |
| Are other connected stations operating normally?  | Check the manual of the module used for the other stations and take action accordingly. (📖 User's manual for the module used)  |
| Does the communication speed of the connected device match the communication speed set in "Communication Speed"?  | Connect the device with the communication speed set in "Communication Speed".  |
| If the RJ71GN11-T2 with a firmware version of "03" or earlier is used, is the communication speed of the connected device 1Gbps?  | Connect devices which support a communication speed of 1Gbps.  |
| If "Communication Speed" is set to 100Mbps for the master station and local station to connect a device with a communication speed of 100Mbps, is the auto-negotiation of the device valid? | Enable the auto-negotiation of the connected device. Or, connect a device with auto-negotiation enabled.   |

If the above actions do not solve the problem, perform the following test to check for an error.

- Module communication test (📖 Page 188 Module Communication Test)

## The L ERR LED turns on or is flashing (RJ71GN11-SX)

Check the following.

| Check item  | Action  |
|---|---|
| Does the optical fiber cable used conform to the standard?  | Replace the optical fiber cable with one conforming to the standard. (📖 MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))   |
| Does the station-to-station distance meet the specifications?   | Set the station-to-station distance within 550m.  |
| Is any optical fiber cable disconnected?  | Replace the optical fiber cable.  |
| Are other connected stations operating normally?  | Check if the other stations are performing data link using CC-Link IE TSN/CC-Link IE Field diagnostics. (📖 Page 189 Checking the Network Status).   |
| Is the connection different from the one set for "Network Topology" under "Basic Settings" of the master station? | Correct the wiring to be a proper ring topology.  |
| Is the optical fiber cable surely connected to a port of the module?  | <ul style="list-style-type: none"> <li>• Lightly pull the optical fiber cable connector to check if it is surely connected. If the cable is not connected properly, disconnect the optical fiber cable once and then push its connector into the port of the module until it clicks.</li> <li>• When the L ERR LED does not turn off even the above actions are taken, reset all stations or turn off and on the system.</li> </ul> |

## 4.2 Checking the Module Status

This section describes troubleshooting to check the status of the module by executing diagnostics and operation tests using the engineering tool.

### Module Diagnostics

The following items can be checked in the "Module Diagnostics" window for the RJ71GN11.

| Item                          | Description   |
|-------------------------------|---|
| [Error Information] tab       | Displays the details of the errors currently occurring and the corrective actions for these errors. "-" may be displayed in "Occurrence Data" of an error that occurred immediately after the power was turned on. To check the occurrence date, click the [Event History] button and refer to the event history. |
| [Module Information List] tab | Displays the LED information and individual information of the RJ71GN11.  |
| Supplementary Function        | CCIET/CCIEF diagnostics<br>Enables checking the cause to resolve the problem when an error occurs in the CC-Link IE TSN. (Page 189 Checking the Network Status)   |

### Error Information

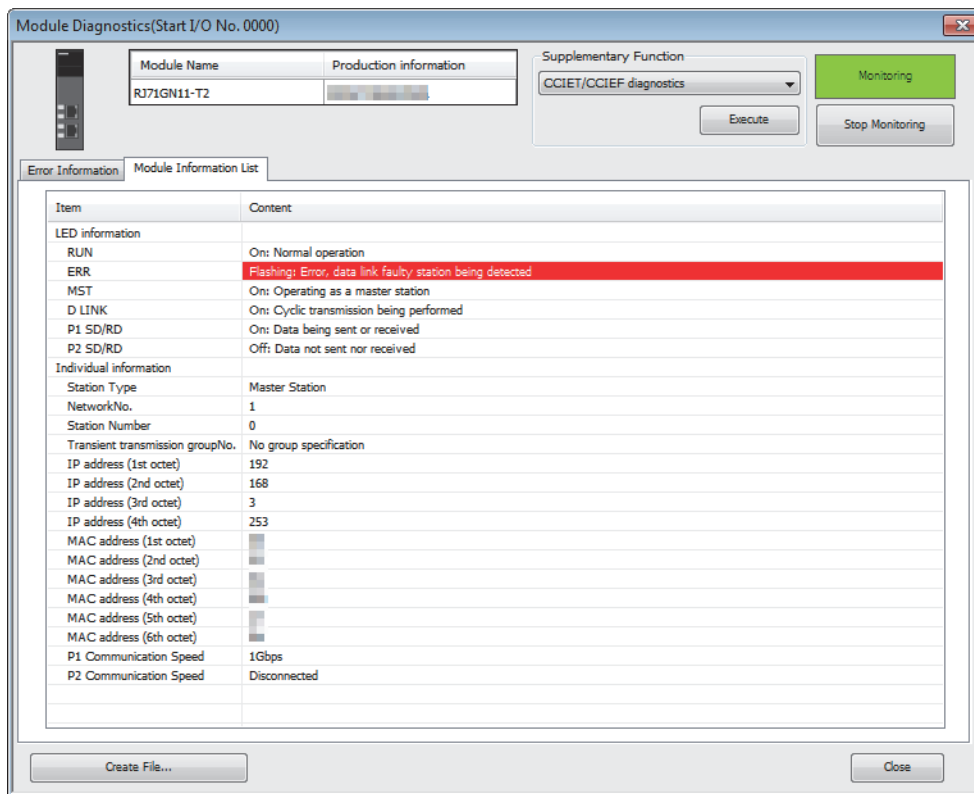

The details of the errors currently occurring and the corrective actions for these errors are displayed in the [Error Information] tab.

| Item                   | Description   |
|------------------------|---|
| Status                 | Major: An error such as hardware failure or memory failure. The module stops operating.<br>Moderate: An error, such as parameter error, which affects module operation. The module stops operating.<br>Minor: An error such as communication failure. The module continues operating. |
| Error code             | Page 226 List of Error Codes  |
| [Event History] button | Click this button to check the history of errors that have occurred on the network, errors detected for each module, and operations that have been executed. (Page 260 Event List)  |
| Detailed Information   | Displays up to three information items for each error, such as parameter information, operation source information, and system configuration information. (Page 258 List of Parameter Numbers)  |
| Cause                  | Displays the detailed error causes.   |
| Corrective Action      | Displays the actions to eliminate the error causes.   |

## Module Information List

The LED information and individual information of the RJ71GN11 are displayed in the [Module Information List] tab.

| Item                               | Description                                      |   |
|------------------------------------|--|---|
| LED information                    | Displays the LED status of the RJ71GN11.         |   |
| Individual information             | Station Type                                     | Displays the station type set for the selected module.                                |
|                                    | Network No.                                      | Displays the network number set for the selected module.                              |
|                                    | Station Number                                   | Displays the station number set for the selected module.                              |
|                                    | Transient transmission group No.                 | Displays the transient transmission group number set for the selected module.         |
|                                    | IP address                                       | Displays the IP address set for the selected module.                                  |
|                                    | MAC address                                      | Displays the MAC address of the selected module.                                      |
|                                    | P1 Communication Speed                           | Displays the communication speed set using the auto-negotiation function.             |
| P2 Communication Speed             |  |   |
| Function Configuration Information | LB/LW points extended setting (RJ71GN11-SX only) | Displays the settings for the number of link points extension of the selected module. |

# Module Communication Test

This function checks the module hardware when communication using the RJ71GN11 is unstable.

Connect the P1 and P2 of the RJ71GN11-T2 with an Ethernet cable or the P1 and P2 of the RJ71GN11-SX with an optical fiber cable.

The following table lists the tests performed.

| Test item                   | Description   |
|-----------------------------|---|
| Internal self-loopback test | Checks whether the communication function of the module can be performed normally.  |
| External self-loopback test | Checks whether the communication can be performed normally with the cable connected between two connectors of the module. |

## Procedure

1. Set the module operation mode to module communication test mode in the following item.

 [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ Target module ⇒ [Application Settings] ⇒ [Module Operation Mode]

2. Connect the P1 and P2 of the RJ71GN11 with a cable.

3. Write the module parameters to the CPU module.

4. Reset or power off and on the CPU module to start the module communication test.

### Point

Do not perform a module communication test while connected to another station. The operation of the other station may fail.

## Checking the status and result

The test status and result can be checked with the LED indications of the module.

| Test status             | LED indication   |
|-------------------------|--|
| Test in progress        | The dot matrix LED displays "UCT".   |
| Normal completion       | The dot matrix LED displays "OK".  |
| Completed with an error | The ERR LED turns on and the dot matrix LED indicates "ERR" and error number alternately at intervals of 1 second. |

### ■ Error number when the test completed with an error

The dot matrix LED indicates an error with the form of "P1 or P2\_Error number".

For example, "1\_3" is displayed when error No.3 occurs in P1.

If the module communication test is completed with an error, check the following.

| Error number | Description                                     | Action   |
|--------------|---|--|
| 1            | Internal self-loopback test error               | Please consult your local Mitsubishi representative.   |
| 2            | External self-loopback test connection error    | Check the cable connection or replace the cable, and perform the test again. If the test results in an error again, please consult your local Mitsubishi representative. |
| 3            | External self-loopback test communication error | Replace the cable and perform the test again. If the test results in an error again, please consult your local Mitsubishi representative.                                |

## 4.3 Checking the Network Status

This section describes troubleshooting to check the status of the network by executing diagnostics and operation tests using the engineering tool.

### CC-Link IE TSN/CC-Link IE Field Diagnostics

For CC-Link IE TSN, perform status monitoring, operation tests, or others.

#### Precautions

In the following cases, the CC-Link IE TSN/CC-Link IE Field diagnostics cannot start.

- The RJ71GN11 is not connected to CPU modules specified on the "Specify Connection Destination Connection" window.
- In CPU parameters of CPU modules specified on the "Specify Connection Destination Connection" window, "Link Direct Device Setting" of "Memory/Device Setting" is not "Extended Mode (iQ-R Series Mode)".
- "Module Operation Mode Setting" under "Application Settings" of the RJ71GN11 is not in the online mode.
- The error code 20E0H occurs.
- The engineering tool is not connected to a station with the same communication speed as the master station.
- The network topology of the diagnostics destination does not support the version of the engineering tool or module.
- In the network where the master station switch function is enabled, a supported version of the engineering tool is not used.

#### Diagnostic items

When starting the CC-Link IE TSN/CC-Link IE Field diagnostics by specifying "No Specification" in "Other Station Setting" on the "Specify Connection Destination Connection" window, the following items can be used.

○: Diagnosed △: Diagnosed with restrictions ×: Not diagnosed

| Item                             |   | Overview  | Connection destination of engineering tool |                 | Reference   |
|----------------------------------|---|---|--|-----------------|---|
|                                  |   |   | Master station                             | Local station   |   |
| Status monitor                   | Network map                                   | Check if any errors are being caused by the devices and cables that configure the network. In addition, check the operating status of each station. | ○  | ○               | Page 194 "CC-Link IE TSN/CC-Link IE Field Diagnostics" window |
|                                  | Data Unlinked                                 | Check that there is no station that is set on an actual network.  | ○  | ○               |   |
|                                  | Selected Station Communication Status Monitor | Check details of, or actions for, errors that occurred in a selected station.   | ○  | ○               |   |
| Operation Test                   | Communication Test                            | Check whether outgoing/incoming paths of transient transmission between the own station and the communication target are correct.                   | ○  | ○               | Page 201 Communication Test                                   |
| Information Confirmation/Setting | Station Information List                      | Check information of the device stations which are performing data link in list form.   | ○  | ○               | Page 203 Station Information List                             |
| Selected Station Operation       | Remote Operation                              | Operate remotely from the engineering tool to device stations.  | △ <sup>*1</sup>                            | △ <sup>*1</sup> | Page 204 Remote Operation                                     |

\*1 If the setting on the "Specify Connection Destination Connection" window of the engineering tool is as follows, remote operation cannot be executed with "All Stations Specified".  
 Connection via Ethernet with the selections "Ethernet Board" for the personal computer-side I/F and "CC IE TSN/Field Module" for the programmable controller-side I/F

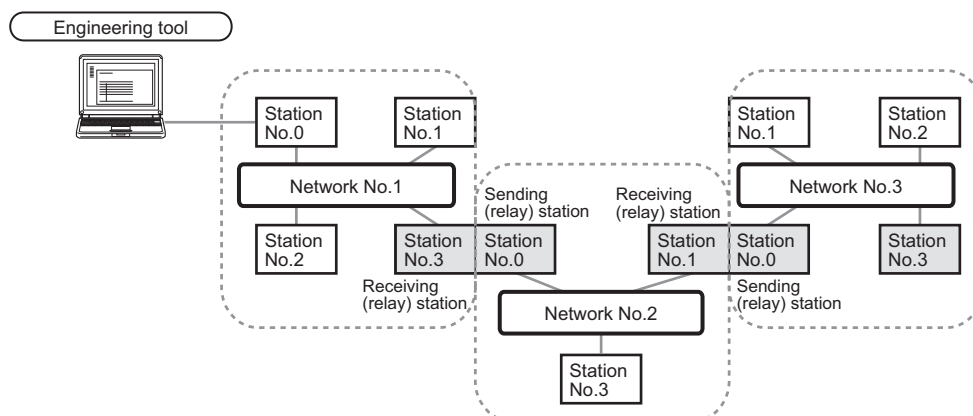

When starting the CC-Link IE TSN/CC-Link IE Field diagnostics by specifying "Other Station (Single Network)" or "Other Station (Co-existence Network)" in "Other Station Setting" on the "Specify Connection Destination Connection" window, the following restrictions apply.

- A communication test cannot be used.
- A station information list cannot be used.
- If MELSECNET/H, multidrop connection of serial communication modules, an interface board for personal computer, a GOT (FA transparent function used), or network modules of the MELSEC-Q/L series are included in the communication path, diagnostics cannot start.

When "Other Station (Co-existence Network)" is specified in "Other Station Setting" on the "Specify Connection Destination Connection" window and "CC-Link" or "C24" is specified in "Co-existence Network Route", diagnostics cannot start.

When starting the CC-Link IE TSN/CC-Link IE Field diagnostics by specifying "Other Station (Single Network)" or "Other Station (Co-existence Network)" in "Other Station Setting" on the "Specify Connection Destination Connection" window, specify the network number and station number of the relay receiving station or relay sending station for "Network No." and "Station No." in "Network Communication Route" on the "Specify Connection Destination Connection" window.

For example, to start the CC-Link IE TSN/CC-Link IE Field diagnostics of the network number 2, specify the network number 1 and station number 3, or the network number 2 and station number 0 in "Network No." and "Station No.".

- Although the CC-Link IE TSN/CC-Link IE Field diagnostics of the network to which the relay sending station belongs can be started, that of the network to which the relay receiving station belongs cannot be started.
- The CC-Link IE TSN/CC-Link IE Field diagnostics can be started for stations of up to eight networks ahead (number of relay stations: 7) including the station directly connected to the engineering tool.

## Usage methods

The following describes how to use the CC-Link IE TSN/CC-Link IE Field diagnostics.

### ■When "No Specification" is specified in "Other Station Setting" on the "Specify Connection Destination Connection" window

1. Connect the engineering tool to the CPU module.

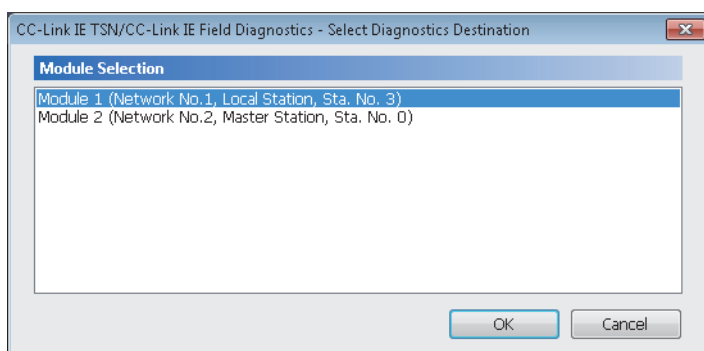

If a device station cannot be monitored due to an error such as cable disconnection, directly connect the engineering tool to the device station.

2. Start the CC-Link IE TSN/CC-Link IE Field diagnostics.

[Diagnostics] ⇒ [CC-Link IE TSN/CC-Link IE Field Diagnostics]

3. When the following window opens, select the RJ71GN11 to be diagnosed and click the [OK] button to start the CC-Link IE TSN/CC-Link IE Field diagnostics.

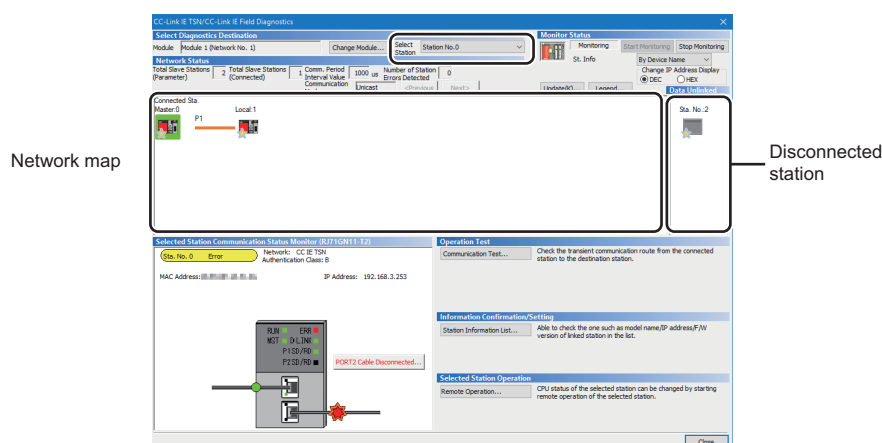

Modules are listed in the order configured in module information.

### Point

When multiple RJ71GN11s with the same network number are mounted on the same base unit, the module with the smallest slot number on that base unit is always diagnosed, regardless of setting. However, when the master station or current master station exists on the same base unit while the RJ71GN11-SX is being used, the master station or current master station with the smallest slot number on that base unit will be diagnosed even if any modules are selected. In addition, if data link error occurs in the module with the smallest slot number on that base unit, the network map is not displayed if the local station is selected.

4. Select the station to be diagnosed from "Select Station" or in the network map.

In this manual, "Authentication Class" is described as "CC-Link IE TSN Class".

- An icon indicating an error is displayed on the module icon of the station where an error occurs.
- A disconnected station that has performed data link is indicated with the "Disconnected Station" icon in the network map. However, a disconnected station in following case is displayed on the right end of the area.

#### Stations displayed on the right end of the area.

- A station that was reconnected to a network after disconnecting/inserting the cable or powering off and on the system, and remains disconnected
- A disconnected station with the station icon deleted in the network map by clicking the [Update] button

- The "Error" icon is displayed on the icon of a cable where a communication error occurs. To check the details of the communication error, click the neighboring stations of the "Error" icon.

#### Point

When the station to be diagnosed cannot be selected, the status of network number mismatch or overlap of master stations cannot be checked using the CC-Link TSN/CC-Link IE Field diagnostics. Check the error details by directly connecting the engineering tool to the station where an error occurs, and opening the "System Monitor" window.

5. The status of a station selected in "Network Status" is displayed in "Selected Station Communication Status Monitor".  
( Page 194 "CC-Link IE TSN/CC-Link IE Field Diagnostics" window)

The station status is displayed on the top of "Selected Station Communication Status Monitor".

If an error occurs, a button indicating the error such as [PORT2 Communication Error] is displayed in "Selected Station Communication Status Monitor". Click the button to check the error details and actions.

6. Various tests and operations can be performed by clicking the "Operation Test" or "Selected Station Operation" on the bottom left of the window. ( Page 201 Communication Test, Page 204 Remote Operation)

## ■When a setting other than "No Specification" is specified in "Other Station Setting" on the "Specify Connection Destination Connection" window

1. Connect the engineering tool to the CPU module.
2. Start the CC-Link IE TSN/CC-Link IE Field diagnostics.

[Diagnostics] ⇒ [CC-Link IE TSN/CC-Link IE Field Diagnostics]

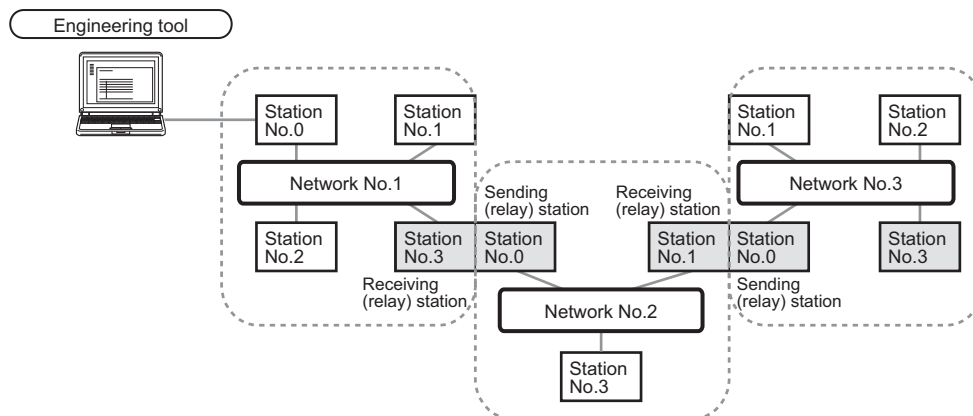

### Point

The CC-Link IE TSN/CC-Link IE Field diagnostics cannot be started when "Other Station (Co-existence Network)" has been specified in "Other Station Setting" on the "Specify Connection Destination Connection" window and "CC-Link" or "C24" has been specified in "Co-existence Network Route".

3. Select the RJ71GN11 of the network number to be diagnosed and click the [OK] button to start the CC-Link IE TSN/CC-Link IE Field diagnostics.

### Point

- Although the CC-Link IE TSN/CC-Link IE Field diagnostics of the network to which the relay sending station belongs can be started, that of the network to which the relay receiving station belongs cannot be started.
- To start the CC-Link IE TSN/CC-Link IE Field diagnostics, specify the network number and station number of the relay receiving station or relay sending station for "Network No." and "Station No." in "Network Communication Route" on the "Specify Connection Destination Connection" window. For example, to start the CC-Link IE TSN/CC-Link IE Field diagnostics of the network number 2, specify the network number 1 and station number 3, or the network number 2 and station number 0 in "Network No." and "Station No."

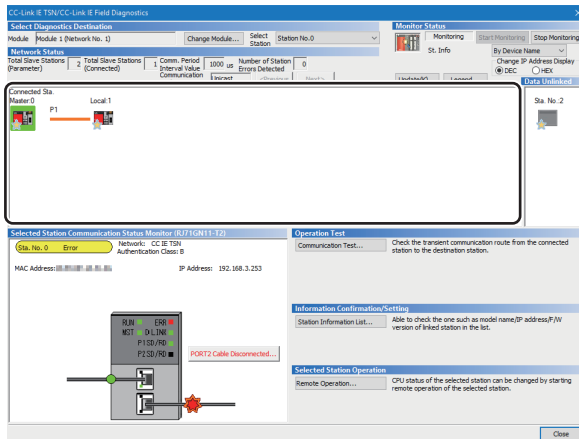

- The CC-Link IE TSN/CC-Link IE Field diagnostics can be started for stations of up to eight networks ahead (number of relay stations: 7) including the station directly connected to the engineering tool.
- The selected station communication status monitor of the RJ72GF15-T2 cannot be executed in the CC-Link IE TSN/CC-Link IE Field diagnostics for the stations of five networks ahead (number of relay stations: 4) or later.

4. Step 4 and later is the same procedure as when "No Specification" is specified in "Other Station Setting" on the "Specify Connection Destination Connection" window. (☞ Page 191 When "No Specification" is specified in "Other Station Setting" on the "Specify Connection Destination Connection" window)

## "CC-Link IE TSN/CC-Link IE Field Diagnostics" window

Network map

In this manual, "Authentication Class" is described as "CC-Link IE TSN Class".

| Item                           |  | Description  |
|--------------------------------|--|--|
| Select Diagnostics Destination | Module                                     | The RJ71GN11 under diagnostics is displayed.   |
|                                | [Change Module] button                     | Allows to change the target RJ71GN11 when multiple RJ71GN11s are mounted. However, when multiple RJ71GN11s with the same network number are mounted on the same base unit, the module with the smallest slot number on that base unit is always diagnosed, regardless of setting.  |
|                                | Select Station                             | Selects the station number of the station to be diagnosed. A station to be diagnosed can also be selected by clicking the module icon displayed in the network map.  |
| Monitor Status                 | [Start Monitoring] button                  | Starts monitoring the CC-Link IE TSN/CC-Link IE Field diagnostics.   |
|                                | [Stop Monitoring] button                   | Stops monitoring the CC-Link IE TSN/CC-Link IE Field diagnostics.  |
| [Update] button                |  | If the actual network configuration and network map of the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window are inconsistent, the network map update is executed so they are matched. A data link error may momentarily occur in all the stations and outputs of the connected device stations may turn off since all stations on the network will be reconnected when executing the network map update. Set output data if needed.  |
| [Legend] button                |  | Displays the meaning of icons displayed in the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window.   |
| St. Info                       |  | The display name of the device station can be selected from "By Device Name", "By Station Type", "By Model Name", or "By IP Address".<br>"By Device Name" displays the information entered in "Alias" of "Network Configuration Settings" under "Basic Settings". The station type is displayed when the "Alias" is not entered.   |
| Network Status                 | Total Linked Stations (Parameter)          | Displays the total number of device stations set in "Network Configuration Settings" under "Basic Settings".   |
|                                | Total Linked Stations (Connected)          | Stores the total number of device stations that are actually connected by data link in the CC-Link IE TSN.   |
|                                | Communication Cycle Interval Setting value | The communication cycle interval set in "Communication Period Setting" under "Basic Settings" of the master station is displayed. ( $\mu$ s unit)  |
|                                | Number of Station Errors Detected          | Indicates the number of error stations in the displayed network.   |
|                                | Communication Mode                         | Indicates the communication mode set in "Communication Mode" under "Application Settings" of the master station.   |
|                                | Change IP Address Display                  | Allows to select from "DEC" or "HEX" for IP address display on the selected communication status monitor and network map. (Default: Decimal)   |
|                                | Network map                                | Indicates the CC-Link IE TSN structure and the status of each station. (Page 196 Network map)<br>If the status of each station is not displayed, check whether there are any overlaps of master stations.  |
|                                | Data Unlinked                              | Displays a disconnected station that has been set in "Network Configuration Settings" under "Basic Settings" but has not yet performed data link. Reserved stations or error invalid stations are also included. However, even if a disconnected station had performed data link, disconnected stations in the following cases are displayed in this area. <ul style="list-style-type: none"> <li>A station that was reconnected to a network after disconnecting/inserting the cable or powering off and on the system, and remains disconnected</li> <li>A disconnected station with the station icon deleted in the network map by clicking the [Update] button</li> </ul> Displays the station number on the station icon.<br>The "Other Modules" icon indicates a station that has not yet performed data link.<br>Icons other than the "Other Modules" icon indicate stations that had performed data link before disconnection. For details on the displayed icon, click the [Legend] button. |

| Item  |                                   | Description  |
|---|-----------------------------------|--|
| Selected Station Communication Status Monitor |                                   | Status of the station selected in "Network Status" is displayed. (☞ Page 199 Selected Station Communication Status Monitor)    |
| Operation Test                                | [Communication Test] button       | Performs a communication test. (☞ Page 201 Communication Test)   |
| Information Confirmation/Setting              | [Station Information List] button | Displays information of the device stations which are performing data link in list form. (☞ Page 203 Station Information List) |
| Selected Station Operation                    | [Remote Operation] button         | Performs remote operation (such as RUN, STOP, or RESET operations) to the CPU module. (☞ Page 204 Remote Operation)            |

## Network map

### Icon

The module type and station number are displayed with an icon.

- Click: Selection
- Right-click: Executes tests or debugging.
- keys on the keyboard: Move the focus to the module to be diagnosed, and determine it with the key.

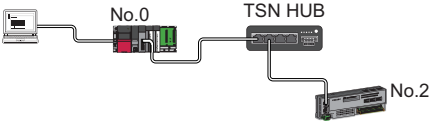

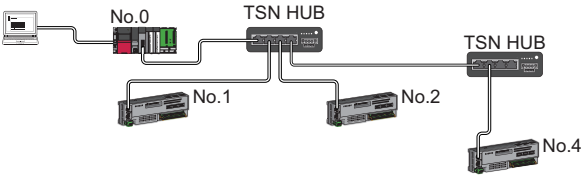

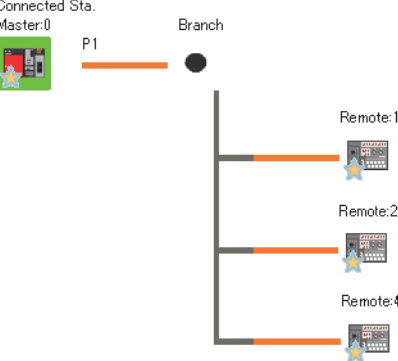

| No. | Description   |
|-----|---|
| (1) | Displays the station (own station) where the engineering tool is connected.   |
| (2) | Displays the station type and station number. "?" is displayed when a station number has not been set. When the background of the text is colored, the relevant station may have been set as a reserved station or an error invalid station. Click the [Legend] button to check the meaning of the background colors. |
| (3) | Module status is displayed. Click the [Legend] button to check the meaning of the icon. When the "Error (Illegal ring connection detected)" icon is displayed, take actions displayed in "Troubleshooting" of "Error details". ( Page 199 Selected Station Communication Status Monitor)                              |
| (4) | P1 or P2 to which an Ethernet cable or optical fiber cable is connected is displayed.   |

### Network map

A network map is displayed according to the connection status. (Only ring topology for the RJ71GN11-SX)

| Connection status                                  | Display of the network map |
|--|----------------------------|
| <b>Line topology</b><br>                           |                            |
| <b>Star topology</b><br>                           |                            |
| <b>Ring topology</b><br>                           |                            |
| <b>Coexistence of line and star topologies</b><br> |                            |

In the following cases, the network map is displayed differently from the actual connection status.

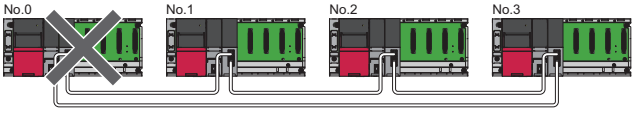

| Connection status  | Display of the network map   |
|--|--|
| <p>Two stations are connected through a switching hub.</p>  | <p>Branches are not displayed in the network map.</p> <p>Connected Sta.<br/>Master:0</p>  |
| <p>Switching hubs are in cascade connection.</p>            | <p>Only one branch is displayed.</p> <p>Connected Sta.<br/>Master:0</p>                   |

### Precautions

- Stations in offline mode are not displayed in the network map. In line topology, stations connected after a station in offline mode are not displayed because they are disconnected.
- If a station whose connection information cannot be obtained exists in a line topology, the network map will be displayed as a star topology.
- Stations whose connection order has not been set in a ring topology will be displayed in ascending order of the IP addresses.

### ■ Display during use of the master station switch function

When the master station switch function is used, the network map on the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window displays the current master station at the center. When the current master station is switched, the display changes to the display of the local station that has become the current master station at the center, and it is displayed in the upper left of the network map.

| Connection status  | Display of the network map   |
|--|--|
| <p>Ring topology</p>  | <p>If the local station is the current master station, the local station (current master station) is displayed as the master station in the upper left of the network map.</p> <p>Connected Sta.<br/>Master:0</p>  |

## Precautions

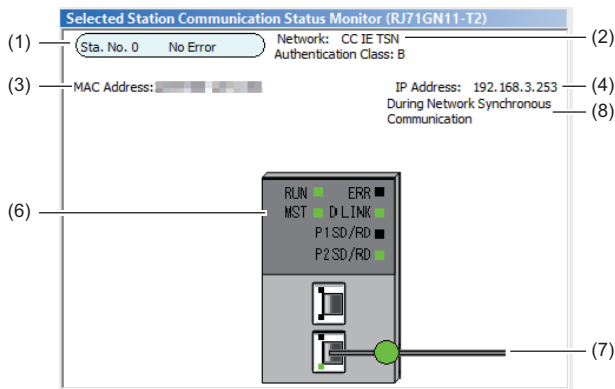

- If the local station is the current master station and "By Device Name" is selected in "St. Info", the station type will be displayed instead of the device name.
- If master station switching occurs while the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window is being displayed, an error message will be displayed and monitoring may stop. To restart monitoring, click the [Start Monitoring] button. However, the time may take to start monitoring depending on the number of connected modules, and an error message may be displayed again.
- If master station switching occurs while the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window is being displayed, the display may temporarily differ from the actual system.
- When the master station returns, the network map changes to display the master station that is the current master station in the center. However, it may take some time for the returning master station to detect local stations and perform data links with all local stations. Therefore, it may take some time for the local stations to be displayed as a normally operating stations in the network map.

## Selected Station Communication Status Monitor

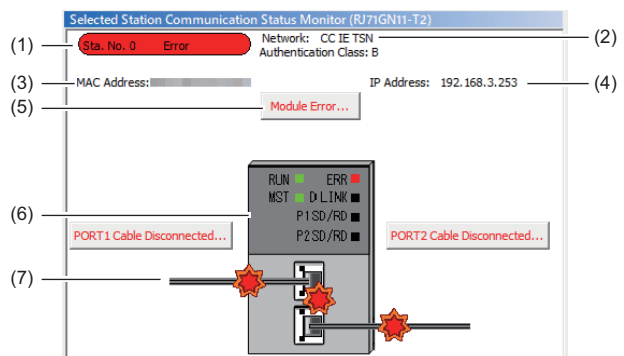

Displays status of the station selected in "Network Status".

### ■RJ71GN11-T2

#### ■Normal operation

#### ■Error status

In this manual, "Authentication Class" is described as "CC-Link IE TSN Class".

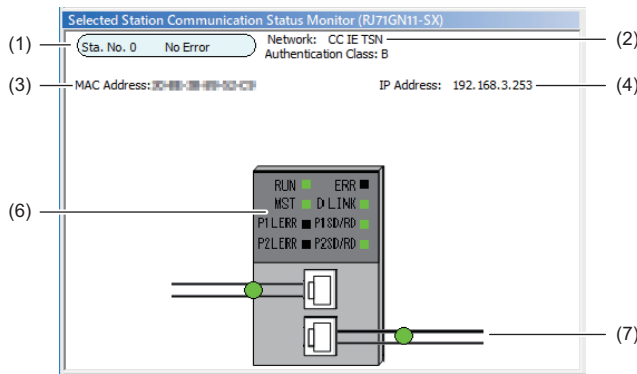

| No. | Description  |
|-----|--|
| (1) | Indicates the station number and operating status.<br><b>■Normal operation</b> <ul style="list-style-type: none"> <li>Station number No error (light blue): Normal operation</li> </ul> <b>■Error status</b> <ul style="list-style-type: none"> <li>Station number Error (yellow): Error (Data link is continued)</li> <li>Station number Error (red): Error (Data link is stopped)</li> </ul> |
| (2) | Displays the network type.   |
| (3) | Displays a MAC address.*1  |
| (4) | Displays an IP address.  |
| (5) | Click this button to check error details. Take actions following the description displayed in "Error Factor" and "Troubleshooting".  |
| (6) | The LED status of a module and communication status of P1 and P2 is displayed. (MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))  |
| (7) | Status of the Ethernet cables connected to P1 and P2 is displayed.   |
| (8) | The operating status of the network synchronous communications is displayed.*2   |

\*1 When 00-00-00-00-00-00 is displayed as a MAC address, the status of the selected station cannot be checked with the selected station communication status monitor. Check the error details by directly connecting the engineering tool to the station where an error occurs, and opening the "System Monitor" window.

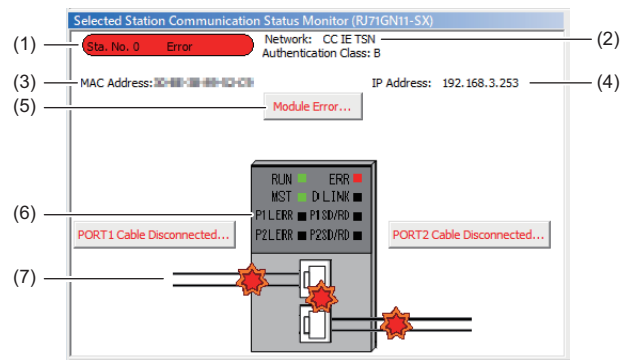

\*2 "During Network Synchronous Communication" displayed in "Selected Station Communications Status Monitor" indicates that the selected station is synchronizing through the network synchronous communications. When the master station does not perform the network synchronous communications, "During Network Synchronous Communication" is displayed in a device station while the device station is performing the network synchronous communications.

## ■RJ71GN11-SX

### ■Normal operation

### ■Error status

In this manual, "Authentication Class" is described as "CC-Link IE TSN Class".

| No. | Description  |
|-----|--|
| (1) | Indicates the station number and operating status.<br><b>■Normal operation</b> <ul style="list-style-type: none"> <li>Station number No error (light blue): Normal operation</li> </ul> <b>■Error status</b> <ul style="list-style-type: none"> <li>Station number Error (yellow): Error (Data link is continued)</li> <li>Station number Error (red): Error (Data link is stopped)</li> </ul> |
| (2) | Displays the network type.   |
| (3) | Displays a MAC address.*1  |
| (4) | Displays an IP address.  |
| (5) | Click this button to check error details. Take actions following the description displayed in "Error Factor" and "Troubleshooting".  |
| (6) | The LED status of a module and communication status of P1 and P2 is displayed. (MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))  |
| (7) | Status of the optical fiber cables connected to P1 and P2 is displayed.  |

\*1 When 00-00-00-00-00-00 is displayed as a MAC address, the selected station communication status monitor does not operate. Check the error details by directly connecting the engineering tool to the station where an error occurs, and opening the "System Monitor" window.

### ■When a selected station is not available for communication status monitor

The information of devices are not displayed. The "Error details" window (detailed information, error factor, troubleshooting) is displayed.

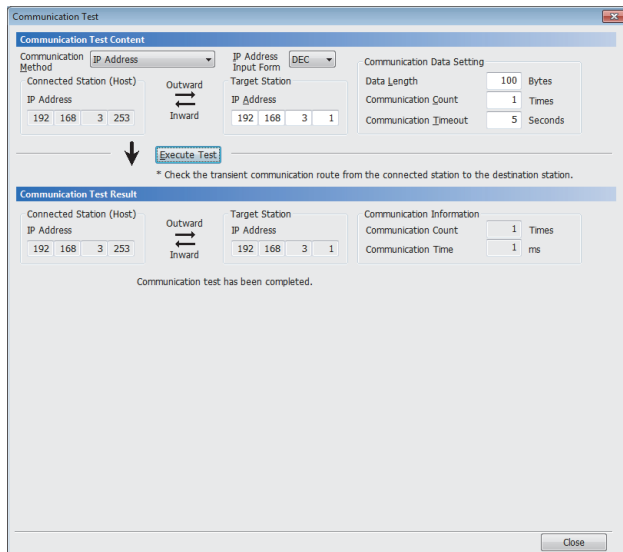

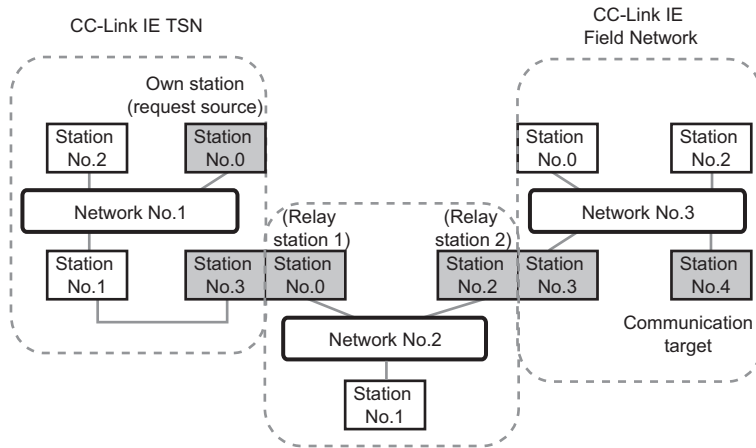

# Communication Test

This function checks if transient transmission data can be properly routed from the own station to the communication target. Depending on selection for "Communication Method" ("Network No./Station No." or "IP Address"), the range that can be checked may vary.

| Selection of "Communication Method" | Communication target of transient transmission |  |
|-------------------------------------|--|--|
|                                     | Stations on the same network                   | Stations on the other network  |
| Network No./Station No.             | <input type="radio"/> Available for check      | <input type="radio"/> Available for check (relay stations to be transmitted through can also be checked) |
| IP Address                          | <input type="radio"/> Available for check      | <input checked="" type="radio"/> Not available for check   |

The following system configuration is used to explain the procedure of the communication test.

1. Display the "Communication Test" window and select "Network No./Station No." or "IP Address" from "Communication Method".  
 [Diagnostics] ⇒ [CC-Link IE TSN/CC-Link IE Field Diagnostics] ⇒ [Communication Test] button
2. Enter values for "Target Station" and "Communication Data Setting".
3. Click the [Execute Test] button to execute the communication test. If an error occurs, take corrective actions according to the error message.

## Precautions

- When a relay sending station is set to "Target Station", the communication test ends with an error. Set a relay receiving station to "Target Station".

- When "Network No./Station No." is selected for "Communication Method" and a station mounted on the same base unit (main base unit and extension base unit) is set to "Target Station", the communication test ends with an error.
- Since this function uses PING, a communication test target station communication error (error code D919H) occurs if the communication target does not respond to PING. When executing this function, check if the security setting (such as firewall) of the communication target is set to respond to PING. Moreover, if the target is set not to respond to PING in the security settings (such as a firewall), it may take some time until a timeout error occurs on the engineering tool. For details on when communication using the engineering tool is not allowed in the settings of Windows Firewall, refer to the following.

GX Works3 Operating Manual

# Station Information List

The station information list displays information of the device stations which are performing data link in list form.

| Station Information List                          |               |             |             |             |                        |   |
|---|---------------|-------------|-------------|-------------|------------------------|---|
| Number of Stations <input type="text" value="3"/> |               |             |             |             |                        | Change IP Address Display<br><input checked="" type="radio"/> DEC <input type="radio"/> HEX |
| Station No.                                       | Model Name    | IP Address  | MAC Address | F/W Version | Production Information | Module Inherent Information   |
| 1   | NZ2GN251-32DT | 192.168.3.1 | ■■■■■■■■■■  | 03          | ■■■■■■■■■■             | 0020  |
| 2   | NZ2GN25-60AD4 | 192.168.3.2 | ■■■■■■■■■■  | 03          | ■■■■■■■■■■             | 0180  |
| 3   | NZ2GN25-60DA4 | 192.168.3.3 | ■■■■■■■■■■  | 03          | ■■■■■■■■■■             | 0140  |

| Item                        | Description   |
|-----------------------------|---|
| Number of Stations          | Displays the number of device stations to be displayed in the station information list. |
| Change IP Address Display   | Select an IP address display format.  |
| Station No.                 | Displays the station number of the device station.                                      |
| Model Name                  | Displays the model name of the device station.  |
| IP Address                  | Displays the IP address of the device station.  |
| MAC Address                 | Displays the MAC address of the device station.   |
| F/W Version                 | Displays the firmware version of the device station.                                    |
| Production Information      | Displays the production information of the device station.                              |
| Module Inherent Information | Displays the module-specific information of the device station.                         |

**Point** 

- The station information list displays only the device stations which are performing data link.
- If the engineering tool does not have information of the relevant device station, "—" is displayed for each item.
- If the relevant device station is an unsupported module, "Other Modules" is displayed.

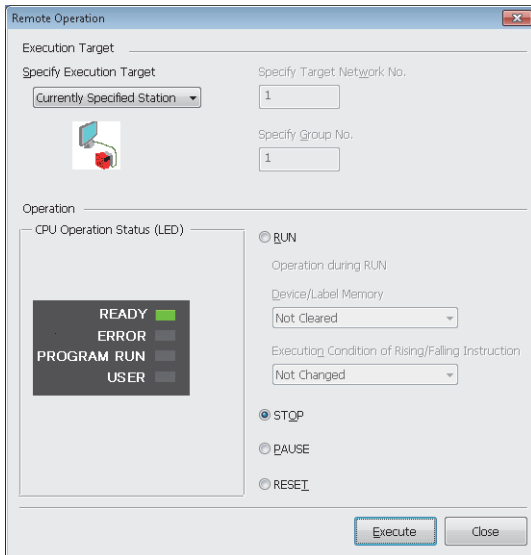

# Remote Operation

This function executes remote operations (such as RUN, STOP, and RESET operations) to the station selected on the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window, from the engineering tool. (Remote operation for device stations is available only for RESET)

The displayed window varies depending on the station selected. For the operations with a module other than the RJ71GN11 selected, refer to the manual for the module used.

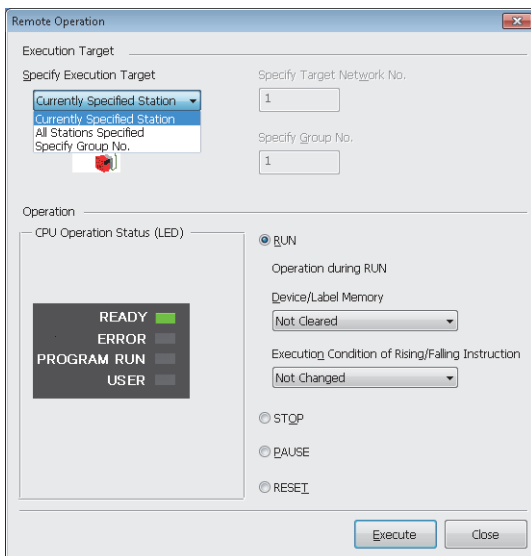

## Procedure

To perform remote operations, follow the steps below.

1. Select the module where the remote operations are performed in the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window.
2. Click the [Remote Operation] button in the "CC-Link IE TSN/CC-Link IE Field Diagnostics" window, or right-click a module icon in the "Network Status" and click [Remote Operation].

The "Remote Operation" window is displayed.

3. Specify the target station in "Specify Execution Target".
  - "Currently Specified Station": The remote operations are performed only to the CPU module on the station selected in the CC-Link IE TSN/CC-Link IE Field diagnostics.
  - "All Stations Specified": Remote operations are performed on all stations under "Specify Target Network No."
  - "Specify Group No.": Among the stations for which a transient transmission group number has been set, remote operations are performed only on the stations that are selected in "Specify Group No."
4. Select a remote operation (RUN, STOP, PAUSE, or RESET) to the CPU module to be performed in "Operation".\*1
5. Click the [Execute] button to perform the remote operation.

\*1 To perform remote RESET, set "Remote Reset Setting" under "Operation Related Setting" of "CPU Parameter" to "Enable" in advance.

### Point

For details on the remote operations, refer to the user's manual for the CPU module used.

## 4.4 Troubleshooting by Symptom

This section describes troubleshooting when a data link cannot be performed with the target station regardless of no error occurring in the RJ71GN11.

If an error has occurred in the RJ71GN11, identify the error cause using the engineering tool. (🔍 Page 189 Checking the Network Status)

- Cyclic transmission failed (🔍 Page 206 Cyclic transmission failed)
- Transient transmission failed (🔍 Page 211 Transient transmission failed)
- Station is disconnected from the network (🔍 Page 216 Station is disconnected from the network)
- Station is repeatedly disconnected and reconnected (🔍 Page 216 Station is repeatedly disconnected and reconnected (RJ71GN11-T2))
- Communications are unstable (🔍 Page 218 Communications are unstable)
- SLMP communications failed (🔍 Page 219 SLMP communications failed (RJ71GN11-T2 only))
- The control CPU of the local station cannot be synchronized time (🔍 Page 220 The control CPU of the local station cannot be synchronized time)
- Communications with Ethernet devices failed (🔍 Page 220 Communications with Ethernet devices failed (RJ71GN11-T2 only))
- Although the data link is normal, communications for the link device failed (🔍 Page 221 Although the data link is normal, communications for the link device failed)
- Desynchronization with CC-Link IE TSN network synchronous communication function (🔍 Page 221 Desynchronization with synchronous communication function (RJ71GN11-T2 only))
- Safety communications failed (🔍 Page 222 Safety communications failed (RJ71GN11-T2 only))
- Cannot be monitored using the CC-Link IE TSN Communication Software (🔍 Page 222 Cannot be monitored using the TSN Communication Software (RJ71GN11-T2 only))
- The network map is not displayed correctly (🔍 Page 223 The network map is not displayed correctly)
- CC-Link IE TSN Class A device does not perform data link (🔍 Page 224 CC-Link IE TSN Class A device does not perform data link (RJ71GN11-T2 only))
- The co-recording function does not operate properly (📖 MELSEC iQ-R System Recorder Co-recording Function Reference Manual)

## Cyclic transmission failed

Check the following.

| Check item  | Action   |
|---|--|
| Is the D LINK LED turned on?  | Perform troubleshooting for when the D LINK LED turns off or is flashing. (☞ Page 183 The D LINK LED turns off or is flashing)   |
| Do the station types set in "Network Configuration Settings" under "Basic Settings" of the master station match those set for the connected device stations?  | Check 'Station type match status' (SB00E8) and 'Station type match status' (SW00E8 to SW00EF) to correct the station type of stations in which the station type does not match.  |
| (RJ71GN11-T2 only)<br>Is a dedicated TSN hub used?  | <ul style="list-style-type: none"> <li>• Correct the used switching hub and the switching hub settings. For the setting method, refer to the manual for the switching hub used.</li> <li>• When using a TSN hub, check the precautions and restrictions for system configuration on the CC-Link Partner Association website (<a href="http://www.cc-link.org">www.cc-link.org</a>).</li> <li>• Correct the switching hub delay time according to the switching hub used. (☞ Page 322 Communication cycle intervals) For the switching hub delay time, refer to the manual for the switching hub used.</li> </ul> |
| (RJ71GN11-T2 only)<br>When "Communication Speed" under "Application Settings" of the master station is set to "100Mbps", is "System Reservation Time" in "Communication Period Setting" under "Basic Settings" of the master station set to 20μs? | Set "System Reservation Time" to 200μs.  |
| Is "— — —" displayed on the dot matrix LED?   | <ul style="list-style-type: none"> <li>• Set the module parameters.</li> <li>• Check the firmware version of the RJ71GN11. When module parameters that are not supported are set, upgrade the firmware version or correct the module parameters.</li> </ul>  |
| (RJ71GN11-T2 only)<br>When "Connection Device Information" under "Basic Settings" of the master station is set to "CC-Link IE TSN Class B Only"   | <p>Are CC-Link IE TSN Class A devices connected?</p> <ul style="list-style-type: none"> <li>• Check the connected device and disconnect the CC-Link IE TSN Class A devices.</li> <li>• When connecting a CC-Link IE TSN Class A device, set "Connection Device Information" of the master station to "Mixture of CC-Link IE TSN Class B/A or CC-Link IE TSN Class A Only".</li> </ul>  |
|   | <p>Is a general-purpose hub connected between CC-Link IE TSN Class B devices?</p> <p>Check the connected device and disconnect the general-purpose hub or replace it with a TSN hub.</p>   |

| Check item   | Action  |   |
|--|---|---|
| (RJ71GN11-T2 only)<br>When "Connection Device Information" under "Basic Settings" of the master station is set to "Mixture of CC-Link IE TSN Class B/A or CC-Link IE TSN Class A Only" | ■For firmware version "13" or earlier<br>Are nine or more CC-Link IE TSN Class B devices and TSN hubs connected in total to each port of the master station in the transmission path from the master station to the CC-Link IE TSN Class B device of the end? | Check the connected device and reduce the number of CC-Link IE TSN Class B devices and TSN hubs to eight or less in total for each port of the master station in the transmission path from the master station to the CC-Link IE TSN Class B device of the end.   |
|  | Is the CC-Link IE TSN Class B device other than the master station connected in a star topology via a general-purpose hub?  | <ul style="list-style-type: none"> <li>• Other than the master station, do not connect CC-Link IE TSN Class B devices to a general-purpose hub in the star topology.</li> <li>• Connect CC-Link IE TSN Class B devices to a TSN hub.</li> </ul>   |
|  | Is the master station connected with CC-Link IE TSN Class B devices via a general-purpose hub?  | <ul style="list-style-type: none"> <li>• Check the connected device and connect the master station to CC-Link IE TSN Class B devices in a line topology without using a general-purpose hub.</li> <li>• Check the connected device and connect the master station and CC-Link IE TSN Class B devices to a TSN hub.</li> </ul>   |
|  | ■For firmware version "13" or earlier<br>In multicast mode, is the CC-Link IE TSN Class A remote station connected to the master station?   | <ul style="list-style-type: none"> <li>• Connect the local station or remote station supporting the multicast filter to the CC-Link IE TSN Class A remote station.</li> <li>• Set unicast mode.</li> </ul>  |
|  | In multicast mode, is the CC-Link IE TSN Class A remote station connected to a local station or remote station that does not support the multicast filter?  |   |
|  | In multicast mode, are a local station and a CC-Link IE TSN Class A remote station connected on the end side via a switching hub?   | <ul style="list-style-type: none"> <li>• Configure settings with the switching hub so that the multicast frame (with multicast MAC address 09:00:70:00:10:02 and 09:00:70:00:10:05) will not be transferred to the port of the CC-Link IE TSN Class A remote station.</li> <li>• Check the connected device and do not connect both a local station and a CC-Link IE TSN Class A remote station on the end side of the switching hub.</li> <li>• Set unicast mode.</li> </ul> |
|  | Is an Ethernet device connected to places other than the end of the network?  | Check the connected device and connect the Ethernet device at the end of the network.   |
|  | Does the connected switching hub support the CC-Link IE TSN Class used?   | Use the switching hubs that support "CC-Link IE TSN Class Setting" set to the master station. For the models and usage methods of the switching hubs, refer to the CC-Link Partner Association website ( <a href="http://www.cc-link.org">www.cc-link.org</a> ).  |
|  | ■For firmware version "14" or later<br>Is the event code 00C81 registered in the event history?   | Change "CC-Link IE TSN Class Setting" under "Network Configuration Settings" or "CC-Link IE TSN Class" on the device station side so that the CC-Link IE TSN Class settings for each station match.   |
| If the device stations being used support protocol version 2.0, is a master station that does not support protocol version 2.0 being used?   | Update the master station to a firmware version that supports protocol version 2.0. Alternatively, replace with a master station that supports protocol version 2.0.  |   |

| Check item  | Action   |

|  | Are a CC-Link IE TSN Class A device and an Ethernet device in line topology?  | Check the connected device and do not connect a CC-Link IE TSN Class A device and an Ethernet device.   |
|  | Is a general-purpose hub in cascade connection?   | Check the connected device and do not connect it in cascade connection.   |

## Transient transmission failed

The following lists the actions to be taken if transient transmission cannot be performed with the target station, and the engineering tool cannot perform monitoring.

| Check item  | Action  |  |
|---|---|--|
| Is the D LINK LED turned off?   | If turned off, perform troubleshooting for when the D LINK LED turns off or is flashing. (☞ Page 183 The D LINK LED turns off or is flashing)   |  |
| Is the data link status of the target station normal?   | In the CC-Link IE TSN/CC-Link IE Field diagnostics, identify the cause of the error and take action. (☞ Page 189 Checking the Network Status)   |  |
| Is the following control data of the module FB or dedicated instruction correct? <ul style="list-style-type: none"> <li>• CPU type of the target module</li> <li>• Target network number</li> <li>• Target station number</li> <li>• Target IP address</li> </ul> | Correct the control data of the module FB or dedicated instruction.   |  |
| Is the network number overlapped on the network?  | Change the overlapped network number.   |  |
| Are multiple link dedicated instructions with the same channel setting executed simultaneously?   | <ul style="list-style-type: none"> <li>• Set a different channel to each instruction.</li> <li>• Shift the execution timing of the link dedicated instructions.</li> </ul>  |  |
| Is "— —" displayed on the dot matrix LED?   | <ul style="list-style-type: none"> <li>• Set the module parameters.</li> <li>• Check the firmware version of the RJ71GN11. When module parameters that are not supported are set, upgrade the firmware version or correct the module parameters.</li> </ul> |  |
| (RJ71GN11-T2 only)<br>When "Connection Device Information" under "Basic Settings" of the master station is set to "CC-Link IE TSN Class B Only"   | Are CC-Link IE TSN Class A devices connected?   | <ul style="list-style-type: none"> <li>• Check the connected device and disconnect the CC-Link IE TSN Class A devices.</li> <li>• When connecting a CC-Link IE TSN Class A device, set "Connection Device Information" of the master station to "Mixture of CC-Link IE TSN Class B/A or CC-Link IE TSN Class A Only".</li> </ul> |
|   | Is a general-purpose hub connected between CC-Link IE TSN Class B devices?  | Check the connected device and disconnect the general-purpose hub or replace it with a TSN hub.  |

| Check item   | Action   |   |
|--|--|---|
| (RJ71GN11-T2 only)<br>When "Connection Device Information" under "Basic Settings" of the master station is set to "Mixture of CC-Link IE TSN Class B/A or CC-Link IE TSN Class A Only" | <b>■For firmware version "13" or earlier</b><br>Are nine or more CC-Link IE TSN Class B devices and TSN hubs connected in total to each port of the master station in the transmission path from the master station to the CC-Link IE TSN Class B device of the end?   | Check the connected device and reduce the number of CC-Link IE TSN Class B devices and TSN hubs to eight or less in total for each port of the master station in the transmission path from the master station to the CC-Link IE TSN Class B device of the end.   |
|  | Is the CC-Link IE TSN Class B device other than the master station connected in a star topology via a general-purpose hub?   | <ul style="list-style-type: none"> <li>Other than the master station, do not connect CC-Link IE TSN Class B devices to a general-purpose hub in the star topology.</li> <li>Connect CC-Link IE TSN Class B devices to a TSN hub.</li> </ul>   |
|  | Is the master station connected with CC-Link IE TSN Class B devices via a general-purpose hub?   | <ul style="list-style-type: none"> <li>Check the connected device and connect the master station to CC-Link IE TSN Class B devices in a line topology without using a general-purpose hub.</li> <li>Check the connected device and connect the master station and CC-Link IE TSN Class B devices to a TSN hub.</li> </ul>   |
|  | <b>■For firmware version "13" or earlier</b><br>In multicast mode, is the CC-Link IE TSN Class A remote station connected to the master station?   | <ul style="list-style-type: none"> <li>Connect the local station or remote station supporting the multicast filter to the CC-Link IE TSN Class A remote station.</li> <li>Set unicast mode.</li> </ul>  |
|  | In multicast mode, is the CC-Link IE TSN Class A remote station connected to a local station or remote station that does not support the multicast filter?   |   |
|  | In multicast mode, are a local station and a CC-Link IE TSN Class A remote station connected on the end side via a switching hub?  | <ul style="list-style-type: none"> <li>Configure settings with the switching hub so that the multicast frame (with multicast MAC address 09:00:70:00:10:02 and 09:00:70:00:10:05) will not be transferred to the port of the CC-Link IE TSN Class A remote station.</li> <li>Check the connected device and do not connect both a local station and a CC-Link IE TSN Class A remote station on the end side of the switching hub.</li> <li>Set unicast mode.</li> </ul> |
|  | Is an Ethernet device connected to places other than the end of the network?   | Check the connected device and connect the Ethernet device at the end of the network.   |
|  | Does the connected switching hub support the CC-Link IE TSN Class used?  | Use the switching hubs that support "CC-Link IE TSN Class Setting" set to the master station. For the models and usage methods of the switching hubs, refer to the CC-Link Partner Association website ( <a href="http://www.cc-link.org">www.cc-link.org</a> ).  |
|  | <b>■For firmware version "14" or later</b><br>Is the event code 00C81 registered in the event history?   | Change "CC-Link IE TSN Class" under "Network Configuration Settings" or CC-Link IE TSN Class settings on the device station side so that the CC-Link IE TSN Class settings match.   |
|  | If the device stations being used support protocol version 2.0, is the master station that does not support protocol version 2.0 being used?   | Update the master station to a firmware version that supports protocol version 2.0. Alternatively, replace with a master station that supports protocol version 2.0.  |
| <b>■When connected devices are protocol version 2.0</b><br>Is the event code 00C80 registered in the event history?  | Take one of the following actions. <ul style="list-style-type: none"> <li>Check 'Station protocol version 2.0 support status' (SW01A0 to SW01A7) and update the firmware of all device stations to a version that supports the protocol version 2.0. Alternatively, replace with device stations that support protocol version 2.0.</li> <li>For firmware version "15" or later, set 'Protocol setting' (Un\G1294018) of the master station to '1: Protocol version 1.0 fixed'. (📖 Page 288 Protocol information (Un\G1294016 to Un\G1294031))</li> <li>After powering on the device stations and the devices on the communication path, power on the master station.</li> </ul> |   |

| Check item   | Action   |

(☞ Page 322 Communication cycle intervals)</li> </ul>   |  |
| Does a loopback occur or is a loopback not resolved?   | <ul style="list-style-type: none"> <li>• Perform transient transmission again.</li> <li>• When using a dedicated instruction, correct the number of resends or the monitoring time. (☞ Page 77 Precautions)</li> </ul>  |  |
| Has the communication path using dynamic routing been determined?  | <ul style="list-style-type: none"> <li>• Power on the system, and then start transient transmission after a while.</li> <li>• When "Dynamic Routing" is set to "Disable" for the stations on the communication path, change the settings to "Enable".</li> </ul>  |  |
| Do the relay stations on the communication path support dynamic routing?   | If relay stations which do not support dynamic routing exist, set "Routing Setting" in "CPU parameter" to all stations on the communication path.   |  |
| Is the routing parameter for the sending source of transient transmission correct?   | Correct the "Routing Setting" of "CPU Parameters" if there is an error.   |  |
| Have the routing parameters of the relay station correctly been set?   | Correct the "Routing Setting" of "CPU Parameters" if there is an error.   |  |
| Is the line congested due to other transient transmission?   | <ul style="list-style-type: none"> <li>• Execute the transient transmission again after lowering the transient transmission usage frequency.</li> <li>• Increase the "Transient Transmission Time" setting value.</li> </ul>  |  |
| Is any Ethernet cable or optical fiber cable disconnected?   | Replace the cable.  |  |

If the above actions do not solve the problem, perform the following tests to check for an error.

- Module communication test (☞ Page 188 Module Communication Test)
- Communication test (☞ Page 201 Communication Test)

■If the RJ71GN11-T2 with a firmware version of "03" or earlier is used

Also check the following:

| Check item   | Action  |   |
|--|---|---|
| When "Connection Device Information" under "Basic Settings" of the master station is set to "Mixture of CC-Link IE TSN Class B/A or CC-Link IE TSN Class A Only" | Are 32 stations or more in total connected?   | Check the connected device and reduce the maximum number of connectable stations to 31 stations (master station: 1, device station: 30) or less.  |
|  | Are CC-Link IE TSN Class A devices connected in line topology?  | <ul style="list-style-type: none"> <li>• Check the connected device and do not connect the CC-Link IE TSN Class A device in line topology.</li> <li>• When connecting a CC-Link IE TSN Class B device and a CC-Link IE TSN Class A device, connect them via a general-purpose hub.</li> </ul> |
|  | In a line topology plus star topology, are CC-Link IE TSN Class A devices connected to the master station in a line topology? | Check the connected device, and, if the master station is connected in line topology, only connect CC-Link IE TSN Class B devices.  |
|  | Is a CC-Link IE TSN Class A device connected between the master station and CC-Link IE TSN Class B devices?                   | <ul style="list-style-type: none"> <li>• Check the connected device, and connect the master station and a CC-Link IE TSN Class B device without a general-purpose hub.</li> <li>• When connecting CC-Link IE TSN Class A devices, connect them via a general-purpose hub.</li> </ul>          |
|  | Are the master station and CC-Link IE TSN Class A devices connected in line topology?   | Check the connected devices, and if connecting the master station and a CC-Link IE TSN Class A device, connect them with a general-purpose hub.   |
|  | Are CC-Link IE TSN Class A devices connected to other CC-Link IE TSN Class A devices?   | Check the connected devices, and connect only one CC-Link IE TSN Class A device to each port of a general-purpose hub.  |
|  | Are a CC-Link IE TSN Class A device and an Ethernet device in line topology?  | Check the connected device and do not connect a CC-Link IE TSN Class A device and an Ethernet device.   |
| Other than the master station, is a dedicated instruction executed for the station with a communication speed different from the master station?                 | Execute it on the master station.   |   |
| Are multiple dedicated instructions simultaneously executed for the station with a communication speed different from the master station?                        | Shift the execution timing of the dedicated instructions.   |   |

## Station is disconnected from the network

The following is the action to be taken when a station in data link is disconnected.

| Check item   | Action   |
|--|--|
| Is the ambient temperature for the module outside the specified range? | Keep the ambient temperature within the specified range by taking action such as removing heat source. |

If the above action does not solve the problem, perform the following tests to check for an error.

- Module communication test (☞ Page 188 Module Communication Test)

## Station is repeatedly disconnected and reconnected (RJ71GN11-T2)

The following lists the actions to be taken when a station in data link to RJ71GN11-T2 is repeatedly disconnected and reconnected.

| Check item   | Action   |   |   |
|--|--|---|---|
| Do the used Ethernet cables conform to the Ethernet standard?  | Replace the cable with one conforming to the standard. (☞ MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))  |   |   |
| Is the station-to-station distance 100m or less?   | Change the station-to-station distance to 100m or less.  |   |   |
| Does the cabling condition (bending radius) meet the specifications?   | Refer to the manual for the cable, and if the bending radius exceeds the specified range, correct the bending radius.  |   |   |
| Is any Ethernet cable disconnected?  | If a cable is disconnected, replace it.  |   |   |
| Is the switching hub used operating normally?  | <ul style="list-style-type: none"> <li>• Use a switching hub that conforms to the standard. (☞ MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))</li> <li>• Power off and on the switching hub.</li> </ul>   |   |   |
| Is the station that is the time synchronization source normal?   | Check the manual of the module used for the time synchronization source station.   |   |   |
| Are resets of other stations repeated?   | Avoid unnecessary reset since a station is disconnected while resetting.   |   |   |
| Are other stations repeatedly powering on/off?   | Avoid unnecessary power-off, since a station is disconnected while turned off.   |   |   |
| When "Communication Speed" of the master station is set to "100Mbps", is "System Reservation Time" in "Communication Period Setting" under "Basic Settings" of the master station set to 20μs?   | Set "System Reservation Time" to 200μs.  |   |   |
| When "Communication Period Setting" of the master station is set to "1Gbps" and a CC-Link IE TSN Class B/A device with a communication speed of 100Mbps is used, is "Communication Period Setting" set to "Basic Period" or "Normal-Speed"?  | For a CC-Link IE TSN Class B/A device with a communication speed of 100Mbps, set "Communication Period Setting" to "Low-Speed".  |   |   |
| When "Communication Period Setting" of the master station is set to "1Gbps" and a CC-Link IE TSN Class B/A device with a communication speed of 100Mbps is used in multicast mode, does the station disconnect and return repeatedly even if "Communication Period Setting" is set to "Low-Speed"? | Connect the data link faulty station to the device supporting the multicast filter. (☞ Manual of the device used)  |   |   |
| In multicast mode, is the CC-Link IE TSN Class A remote station connected to the master station, remote station, or CC-Link IE TSN Class A local station?  | <ul style="list-style-type: none"> <li>• Check the connected devices and connect the CC-Link IE TSN Class A remote station to the CC-Link IE TSN Class B local station.</li> <li>• Set unicast mode.</li> </ul>  |   |   |
| In multicast mode, are a local station and a CC-Link IE TSN Class A remote station connected on the end side via a switching hub?  | <ul style="list-style-type: none"> <li>• Configure settings with the switching hub so that the multicast frame (with multicast MAC address 09:00:70:00:10:02 and 09:00:70:00:10:05) will not be transferred to the port of the Ethernet device.</li> <li>• Check the connected device and do not connect both a local station and a CC-Link IE TSN Class A remote station on the end side of the switching hub.</li> <li>• Set unicast mode.</li> </ul>  |   |   |
| Is '1: Operating with the protocol version 1.0' stored in 'Protocol operating status' (UnG1294016)?  | <table border="1"> <tr> <td>Has the cyclic data size exceeded 2K bytes in total for CC-Link IE TSN Class A devices connected to the CC-Link IE TSN Class B devices other than the master station? (Including when connected to a CC-Link IE TSN Class B device via a general-purpose hub)</td> <td> <ul style="list-style-type: none"> <li>• Connect to a CC-Link IE TSN Class B device via a TSN hub. (If connecting via a general-purpose hub, change the general-purpose hub to a TSN hub)</li> <li>• Limit the number of the connected stations so that the cyclic data size does not exceed 2K bytes in total for CC-Link IE TSN Class A devices connected to CC-Link IE TSN Class B devices other than the master station. (Including when connected to a CC-Link IE TSN Class B device via a general-purpose hub)</li> </ul> </td> </tr> </table> | Has the cyclic data size exceeded 2K bytes in total for CC-Link IE TSN Class A devices connected to the CC-Link IE TSN Class B devices other than the master station? (Including when connected to a CC-Link IE TSN Class B device via a general-purpose hub) | <ul style="list-style-type: none"> <li>• Connect to a CC-Link IE TSN Class B device via a TSN hub. (If connecting via a general-purpose hub, change the general-purpose hub to a TSN hub)</li> <li>• Limit the number of the connected stations so that the cyclic data size does not exceed 2K bytes in total for CC-Link IE TSN Class A devices connected to CC-Link IE TSN Class B devices other than the master station. (Including when connected to a CC-Link IE TSN Class B device via a general-purpose hub)</li> </ul> |
| Has the cyclic data size exceeded 2K bytes in total for CC-Link IE TSN Class A devices connected to the CC-Link IE TSN Class B devices other than the master station? (Including when connected to a CC-Link IE TSN Class B device via a general-purpose hub)                                      | <ul style="list-style-type: none"> <li>• Connect to a CC-Link IE TSN Class B device via a TSN hub. (Including when connected to a CC-Link IE TSN Class B device via a general-purpose hub)</li> </ul>  |   |   |
| <p>■When connected devices are protocol version 2.0</p> <p>Is there any difference between the CC-Link IE TSN Class B/A mixed system configuration and the "TSN HUB Setting" in "Connection Device Information" under "Basic Settings"?</p>  | <p>For details, refer to the following.</p> <p>☞ Page 224 CC-Link IE TSN Class A device does not perform data link (RJ71GN11-T2 only)</p>  |   |   |

| Check item   | Action  |
|--|---|
| Does any of the stations break the restrictions of the TSN hub?  | Comply with the restrictions of the TSN hub. For the restrictions, refer to the manual for the TSN hub used.  |
| When "Communication Speed" of the master station is 1Gbps, has the cyclic data size exceeded 2K bytes in total for all device stations on the CC-Link IE TSN Class B device side with the communication speed of 100Mbps at the boundary between CC-Link IE TSN Class B devices (except for the master station) with the communication speed of 1Gbps and CC-Link IE TSN Class B device with the communication speed of 100Mbps? | <ul style="list-style-type: none"> <li>Restrict the number of the connected stations so that the cyclic data size of the devices with communication speed of 100Mbps does not exceed 2K bytes in total.</li> <li>Connect the device with communication speed of 100Mbps to the master station.</li> </ul> |
| Has the cyclic data size exceeded 2K bytes in total for all device stations on the CC-Link IE TSN Class A device side at the boundary between CC-Link IE TSN Class B devices (except for the master station) and CC-Link IE TSN Class A devices?   | <ul style="list-style-type: none"> <li>Correct the number of the connected stations so that the cyclic data size of the CC-Link IE TSN Class A devices does not exceed 2K bytes in total.</li> <li>Connect the CC-Link IE TSN Class A device to the master station.</li> </ul>                            |
| In multicast mode, is the CC-Link IE TSN Class A remote station connected to a local station or remote station that does not support the multicast filter?   | <ul style="list-style-type: none"> <li>Connect the local station or remote station supporting the multicast filter to the CC-Link IE TSN Class A remote station.</li> <li>Set unicast mode.</li> </ul>  |
| <p>■For firmware version "14"</p> Is a CC-Link IE TSN Class A device that supports the CANopen profile with the protocol version 2.0 connected?  | Update the firmware version of the master station to "15" or later.   |

If the above actions do not solve the problem, perform the following test to check for an error.

- Module communication test (🔧 Page 188 Module Communication Test)

### ■If the RJ71GN11-T2 with a firmware version of "13" or earlier is used

Also check the following:

| Check item   | Action   |
|--|--|
| In multicast mode, is the CC-Link IE TSN Class A remote station connected to the master station? | <ul style="list-style-type: none"> <li>Connect the local station or remote station supporting the multicast filter to the CC-Link IE TSN Class A remote station.</li> <li>Set unicast mode.</li> </ul> |

### ■If the RJ71GN11-T2 with a firmware version of "11" or earlier is used

Also check the following:

| Check item   | Action  |
|--|---|
| When "Communication Period Setting" of the master station is set to "1Gbps" and a CC-Link IE TSN Class B/A device with a communication speed of 100Mbps is used, does the station disconnect and return repeatedly even if "Communication Period Setting" is set to "Low-Speed"? | Take either of the following actions for wiring and setting. <ul style="list-style-type: none"> <li>Use either P1 or P2 of the master station.</li> <li>Connect the data link faulty station to a multicast filter supported device and activate the multicast mode. (📖 Manual of the device used)</li> </ul> |

## Station is repeatedly disconnected and reconnected (RJ71GN11-SX)

The following lists the actions to be taken when a station in data link to RJ71GN11-SX is repeatedly disconnected and reconnected.

| Check item   | Action  |
|--|---|
| Does the optical fiber cable used conform to the standard?           | Replace the cable with one conforming to the standard. (MELSEC iQ-R CC-Link IE TSN User's Manual (Startup))           |
| Is the station-to-station distance 550m or less?                     | Change the station-to-station distance to 550m or less.   |
| Does the cabling condition (bending radius) meet the specifications? | Refer to the manual for the cable, and if the bending radius exceeds the specified range, correct the bending radius. |
| Is any optical fiber cable disconnected?                             | If a cable is disconnected, replace it.   |
| Is the station that is the time synchronization source normal?       | Check the manual of the module used for the time synchronization source station.                                      |
| Are resets of other stations repeated?                               | Avoid unnecessary reset since a station is disconnected while resetting.  |
| Are other stations repeatedly powering on/off?                       | Avoid unnecessary power-off, since a station is disconnected while turned off.  |

If the above action does not solve the problem, perform the following tests to check for an error.

- Module communication test (Page 188 Module Communication Test)

## Communications are unstable

When cyclic data transfer processing time or transmission delay time is long or when a transient transmission timeout occurred, check the following items.

| Check item   | Action   |
|--|--|
| <b>■RJ71GN11-T2</b><br>Is the L ER LED turned on?  | If turned on, perform troubleshooting for a case when the L ER LED is turned on. (Page 184 The L ER LED turns on (RJ71GN11-T2))                  |
| <b>■RJ71GN11-SX</b><br>Is the L ERR LED turned on?   | If turned on, perform troubleshooting for a case when the L ERR LED is turned on. (Page 185 The L ERR LED turns on or is flashing (RJ71GN11-SX)) |
| Is the ambient temperature for the module outside the specified range?   | Keep the ambient temperature within the specified range by taking action such as removing heat source.   |
| Is any error shown in "Selected Station Communications Status Monitor" of CC-Link IE TSN/CC-Link IE Field diagnostics? | If an error is identified at P1 or P2, perform a module communication test. (Page 188 Module Communication Test).                                |
| (RJ71GN11-T2 only)<br>Is there any noise affecting the system?   | Change the placement and/or wiring of the modules so that the system is not affected by noise.   |

## SLMP communications failed (RJ71GN11-T2 only)

Check the following.

| Check item  | Action   |
|---|--|
| Has the connection with the external device been opened?  | <ul style="list-style-type: none"> <li>• If the connection with the external device is not opened, perform the open processing.<sup>*1</sup></li> <li>• If an error occurs, check and eliminate the error cause.</li> </ul>  |
| Is the correct command format used for the command type, device specification, address specification, and others?                   | Correct the command format. (☞ SLMP Reference Manual)  |
| Did the external device send a command?   | If the external device did not send a command, send a command to the RJ71GN11.   |
| Was a response returned to the device that had sent the command?  | <ul style="list-style-type: none"> <li>• If no response was returned, check if the correct IP address was specified in the command. If not, correct the IP address and send the command again.</li> <li>• If a response was returned, check the end and error codes to correct the faulty area.</li> </ul>   |
| Is the same communication speed set for the connected device and access destination?  | Change the connection destination so that the connected device and access destination have the same communication speed.   |
| In multicast mode, is an Ethernet device connected to a local station or remote station that does not support the multicast filter? | <ul style="list-style-type: none"> <li>• Connect the Ethernet device to a local station or remote station that supports the multicast filter.</li> <li>• Set unicast mode.</li> <li>• Take actions so that the Ethernet device does not receive cyclic data in multicast mode.</li> </ul>  |
| In multicast mode, are a local station and an Ethernet device connected on the end side via a switching hub?                        | <ul style="list-style-type: none"> <li>• Configure settings with the switching hub so that the multicast frame (with multicast MAC address 09:00:70:00:10:02 and 09:00:70:00:10:05) will not be transferred to the port of the Ethernet device.</li> <li>• Check the connected device and do not connect both a local station and an Ethernet device on the end side of the switching hub.</li> <li>• Set unicast mode.</li> <li>• Take actions so that the Ethernet device does not receive cyclic data in multicast mode.</li> </ul> |

If the above actions do not solve the problem, perform the module communication test to check for hardware failure. (☞ Page 188 Module Communication Test)

\*1 If the connection of only the external device is closed due to communication cable disconnection, personal computer restart, or other reasons, reopen the connection using the same port used before the error occurred. A connection is not closed if another Active open request is received from the external device with a different IP address or a port number.

### ■If the RJ71GN11-T2 with a firmware version of "13" or earlier is used

Also check the following:

| Check item  | Action  |
|---|---|
| In multicast mode, is an Ethernet device connected to the master station? | <ul style="list-style-type: none"> <li>• Connect the Ethernet device to a local station or remote station that supports the multicast filter.</li> <li>• Set unicast mode.</li> <li>• Take actions so that the Ethernet device does not receive cyclic data in multicast mode.</li> </ul> |

## The control CPU of the local station cannot be synchronized time

Check the following.

| Check item  | Action  |
|---|---|
| Is the time zone and daylight savings time that is set to control CPUs different between the master station and local stations? | Set the same time zone and daylight savings time to the control CPUs of the master station and local stations.                    |
| Has the clock data been changed by the clock function of the control CPUs of the master station and local stations?             | Check whether the clock data has been changed by the clock function of the control CPUs of the master station and local stations. |
| Is the setting of 'Time distribution interval setting of the CPU module' (Un\G1275136) correct?                                 | Set 'Time distribution interval setting of the CPU module' (Un\G1275136) correctly.   |
| Is the setting of 'Time reflection setting to the CPU module' (Un\G1275137) correct?  | Set 'Time reflection setting to the CPU module (Un\G1275137)' correctly.  |

## Communications with Ethernet devices failed (RJ71GN11-T2 only)

Check the following.

| Check item  | Action   |
|---|--|
| Is the firewall or proxy server setting enabled on the Ethernet device?   | Check and correct the settings on the Ethernet device.<br>Is a response to the PING command (ICMP echo request) disabled?  |
| Is the antivirus software on the Ethernet device blocking the communication?  | Check and correct the antivirus software settings on the Ethernet device. <ul style="list-style-type: none"> <li>Is the security setting level of the antivirus software low?</li> <li>Is a response to the PING command (ICMP echo request) disabled in the firewall settings?</li> </ul>   |
| In multicast mode, is an Ethernet device connected to the master station?   | <ul style="list-style-type: none"> <li>Connect the Ethernet device to a local station or remote station that supports the multicast filter.</li> <li>Set unicast mode.</li> <li>Take actions so that the Ethernet device does not receive cyclic data in multicast mode.</li> </ul>  |
| In multicast mode, is an Ethernet device connected to a local station or remote station that does not support the multicast filter? | <ul style="list-style-type: none"> <li>Connect the Ethernet device to a local station or remote station that supports the multicast filter.</li> <li>Set unicast mode.</li> <li>Take actions so that the Ethernet device does not receive cyclic data in multicast mode.</li> </ul>  |
| In multicast mode, are a local station and an Ethernet device connected on the end side via a switching hub?                        | <ul style="list-style-type: none"> <li>Configure settings with the switching hub so that the multicast frame (with multicast MAC address 09:00:70:00:10:02 and 09:00:70:00:10:05) will not be transferred to the port of the Ethernet device.</li> <li>Check the connected device and do not connect both a local station and an Ethernet device on the end side of the switching hub.</li> <li>Set unicast mode.</li> <li>Take actions so that the Ethernet device does not receive cyclic data in multicast mode.</li> </ul> |

For details on when communication using the engineering tool is not allowed in the settings of Windows Firewall, refer to the following.

 GX Works3 Operating Manual

If the above actions do not solve the problem, perform the module communication test to check for hardware failure. ()

Page 188 Module Communication Test)

## Although the data link is normal, communications for the link device failed

When the link device cannot communicate although the data link is normal (D LINK LED is on), check the following items.

| Check item   | Action   |
|--|--|
| Is "Reserved/Error Invalid Station" of the device station set to "Reserved Station" in "Network Configuration Settings" of the master station?   | Set "Reserved/Error Invalid Station" of the device station to "No Setting".  |
| Is the input/output bit setting or input/output word setting of the device station set in "Network Configuration Settings" of the master station? (Simple display)                                   | Set a link device used in the device station correctly.  |
| Are "RX Setting", "RY Setting", "RWw Setting", "RWr Setting", "LB Setting", and "LW Setting" of the device station set in "Network Configuration Settings" of the master station? (Detailed display) | Set a link device used in the device station correctly.  |
| Does the device station support the link devices set in "Network Configuration Settings" of the master station?  | Correct the link devices to be assigned to the device station in "Network Configuration Settings" of the master station. |
| Is the link refresh setting range correct?   | Correct the setting in "Refresh Settings" of "Basic Settings".   |
| Is the refresh range of "CPU Side" in "Refresh Settings" overlapped with that of "CPU Side" of another network module?   | Correct the setting in "Refresh Settings" of "Basic Settings".   |
| Is the transfer range set in "Interlink Transmission Settings" correct?  | Correct the transfer range set in "Interlink Transmission Settings".   |
| Are the settings in "Transfer Source Module" and "Transfer Destination Module" of "Interlink Transmission Settings" correct?   | Correct the settings in "Transfer Source Module" and "Transfer Destination Module" of "Interlink Transmission Settings". |
| When the local station cannot receive cyclic data from another station, is "Communication Mode" of the master station set to "Multicast"?  | Set "Communication Mode" of the master station to "Multicast".   |

## Desynchronization with synchronous communication function (RJ71GN11-T2 only)

When synchronization with the CC-Link IE TSN network synchronous communication function fails, check the following.

| Check item  | Action  |
|---|---|
| Is an inter-module synchronization target module selected?  | Set "Select Inter-module Synchronization Target Module" under "Inter-module Synchronization Setting" in the "System Parameter" window to "Synchronous".   |
| Is an inter-module synchronous master set?  | For "Synchronization Master Setting of CC IE TSN/CC IE Field" in "Inter-module Synchronization Master Setting" of "Inter-Module Synchronization Setting" in "System Parameter", set "Mounting Slot No." for the inter-module synchronous master.<br>For details on the inter-module synchronous master, refer to the following.<br><a href="#">MELSEC iQ-R Inter-Module Synchronization Function Reference Manual</a> |
| Is the network synchronous communication of the device station set in the network configuration settings of the master station? | By using "Network Configuration Settings" under "Basic Settings" of the module parameter, set "Network Synchronous Communication" of the device station to "Synchronous".   |
| Is the network synchronous communication set in the parameter settings of the device station?                                   | Set "Network Synchronous Communication" in the parameter settings of the device station to "Synchronous". ( <a href="#">Manual for the module used</a> )  |
| Does the firmware version of the CPU module support the CC-Link IE TSN network synchronous communication function?              | Check the firmware version of the CPU module in "Product Information List" of "System Monitor". If the firmware version of the CPU module does not support the CC-Link IE TSN network synchronous communication function, either update the firmware of the CPU module or change the CPU module to a CPU module supporting that function.   |

## Safety communications failed (RJ71GN11-T2 only)

Check the following.

| Check item  | Action   |
|---|--|
| Is a safety station specified as a reserved station in "Network Configuration Settings" of "Basic Settings" of the master station?  | Set "No Setting" for "Reserved/Error Invalid Station" in "Network Configuration Settings" under "Basic Settings" of the master station. (☞ Page 132 "CC-Link IE TSN Configuration" Window)   |
| Is safety connection set among safety stations that perform safety communications?  | Set safety connection among safety stations that perform safety communications in "Safety Communication Setting" under "Basic Settings".   |
| Is the setting value of "Sending Interval Monitoring Time" in "Safety Communication Setting" under "Basic Settings" correct?  | Correct the setting value of "Sending Interval Monitoring Time" in "Safety Communication Setting" under "Basic Settings". (☞ Page 345 Transmission interval monitoring time)   |
| Is the setting value of "Safety Refresh Monitoring Time" in "Safety Communication Setting" under "Basic Settings" correct?  | Correct the setting value of "Safety Refresh Monitoring Time" in "Safety Communication Setting" under "Basic Settings". (☞ Page 346 Safety refresh monitoring time)  |
| Does safety station interlock status indicate interlock state?  | <ul style="list-style-type: none"> <li>• Correct the setting value of "Sending Interval Monitoring Time" in "Safety Communication Setting" under "Basic Settings". (☞ Page 345 Transmission interval monitoring time)</li> <li>• Correct the setting value of "Safety Refresh Monitoring Time" in "Safety Communication Setting" under "Basic Settings". (☞ Page 346 Safety refresh monitoring time)</li> <li>• Release the interlock state by using Interlock release request for each safety connection. (☞ MELSEC iQ-R CPU Module User's Manual (Application))</li> </ul> |
| Is a standard station set for the IP address of the communication destination in "Safety Communication Setting" under "Basic Settings" in the local station?  | Set a safety station for the IP address of the communication destination in "Safety Communication Setting" under "Basic Settings".   |
| Is "Safety Data Transfer Device Setting" in "Safety Communication Setting" under "Basic Settings" correctly set?  | Correct "Safety Data Transfer Device Setting" set in "Safety Communication Setting" under "Basic Settings" among safety stations that perform safety communications.   |
| When safety communications are performed with the remote station (safety station), has the safety module validation been performed?   | Perform the safety module validation. (☞ Manual for the remote station used)   |
| Is the CPU number set correctly when the CPU module whose CPU number is set to the communication destination is selected in "Safety Communication Setting" of "Basic Settings" of the master station? | Set the CPU number of the CPU module in a local station to perform safety communications with the master station. (☞ User's manual for the CPU module of the communication destination)  |

If the above actions do not solve the problem, perform the module communication test to check for hardware failure. (☞ Page 188 Module Communication Test)

## Cannot be monitored using the TSN Communication Software (RJ71GN11-T2 only)

When monitoring using the CC-Link IE TSN Communication Software fails, check the following.

| Check item   | Action   |
|--|--|
| Are three or more modules connected to CC-Link IE TSN Communication Software?                | Connect two or fewer modules.  |
| Is "Network Topology" under "Basic Settings" in the master station set to "Ring"?            | Set "Network Topology" under "Basic Settings" to "Line", "Star", or "Line/Star".                   |
| Is the CC-Link IE TSN communication software connected to a CC-Link IE TSN Class A device?   | Connect the CC-Link IE TSN communication software to a CC-Link IE TSN Class B device or a TSN hub. |
| Is "Communication Mode" under "Application Settings" set to "Unicast"?                       | Set "Communication Mode" under "Application Settings" to "Multicast".                              |
| Is the CC-Link IE TSN Communication Software connected to a general-purpose hub?             | Connect the CC-Link IE TSN communication software to a CC-Link IE TSN Class B device or a TSN hub. |
| Does the CC-Link IE TSN Communication Software reconnect within 20 seconds of disconnecting? | Before reconnecting the CC-Link IE TSN Communication Software, wait more than 20 seconds.          |

In addition to the above actions, refer to the following troubleshooting methods.

☞ CC-Link IE TSN Communication Software for Windows User's Manual

## The network map is not displayed correctly

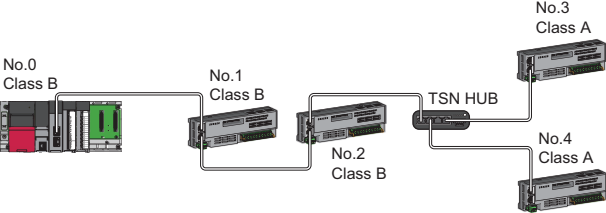

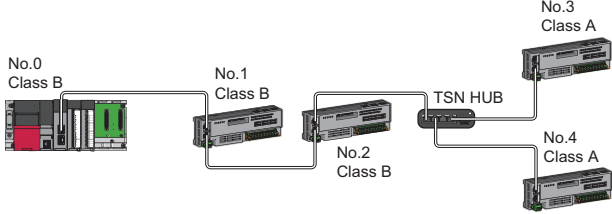

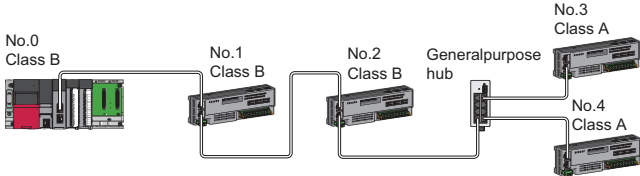

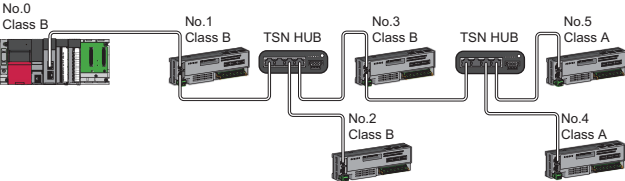

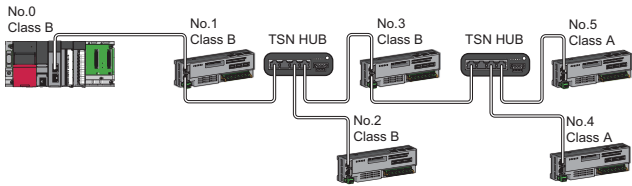

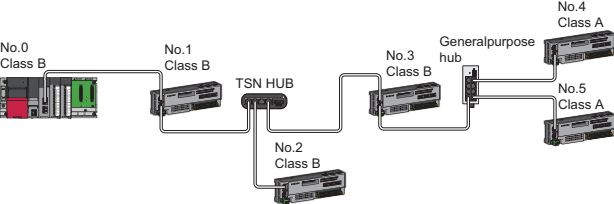

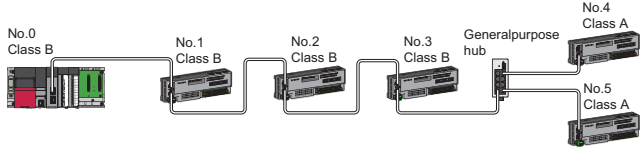

If the network map in "CC-Link IE TSN/CC-Link IE Field Diagnostics" is not displayed correctly, check the following.

| Check item  | Action   |
|---|--|
| Is the network in the ring topology configured correctly? | <ul style="list-style-type: none"><li>■RJ71GN11-T2<ul style="list-style-type: none"><li>• Match "Network Topology" under "Basic Settings" to the actual connection status.</li><li>• Disconnect the switching hub.</li></ul></li><li>When "Network Topology" under "Basic Settings" is set to "Ring", disconnect the following network modules.<ul style="list-style-type: none"><li>• A network module not supporting ring topology</li><li>• A network module with a communication speed different from the communication speed of the master station</li><li>• A network module not set in the parameters of the master station</li></ul></li></ul> <hr/> <ul style="list-style-type: none"><li>■RJ71GN11-SX<ul style="list-style-type: none"><li>• Disconnect the switching hub.</li><li>• When "Network Topology" under "Basic Settings" is set to "Ring", disconnect the network modules that are not set in the parameters of the master station.</li></ul></li></ul> |

## CC-Link IE TSN Class A device does not perform data link (RJ71GN11-T2 only)

### ■When set to "Not to Use TSN HUB"

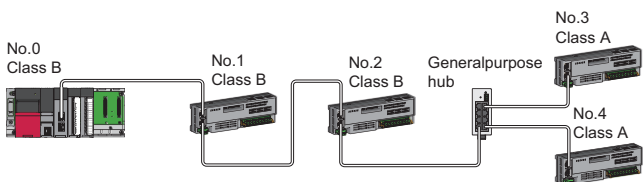

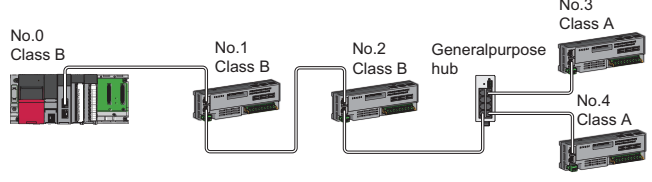

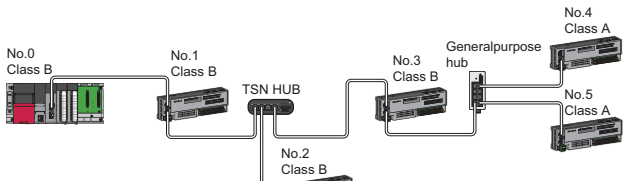

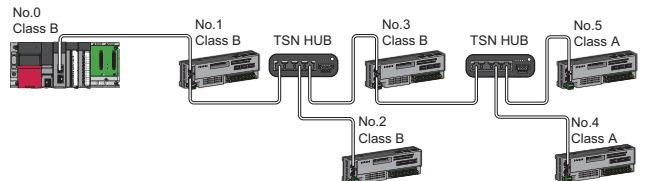

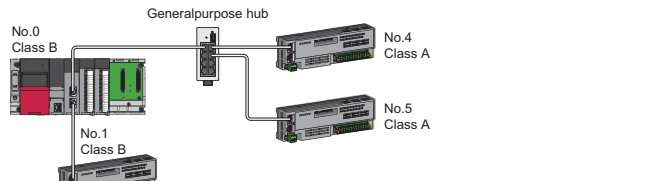

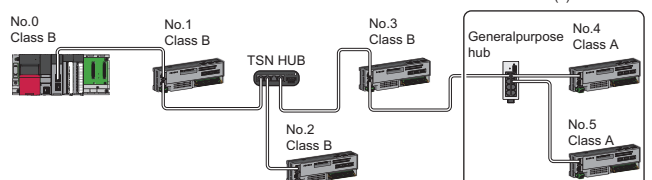

If "TSN HUB Setting" in "Connection Device Information" under "Basic Settings" is set to "Not to Use TSN HUB", check the following.

| Check item  | Action   |
|---|--|
| <p>Is a CC-Link IE TSN Class B device connected to a CC-Link IE TSN Class A device via a TSN hub?</p>  | <p>Set "TSN HUB Setting" in "Connection Device Information" under "Basic Settings" to "Use TSN HUB".</p>  <p>Connect the CC-Link IE TSN Class B device directly to the CC-Link IE TSN Class A device. Alternatively, connect via a general-purpose hub.</p>  |
| <p>Is a TSN hub used for connection between CC-Link IE TSN Class B devices?</p>                       | <p>Set "TSN HUB Setting" in "Connection Device Information" under "Basic Settings" to "Use TSN HUB".</p>    |
| <p>Is a TSN hub used for connection between CC-Link IE TSN Class B devices?</p>                      | <p>Disconnect the TSN hub used for the connection between the CC-Link IE TSN Class B devices.</p>    |

## ■When set to "Use TSN HUB"

If "TSN HUB Setting" in "Connection Device Information" under "Basic Settings" is set to "Use TSN HUB", check the following.

| Check item  | Action   |
|---|--|
| <p>Are the CC-Link IE TSN Class B device and CC-Link IE TSN Class A device connected directly or via a general-purpose hub?</p>    | <p>Set "TSN HUB Setting" in "Connection Device Information" under "Basic Settings" to "Not to Use TSN HUB".</p>                      |
| <p>Are the CC-Link IE TSN Class B device and CC-Link IE TSN Class A device connected directly or via a general-purpose hub?</p>    | <p>Connect the CC-Link IE TSN Class B device to the CC-Link IE TSN Class A device via a TSN hub.</p>                                 |
| <p>Are the CC-Link IE TSN Class B device and CC-Link IE TSN Class A device connected directly or via a general-purpose hub?</p>   | <p>Connect the CC-Link IE TSN Class A device directly to the master station. Alternatively, connect via a general-purpose hub.</p>  |
| <p>Limit the number of the connected stations so that the cyclic data size does not exceed 2K bytes in total (1) for device stations on the CC-Link IE TSN Class A device side at the boundary between CC-Link IE TSN Class B devices and CC-Link IE TSN Class A devices?</p>  | <p>(1)</p>   |

## 4.5 List of Error Codes

This section lists the error codes, error definitions and causes, and actions for the errors that occur in the processing for data communication between the RJ71GN11 and external devices or occur by processing requests from the CPU module on the own station.

Error codes are displayed in the [Error Information] tab in the "Module Diagnostics" window of the RJ71GN11. (Page 186 Error Information)

| Error code | Error definition and causes   | Action   | Detailed information 1   |
|------------|---|--|--|
|            |   |  | Detailed information 2   |
| 1080H      | The number of writes to the flash ROM has exceeded 100000.  | Replace the module.  | —  |
| 1082H      | Writing failed because it was performed continuously to the same sector of the flash ROM within 90 seconds.   | Wait for at least 90 seconds before writing to the same sector.  |  |
| 1124H      | <ul style="list-style-type: none"> <li>The default gateway is not set correctly.</li> <li>The gateway IP address is not set correctly.</li> <li>The default gateway/gateway IP address (network address after the subnet mask) is different from that of the IP address of the own node.</li> </ul> | <ul style="list-style-type: none"> <li>Correct the default gateway IP address.</li> <li>Set the same network address as that of the IP address.</li> </ul>   | <ul style="list-style-type: none"> <li>■Parameter information</li> <li>• Parameter type</li> <li>• I/O No.</li> <li>• Parameter No.</li> <li>• Network No.</li> <li>• Station No.</li> <li>■—</li> </ul> |
| 1128H      | The port number is incorrect.   | Correct the port number.   | —  |
| 1152H      | The IP address is not set correctly.  | Correct the IP addresses.  | <ul style="list-style-type: none"> <li>■Parameter information</li> <li>• Parameter type</li> <li>• I/O No.</li> <li>• Parameter No.</li> <li>• Network No.</li> <li>• Station No.</li> <li>■—</li> </ul> |
| 1155H      | <ul style="list-style-type: none"> <li>The specified connection was already closed in TCP/IP communications.</li> <li>Open processing is not performed.</li> </ul>  | <ul style="list-style-type: none"> <li>Perform the open processing for the specified connection.</li> <li>Check if the open processing has been performed in the external device.</li> </ul>   | —  |
| 1167H      | Unsent data found, but could not be sent.   | <ul style="list-style-type: none"> <li>Check the settings for connection with the external device.</li> <li>(RJ71GN11-T2 only) Check the operation of the external device or switching hub.</li> <li>Since there may be congestion of packets on the line, send data after a certain period of time.</li> <li>Check if the Ethernet cable or optical fiber cable is connected properly.</li> <li>(RJ71GN11-T2 only) Check that there is no connection failure with the switching hub.</li> <li>Execute the communication test, and if the test was completed with an error, take corrective action.</li> </ul> | —  |

| Error code | Error definition and causes                                    | Action   | Detailed information 1   |
|------------|--|--|--|
|            |  |  | Detailed information 2   |
| 1802H      | During data link, overlapping IP addresses have been detected. | Change the IP address of devices with an overlapped IP address.  | <ul style="list-style-type: none"> <li>■ Operation source information <ul style="list-style-type: none"> <li>• IP address</li> </ul> </li> <li>■ IP address duplication information <ul style="list-style-type: none"> <li>• Duplication station 1 MAC address (1st octet, 2nd octet)</li> <li>• Duplication station 1 MAC address (3rd octet, 4th octet)</li> <li>• Duplication station 1 MAC address (5th octet, 6th octet)</li> <li>• Duplication station 2 MAC address (1st octet, 2nd octet)</li> <li>• Duplication station 2 MAC address (3rd octet, 4th octet)</li> <li>• Duplication station 2 MAC address (5th octet, 6th octet)</li> </ul> </li> </ul> |
| 1803H      | Over the number of stations that can be connected.             | <ul style="list-style-type: none"> <li>■ When the firmware version of the RJ71GN11-T2 is "04" or later <ul style="list-style-type: none"> <li>• Reduce the number of CC-Link IE TSN Class B devices and TSN hubs to eight or less in total for each port of the master station in the transmission path from the master station to the CC-Link IE TSN Class B device of the end.</li> </ul> </li> <li>Do one or both of the following: <ul style="list-style-type: none"> <li>• Update the master station to a version that supports CC-Link IE TSN protocol version 2.0.</li> <li>• Update the firmware of the CC-Link IE TSN Class A device to the latest version, or replace it with a device that supports CC-Link IE TSN protocol version 2.0.</li> </ul> </li> <li>■ When the firmware version of the RJ71GN11-T2 is "03" or earlier <ul style="list-style-type: none"> <li>• Configure the system with the total number of stations to 31 (master station: 1, device station: 30) or less.</li> <li>• Configure the system with the number of CC-Link IE TSN Class B devices to eight or less for each port of the master station.</li> </ul> </li> </ul> | —  |

| Error code | Error definition and causes  | Action  | Detailed information 1  |
|------------|--|---|---|
|            |  |   | Detailed information 2  |
| 1804H      | <p>During data link, invalid connection structure has been detected.</p> <ul style="list-style-type: none"> <li>A CC-Link IE TSN Class B station is connected further on the end side than a CC-Link IE TSN Class A station.</li> <li>With the master station with a communication speed of 1Gbps, further on the end side than a station with a communication speed of 100Mbps, a station with a communication speed of 1Gbps is connected.</li> <li>With the master station with a communication speed of 100Mbps, a station with a communication speed of 1Gbps is connected.</li> <li>With the master station with a communication speed of 100Mbps, "Communication Period Setting" of the CC-Link IE TSN Class B station with a communication speed of 100Mbps is set to "Low-Speed".</li> <li>With the master station with a communication speed of 1Gbps, "Communication Period Setting" of the station with a communication speed of 100Mbps is set to "Basic Period" or "Normal-Speed" (×4).</li> <li>The communication speed of the master station and local station are not matched.</li> </ul> <p>■Multicast mode</p> <ul style="list-style-type: none"> <li>A CC-Link IE TSN Class A local station is connected further on the end side than a CC-Link IE TSN Class A remote station.</li> <li>When the master station with a communication speed of 1Gbps, stations with a communication speed of 1Gbps and 100Mbps are connected on the end side of the switching hub.</li> </ul> | <p>Check the connection and setting on the end side of the station shown in detailed information 2 and take the following actions.</p> <ul style="list-style-type: none"> <li>Connect the CC-Link IE TSN Class A station further on the end side than the CC-Link IE TSN Class B station.</li> <li>If the master station has a communication speed of 1Gbps, connect the station with a communication speed of 1Gbps on the master station side rather than on the side where a station with a communication speed of 100Mbps is connected.</li> <li>If the master station has a communication speed of 100Mbps, set the communication speed of the device station to 100Mbps.</li> <li>If the master station has a communication speed of 100Mbps, set "Communication Period Setting" of the CC-Link IE TSN Class B station with a communication speed of 100Mbps to basic cycle or normal speed (×4).</li> <li>If the master station has a communication speed of 1Gbps, set "Communication Period Setting" to "Low-Speed" for the station with a communication speed of 100Mbps.</li> <li>Set the same communication speed for the master station and local station.</li> </ul> <p>■Multicast mode</p> <ul style="list-style-type: none"> <li>Connect the CC-Link IE TSN Class A remote station further on the end side than the CC-Link IE TSN Class A local station.</li> <li>If the master station has a communication speed of 1Gbps, do not connect both a station with a communication speed of 1Gbps and 100Mbps on the end side of the switching hub.</li> </ul> | <p>■Own station information</p> <ul style="list-style-type: none"> <li>I/O No.</li> <li>Network No.</li> <li>Station No.</li> <li>IP address</li> </ul> <p>■Target station information</p> <ul style="list-style-type: none"> <li>Network No.</li> <li>Station No.</li> <li>IP address</li> </ul> |

| 4000H to 4FFFH | Errors detected by the CPU module (📖 MELSEC iQ-R CPU Module User's Manual (Application)) |  |                        |
| C011H          | The port number of the external device is not set correctly.                             | Correct the port number of the external device.  | —                      |
| C012H          | The port number used in a connection already opened is set. (For TCP/IP)                 | Correct the port numbers of the CC-Link IE TSN-equipped module and the external device.  | —                      |

| Error code | Error definition and causes  | Action  | Detailed information 1 |
|------------|--|---|------------------------|
|            |  |   | Detailed information 2 |
| C013H      | The port number used in a connection already opened is set. (For UDP/IP)   | Correct the port numbers of the CC-Link IE TSN-equipped module and the external device.   | —                      |
| C015H      | The data was sent to the connected device while the IP address setting of the device set in the network configuration setting was incorrect.   | <ul style="list-style-type: none"> <li>Correct the IP address of the connected device in the network configuration setting.</li> <li>Check that the IP address class of the connected device is set to A, B, or C in the network configuration setting.</li> </ul>  | —                      |
| C017H      | A connection could not be established in the open processing.  | <ul style="list-style-type: none"> <li>Check the operation of the external device.</li> <li>Check if the open processing has been performed in the external device.</li> <li>When a firewall is set in the external device, check if access is permitted.</li> <li>Check if the Ethernet cable is connected properly.</li> </ul>  | —                      |
| C018H      | The specified IP address of the external device is incorrect.  | Correct the specified IP address of the external device.  | —                      |
| C032H      | The external device does not send an ACK response in the TCP/IP communications.  | <ul style="list-style-type: none"> <li>Since there may be congestion of packets on the line, send data after a certain period of time.</li> <li>Check if the Ethernet cable is connected properly.</li> </ul>   | —                      |
| C035H      | The alive status of an external device could not be checked.   | <ul style="list-style-type: none"> <li>Check the operation of the external device.</li> <li>Correct the timer setting for data communication of the CC-Link IE TSN-equipped module.</li> <li>Check if the Ethernet cable is connected properly.</li> </ul>  | —                      |
| C037H      | <ul style="list-style-type: none"> <li>The receive buffer or send buffer is not sufficient.</li> <li>The window size of the external device is not sufficient.</li> </ul>  | <ul style="list-style-type: none"> <li>Check the operation of the external device or switching hub.</li> <li>When the value of the 'Receive buffer status storage area' (UnIG6291486) is 0001H, reduce the frequency of data received from the external device.</li> </ul>  | —                      |
| C038H      | Data was not sent correctly with UDP/IP.   | <ul style="list-style-type: none"> <li>Check that the external device (including a switching hub) has no error in the connection setting, operation (an error and being in a reset state, or others), and connection (error such as a connection cable being disconnected).</li> <li>Since there may be congestion of packets on the line, send data after a certain period of time.</li> <li>Execute the PING test and communication status test, and if the test was completed with an error, take the corrective action.</li> <li>Correct the network number and station number or IP address of the target station of the dedicated instruction.</li> </ul> | —                      |
| C039H      | Data was not sent correctly via TCP/IP.  | <ul style="list-style-type: none"> <li>Check that the external device (including a switching hub) has no error in the connection setting, operation (an error and being in a reset state, or others), and connection (error such as a connection cable being disconnected).</li> <li>Since there may be congestion of packets on the line, send data after a certain period of time.</li> <li>Execute the PING test and communication status test, and if the test was completed with an error, take the corrective action.</li> </ul>  | —                      |
| C040H      | <ul style="list-style-type: none"> <li>Sufficient data for the data length could not be received.</li> <li>The remaining part of the message divided at the TCP/IP level could not be received.</li> </ul>   | <ul style="list-style-type: none"> <li>Correct the data length of the communication data.</li> <li>Since there may be congestion of packets on the line, send the data again from the external device after a random amount of time has passed.</li> </ul>  | —                      |
| C050H      | ASCII code data that cannot be converted to binary code was received.  | Check if the ASCII code data that cannot be converted into binary code data was sent from the external device.  | —                      |
| C051H      | <ul style="list-style-type: none"> <li>The number of read/write points from/to the device of SLMP message is out of the allowable range in the CPU module (in units of words).</li> <li>The number of write points for the long counter of SLMP message is not in two-word units.</li> </ul> | Correct the number of read/write points and send the SLMP message to the CC-Link IE TSN-equipped module again.  | —                      |
| C052H      | The number of read/write points from/to the device of SLMP message is out of the allowable range in the CPU module (in units of bits).   | Correct the number of read/write points and send the SLMP message to the CC-Link IE TSN-equipped module again.  | —                      |
| C053H      | The number of read/write points from/to the random device of SLMP message is out of the allowable range in the CPU module (in units of bits).  | Correct the number of read/write points and send the SLMP message to the CC-Link IE TSN-equipped module again.  | —                      |

| Error code | Error definition and causes   | Action  | Detailed information 1 |
|------------|---|---|------------------------|
|            |   |   | Detailed information 2 |
| C054H      | The number of read/write points from/to the random device of SLMP message is out of the allowable range in the CPU module (in units of words, double words).  | Correct the number of read/write points and send the SLMP message to the CC-Link IE TSN-equipped module again.  | —                      |
| C055H      | The read/write size from/to the file data of SLMP message is out of the allowable range.  | Correct the read/write size send the SLMP message to the CC-Link IE TSN-equipped module again.  | —                      |
| C056H      | The read/write request exceeds the largest address.   | <ul style="list-style-type: none"> <li>• Correct the start address or the number of read/write points so that the request does not exceed the largest address and send the data to the CC-Link IE TSN-equipped module again.</li> <li>• If the access target and connection stations are modules of the MELSEC iQ-R series, send the SLMP message again to the CC-Link IE TSN-equipped module using 00□3 and 00□2 of subcommands.</li> </ul>  | —                      |
| C057H      | The request data length of the SLMP message does not match the number of data in the character (a part of text).  | Check and correct the text or request data length, and send the SLMP message to the CC-Link IE TSN-equipped module again.   | —                      |
| C058H      | The request data length of the SLMP message after the ASCII/binary conversion does not match with the number of data in the character (a part of text).   | Check and correct the text or request data length, and send the SLMP message to the CC-Link IE TSN-equipped module again.   | —                      |
| C059H      | <ul style="list-style-type: none"> <li>• The specified command and subcommand of the SLMP message are incorrect</li> <li>• A function that is not supported by the target device was executed.</li> </ul>   | <ul style="list-style-type: none"> <li>• Check that there are no errors in the specification of the command and subcommand of the SLMP message.</li> <li>• Check whether the function executed is supported by the target device.</li> <li>• Check the version of the target device.</li> </ul>   | —                      |
| C05AH      | The CC-Link IE TSN-equipped module cannot read/write data from/to the device specified by the SLMP message.   | Correct the specification of the device to be read/written and send the SLMP message to the CC-Link IE TSN-equipped module again.   | —                      |
| C05BH      | The CC-Link IE TSN-equipped module cannot read/write data from/to the device specified by the SLMP message.   | Correct the specification of the device to be read/written and send the SLMP message to the CC-Link IE TSN-equipped module again.   | —                      |
| C05CH      | The received request data of the SLMP message is incorrect.   | Correct the request data and send the SLMP message to the CC-Link IE TSN-equipped module again.   | —                      |
| C05DH      | The "Monitor Request" command is received before the monitor registration is performed by the "Monitor Registration/Clear" command of the SLMP message.   | Register the monitoring data using "Monitor Registration/Clear" command and perform monitoring.   | —                      |
| C05EH      | <ul style="list-style-type: none"> <li>• The time between reception of the SLMP message by the CC-Link IE TSN-equipped module and the returned response from the access destination exceeded the monitoring timer value set in the SLMP command.</li> <li>• An unresponsive command was sent to another network station as the access destination. (If this error does not cause any problems, it can be ignored.)</li> </ul> | <ul style="list-style-type: none"> <li>• Increase the monitoring timer value.</li> <li>• Check if the access destination is operating normally.</li> <li>• Correct the network number or request destination station number.</li> <li>• If the access destination is a module with a different network number, correct the routing parameter setting.</li> <li>• If the access destination is a module with a different network number, check if the network number is not in use.</li> </ul> | —                      |
| C05FH      | This request cannot be executed to the access destination specified by the SLMP message.  | Correct the access destination.   | —                      |
| C060H      | The request details for bit devices of the SLMP message is incorrect.   | Correct the request details and send the SLMP message to the CC-Link IE TSN-equipped module again.  | —                      |
| C061H      | <ul style="list-style-type: none"> <li>• The request data length of the SLMP message does not match the number of data in the character (a part of text).</li> <li>• The write data length specified by the label write command is not even byte.</li> </ul>  | <ul style="list-style-type: none"> <li>• Check and correct the text or request data length, and send the SLMP message to the CC-Link IE TSN-equipped module again.</li> <li>• Add one byte of dummy data, and specify the length as an even number of bytes.</li> </ul>   | —                      |
| C06FH      | The network number of request destination specified by the SLMP request message is not available for communications with the station number 121 or larger.  | <ul style="list-style-type: none"> <li>• If the 3E or 4E frame is used at SLMP, check that there is no error for the network number of the request destination and station number.</li> <li>• If the station number extension frame is used at SLMP, check that there is no error for the network number of the request destination and station number.</li> </ul>  | —                      |

| Error code | Error definition and causes  | Action  | Detailed information 1 |
|------------|--|---|------------------------|
|            |  |   | Detailed information 2 |
| C070H      | The device memory cannot be extended for the access destination specified by the SLMP message.   | <ul style="list-style-type: none"> <li>Correct the SLMP message to read/write data without the device memory set for extension.</li> <li>Specify the extension of the device memory only for the CC-Link IE TSN-equipped module mounted station and R/Q/QnACPU via CC-Link IE Controller Network, MELSECNET/H, or MELSECNET/10.</li> </ul>  | —                      |
| C071H      | The number of device points for data read/write set for modules other than a MELSEC iQ-R/Q/QnACPU with the SLMP message is out of the range.   | Correct the number of read/write points and send the SLMP message to the CC-Link IE TSN-equipped module again.  | —                      |
| C072H      | The request details of the SLMP message are incorrect. (For example, a request for data read/write in bit units has been issued to a word device.)   | <ul style="list-style-type: none"> <li>Check if the data can be requested to the access destination.</li> <li>Correct the request details and send the SLMP message to the CC-Link IE TSN-equipped module again.</li> </ul>   | —                      |
| C073H      | The access destination of the SLMP message cannot issue this request. (For example, the number of double word access points cannot be specified for modules other than a MELSEC iQ-R/Q/QnACPU.)                    | Correct the request details of the SLMP message.  | —                      |
| C075H      | The request data length for the label access is out of range.  | <ul style="list-style-type: none"> <li>Correct the number of array points or number of read/write points and send the SLMP message to the CC-Link IE TSN-equipped module again.</li> <li>Correct the number of abbreviated points and send the SLMP message to the CC-Link IE TSN-equipped module again.</li> <li>Correct the label name length and send the SLMP message to the CC-Link IE TSN-equipped module again.</li> <li>Shorten the label name and send the SLMP message to the CC-Link IE TSN-equipped module again.</li> <li>Correct the read/write data length and send the SLMP message to the CC-Link IE TSN-equipped module again.</li> </ul> | —                      |
| C081H      | The termination processing for the CC-Link IE TSN-equipped module that is involved with the reinitialization processing is being performed, and arrival of link dedicated instructions cannot be checked.          | Finish all the communications to perform the reinitialization processing of the CC-Link IE TSN-equipped module.   | —                      |
| C087H      | IP address of the destination external device could not be acquired.   | <ul style="list-style-type: none"> <li>Correct the IP address in the network station number ↔ IP information setting.</li> <li>Check if the network or station number of the external device is correctly specified by using control data of the dedicated instruction.</li> <li>Check if the Ethernet cable is connected properly.</li> </ul>  | —                      |
| C0B2H      | There is insufficient space in the receive buffer or the send buffer of the relay station or external station for the MELSOFT connection, link dedicated instructions, or SLMP. (Send · receive buffer full error) | <p>Increase the request interval (execution interval) and execute the operation.</p> <ul style="list-style-type: none"> <li>Do not access through one station using the MELSOFT connection, link dedicated instruction, or SLMP.</li> <li>Wait for a response to the previous request before sending the next request.</li> <li>Correct the setting value of the timer setting for data communication of the CC-Link IE TSN-equipped module.</li> </ul>   | —                      |

| D65DH      | Parameter error (multiple period setting)                                  | <ul style="list-style-type: none"> <li>Write the network parameter to the CPU module again.</li> <li>Execute the instruction again after correcting "Multiple Period Setting" in the setting data.</li> <li>If the error occurs again even after taking the above action, please consult your local Mitsubishi representative.</li> </ul>  | —                      |
| D65EH      | Parameter error (co-recording setting)                                     | <ul style="list-style-type: none"> <li>Write the network parameter to the CPU module again.</li> <li>Execute the instruction again after correcting the co-recording setting.</li> <li>If the error occurs again even after taking the above action, please consult your local Mitsubishi representative.</li> </ul>   | —                      |

| Error code | Error definition and causes   | Action   | Detailed information 1 |
|------------|---|--|------------------------|
|            |   |  | Detailed information 2 |
| D65FH      | Parameter error (Link points extended setting)  | <ul style="list-style-type: none"> <li>Write the network parameter to the CPU module again.</li> <li>Execute the instruction again after correcting link points extended setting in the setting data.</li> <li>If the error occurs again even after taking the above action, please consult your local Mitsubishi representative.</li> </ul>   | —                      |
| D662H      | Parameter error (master station switch setting)   | <ul style="list-style-type: none"> <li>Write the network parameter to the CPU module again.</li> <li>Execute the instruction again after correcting the master station switch setting in the setting data.</li> <li>If the error occurs again even after taking the above action, please consult your local Mitsubishi representative.</li> </ul>  | —                      |
| D720H      | Link startup/stop direction is incorrect.   | Check the setting and stop or startup of data link.  | —                      |
| D721H      | Link startup/stop was requested by another station during link startup/stop processing.   | Retry the operation after the stop or restart of data link is completed.   | —                      |
| D722H      | Link startup/stop was requested by own station during link startup/stop processing.   | Retry the operation after the stop or restart of data link is completed.   | —                      |
| D723H      | System link startup/stop was requested during link startup/stop processing.   | Retry the operation after the stop or restart of data link is completed.   | —                      |
| D724H      | Link startup/stop station specification is incorrect.   | Check the setting and stop or startup of data link.  | —                      |
| D725H      | Requested system link startup/stop from local station.  | For local stations, data link cannot be started or stopped for all or multiple stations. Execute data link startup/stop of all or multiple stations on the master station.   | —                      |
| D727H      | Link startup was requested from a station other than the one requesting the link stop.  | <ul style="list-style-type: none"> <li>Data link startup was instructed from a station other than the one that instructed the data link stop during data link startup. Ensure that the station that instructs the data link startup is the same as the one that instructs the data link stop.</li> <li>The procedure during data link startup is different from the procedure that instructed the data link stop. Please instruct the data link startup using the same procedure as the one that instructed the data link stop. (Example: The data link was stopped by the CC-Link IE Field Network diagnostics, and the data link was started from a program)</li> <li>Failed data link startup in the past. Restart by performing forced data link startup.</li> </ul> | —                      |
| D728H      | A data link startup instruction was given to a station that is performing data link.  | Please give data link startup instructions to stations where data link is stopped.   | —                      |
| D729H      | Link stop for own station was instructed to a station where the station number/IP address is not set.   | Specify the station number/IP address using the UINI instruction, and execute the link stop again.   | —                      |
| D731H      | A forced master switching instruction was made from a station other than a submaster station performing a master operation.   | Please execute forced master switching to a submaster station performing master operation.   | —                      |
| D812H      | Parameter error   | <ul style="list-style-type: none"> <li>Write the network parameter to the CPU module again.</li> <li>If the error occurs again even after taking the above action, please consult your local Mitsubishi representative.</li> </ul>   | —                      |
| D840H      | Number of transient requests exceeded the upper limit of simultaneously processable requests.   | <ul style="list-style-type: none"> <li>Execute the instruction again after pausing the transient transmission temporarily.</li> <li>Execute the instruction again after lower the transient transmission usage frequency.</li> </ul>   | —                      |
| D841H      | The request data size of memory read/write command is out of range.   | Execute the instruction again after correcting the read or write size specification at the transient request source.   | —                      |
| D842H      | <ul style="list-style-type: none"> <li>Routing information to the destination network number is not registered.</li> <li>In transient transmission, the number of relays to other networks exceeded seven.</li> <li>The communication path is being updated.</li> </ul> | <ul style="list-style-type: none"> <li>Execute the instruction again after correcting the target network number at the transient request source.</li> <li>Execute the instruction again after correcting the communication path from the transient request source to the destination.</li> <li>When the dynamic routing is not used, or the module of the series other than MELSEC iQ-R is included, retry the operation after correcting the routing setting.</li> <li>Change the system configuration so that the number of relay stations is seven or less.</li> <li>Transient transmission cannot be performed while the communication path is being updated. Retry the operation.</li> </ul>  | —                      |

| Error code     | Error definition and causes  | Action   | Detailed information 1 |
|----------------|--|--|------------------------|
|                |  |  | Detailed information 2 |
| D843H          | The module operation mode is set to a mode in which transient transmission cannot be executed.   | After completion of the module communication test, retry the transient transmission.   | —                      |
| D844H          | Incorrect frame was received. <ul style="list-style-type: none"> <li>• Unsupported pre-conversion protocol</li> <li>• Unsupported frame type</li> <li>• Application header variable part</li> <li>• Application header HDS</li> <li>• Application header RTP</li> <li>• Read command not requiring response</li> </ul> | Execute the instruction again after correcting the request data at the transient request source.   | —                      |
| D902H          | The online test data is incorrect.   | <ul style="list-style-type: none"> <li>• Correct the data at the station that started the online test, and retry the operation.</li> <li>• If the error occurs again even after taking the above action, please consult your local Mitsubishi representative.</li> </ul>   | —                      |
| D903H          | During execution of the communication test, the test was retried.  | After completion of the communication test, retry the operation.   | —                      |
| D905H          | A communication monitoring timeout has occurred in communication test.   | <ul style="list-style-type: none"> <li>• Check the network status using the CC-Link IE TSN/CC-Link IE Field diagnostics of the engineering tool, and take action. Then, retry the operation.</li> <li>• Check if "Routing Setting" of "CPU Parameter" is correctly set, and take action.</li> </ul>  | —                      |
| D906H          | Transmission completion wait timeout has occurred in communication test.   | <ul style="list-style-type: none"> <li>• Check the network status using the CC-Link IE TSN/CC-Link IE Field diagnostics of the engineering tool, and take action. Then, retry the operation.</li> <li>• Execute the instruction again after lower the transient transmission usage frequency.</li> <li>• Check if "Routing Setting" of "CPU Parameter" is correctly set, and take action.</li> </ul>   | —                      |
| D909H          | The header information of transient transmission is incorrect.   | Execute the instruction again after correcting the header information at the transient request source.   | —                      |
| D90AH          | During execution of the communication test, the test was retried.  | Check the network status using the CC-Link IE TSN/CC-Link IE Field diagnostics of the engineering tool, and take action. Then, retry the operation.  | —                      |
| D90BH          | The number of stations that communicate in the network is out of the specification range.  | <ul style="list-style-type: none"> <li>• Check the network status using the CC-Link IE TSN/CC-Link IE Field diagnostics of the engineering tool, and take action.</li> <li>• If the number of device stations per network is more than 120, reduce it to 120 or less.</li> </ul>   | —                      |
| D90CH          | The communication destination specified for the communication test is incorrect.   | <ul style="list-style-type: none"> <li>• Correct "Target Station" of communication test, and retry the operation.</li> <li>• "Communication Test" cannot be executed for own station and relay sending station. Set "Target Station" to other than own station and relay transmission station.</li> <li>• The target station is mounted on the same base unit (main base unit and extension base unit) as the connected station (own station). Do not execute the communication test for station on the same base unit (main base unit and extension base unit) as the connected station (own station).</li> </ul> | —                      |
| D90DH          | An error was detected in the network module.   | Please consult your local Mitsubishi representative.   | —                      |
| D912H          | Transient transmission sending failed.   | <ul style="list-style-type: none"> <li>• Execute the instruction again after lower the transient transmission usage frequency.</li> <li>• Check if the switching hub and the Ethernet cables are connected properly.</li> </ul>  | —                      |
| D913H to D917H | An error was detected in the network module.   | Please consult your local Mitsubishi representative.   | —                      |

| Error code     | Error definition and causes   | Action   | Detailed information 1 |
|----------------|---|--|------------------------|
|                |   |  | Detailed information 2 |
| D919H          | No response from the target station of the communication test.  | <ul style="list-style-type: none"> <li>• Correct the network number, station number, or IP address for the target station of the communication test.</li> <li>• Check if the network configuration setting is correctly set in the master station within the same network as the target station of the communication test.</li> <li>• When "IP Address" is selected for "Communication Method", "Communication Test" cannot be executed for stations on networks different from that of the connected station (own station). Change "Communication Method" to "Network No./ Station No.".</li> </ul> | —                      |
| DA00H          | An error was detected in the network module.  | Please consult your local Mitsubishi representative.   | —                      |
| DA10H to DA17H | An error was detected in the network module.  | Please consult your local Mitsubishi representative.   | —                      |
| DA19H          | An error was detected in the network module.  | Please consult your local Mitsubishi representative.   | —                      |
| DA1AH          | After parameters were set using the CCPASET instruction/CCPASET instruction, the CCPASET instruction/CCPASET instruction were executed again. | Parameter setting with the CCPASET or CCPASET instruction is limited to one time only. Execute the instruction again after resetting the CPU module.   | —                      |
| DA1BH          | A dedicated instruction which the target station does not support was executed.   | <ul style="list-style-type: none"> <li>• Change the target station at the station that executed the READ/SREAD/WRITE/SWRITE/SEND/REQ instruction.</li> <li>• Correct the network number and station number/IP address of the target station of the dedicated instruction.</li> </ul>   | —                      |
| DA1CH          | The target station of the READ/SREAD/WRITE/SWRITE/SEND/REQ instruction does not exist.  | If the target station of the READ/SREAD/WRITE/SWRITE/SEND/REQ instruction is disconnected, execute the dedicated instruction again after return of the target station.   | —                      |
| DB00H          | The station numbers of 121 stations or more are specified.  | Check station numbers.   | —                      |
| DC00H          | The setting value is incorrect.   | Execute the write instruction again after correcting the setting value.  | —                      |
| DC01H          | The setting value was not written correctly.  | Execute the write instruction again. Please consult your local Mitsubishi representative.  | —                      |

# 4.6 List of Parameter Numbers

This section lists the parameter numbers displayed in the module diagnostics.

If there is an error in the parameter settings and the parameter number is displayed, the corresponding parameter can be identified.

It is displayed in "Detailed information" in the [Error Information] tab in the "Module Diagnostics" window of the RJ71GN11. (Page 186 Error Information)

| Item                     |                                      |   | Parameter No.                              |                |   |       |  |

\*1 When the co-recording setting is set to "Not Use"

\*2 When the co-recording setting is set to "Use"

# 4.7 Event List

This section lists the events which occur in CC-Link IE TSN. The three event types are system, security, and operation. The event type is displayed when the [Event History] button in the [Error Information] tab in the "Module Diagnostics" window of the RJ71GN11 is clicked. (📄 Page 186 Error Information)

| System     |  |  |
|------------|--|--|
| Event code | Overview   | Cause  |
| 00100      | Link-up  | The system was linked up by connecting a device (such as an external device).  |
| 00141      | CPU module time setting failure  | Setting of the time to the CPU module failed.  |
| 00173      | Co-recording trigger sending/receiving                                       | The co-recording trigger received from a CPU module has been sent to the network.  |
| 00174      | Co-recording trigger sending/receiving                                       | The co-recording trigger received from another station has been sent to the CPU module.  |
| 00175      | Co-recording trigger sending/receiving                                       | The co-recording trigger received from another station has been sent to the network.   |
| 00406      | Device station time synchronization completion                               | The device station time synchronization has completed.   |
| 00407      | Grandmaster selection (CC-Link IE TSN device)                                | The CC-Link IE TSN device was selected as the grandmaster.   |
| 00408      | Grandmaster selection (general-purpose device)                               | The general-purpose device was selected as the grandmaster.  |
| 00409      | Own station time synchronization completion                                  | The own station time synchronization has completed.  |
| 00500      | Own station: Network entry   | Own station enters the network.  |
| 00501      | Another station: Network entry   | Another station enters the network.  |
| 00502      | Network entry in all stations  | All stations enter the network.  |
| 0050A      | Connection of a tool that supports the CC-Link IE TSN                        | A tool that supports the CC-Link IE TSN is connected.  |
| 0050B      | Disconnection of a tool that supports the CC-Link IE TSN                     | A tool that supports the CC-Link IE TSN is disconnected.   |
| 00510      | Own station: Data link restart (cyclic transmission start)                   | Own station data link restarted.   |
| 00511      | Another station: Data link restart (cyclic transmission start)               | Data link of another station restarted.  |
| 00512      | All stations data link normalization (all-station cyclic transmission start) | Data link returned to normal status at all stations.   |
| 00535      | Another station: Reserved station enable setting instruction execution       | Reserved station enable setting was executed at another station.   |
| 00540      | Loopback resolution  | Loopback execution status was resolved when using a ring topology (using the loopback function).   |
| 00542      | Own station: Receive frame error line status caution level                   | A receive frame error (line status: caution level) has occurred.   |
| 00603      | Own station: Occurrence of switching to the current master station           | Switching of the current master station occurred due to the current master station being down.   |
| 00800      | Link-down  | The system was linked down by removing a device (such as an external device).  |
| 00906      | Alive check error  | The alive status of an external device could not be checked.   |
| 00907      | Divided messages receive timeout error                                       | <ul style="list-style-type: none"> <li>• Sufficient data for the data length could not be received.</li> <li>• The remaining part of the divided message could not be received.</li> </ul>   |
| 00908      | IP assembly timeout error  | An IP assembly timeout error has occurred since the transient transmission load is high or transient transmission time is not enough. (The remaining part of the divided data could not be received and a timeout has occurred.)         |
| 00909      | TCP specification port number error  | The port number used in a connection already opened is set. (For TCP/IP)   |
| 0090A      | UDP specification port number error  | The port number used in a connection already opened is set. (For UDP/IP)   |
| 00C00      | Own station: Disconnection from network                                      | Own station was disconnected from the network.   |
| 00C01      | Another station: Disconnection from network                                  | Another station was disconnected from the network.   |
| 00C02      | Abnormal access response of another station                                  | <ul style="list-style-type: none"> <li>• Abnormal response was returned from another station when accessing another station.</li> <li>• Abnormal response was returned to another station when accessed from another station.</li> </ul> |
| 00C10      | Own station: Data link stop (cyclic transmission stop)                       | Own station data link was stopped.   |

| Event code | Overview   | Cause   |
|------------|--|---|
| 00C11      | Another station: Data link stop (cyclic transmission stop)                             | Data link of another station was stopped.   |
| 00C21      | Another station: Error occurrence  | An error has occurred in another station.   |
| 00C23      | Loopback occurrence  | Path switching has occurred when using a ring topology (using the loopback function).   |
| 00C24      | Another station: Receive frame error occurrence  | A receive frame error has occurred at another station.  |
| 00C2A      | Detection of a device station that does not support the master station switch function | In a network where the master station switch function is enabled, a device station that does not support the master station switch function has been detected.  |
| 00C40      | Device station parameter automatic setting: Interruption                               | An abnormal response was received from the device station, and device station parameter automatic setting processing was interrupted.<br>For details on device station response codes, refer to the manual for the device station used.   |
| 00C41      | Device station parameter automatic setting: Parameter update interruption              | An abnormal response was received from the device station, and parameter update processing of device station parameter automatic setting was interrupted.<br>For details on device station response codes, refer to the manual for the device station used.   |
| 00C42      | Device station parameter automatic setting: System error                               | An error occurred while the device station parameter automatic setting was executing.   |
| 00C43      | Device station parameter automatic setting: Transmission timeout                       | Transmission timed out while communicating with the device station parameter automatic setting.   |
| 00C44      | Device station parameter automatic setting: Receive timeout                            | The specified period of time expired without receiving while communicating with the device station parameter automatic setting.   |
| 00C46      | Device station parameter automatic setting: SLMP transmission error                    | An error occurred while transmitting SLMP for the device station parameter automatic setting.   |
| 00C47      | Device station parameter automatic setting: CPU module access failure                  | Access to the CPU module failed during device station parameter automatic setting.  |
| 00C48      | Device station parameter automatic setting: No target station parameter                | The device station parameter file targeted during device station parameter automatic setting was not stored in the CPU module. Or, the writing destination of the device station parameter is different from the setting of the memory card parameter.  |
| 00C50      | Time synchronization loss  | The time difference between the time notified from the grandmaster and the time of the own station exceeded the allowable value.  |
| 00C51      | Time synchronization error   | The time synchronization loss occurred more than a fixed number.  |
| 00C54      | Initialization failure   | A communication error occurred in the initialization processing when control communications started.  |
| 00C55      | Message disposal   | The request was discarded because there were too many requests to be processed.   |
| 00C56      | Response timeout   | There was no response from the external device and timeout occurred.  |
| 00C57      | Message disposal   | After response timeout, the response data from the external device was received.  |
| 00C58      | SLMP response frame disposal   | The SLMP response frame was disposed of due to any of the following causes. <ul style="list-style-type: none"> <li>• The request source of the received SLMP response frame is not clear.</li> <li>• The received SLMP response frame has already returned an error response according to the monitoring timeout.</li> <li>• The SLMP communication load is high so that the received SLMP response frame cannot be transferred.</li> </ul> |
| 00C59      | Specified port number error  | There was a request for a port number not open from the external device.  |
| 00C5A      | Specification IP address error   | Sending was performed while the "IP Address" setting of the device station set in "Network Configuration Settings" under "Basic Settings" of the master station was incorrect.  |
| 00C5B      | Connection establishment failed  | A connection could not be established in the open processing.   |
| 00C5C      | TCP connection timeout   | The external device does not send an ACK response in the TCP/IP communications.   |
| 00C5D      | Send processing execution disabled   | <ul style="list-style-type: none"> <li>• The receive buffer or send buffer is not sufficient.</li> <li>• The window size of the external device is not sufficient.</li> </ul>   |
| 00C5E      | UDP/IP send failed   | Data was not sent correctly with UDP/IP due to either of the following causes. <ul style="list-style-type: none"> <li>• An error occurs in the external device.</li> <li>• A switching hub, Ethernet cable, or optical fiber cable error has occurred.</li> <li>• Congestion of packets on the line</li> </ul>  |
| 00C5F      | TCP/IP send failed   | Data was not sent correctly via TCP/IP due to either of following causes. <ul style="list-style-type: none"> <li>• An error occurs in the external device.</li> <li>• A switching hub, Ethernet cable, or optical fiber cable error has occurred.</li> <li>• Congestion of packets on the line</li> </ul>   |
| 00C60      | IP address of the external device acquisition error                                    | Target IP address could not be acquired from the network number and station number.   |

| Event code | Overview  | Cause   |
|------------|---|---|
| 00C61      | Time synchronization loss   | The time difference between the time notified from the grandmaster and the time of the own station exceeded the allowable value.  |
| 00C62      | Time synchronization error  | The time synchronization loss occurred more than a fixed number.  |
| 00C63      | Grandmaster switching (CC-Link IE TSN device)                                       | The device acting as the grandmaster station was disconnected, and then the CC-Link IE TSN device was newly selected as the grandmaster.  |
| 00C64      | Grandmaster switching (general-purpose device)                                      | The device acting as the grandmaster was disconnected, and then the general-purpose device was newly selected as the grandmaster.   |
| 00C65      | Time synchronization receive processing failure                                     | The receive processing for time synchronization failed.   |
| 00C70      | CANopen initialization failure  | A communication error occurs in CANopen initialization processing.  |
| 00C71      | Initialization failure (parameter mismatch between master and device stations)      | During initialization processing at the start of control communication, a parameter mismatch was detected between the master station and device stations.   |
| 00C72      | Maximum response time mismatch during time-managed polling                          | A mismatch was detected in the maximum response time during time-managed polling. Update the version of the engineering tool and the device stations to the latest version, and then retry the operation. |
| 00C75      | Another station: Parameter error occurrence   | A network parameter error has occurred in another station.  |
| 00C76      | <<Own station>> Parameter mismatch (during data link)                               | In a network where the master station switch function is enabled, parameters different from those currently in operation were received.   |
| 00C80      | A device station that does not support CC-Link IE TSN Protocol version 2.0 detected | A device station that does not support CC-Link IE TSN Protocol version 2.0 was detected.  |
| 00C81      | CC-Link IE TSN Class settings mismatch  | A mismatch was detected between the parameter of the master station and the CC-Link IE TSN Class of the device stations.  |

## Security

| Event code | Overview   | Cause   |
|------------|--|---|
| 10200      | Remote password lock                             | The lock processing of the remote password was performed.       |
| 10201      | Remote password unlock successful                | The unlock processing of the remote password was succeeded.     |
| 10202      | Remote password unlock failed                    | The unlock processing of the remote password has failed.        |
| 10300      | Access from IP restricted with IP filter setting | Accessed from IP address restricted with the IP filter setting. |

## Operation

| Event code | Overview   | Cause   |
|------------|--|---|
| 24100      | Own station: Parameter change/new parameter reception  | Parameter was changed. Or new parameter was received at power-on.   |
| 24300      | Own station: Enabling remote device test function  | Remote device test function was enabled.  |
| 24301      | Own station: Failure in enabling remote device test function (Programmable controller CPU is not in STOP state (excluding a stop error)) | The operating status of the programmable controller CPU is not in STOP state (excluding a stop error), and enabling remote device test function failed. |
| 24302      | Own station: Failure in enabling remote device test function (Own station is not set as a master station.)                               | The own station is not set as a master station and enabling remote device test function failed.   |
| 24303      | Own station: Disabling remote device test function (SB0016 is turned off.)   | Remote device test function was disabled because SB0016 (Remote device forced output request) has been turned off.                                      |
| 24304      | Own station: Disabling remote device test function (Programmable controller CPU is in RUN or PAUSE state).                               | Remote device test function was disabled because operating status of the programmable controller CPU has been changed to RUN or PAUSE state.            |
| 24305      | Own station: Disabling remote device test function (Programmable controller CPU indicates a stop error.)                                 | Remote device test function was disabled because a stop error has occurred in the programmable controller CPU.  |
| 24307      | Network number, station number, IP address setting/change execution  | Setting or change of the network number, station number, or IP address of the own station was executed.   |
| 24F00      | Another station: CPU operating status change detection   | Operating status of the CPU module on another station was changed.  |

# APPENDICES

## Appendix 1 Module Label

The I/O signals, buffer memory, link special relay (SB), and link special register (SW) of the RJ71GN11 can be set using module label.

### Structure of the module label

The module label name is defined with the following structure.

"Instance name"\_"Module number"."Label name"

"Instance name"\_"Module number"."Label name"\_D

**Ex.**

GN11\_1.bSts\_DataLinkError

#### ■ Instance name

The following is the instance name of the RJ71GN11.

| Module name | Instance name |
|-------------|---------------|
| RJ71GN11-T2 | GN11          |
| RJ71GN11-SX | GN11_SX       |

#### ■ Module number

A sequential number starting with "1" for identifying a module from the one with the same instance name.

#### ■ Label name

A label name unique to the module.

#### ■ \_D

This symbol indicates that the module label is for direct access. The label without "\_D" is for link refresh. The following are the differences between link refresh and direct access.

| Type          | Description   | Access timing                                  |
|---------------|---|--|
| Link refresh  | The values read/written from/to the module labels are reflected to the module at link refresh. The execution time of the program can be shortened.  | At link refresh                                |
| Direct access | The values read/written from/to the module labels are reflected to the module immediately. Although the execution time of the program is longer than the one at the link refresh, the responsiveness is improved. | At writing to or reading from the module label |

#### Point

When multiple RJ71GN11s with the same network number are mounted and the module labels of link special relay (SB) and link special register (SW) are used for direct access, the access target is the module having the smallest slot number on the base unit.

# Appendix 2 I/O Signals

This section describes the I/O signals for the CPU module. The I/O signal assignment for when the start I/O number of the RJ71GN11 is "0" is listed below.

## List of I/O signals

The following table lists I/O signals. The device X is an input signal from the RJ71GN11 to the CPU module. The device Y is an output signal from the CPU module to the RJ71GN11.

### Input signals

| Device number | Signal name   |
|---------------|---|
| X0            | Module failure  |
| X1            | Own station data link status  |
| X2            | Use prohibited  |
| X3            | Other stations data link status (use prohibited in a local station) |
| X4 to XE      | Use prohibited  |
| XF            | Module READY  |
| X10 to X1F    | Use prohibited  |

### Output signals

| Device number | Signal name    |
|---------------|----------------|
| Y0 to Y1F     | Use prohibited |

#### Point

Do not use (turn on) any "use prohibited" signals as an input or output signal to the CPU module. Doing so may cause the programmable controller system to malfunction.

## Details of I/O signals

### Module failure (X0)

This signal is used to check the status of the RJ71GN11.

- Off: Module normal
- On: Module failure

### Own station data link status (X1)

This signal is used to check the data link status of the own station.

- Off: Data link stop
- On: Data link in progress

'Data link error status of own station' (SB0049) has the same signal, but when using it in a program, use either X1 or 'Data link error status of own station' (SB0049) only. Also note that the on/off conditions for X1 and SB0049 are reversed.

If an error occurs, the cause of the fault can be checked by CC-Link IE TSN/CC-Link IE Field diagnostics or 'Cause of data link stop' (SW0049).

### Other stations data link status (X3)

This signal is used to check the data link status of other stations.

- Off: All stations normal
- On: Faulty station exists

'Data link error status of each station' (SB00B0) has the same signal, but when using it in a program, use either X3 or 'Data link error status of each station' (SB00B0) only.

If an error occurs, the faulty station can be checked by CC-Link IE TSN/CC-Link IE Field diagnostics or with 'Data link status of each station' (SW00B0 to SW00B7).

### Module READY (XF)

This signal is used to check the status of module operation preparation.

- Off: Not available for module operation
- On: Available for module operation

For the module READY timing chart, refer to Module failure (X0). (📄 Page 265 Module failure (X0))

# Appendix 3 Buffer Memory

The buffer memory is used to exchange data between the RJ71GN11 and the CPU module.

Buffer memory values are reset to default (initial values) when the CPU module is reset or the system is powered off.

## List of buffer memory addresses

←: Same as the address of P1

| P1                |                       | P2                |                       | Name                                       | Initial value                                       | Read Write               |             |      |
|-------------------|-----------------------|-------------------|-----------------------|--|---|--------------------------|-------------|------|
| Address (decimal) | Address (hexadecimal) | Address (decimal) | Address (hexadecimal) |  |   |                          |             |      |
| 0 to 57343        | 0 to DFFFH            | ←                 |                       | System area                                |   |                          |             |      |
| 57344 to 58367    | E000H to E3FFH        | ←                 |                       | Link device area                           | Remote input (RX)                                   | 0                        | Read        |      |
| 58368 to 59391    | E400H to E7FFH        | ←                 |                       |  | Remote output (RY)                                  | 0                        | Read, write |      |
| 59392 to 67583    | E800H to 107FFH       | ←                 |                       |  | Remote register (RWw)                               | 0                        | Read, write |      |
| 67584 to 75775    | 10800H to 127FFH      | ←                 |                       |  | Remote register (RWr)                               | 0                        | Read        |      |
| 75776 to 92159    | 12800H to 167FFH      | ←                 |                       |  | Link register (LW)                                  | 0                        | Read, write |      |
| 92160 to 94207    | 16800H to 16FFFH      | ←                 |                       |  | Link relay (LB)                                     | 0                        | Read, write |      |
| 94208 to 94463    | 17000H to 170FFH      | ←                 |                       |  | Link special relay (SB)                             | 0                        | Read, write |      |
| 94464 to 98559    | 17100H to 180FFH      | ←                 |                       |  | Link special register (SW)                          | 0                        | Read, write |      |

| 6291487 to 16777215 | 60001FH to FFFFFFFH   | ←                 |                       | System area |               |            |

**Point** 

- Do not write data to the system areas. Doing so may cause malfunction of the programmable controller system.
- If the value in an area of one word becomes equal to or higher than 65536, the count stops at 65535 (FFFFFFH).

# Details of buffer memory addresses

## Link device area

The RX, RY, RWw, RWr, LB, LW, SB, and SW values are stored.

### Remote input (RX) (Un\G57344 to Un\G58367)

The RX value is stored. The RX start number and number of points for each station number can be checked by the RX offset/size information (Un\G1245696 to Un\G1246179). (☞ Page 280 RX offset/size information)

| Address   | b15        | b14        | b13        | b12        | b11        | b10        | b9         | b8         | b7         | b6         | b5         | b4         | b3         | b2         | b1         | b0         |

| Un\G58367 | RX<br>3FFF | RX<br>3FFE | RX<br>3FFD | RX<br>3FFC | RX<br>3FFB | RX<br>3FFA | RX<br>3FF9 | RX<br>3FF8 | RX<br>3FF7 | RX<br>3FF6 | RX<br>3FF5 | RX<br>3FF4 | RX<br>3FF3 | RX<br>3FF2 | RX<br>3FF1 | RX<br>3FF0 |

Each bit corresponds to 1 bit of RX.

### Remote output (RY) (Un\G58368 to Un\G59391)

The RY value is stored. The RY start number and number of points for each station number can be checked by the RY offset/size information (Un\G1246720 to Un\G1247203). (☞ Page 281 RY offset/size information)

| Address   | b15        | b14        | b13        | b12        | b11        | b10        | b9         | b8         | b7         | b6         | b5         | b4         | b3         | b2         | b1         | b0         |

| Un\G59391 | RY<br>3FFF | RY<br>3FFE | RY<br>3FFD | RY<br>3FFC | RY<br>3FFB | RY<br>3FFA | RY<br>3FF9 | RY<br>3FF8 | RY<br>3FF7 | RY<br>3FF6 | RY<br>3FF5 | RY<br>3FF4 | RY<br>3FF3 | RY<br>3FF2 | RY<br>3FF1 | RY<br>3FF0 |

Each bit corresponds to 1 bit of RY.

### Remote register (RWw) (Un\G59392 to Un\G67583)

The RWw value is stored. The RWw start number and number of points for each station number can be checked by the RWw offset/size information (Un\G1247744 to Un\G1248227). (☞ Page 281 RWw offset/size information)

| Address   | b15     | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|-----------|---------|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| Un\G59392 | RWw0    |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| Un\G59393 | RWw1    |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| ⋮         |         |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| Un\G67583 | RWw1FFF |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |

### Remote register (RWr) (Un\G67584 to Un\G75775)

The RWr value is stored. The RWr start number and number of points for each station number can be checked by the RWr offset/size information (Un\G1248768 to Un\G1249251). (☞ Page 281 RWr offset/size information)

| Address   | b15     | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|-----------|---------|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| Un\G67584 | RWr0    |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| Un\G67585 | RWr1    |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| ⋮         |         |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| Un\G75775 | RWr1FFF |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |

### ■Link register (LW) (Un\G75776 to Un\G92159)

The LW value is stored. The LW start number and number of points for each station number can be checked by the LW offset/size information (Un\G1250816 to Un\G1251299). (☞ Page 282 LW offset/size information)

| Address   | b15    | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|-----------|--------|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| Un\G75776 | LW0    |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| Un\G75777 | LW1    |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| ⋮         |        |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| Un\G92159 | LW3FFF |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |

### ■Link relay (LB) (Un\G92160 to Un\G94207)

The LB value is stored. The LB start number and number of points for each station number can be checked by the LB offset/size information (Un\G1249792 to Un\G1250275). (☞ Page 282 LB offset/size information)

| Address   | b15        | b14        | b13        | b12        | b11        | b10        | b9         | b8         | b7         | b6         | b5         | b4         | b3         | b2         | b1         | b0         |

| Un\G94208 | SBF       | SBE       | SBD       | SBC       | SBB       | SBA       | SB9       | SB8       | SB7       | SB6       | SB5       | SB4       | SB3       | SB2       | SB1       | SB0       |
| ⋮         |           |           |           |           |           |           |           |           |           |           |           |           |           |           |           |           |
| Un\G94463 | SB1F<br>F | SB1F<br>E | SB1F<br>D | SB1F<br>C | SB1F<br>B | SB1F<br>A | SB1F<br>9 | SB1F<br>8 | SB1F<br>7 | SB1F<br>6 | SB1F<br>5 | SB1F<br>4 | SB1F<br>3 | SB1F<br>2 | SB1F<br>1 | SB1F<br>0 |

Each bit corresponds to 1 bit of SB.

### ■Link special register (SW) (Un\G94464 to Un\G98559)

The SW value is stored.

| Address   | b15    | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|-----------|--------|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| Un\G94464 | SW0    |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| Un\G94465 | SW1    |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| ⋮         |        |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| Un\G98559 | SW1FFF |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |

## Link points extended device area (RJ71GN11-SX only)

When link points are not extended, values are 0 and this area is invalid. Use the link device area. (  Page 277 Link device area)

### ■Start offset and size of link device when link points are extended (Un\G98560 to Un\G98583)

The start offset and size of RX, RY, RWw, RWr, LB, and LW with "LB/LW Points Extended Setting" under "Application Settings" set to "Extend" are stored.

| Address                | Description   |
|------------------------|---|
| Un\G98560 to Un\G98561 | RX start offset when link points are extended                     |
| Un\G98562 to Un\G98563 | RX size when link points are extended (in units of words)         |
| Un\G98564 to Un\G98565 | RY start offset when link points are extended (in units of words) |
| Un\G98566 to Un\G98567 | RY size when link points are extended (in units of words)         |
| Un\G98568 to Un\G98569 | RWw start offset when link points are extended                    |
| Un\G98570 to Un\G98571 | RWw size when link points are extended (in units of words)        |
| Un\G98572 to Un\G98573 | RWr start offset when link points are extended                    |
| Un\G98574 to Un\G98575 | RWr size when link points are extended (in units of words)        |
| Un\G98576 to Un\G98577 | LW start offset when link points are extended                     |
| Un\G98578 to Un\G98579 | LW size when link points are extended (in units of words)         |
| Un\G98580 to Un\G98581 | LB start offset when link points are extended                     |
| Un\G98582 to Un\G98583 | LB size when link points are extended (in units of words)         |

### ■Link device area when link points are extended (Un\G98816 to Un\G649727)

The values of RX, RY, RWw, RWr, LB, and LW with "LB/LW Points Extended Setting" under "Application Settings" set to "Extend" are stored.

For the start offset and size of each link device, reference the start offset and size when link points are extended (Un\G98560 to Un\G98583).

| Address                 | Description  |
|-------------------------|--|
| Un\G98816 to Un\G649727 | The values of RX, RY, RWw, RWr, LB, and LW when link points are extended |

A

## Timeslot information (RJ71GN11-T2 only)

### ■Timeslot 0 information (Un\G1245440 to Un\G1245455)

Cycle start offset (ns, s unit) and cycle end offset (ns, s unit) or other information on timeslot 0 are stored.

| Address                    | Name                         | Description  |
|----------------------------|------------------------------|--|
| Un\G1245440 to Un\G1245441 | Cycle start offset (ns unit) | The ns digits of cycle start offset are stored.<br>Stored range: 0 to 999999999 (ns)   |
| Un\G1245442                | Cycle start offset (s unit)  | The s digits of cycle start offset are stored.<br>Stored range: 0 to 65535 (s)   |
| Un\G1245443                | System area                  |  |
| Un\G1245444 to Un\G1245445 | Cycle end offset (ns unit)   | The ns digits of cycle end offset are stored.<br>Stored range: 0 to 999999999 (ns)   |
| Un\1245446                 | Cycle end offset (s unit)    | The s digits of cycle end offset are stored.<br>Stored range: 0 to 65535 (s)   |
| Un\G1245447 to Un\G1245451 | System area                  |  |
| Un\G1245452                | VID (VLAN Identifier)        | Stores the VID of Timeslot 0.<br>Storage range: 1 to 4094, 65535 (do not use VID or judge frames to be relayed from VID)   |
| Un\G1245453                | PCP (Priority Code Point)    | Stores the PCP of Timeslot 0.<br>Storage range: 0 to 7, 65535 (do not use PCP or judge frames to be relayed from PCP)  |
| Un\G1245454                | EtherType                    | Stores the EtherType of the frame to be relayed in Timeslot 0. Timeslot 0 stores 65535.<br>Storage range: EtherType value of the frame to be relayed, 65535 (Do not judge frames to be relayed from EtherType) |
| Un\G1245455                | System area                  |  |

### ■Timeslot 1 to 7 information (Un\G1245456 to Un\1245567)

Timeslot 1 to 7 information is stored in the same order as Timeslot 0 information.

## RX offset/size information

### ■RX offset/size information (Un\G1245696 to Un\G1246179)

The start number and the number of points of RX for each station are stored.

| Address                    | Description                             |
|----------------------------|---|
| Un\G1245696 to Un\G1245697 | Station No.0 offset                     |
| Un\G1245698 to Un\G1245699 | Station No.0 size (in units of words)   |
| Un\G1245700 to Un\G1245701 | Station No.1 offset                     |
| Un\G1245702 to Un\G1245703 | Station No.1 size (in units of words)   |
| ⋮                          |   |
| Un\G1246176 to Un\G1246177 | Station No.120 offset                   |
| Un\G1246178 to Un\G1246179 | Station No.120 size (in units of words) |

The buffer memory address for the offset and size of each station number can be calculated using the following formulas:

- Offset buffer memory address =  $1245696 + (\text{station No.}) \times 4$
- Size buffer memory address =  $1245698 + (\text{station No.}) \times 4$

## RY offset/size information

### RY offset/size information (Un\G1246720 to Un\G1247203)

The start number and the number of points of RY for each station are stored.

| Address                    | Description                             |
|----------------------------|---|
| Un\G1246720 to Un\G1246721 | Station No.0 offset                     |
| Un\G1246722 to Un\G1246723 | Station No.0 size (in units of words)   |
| Un\G1246724 to Un\G1246725 | Station No.1 offset                     |
| Un\G1246726 to Un\G1246727 | Station No.1 size (in units of words)   |
| ⋮                          |   |
| Un\G1247200 to Un\G1247201 | Station No.120 offset                   |
| Un\G1247202 to Un\G1247203 | Station No.120 size (in units of words) |

The buffer memory address for the offset and size of each station number can be calculated using the following formulas:

- Offset buffer memory address =  $1246720 + (\text{station No.}) \times 4$
- Size buffer memory address =  $1246722 + (\text{station No.}) \times 4$

## RWw offset/size information

### RWw offset/size information (Un\G1247744 to Un\G1248227)

The start number and the number of points of RWw for each station are stored.

| Address                    | Description                             |
|----------------------------|---|
| Un\G1247744 to Un\G1247745 | Station No.0 offset                     |
| Un\G1247746 to Un\G1247747 | Station No.0 size (in units of words)   |
| Un\G1247748 to Un\G1247749 | Station No.1 offset                     |
| Un\G1247750 to Un\G1247751 | Station No.1 size (in units of words)   |
| ⋮                          |   |
| Un\G1248224 to Un\G1248225 | Station No.120 offset                   |
| Un\G1248226 to Un\G1248227 | Station No.120 size (in units of words) |

The buffer memory address for the offset and size of each station number can be calculated using the following formulas:

- Offset buffer memory address =  $1247744 + (\text{station No.}) \times 4$
- Size buffer memory address =  $1247746 + (\text{station No.}) \times 4$

## RWr offset/size information

### RWr offset/size information (Un\G1248768 to Un\G1249251)

The start number and the number of points of RWr for each station are stored.

| Address                    | Description                             |
|----------------------------|---|
| Un\G1248768 to Un\G1248769 | Station No.0 offset                     |
| Un\G1248770 to Un\G1248771 | Station No.0 size (in units of words)   |
| Un\G1248772 to Un\G1248773 | Station No.1 offset                     |
| Un\G1248774 to Un\G1248775 | Station No.1 size (in units of words)   |
| ⋮                          |   |
| Un\G1249248 to Un\G1249249 | Station No.120 offset                   |
| Un\G1249250 to Un\G1249251 | Station No.120 size (in units of words) |

The buffer memory address for the offset and size of each station number can be calculated using the following formulas:

- Offset buffer memory address =  $1248768 + (\text{station No.}) \times 4$
- Size buffer memory address =  $1248770 + (\text{station No.}) \times 4$

## LB offset/size information

### ■LB offset/size information (Un\G1249792 to Un\G1250275)

The start number and the number of points of LB for each station are stored.

| Address                    | Description                             |
|----------------------------|---|
| Un\G1249792 to Un\G1249793 | Station No.0 offset                     |
| Un\G1249794 to Un\G1249795 | Station No.0 size (in units of words)   |
| Un\G1249796 to Un\G1249797 | Station No.1 offset                     |
| Un\G1249798 to Un\G1249799 | Station No.1 size (in units of words)   |
| ⋮                          |   |
| Un\G1250272 to Un\G1250273 | Station No.120 offset                   |
| Un\G1250274 to Un\G1250275 | Station No.120 size (in units of words) |

The buffer memory address for the offset and size of each station number can be calculated using the following formulas:

- Offset buffer memory address =  $1249792 + (\text{station No.}) \times 4$
- Size buffer memory address =  $1249794 + (\text{station No.}) \times 4$

## LW offset/size information

### ■LW offset/size information (Un\G1250816 to Un\G1251299)

The start number and the number of points of LW for each station are stored.

| Address                    | Description                             |
|----------------------------|---|
| Un\G1250816 to Un\G1250817 | Station No.0 offset                     |
| Un\G1250818 to Un\G1250819 | Station No.0 size (in units of words)   |
| Un\G1250820 to Un\G1250821 | Station No.1 offset                     |
| Un\G1250822 to Un\G1250823 | Station No.1 size (in units of words)   |
| ⋮                          |   |
| Un\G1251296 to Un\G1251297 | Station No.120 offset                   |
| Un\G1251298 to Un\G1251299 | Station No.120 size (in units of words) |

The buffer memory address for the offset and size of each station number can be calculated using the following formulas:

- Offset buffer memory address =  $1250816 + (\text{station No.}) \times 4$
- Size buffer memory address =  $1250818 + (\text{station No.}) \times 4$

## Own station information

The information of the own station on the network is stored.

### ■Own station (network card) information (Un\G1252096 to Un\G1252103)

| Address                    | Name                       | Description  |
|----------------------------|----------------------------|--|
| Un\G1252096                | Manufacturer code          | The information of the own station is stored.<br>(Also used in the CLPA conformance test.)<br>(Updated even if set as an error invalid station.)<br>(Updated even if set as a reserved station.)         |
| Un\G1252097                | Model type                 |  |
| Un\G1252098                | Model code (lower 2 bytes) |  |
| Un\G1252099                | Model code (upper 2 bytes) |  |
| Un\G1252100                | Version                    |  |
| Un\G1252101 to Un\G1252103 | MAC address                | The own station MAC address is stored.<br>Un\G1252101: 5th byte, 6th byte of the MAC address<br>Un\G1252102: 3rd byte, 4th byte of the MAC address<br>Un\G1252103: 1st byte, 2nd byte of the MAC address |

### ■Own station (controller) information (Un\G1252104 to Un\G1252121)

| Address                    | Name                                      | Description   |
|----------------------------|---|---|
| Un\G1252104                | Controller information valid/invalid flag | Whether the value stored in the own station (controller) information is valid or invalid is stored.<br>• 0: Invalid<br>• 1: Valid |
| Un\G1252105                | Manufacturer code                         | The RJ71GN11 information of the own station is stored.  |
| Un\G1252106                | Model type                                |   |
| Un\G1252107                | Model code (lower 2 bytes)                |   |
| Un\G1252108                | Model code (upper 2 bytes)                |   |
| Un\G1252109                | Version                                   |   |
| Un\G1252110 to Un\G1252119 | Model name string                         |   |
| Un\G1252120 to Un\G1252121 | Vendor-specific device information        |   |

## Communication path determination status

### ■Communication path determination status (Un\G1260544 to Un\G1260559)

The determination information on the communication path for each network number of the destination station is stored.

- 0: Path undetermined
- 1: Path determined

| Address     | b15   | b14 | b13 | b12 | b11 | b10 | b9  | b8  | b7  | b6  | b5  | b4  | b3  | b2  | b1  | b0  |
|-------------|-------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Un\G1260544 | 16    | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   |
| ⋮           |       |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
| Un\G1260558 | Empty | 239 | 238 | 237 | 236 | 235 | 234 | 233 | 232 | 231 | 230 | 229 | 228 | 227 | 226 | 225 |
| Un\G1260559 | Empty |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

The numbers in the table indicate network numbers.

## Time synchronization

### ■Time distribution interval setting of the CPU module (Un\G1275136)

The time distribution interval of the CPU module on the master station to device stations is set (CPU No.1 when the multiple CPU system is used). This setting is set to the buffer memory of the master station.

When the setting is changed, the new setting value is enabled after the interval of the distribution operating with the old setting value has elapsed. The setting value is distributed once after the distribution interval elapses. If the new setting value needs to be enabled immediately, stop the distribution and set the value.

When "Master Station Shift Setting" in "Application Settings" is set to "Enable" on the RJ71GN11-SX, set the interval at which the time of the CPU module on the same base unit as the local station (current master station) is distributed from the local station (current master station) to the local station.

- 0000H: 10s
- 0001H to FFFEh: Send using the set time interval (second)
- FFFFH: Distribution stop

(Default: 0000H)

### ■Time reflection setting to the CPU module (Un\G1275137)

Whether the time of the CPU module distributed from the master station is reflected to the CPU module in the local station is set (CPU No.1 when the multiple CPU system is used). This setting is set to the buffer memory of the local station.<sup>\*1</sup>

- 0000H: Do not reflect the time to the CPU module.<sup>\*2</sup>
- 0001H: Reflect the time to the CPU module.

(Default: 0000H)

\*1 If 0001H is set to the buffer memory of the master station, the time distributed is not reflected to the CPU module in the local station (CPU No.1 when the multiple CPU system is used).

\*2 The time that was set to the CPU module on the local station is used for operation.

### ■Time distribution start setting in the master station (Un\G1275138) (RJ71GN11-SX only)

The time distribution interval complies with the time distribution interval setting in the CPU module (Un\G1275136).

- 0000H: Start time distribution without waiting for time distribution reception from the local station.
- 0001H: Start time distribution after time distribution reception from the local station.<sup>\*1\*2</sup>

(Default: 0000H)

\*1 This operates when the master station switch function is enabled and the master station is reconnected.

\*2 If the master station switch function is disabled, the setting is invalid.

## Grandmaster information

The grandmaster status of the own station and MAC address are stored.

### ■Grandmaster (Un\G1275904)

When the own station is the grandmaster, "1" is stored.

- 1: Own station is the grandmaster
- 0: Another station is the grandmaster

### ■Grandmaster MAC address (Un\G1275907 to Un\G1275909)

The grandmaster MAC address is stored.

- Un\G1275907: 5th byte, 6th byte of the MAC address
- Un\G1275908: 3rd byte, 4th byte of the MAC address
- Un\G1275909: 1st byte, 2nd byte of the MAC address

## Time synchronization setting

### ■PTP frame send source check enable/disable (Un\G1275933)

- 1: Check
- 0: Do not check

### ■PTP frame send source check result (P1) (Un\G1275934)

- 1: Two or more send sources
- 0: One send source

### ■PTP frame send source check result (P2) (Un\G1275935)

- 1: Two or more send sources
- 0: One send source

## Communication cycle timing (RJ71GN11-T2 only)

The communication cycle timing is stored.

This area can be used by an inter-module synchronous interrupt program (I44). In unicast mode, this area cannot be used in a local station.

### ■Normal speed (Un\G1277440)

"1" is stored at the timing of the start (1st cycle during N cycles)/end (N cycle during N cycles) of the basic cycle intervals during normal speed cycles.

[b0]

- 1: Start (1st cycle during N cycles)
- 0: Other than the start

[bF]

- 1: End (N cycle during N cycles)
- 0: Other than the end

### ■Low speed (Un\G1277441)

"1" is stored at the timing of the start (1st cycle during N cycles)/end (N cycle during N cycles) of the basic cycle intervals during low speed cycles.

[b0]

- 1: Start (1st cycle during N cycles)
- 0: Other than the start

[bF]

- 1: End (N cycle during N cycles)
- 0: Other than the end

## Cyclic data send/receive assurance information (RJ71GN11-T2 only)

### ■Multiple cycle setting (low speed) (Un\G1277442)

The setting value of the multiple cycle setting (low speed) that ensures the cyclic data communications (send/receive) is stored.\*1

- 0: Calculation not performed
- 16, 32, 64, 128: Low speed cycle for basic cycle

\*1 This value is stored when both of the following conditions are satisfied.

- When a device station exists for which, under "Basic Settings", "CC-Link IE TSN Class Setting" in "Connection Device Information" is "CC-Link IE TSN Class A" and "Communication Period Setting" is "Low-Speed"
- When 'Protocol setting' (Un\G1294018) is set to Automatic setting (0) or Protocol version 2.0 fixed (2)

### ■Communication cycle interval (calculation value) (Un\G1277443)

The setting value of the communication cycle interval that ensures the cyclic data communications (send/receive) is stored.

This value is stored when a device station exists for which, under "Basic Settings", "CC-Link IE TSN Class Setting" in "Connection Device Information" is "CC-Link IE TSN Class A" and "Communication Period Setting" is "Low-Speed".

- 0: Calculation not performed
- 125 to 4294967295: Communication cycle interval (unit:  $\mu$ s)

## Communication period setting value (protocol version 2.0) (RJ71GN11-T2 only)

### ■Communication cycle interval (calculation value) (Un\G1277444)

Stores the communication cycle intervals that are calculated by the number of device stations and the number of link device points set in "Network Configuration Settings" under "Basic Settings".

Stores the communication cycle interval of protocol version 2.0 regardless of the setting value of 'Protocol setting' (Un\G1294018). When 'Protocol setting' (Un\G1294018) is set to '1: Protocol version 1.0 fixed', if devices supporting protocol version 1.0 and devices supporting protocol version 2.0 are mixed, refer to the value in this buffer memory, and set the appropriate value to "Communication Period Interval Setting" in "Communication Period Setting" under "Basic Settings".

- 125 or greater: Communication cycle intervals (unit:  $\mu\text{s}$ )

### ■Cyclic transmission time (calculation value) (Un\G1277445)

Stores the cyclic transmission times that are calculated by the number of device stations and the number of link device points set in "Network Configuration Settings" under "Basic Settings".

Stores the cyclic transmission times of protocol version 2.0 regardless of the setting value of 'Protocol setting' (Un\G1294018). When 'Protocol setting' (Un\G1294018) is set to '1: Protocol version 1.0 fixed', if devices supporting protocol version 1.0 and devices supporting protocol version 2.0 are mixed, refer to the value in this buffer memory, and set the appropriate value to "Communication Period Interval Setting" in "Communication Period Setting" under "Basic Settings".

- 1 or greater: Cyclic transmission time (unit:  $\mu\text{s}$ )

### ■Transient transmission time (calculation value) (Un\G1277446)

Stores the transient transmission times that are calculated by the number of device stations and the number of link device points set in "Network Configuration Settings" under "Basic Settings".

Stores the transient transmission times of protocol version 2.0 regardless of the setting value of 'Protocol setting' (Un\G1294018). When 'Protocol setting' (Un\G1294018) is set to '1: Protocol version 1.0 fixed', if devices supporting protocol version 1.0 and devices supporting protocol version 2.0 are mixed, refer to the value in this buffer memory, and set the appropriate value to "Communication Period Interval Setting" in "Communication Period Setting" under "Basic Settings".

- 1 or greater: Transient transmission time (unit:  $\mu\text{s}$ )

## CC-Link IE TSN Communication Software information (RJ71GN11-T2 only)

Information related to the CC-Link IE TSN Communication Software is stored.

### ■CC-Link IE TSN Communication Software information (1st module) (Un\G1277456 to Un\G1277479)

| Address                    | Name                           | Description   |
|----------------------------|--------------------------------|---|
| Un\G1277456                | Manufacturer code              | Information of the CC-Link IE TSN Communication Software in the 1st module is stored. |
| Un\G1277457                | Model type                     |   |
| Un\G1277458                | Model code (lower 2 bytes)     |   |
| Un\G1277459                | Model code (upper 2 bytes)     |   |
| Un\G1277460                | Model code of extension module |   |
| Un\G1277461                | Version                        |   |
| Un\G1277462 to Un\G1277464 | MAC address                    |   |
| Un\G1277465, Un\G1277466   | IP address (IPv4)              |   |
| Un\G1277467 to Un\G1277474 | IP address (IPv6)              |   |
| Un\G1277475 to Un\G1277479 | System area                    |   |

### ■CC-Link IE TSN Communication Software information (2nd module) (Un\G1277480 to Un\G1277503)

| Address                    | Name                           | Description   |
|----------------------------|--------------------------------|---|
| Un\G1277480                | Manufacturer code              | Information of the CC-Link IE TSN Communication Software in the 2nd module is stored. |
| Un\G1277481                | Model type                     |   |
| Un\G1277482                | Model code (lower 2 bytes)     |   |
| Un\G1277483                | Model code (upper 2 bytes)     |   |
| Un\G1277484                | Model code of extension module |   |
| Un\G1277485                | Version                        |   |
| Un\G1277486 to Un\G1277488 | MAC address                    |   |
| Un\G1277489, Un\G1277490   | IP address (IPv4)              |   |
| Un\G1277491 to Un\G1277498 | IP address (IPv6)              |   |
| Un\G1277499 to Un\G1277503 | System area                    |   |

## PDO information (RJ71GN11-T2 only)

### ■PDO information (Un\G1277648 to Un\G1293967)

| Address                    | Name                                 | Description                                    |
|----------------------------|--------------------------------------|--|
| Un\G1277648 to Un\G1277649 | Multidrop No.0 of the station No.1   | Start offset of link device using RPDO         |
| Un\G1277650 to Un\G1277651 |                                      | RPDO size                                      |
| Un\G1277652 to Un\G1277653 |                                      | Start offset of link device using TPDO         |
| Un\G1277654 to Un\G1277655 |                                      | TPDO size                                      |
| ⋮                          |                                      |  |
| Un\G1277704 to Un\G1277711 | Multidrop No.7 of the station No.1   | Same as the multidrop No.0 of the station No.1 |
| ⋮                          |                                      |  |
| Un\G1285264 to Un\G1285271 | Multidrop No.0 of the station No.120 | Same as the multidrop No.0 of the station No.1 |
| ⋮                          |                                      |  |

| Un\G1285328 to Un\G1293967 | System area                          | —  |

A

## Protocol information (RJ71GN11-T2 only)

### ■ Protocol information (Un\G1294016 to Un\G1294031)

| Address                    | Name                        | Description  |
|----------------------------|-----------------------------|--|
| Un\G1294016                | Protocol operating status   | Stores the operating status of the protocol.<br>0: Operating protocol not determined or CC-Link IE TSN Class settings set to CC-Link IE TSN Class B only<br>1: Operating with the protocol version 1.0<br>2: Operating with the protocol version 2.0 |
| Un\G1294017                | Write request               | Write the protocol settings to RJ71GN11.<br>0: Do not write<br>1: Write  |
| Un\G1294018                | Protocol setting            | Set the operating protocol.<br>0: Automatic setting <sup>*1</sup><br>1: Protocol version 1.0 fixed<br>2: Protocol version 2.0 fixed  |
| Un\G1294019                | Write implementation status | Stores the writing implementation status to RJ71GN11.<br>0: Writing not implemented or in progress<br>1: Writing completed   |
| Un\G1294020                | Setting result              | Stores the setting result.<br>0: Completed successfully<br>Other than 0: Completed with an error (error code)  |
| Un\G1294021                | Protocol setting status     | Stores the protocol settings held by RJ71GN11.<br>0: Automatic setting (factory default)<br>1: Protocol version 1.0 fixed<br>2: Protocol version 2.0 fixed   |
| Un\G1294022 to Un\G1294031 | System area                 | —  |

\*1 Sets the protocol automatically according to the system settings.

While the system is operating with the protocol version 2.0, if a device that supports protocol version 1.0 attempts to join, the joining station does not establish a data link.

| Firmware version | With/without connection to CC-Link IE TSN Class A devices |                      | Operating protocol version |
|------------------|---|----------------------|----------------------------|
|                  | Protocol version 1.0                                      | Protocol version 2.0 |                            |
| "15" or later    | Available   | —                    | 1.0                        |
|                  | Not available   | —                    | 2.0                        |
| "14"             | —   | Not available        | 1.0                        |
|                  | Available   | Available            | 1.0                        |
|                  | Not available   | Available            | 2.0                        |

## Timeslot information for device station cyclic transmission (RJ71GN11-T2 only)

### ■Timeslot information for device station cyclic transmission (Un\G1294048 to Un\G1294167)

| Address     | Name  | Description  |
|-------------|---|--|
| Un\G1294048 | Timeslot for station number 1 cyclic transmission   | Stores the Timeslot for cyclic transmission of station number 1.<br>0: Undetermined<br>1: Timeslot 1<br>3: Timeslot 3<br>4: Timeslot 4<br>5: Timeslot 5<br>6: Timeslot 6   |
| ⋮           |   |  |
| Un\G1294167 | Timeslot for station number 120 cyclic transmission | Stores the Timeslot for cyclic transmission of station number 120.<br>0: Undetermined<br>1: Timeslot 1<br>3: Timeslot 3<br>4: Timeslot 4<br>5: Timeslot 5<br>6: Timeslot 6 |

## Device station cyclic transmission information (RJ71GN11-T2 only)

### ■CC-Link IE TSN Class A (low speed) multiple (Un\G1294304)

Stores the multiple n used to calculate the transmission delay time of a CC-Link IE TSN Class A device station for which "Communication Period Setting" is set to "Low-Speed".

- 0: There is no device station on the network configuration with CC-Link IE TSN Class A and "Communication Period Setting" set to "Low-Speed"
- 1 or greater: n value<sup>\*1</sup>

\*1 When 'Protocol operating status' (Un\G1294016) is '1: Operating with the protocol version 1.0', it is set to 1 Fixed.

## Current master station IP address (RJ71GN11-SX only)

### ■Current master station IP address (Un\G1294352 to Un\G1294353)

When 'Data link error status of own station' (SB0049) is off and 'Master station switch setting status' (SB0195) is on, the IP address of the current master station is stored.

| Address     | b15         | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7           | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|-------------|-------------|-----|-----|-----|-----|-----|----|----|--------------|----|----|----|----|----|----|----|
| Un\G1294352 | Third octet |     |     |     |     |     |    |    | Fourth octet |    |    |    |    |    |    |    |
| Un\G1294353 | First octet |     |     |     |     |     |    |    | Second octet |    |    |    |    |    |    |    |

A

## Own node setting status storage area

### ■Own node IP address (Un\G2097156 to Un\G2097157)

The setting values of the IP address are stored.

Range: 1H to DFFFFFFEH

### ■Subnet mask (Un\G2097166 to Un\G2097167)

The setting values of the subnet mask are stored.

Range: 1H to FFFFFFFFH

0: No setting

### ■Default gateway IP address (Un\G2097170 to Un\G2097171)

The setting values of the default gateway are stored.

Range: 1H to DFFFFFFEH

0: No setting

### ■Own node MAC address (Un\G2097180 to Un\G2097182)

The own node MAC addresses are stored.

- Un\G2097180: 5th byte, 6th byte of the MAC address
- Un\G2097181: 3rd byte, 4th byte of the MAC address
- Un\G2097182: 1st byte, 2nd byte of the MAC address

### ■Own node network number (Un\G2097183)

The setting value of the network number is stored.

Range: 1 to 239

0: Network number not set

### ■Station number (Un\G2097184)

The setting value of the station number is stored.

Range: 1 to 120, 125

1 to 120: Local station

125: Master station

### ■Transient transmission group No. (Un\G2097185)

The setting value of the transient transmission group number is stored.

Range: 1 to 32

0: No group specification

### ■Auto-open UDP port port number (Un\G2097189)

The port number used for the auto-open UDP port is stored.

### ■MELSOFT transmission port (TCP/IP) port number (Un\G2097190)

The port number used for the MELSOFT transmission port (TCP/IP) is stored.

### ■MELSOFT transmission port (UDP/IP) port number (Un\G2097191)

The port number for the MELSOFT transmission port (UDP/IP) is stored

### ■SLMP transmission port (TCP/IP) port number (Un\G2097193)

The port number used for the SLMP transmission port (TCP/IP) is stored.

### ■SLMP transmission port (UDP/IP) port number (Un\G2097194)

The port number used for the SLMP transmission port (UDP/IP) is stored.

## Connection status storage area

### ■Latest error code after the 2nd connection of MELSOFT transmission port (TCP/IP) (Un\G2097380 to Un\G2097386)

The latest error code of the 2nd to 8th connection of the MELSOFT transmission port (TCP/IP) is stored.

### ■Latest error code after the 2nd connection of SLMP transmission port (TCP/IP) (Un\G2097508 to Un\G2097514)

The latest error code of the 2nd to 8th connection of the SLMP transmission port (TCP/IP) is stored.

## System port latest error code storage area

### ■Auto-open UDP port latest error code (Un\G2098154)

The latest error code of the auto-open UDP port is stored.

### ■MELSOFT transmission port (UDP/IP) latest error code (Un\G2098155)

The latest error code of the MELSOFT transmission port (UDP/IP) is stored.

### ■MELSOFT transmission port (TCP/IP) latest error code (Un\G2098156)

The latest error code of the MELSOFT transmission port (TCP/IP) is stored.

### ■SLMP transmission port (UDP/IP) latest error code (Un\G2098157)

The latest error code of the SLMP transmission port (UDP/IP) is stored.

### ■SLMP transmission port (TCP/IP) latest error code (Un\G2098158)

The latest error code of the SLMP transmission port (TCP/IP) is stored.

### ■SLMPSND instruction latest error code (Un\G2098159)

The latest error code of the SLMPSND instruction is stored.

## Status for each protocol (IP packet)

### ■Received packet total count (Un\G2102152 to Un\G2102153, Un\G4199304 to Un\G4199305)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Received packet checksum error discard count (Un\G2102154 to Un\G2102155, Un\G4199306 to Un\G4199307)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Sent packet total count (Un\G2102156 to Un\G2102157, Un\G4199308 to Un\G4199309)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Simultaneous transmission error detection count (receive buffer full count) (Un\G2102174 to Un\G2102175, Un\G4199326 to Un\G4199327)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Receive abort count (Un\G2102181, Un\G4199333)

The status is counted from 0 to 65535 (FFFFH).

## Status for each protocol (ICMP packet)

### ■Received packet total count (Un\G2102192 to Un\G2102193, Un\G4199344 to Un\G4199345)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Received packet checksum error discard count (Un\G2102194 to Un\G2102195, Un\G4199346 to Un\G4199347)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Sent packet total count (Un\G2102196 to Un\G2102197, Un\G4199348 to Un\G4199349)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Received echo request total count (Un\G2102198 to Un\G2102199, Un\G4199350 to Un\G4199351)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Sent echo reply total count (Un\G2102200 to Un\G2102201, Un\G4199352 to Un\G4199353)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Sent echo request total count (Un\G2102202 to Un\G2102203, Un\G4199354 to Un\G4199355)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Received echo reply total count (Un\G2102204 to Un\G2102205, Un\G4199356 to Un\G4199357)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

## Status for each protocol (TCP packet)

### ■Received packet total count (Un\G2102232 to Un\G2102233, Un\G4199384 to Un\G4199385)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Received packet checksum error discard count (Un\G2102234 to Un\G2102235, Un\G4199386 to Un\G4199387)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Sent packet total count (Un\G2102236 to Un\G2102237, Un\G4199388 to Un\G4199389)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

## Status for each protocol (UDP packet)

### ■Received packet total count (Un\G2102272 to Un\G2102273, Un\G4199424 to Un\G4199425)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Received packet checksum error discard count (Un\G2102274 to Un\G2102275, Un\G4199426 to Un\G4199427)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

### ■Sent packet total count (Un\G2102276 to Un\G2102277, Un\G4199428 to Un\G4199429)

The status is counted from 0 to 4294967295 (FFFFFFFFH).

## Own node operation status storage area (LED on/off status)

### ■Own node operation status storage area (LED on/off status) (Un\G2102341)

ERR LED (b0)

- 1: On/flashing
- 0: Off

## Own node operation status storage area (switching hub connection information area)

### ■Communication mode (Un\G2102343, Un\G4199495)

- 0: Half-duplex
- 1: Full-duplex

### ■Connection status (Un\G2102344, Un\G4199496)

- 0: Switching hub not connected/disconnected
- 1: Switching hub connected

### ■Communication speed (Un\G2102345, Un\G4199497)

- 1: Operating at 100BASE-TX
- 2: Operating at 1000BASE-T

### ■The number of disconnection (Un\G2102346, Un\G4199498)

The number of times the cable was disconnected is stored.

## Own node operation status storage area (IP address duplication status storage area)

### ■IP address duplication flag (Un\G2102352)

- 0: IP address not duplicated
- 1: IP address duplicated

### ■MAC address of the station already connected to the network (Un\G2102353 to Un\G2102355)

It is stored in the station with duplicated IP address.

### ■MAC address of the station with the IP address already used (Un\G2102356 to Un\G2102358)

It is stored in the station that has been already connected to the network.

## Area for sending/receiving instructions (RECV instruction execution request)

### ■Area for sending/receiving instructions (RECV instruction execution request) (Un\G2102453)

RECV instruction execution request

- 1: Requesting
- 0: No request

Channels 1 to 8 are displayed in units of bits.

## Remote password lock status storage area

### ■Remote password lock status system port (Un\G2102782, Un\G4199934)

[b0]: Auto-open UDP port

[b1]: MELSOFT transmission port (UDP/IP)

[b2]: MELSOFT transmission port (TCP/IP)

[b5]: SLMP transmission port (UDP/IP)

[b6]: SLMP transmission port (TCP/IP)

- 0: Unlocked/remote password not set
- 1: Lock status

## Remote password function monitoring area

### ■Auto-open UDP port continuous unlock failure count (Un\G2108800, Un\G4205952)

The mismatch count of remote password at unlock of the auto-open UDP port is stored. The count is cleared when the password matches.

Range: 0 to 65535 (Values of 65535 or more are not changed)

### ■MELSOFT transmission port (UDP/IP) continuous unlock failure count (Un\G2108801, Un\G4205953)

The mismatch count of remote password at unlock of the MELSOFT transmission port (UDP/IP) is stored. The count is cleared when the password matches.

Range: 0 to 65535 (Values of 65535 or more are not changed)

### ■MELSOFT transmission port (TCP/IP) continuous unlock failure count (Un\G2108802, Un\G4205954)

The mismatch count of remote password at unlock of the MELSOFT transmission port (TCP/IP) is stored. The count is cleared when the password matches.

Range: 0 to 65535 (Values of 65535 or more are not changed)

### ■SLMP transmission port (UDP/IP) continuous unlock failure count (Un\G2108805, Un\G4205957)

The mismatch count of remote password at unlock of the SLMP transmission port (UDP/IP) is stored. The count is cleared when the password matches.

Range: 0 to 65535 (Values of 65535 or more are not changed)

### ■SLMP transmission port (TCP/IP) continuous unlock failure count (Un\G2108806, Un\G4205958)

The mismatch count of remote password at unlock of the SLMP transmission port (TCP/IP) is stored. The count is cleared when the password matches.

Range: 0 to 65535 (Values of 65535 or more are not changed)

## Network type information area (Network type information)

### ■Network type information area (Network type information) (Un\G2162687)

5: CC-Link IE TSN

## Ethernet P1/2 common information

### ■Initial status (Un\G6291480)

The initial processing status of the RJ71GN11 Ethernet connection is stored.

[b0]: Initial normal completion status

- 1: Initialization normal completion
- 0: —

[b1]: Initial abnormal completion status

- 1: Initialization abnormal completion
- 0: —

[b2 to b15]: Not used (Use prohibited)

### ■Initial error code (Un\G6291481)

The information when the initial processing is completed with an error is stored.

- 1 or more: Initialization abnormal code
- 0: In initial processing or initial normal completion

## Receive buffer status storage area (Receive buffer status)

### ■Receive buffer status storage area (Receive buffer status) (Un\G6291486)

The receive buffer status is stored.

- 1: Receive buffer full

# Appendix 4 List of Link Special Relay (SB)

The link special relay (SB) is turned on/off depending on various factors during data link. Any error status of the data link can be checked by using or monitoring it in the program.

## Application of link special relay (SB)

By using link special relay (SB), the status of CC-Link IE TSN can be checked from HMI (Human Machine Interfaces) as well as the engineering tool.

## Refresh of link special relay (SB)

To use link special relay (SB), set them in "Refresh Setting" in "Basic Settings" so that they are refreshed to the devices or labels of the CPU module. (  Page 115 Refresh Settings)

## Ranges turned on/off by users and by the system

The following ranges correspond to when the link special relay areas (SB) are assigned from SB0000 to SB0FFF.

- Turned on/off by users: SB0000 to SB001F
- Turned on/off by the system: SB0020 to SB0FFF

## List of link special relay (SB)

The following table lists the link special relay areas (SB) when they are assigned from SB0000 to SB0FFF.

Do not turn on or off areas whose numbers are not on the following list or ranges turned on/off by the system. Doing so may cause malfunction of the programmable controller system.

○: Available, ×: Not available, T2: RJ71GN11-T2, SX: RJ71GN11-SX

| No.    | Name                                | Description  | Master station | Local station |                |

\*1 If the station is communicating in multicast mode, this item is enabled when 'Data link error status of own station' (SB0049) is off.

\*2 If the station is communicating in multicast mode, this item is enabled when 'Current master/local station status of own station' (SB0196) is on.

# Appendix 5 List of Link Special Register (SW)

The link special register (SW) stores the information during data link as a numerical value. Faulty areas and causes can be checked by using or monitoring the link special register (SW) in programs.

## Application of link special register (SW)

By using link special register (SW), the status of CC-Link IE TSN can be checked from HMI (Human Machine Interfaces) as well as the engineering tool.

## Refresh of link special register (SW)

To use link special register (SW), set them in "Refresh Settings" under "Basic Settings" so that they are refreshed to the devices or labels of the CPU module. (📖 Page 115 Refresh Settings)

## Range where data is stored by users and range where data is stored by the system

The following ranges correspond to when the link special register areas (SW) are assigned from SW0000 to SW0FFF.

- Stored by users: SW0000 to SW001F
- Stored by the system: SW0020 to SW0FFF

## List of link special register (SW)

The following table lists the link special register areas (SW) when they are assigned from SW0000 to SW0FFF.

Do not write any data to an area whose number is not on the following list or ranges where data is stored by the system. Doing so may cause malfunction of the programmable controller system.

\*1 If the station is communicating in multicast mode, this item is enabled when 'Data link error status of own station' (SB0049) is off.  
\*2 If the station is communicating in multicast mode, this item is enabled when 'Current master/local station status of own station' (SB0196) is on.

# Appendix 6 Dedicated Instruction

This section describes dedicated instructions that can be used in the RJ71GN11 and the transient transmission ranges.

## Point

For details on dedicated instructions, refer to the following.

 MELSEC iQ-R Programming Manual (Module Dedicated Instructions)

## Precautions

### ■Data change

Do not change any data specified (such as control data) until execution of the dedicated instruction is completed.

### ■When the dedicated instruction is not completed

Check whether the module operation mode setting is online.

A dedicated instruction cannot be executed when the mode is offline or module communication test.

## Link dedicated instructions

The following table lists the instructions used for transient transmission to or from programmable controllers on other stations. Each link dedicated instruction allows access to a station on a network other than CC-Link IE TSN.

| Instruction | Description  | RJ71GN11-T2 | RJ71GN11-SX |
|-------------|--|-------------|-------------|
| READ        | Reads the data in units of words from devices in the programmable controller of another station.   | ○           | ○           |
| SREAD       | Reads the data in units of words from devices in the programmable controller of another station. When reading of the data is completed, another station devices are turned on. | ○           | ○           |
| WRITE       | Writes the data in units of words to devices in the programmable controller of another station.  | ○           | ○           |
| SWRITE      | Writes the data in units of words to devices in the programmable controller of another station. When writing of the data is completed, another station devices are turned on.  | ○           | ○           |
| SEND        | Sends data to the programmable controller of another station.  | ○           | ○           |
| RECV        | Reads the data received from the programmable controller of another station. (For a main routine program)  | ○           | ○           |
| REQ         | Requests the remote RUN/STOP to the programmable controller of another station.  | ○           | ○           |
|             | Reads/writes clock data from/to the programmable controller of another station.  |             |             |

## Transient transmission ranges

In a single network system, communication with all stations on the network is possible.

In multi-network system, communications can be made with stations up to eight networks apart.

## Precautions

### ■When multiple link dedicated instructions are executed simultaneously

When executing multiple link dedicated instructions simultaneously, check that the channels for the instructions are not duplicated. Link dedicated instructions with a same channel number cannot be executed simultaneously. To use the same channel for multiple link dedicated instructions, configure an interlock so that an instruction is executed after completion of another.

### ■When different communication speeds are set for the master station and target station

- When executing a dedicated instruction, execute it on the master station.
- Do not execute multiple dedicated instructions simultaneously. If multiple dedicated instructions are executed simultaneously, the other dedicated instruction may not be executed. When executing multiple dedicated instructions, configure an interlock so that an instruction is executed after completion of another.

## Remote instructions

The following table lists the instructions used for transient transmission to the remote station.

○: Available, ×: Not available

| Instruction                        | Description   | RJ71GN11-T2 | RJ71GN11-SX |
|------------------------------------|---|-------------|-------------|
| REMFR <sup>*1</sup>                | Reads data in units of words from the buffer memory in the remote station. (16-bit address specification)   | ○           | ×           |
| REMF <sup>RD</sup> <sup>*1</sup>   | Reads data in units of words from the buffer memory in the remote station. (32-bit address specification)   | ○           | ×           |
| REMF <sup>RI</sup> <sup>*1</sup>   | Reads data in units of words from the buffer memory in the remote station. (Target station IP address specification) (16-bit address specification) | ○           | ×           |
| REMF <sup>RI</sup> <sup>*1</sup>   | Reads data in units of words from the buffer memory in the remote station. (Target station IP address specification) (32-bit address specification) | ○           | ×           |
| REMT <sup>O</sup> <sup>*2</sup>    | Writes data in units of words to the buffer memory in the remote station. (16-bit address specification)  | ○           | ×           |
| REMT <sup>OD</sup> <sup>*2</sup>   | Writes data in units of words to the buffer memory in the remote station. (32-bit address specification)  | ○           | ×           |
| REMT <sup>OIP</sup> <sup>*2</sup>  | Writes data in units of words to the buffer memory in the remote station. (Target station IP address specification) (16-bit address specification)  | ○           | ×           |
| REMT <sup>ODIP</sup> <sup>*2</sup> | Writes data in units of words to the buffer memory in the remote station. (Target station IP address specification) (32-bit address specification)  | ○           | ×           |

\*1 Firmware version "04" or later: When "Communication Mode" is set to "Multicast", the instruction can be executed on the master and local station. When "Communication Mode" is set to "Unicast", the instruction cannot be executed on the local station.

Firmware version "03" or earlier: The instruction cannot be executed on the local station. Execute it on the master station.

\*2 The instruction cannot be executed on the local station. Execute it on the master station.

## Transient transmission ranges

In a single network system, communication with the remote station on the network is possible.

Communication is not available with stations in other networks.

## Precautions

When using the REMFR, REMTO, REMFRD, or REMTOD instructions, configure an interlock with the following module labels.

- 'Data link error status of own station' (SB0049)
- 'Data link status of each station' (SW00B0 to SW00B7) of the target station

Check that the data link status is normal. ('Data link error status of own station' (SB0049) and 'Data link status of each station' (SW00B0 to SW00B7) of the target station are off.)

## SLMP communication instruction

The following table lists the dedicated instruction used to send an SLMP frame to an SLMP-compatible device in the same network.

| Instruction | Description   | RJ71GN11-SX | RJ71GN11-SX |
|-------------|---|-------------|-------------|
| SLMPSND     | Send an SLMP message to the SLMP-compatible device in the same network. | ○           | ○           |

## Other dedicated instructions

The following table lists the dedicated instructions used to set parameters for the own station.

○: Available, ×: Not available

| Instruction          | Description  | RJ71GN11-SX | RJ71GN11-SX |
|----------------------|--|-------------|-------------|
| CCPASET              | Set the parameter in the RJ71GN11-T2. (Only partial parameters)                                | ○           | ×           |
| CCPASET <sup>X</sup> | Set the parameter in the RJ71GN11-T2.  | ○           | ×           |
| UINI                 | Set the IP address to the own station for which the station number and IP address are not set. | ○           | ○           |

## Transient transmission ranges

Access to the own station only is possible.

# Appendix 7 Processing Time

The transmission delay time of CC-Link IE TSN consists of the time components below. (☞ Page 316 Cyclic transmission delay time)

(1) Master station sequence scan time + (2) Communication cycle interval (cyclic data transfer processing time) + (3) Device station processing time

- Master station sequence scan time: 📖 MELSEC iQ-R CPU Module User's Manual (Application)
- Communication cycle interval (cyclic data transfer processing time): ☞ Page 322 Communication cycle intervals
- Device station processing time: 📖 Manual for the device station used

## Cyclic transmission delay time

The transmission delay time of CC-Link IE TSN refers to the following.

- The time between the transmission source CPU module device turning on or off and the transmission destination CPU module device turning on or off
- The time between data setting in the transmission source CPU module device and the data being stored in the transmission destination CPU module device

### Point

When "Communication Period Setting" of the communication destination in "Network Configuration Settings" is set to an option other than "Basic Period", multiply the communication cycle intervals by the multiplier corresponding to the set option, which is specified in "Multiple Period Setting" under "Communication Period Setting".

At this time, the multiple is as follows, depending on "Communication Period Setting" under "Basic Settings" and "CC-Link IE TSN Class" under "Network Configuration Settings".

- For "CC-Link IE TSN Class B": The multiple specified in "Multiple Period Setting" in "Communication Period Setting" under "Basic Settings"
- When "CC-Link IE TSN Class A" and "Communication Period Setting" are "Normal-Speed": The multiple specified in "Multiple Period Setting" in "Communication Period Setting" under "Basic Settings"
- When "CC-Link IE TSN Class A" and "Communication Period Setting" are "Low-Speed": The multiple  $\times n$  (☞ Page 317 Details of  $n$  by which communication cycle intervals are multiplied (RJ71GN11-T2 only)) specified in "Multiple Period Setting" in "Communication Period Setting" under "Basic Settings"

## Details of n by which communication cycle intervals are multiplied (RJ71GN11-T2 only)

In "Network Configuration Settings" of the master station, when "CC-Link IE TSN Class" is set to "CC-Link IE TSN Class A" and "Communication Period Setting" of the communication destination is set to "Low-Speed", multiply the communication cycle intervals by the multiplier  $\times n$  specified in "Multiple Period Setting" under "Communication Period Setting".

This n can be checked with 'Device station cyclic transmission information' (Un\G1294304). (Page 289 Device station cyclic transmission information (RJ71GN11-T2 only))

Moreover, stations with "CC-Link IE TSN Class A" where "Communication Period Setting" is set to "Low-Speed" are grouped by the sizes of cyclic data, and the number n is determined by the number of the groups.

The algorithm for determining n is shown.

| No. | Processing   | Branch |        | Loop 1                   | Loop 2  | Detailed description  |
|-----|--|--------|--------|--------------------------|---|---|
|     |  | Yes    | No     |                          |   |   |
| 1   | Start  | —      | —      | —                        | —   | Check the stations in "Network Configuration Settings" for the master station in the order of "STA#" column to assign stations with "CC-Link IE TSN Class A" whose "Communication Period Setting" is "Low-Speed" to groups.   |
| 2   | Loop according to the number of stations<br>(i = 1; i ≤ set stations; i++)   | —      | —      | No.2 or greater<br>No.11 | —   | Check device stations with "STA#" of 1 to 120 in "Network Configuration Settings" for the master station one by one. (Loop the processing of No.2 to No.11 for the number of stations)  |
| 3   | Are "CC-Link IE TSN Class A" and "Communication Period Setting" set to "Low-Speed"?  | →No.4  | →No.11 |                          | —   | In "Network Configuration Settings" of the master station, check the "CC-Link IE TSN Class" and "Communication Period Setting" of the i-th station. If "CC-Link IE TSN Class A" and "Communication Period Setting" are set to "Low-Speed", perform the processing starting from No.4.                                 |
| 4   | Calculate the values for cyclic data size (DMsi) sent from the master station to a device station and cyclic data size (DSsi) which the master station receives from a device station. | —      | —      | —                        | —   | If DMsi and DSsi are defined as the sizes of cyclic data sent from the master station to a device station and cyclic data which the master station receives from a device station, they are calculated by the following formulas:<br>DMsi = (HBL × n1i) + (16 × n2i) + ndmi<br>DSsi = (HBL × n3i) + (20 × n4i) + ndsi |
| 5   | Loop up to the maximum number of groups<br>(j=1; j ≤ 120; j++)   | —      | —      | No.5 or greater<br>No.10 | —   | Up to a total of 2K bytes can be assigned to a group, and determine which group number (1 to 120) is assigned to i-th station starting from 1. (Loop the processing of No.5 to No.10 for the number of stations)  |
| 6   | Does it satisfy $GMSj + Dmsi \leq 2044$ ?  | →No.7  | →No.10 |                          | —   | If GMSj is defined as the total value of the data sizes of the cyclic data sent from the master station to device stations assigned to the jth group, determine whether the following condition is met.<br>$GMSj + Dmsi \leq 2044$  |
| 7   | Does it satisfy $GSsj + DSsi \leq 2044$ ?  | →No.8  | →No.10 |                          | —   | If GSsj is defined as the total value of the data sizes of the cyclic data that the master station already assigned to the jth group receives from device stations, determine whether the following condition is met.<br>$GSsj + DSsi \leq 2044$  |
| 8   | Update the data size (GMSj, GSsj) of the assigned group.   | —      | —      |                          | —   | The values of GMSj and GSsj are updated when both the conditions No.6 and No.7 are satisfied.   |
| 9   | Assign the group number j to the i-th station.   | —      | —      | —                        | When the conditions No.6 and No.7 are both satisfied, the group number j is assigned to the i-th station. |   |
| 10  | End of loop No.5   | —      | —      | —                        | —   | —   |
| 11  | End of loop No.2   | —      | —      | —                        | —   | —   |
| 12  | Get the maximum value J of the group number.   | —      | —      | —                        | —   | After assigning a group number to all "CC-Link IE TSN Class A" and "Communication Period Setting" stations with "Low-Speed", the maximum value J of the group number is obtained.   |
| 13  | Round up the calculated value to the nearest integer of $n=J \div 4$   | —      | —      | —                        | —   | n is determined from the following equation:<br>Round up the calculated value to the nearest integer of $n=J \div 4$  |
| 14  | End  | —      | —      | —                        | —   | —   |

• Variables used by the algorithm above

| n6i              | A total number of device points for TPDO set in the PDO mapping whose station is set to "CC-Link IE TSN Class A" and "Low-Speed" in "Communication Period Setting" for the i-th station  |
| n7i              | A total number of the main modules and extension modules whose stations are set to "CC-Link IE TSN Class A" and "Low-Speed" in "Communication Period Setting" for the i-th station   |

**Ex.**

When using the inverter FR-E800 (RX: 32 points, RY: 32 points, RWr: 32 points, RWw: 32 points)

When  $1 \leq \text{the number of inverters} \leq 44$ , n=1

When  $45 \leq \text{the number of inverters} \leq 88$ , n=2

When  $89 \leq \text{the number of inverters} \leq 120$ , n=3

### Transmission delay time of a master station ← remote station (RJ71GN11-T2 only)

The following table lists the calculation formula for when data is transmitted from a remote station (input) to the master station (RX/RWr).

| Calculation value | Station-based block data assurance           | No station-based block data assurance |
|-------------------|--|---------------------------------------|
| Normal value      | $(SM \times 1) + (LS \times n1) + Rio$       | $(SM \times 1) + (LS \times 1) + Rio$ |
| Maximum value     | $(SM \times 1) + (LS \times (n1 + 1)) + Rio$ | $(SM \times 1) + (LS \times 2) + Rio$ |

SM: Master station sequence scan time [ $\mu$ s]

LS: Communication cycle intervals (can be checked in the SW0060) [ $\mu$ s]

n1: Round up the calculated value to the nearest integer of  $(SM \div LS)$

Rio: Processing time of the remote station [ $\mu$ s]

### Transmission delay time of a master station → remote station (RJ71GN11-T2 only)

The following table lists the calculation formula for when data is transmitted from the master station (RY/RWw) to a remote station (output).

| Calculation value | Station-based block data assurance     | No station-based block data assurance |
|-------------------|--|---------------------------------------|
| Normal value      | $(SM \times n2) + (LS \times 1) + Rio$ | $(SM \times 1) + (LS \times 1) + Rio$ |
| Maximum value     | $(SM \times n2) + (LS \times 2) + Rio$ | $(SM \times 2) + (LS \times 2) + Rio$ |

SM: Master station sequence scan time [ $\mu$ s]

n2: Round up the calculated value to the nearest integer of  $(LS \div SM)$

LS: Communication cycle intervals (can be checked in the SW0060) [ $\mu$ s]

Rio: Processing time of the remote station [ $\mu$ s]

### Calculation formula for transmission delay time of the master station ← local station

When data is transmitted from a local station to the master station as follows:

- Master station (RX) ← local station (RY)
- Master station (RWr) ← local station (RWw)
- Master station (LB) ← local station (LB)
- Master station (LW) ← local station (LW)

#### ■When the RJ71GN11-T2 is used, or link points are not extended on the RJ71GN11-SX

| Calculation value | Station-based block data assurance                                    | No station-based block data assurance           |
|-------------------|---|---|
| Normal value      | If $LS < SL$ : $(SM \times 1) + (LS \times (n1 + 1)) + (SL \times 1)$ | $(SM \times 1) + (LS \times 2) + (SL \times 1)$ |
|                   | If $LS \geq SL$ : $(SM \times 1) + (LS \times (n1 + 2))$              |   |
| Maximum value     | $(SM \times 2) + (LS \times (n1 + 2)) + (SL \times 1)$                | $(SM \times 2) + (LS \times 3) + (SL \times 1)$ |

LS: Communication cycle intervals (can be checked in the SW0060) [ $\mu$ s]

SL: Local station sequence scan time [ $\mu$ s]

SM: Master station sequence scan time [ $\mu$ s]

n1: Round up the calculated value to the nearest integer of  $(SM \div LS)$

## ■When link points are extended on the RJ71GN11-SX

| "Communication Period Setting LB/LW" of sending station                               | Calculation value                          | Station-based block data assurance   | No station-based block data assurance                  |
|---|--|--|--|
| Basic Period  | Same as when link points are not extended. |  |  |
| <ul style="list-style-type: none"> <li>• Normal-Speed</li> <li>• Low-Speed</li> </ul> | Normal value                               | When $LS \times DV < SL$ and $LS \times DV < SM$ : $SM + LS + (LS \times DV \times n1d) + SL$                | $(SM \times 1) + [LS \times (DV + 1)] + (SL \times 1)$ |
|   |  | When $LS \times DV < SL$ and $LS \times DV \geq SM$ : $SM + [LS \times (DV + 1)] + SL$                       |  |
|   |  | When $LS \times DV \geq SL$ and $LS \times DV < SM$ : $SM + LS + [LS \times DV \times (n1d + 1)]$            |  |
|   |  | When $LS \times DV \geq SL$ and $LS \times DV \geq SM$ : $SM + [LS \times (DV \times 2 + 1)]$                |  |
|   | Maximum value                              | When $LS \times DV < SL$ and $LS \times DV < SM$ : $SM \times 2 + LS + (LS \times DV \times n1d) + SL$       | $(SM \times 2) + [LS \times (DV + 2)] + (SL \times 1)$ |
|   |  | When $LS \times DV < SL$ and $LS \times DV \geq SM$ : $SM \times 2 + [LS \times (DV + 2)] + SL$              |  |
|   |  | When $LS \times DV \geq SL$ and $LS \times DV < SM$ : $SM \times 2 + [(LS \times DV) \times (n1d + 1)] + SL$ |  |
|   |  | When $LS \times DV \geq SL$ and $LS \times DV \geq SM$ : $SM \times 2 + [LS \times (DV \times 2 + 1)] + SL$  |  |

LS: Communication cycle intervals (can be checked in the SW0060) [ $\mu$ s]

DV: The number of divided cyclic data portions (1 for RX/Ry/RWr/RWw, and, for LB/LW, 1 when "Communication Period Setting LB/LW" of the sending station is set to "Basic Period" or a number in multiples as specified in "Multiple Period Setting" under "Basic Settings" when set to "Normal-Speed" or "Low-Speed")

SL: Local station sequence scan time [ $\mu$ s]

SM: Master station sequence scan time [ $\mu$ s]

n1d: Round up the calculated value to the nearest integer of  $[SM \div (LS \times DV)]$

## Calculation formula for transmission delay time of the master station → local station

When data is transmitted from the master station to a local station as follows:

- Master station (RY) → local station (RX)
- Master station (RWw) → local station (RWr)
- Master station (LB) → local station (LB)
- Master station (LW) → local station (LW)

## ■When the RJ71GN11-T2 is used, or link points are not extended on the RJ71GN11-SX

| Calculation value | Station-based block data assurance                                    | No station-based block data assurance           |
|-------------------|---|---|
| Normal value      | If $LS < SM$ : $(SM \times 1) + (LS \times (n3 + 1)) + (SL \times 1)$ | $(SM \times 1) + (LS \times 2) + (SL \times 1)$ |
|                   | If $LS \geq SM$ : $(LS \times (n3 + 2)) + (SL \times 1)$              |   |
| Maximum value     | $(SM \times 1) + (LS \times (n3 + 2)) + (SL \times 2)$                | $(SM \times 1) + (LS \times 3) + (SL \times 2)$ |

LS: Communication cycle intervals (can be checked in the SW0060) [ $\mu$ s]

SM: Master station sequence scan time [ $\mu$ s]

n3: Round up the calculated value to the nearest integer of  $(SL \div LS)$

SL: Local station sequence scan time [ $\mu$ s]

|   |  | When $LS \times DV \geq SL$ and $LS \times DV \geq SM$ : $SM + [LS \times (DV \times 2 + 1)] + SL \times 2$  |  |

LS: Communication cycle intervals (can be checked in the SW0060) [ $\mu$ s]

DV: The number of divided cyclic data portions (1 for RX/Ry/RWr/RWw, and, for LB/LW, 1 when the setting value in "Communication Period Setting LB/LW" of the cyclic data sending station is "Basic Period" or a number in multiples as specified in Multiple Period Setting" under "Basic Period Settings" when set to "Normal-Speed or "Low-Speed")

SL: Local station sequence scan time [ $\mu$ s]

SM: Master station sequence scan time [ $\mu$ s]

n3d: Round up the calculated value to the nearest integer of  $[SL \div (LS \times DV)]$

## Communication cycle intervals

The minimum value of the communication cycle interval (cyclic data transfer processing time) is calculated by the following calculation formula.

| Communication mode | Master station communication speed | Calculation formula references   |
|--------------------|------------------------------------|--|
| Unicast mode       | 1Gbps                              | ☞ Page 324 Calculation formula for communication cycle interval: Unicast/1Gbps   |
|                    | 100Mbps (RJ71GN11-T2 only)         | ☞ Page 328 Communication cycle interval: Unicast/100Mbps (RJ71GN11-T2 only)      |
| Multicast mode     | 1Gbps                              | ☞ Page 332 Calculation formula for communication cycle interval: Multicast/1Gbps |
|                    | 100Mbps (RJ71GN11-T2 only)         | ☞ Page 337 Communication cycle interval: Multicast/100Mbps (RJ71GN11-T2 only)    |

### Precautions

#### ■When cyclic transmission cannot be performed by setting a calculation value

The minimum values for communication cycle interval and cyclic transmission time calculated by the formulas serve as a guide. If cyclic transmission cannot be performed by setting a calculation value, set a value obtained by the following formula: Minimum value for cyclic transmission time + Greatest value among the two values shown below.

- 10% of the minimum value of the calculated cyclic transmission time
- When the communication speed of the master station is set to 1Gbps: Number of device stations × 2μs
- When the communication speed of the master station is set to 100Mbps: Number of device stations × 20μs

Each calculation value obtained from the calculation formulas mentioned above are stored in the following SW.

- SW0072: Communication cycle intervals (calculation value) [μs]
- SW0073: Cyclic transmission time (calculation value) [μs]
- SW0078: Transient transmission time (calculation value) [μs]

#### ■When the calculated value is greater than the setting

If each calculation result is larger than the set value of "Basic Period Setting" under "Basic Settings" as follows, an error occurs.

When an error occurs, each calculation value is displayed in "Detailed information" in the [Error Information] tab of module diagnostics. Correct each set value of "Basic Period Setting" referring to the calculation value displayed so that the set value is equal to or larger than the calculation value.

- 3010H: When the communication cycle interval (calculation value) [μs] is larger than the set value of "Communication Period Interval Setting"
- 3011H: When the cyclic transmission time (calculation value) [μs] is larger than the set value of "Cyclic Transmission Time"
- 3013H: When the transient transmission time (calculation value) [μs] is larger than the displayed value of "Transient Transmission Time"

#### ■When the general CC-Link IE TSN module is CC-Link IE TSN Class A (RJ71GN11-T2 only)

When the "CC-Link IE TSN Class Setting" of the general CC-Link IE TSN module added to the list of network configuration setting stations is CC-Link IE TSN Class A, when the calculated values for the communication cycle interval (calculated value) (SW0072) and the cyclic transmission time (calculated value) (SW0073) are set to "Communication Period Interval Setting" and "Cyclic Transmission Time", cyclic transmission may not be possible. In this case, perform one of the following operations.

- Select the actual equipment to be used from the "Module List" and add it to the list of stations".
- Confirm the maximum response time during time-managed polling in the manual of the device used, and calculate and set the communication cycle interval and cyclic transmission time.

## How to count modules to be used in variables

The number of modules to be used in variables in a calculation formula for communication cycle intervals is counted in "Network Configuration Settings".

When not specifying whether to count main modules or extension modules, the number is the total count of the both.

## Calculation formula for communication cycle interval: Unicast/1Gbps

Communication cycle interval [ $\mu\text{s}$ ] for the RJ71GN11-T2 is  $\alpha_c + \alpha_p + \alpha_{sc} + \alpha_{sp}$  or 125000, whichever is larger.

Communication cycle interval [ $\mu\text{s}$ ] for the RJ71GN11-SX is  $\alpha_c + \alpha_p$  or 125000, whichever is larger.

Round up values of  $\alpha_c$ ,  $\alpha_p$ ,  $\alpha_{sc}$ ,  $\alpha_{sp}$  that are less than  $1\mu\text{s}$ .

### ■Cyclic transmission time

Cyclic transmission time [ $\mu\text{s}$ ] is  $\alpha_c + \alpha_{sc}$  for the RJ71GN11-T2,  $\alpha_c$  for the RJ71GN11-SX.

- $\alpha_c$ : Varies in the following cases.

| Item  | Calculation formula   |
|---|---|
| When the RJ71GN11-T2 is used and a CC-Link IE TSN Class A device station set to "Basic Period" or "Normal-Speed" does not exist | The largest value in items No.1 to No.4 + No.5  |
| When the RJ71GN11-T2 is used and a CC-Link IE TSN Class A device station set to "Basic Period" or "Normal-Speed" exists         | (the larger of No.1 or No.2) + (the larger of No.3 or No.4) + No.5 + No.6   |
| When the RJ71GN11-SX is used  | The largest value among the following four calculation formulae <ul style="list-style-type: none"> <li>• <math>\{(50 \times n1) + (16 \times n2) + ndm\} \times 8 + (Sn - 1) \times 830 + 14000 + nrp</math></li> <li>• <math>\{(30 \times n1) + (16 \times n2) + ndm\} \times 4 + (1661 \times n1) + (Sn - 1) \times 830 + 14300 + nrp</math></li> <li>• <math>\{(50 \times n3) + (20 \times n4) + nds\} \times 8 + 14000 + nrp</math></li> <li>• <math>\{(50 \times n5) + (20 \times n6) + ndl\} \times 8 + (Sn - 1) \times 830 + 14000 + nrp</math></li> </ul> |

| Calculation formula |  |  |
|---------------------|--|--|
| No.1                | A1+A2  | Calculation formula for main module A1: $\{(50 \times n1) + (16 \times n2) + ndm\} \times 8 + (Sn - 1) \times 830 + 14000 + nh + nrp$                    |
|                     |  | Calculation formula for extension module A2: $\{(50 \times en1) + (16 \times en2) + endm\} \times 8$   |
| No.2                | B1+B2  | Calculation formula for main module B1: $\{(30 \times n1) + (16 \times n2) + ndm\} \times 4 + (1661 \times n1) + (Sn - 1) \times 830 + 14300 + nh + nrp$ |
|                     |  | Calculation formula for extension module B2: $\{(30 \times en1) + (16 \times en2) + endm\} \times 4 + (1661 \times en1)$                                 |
| No.3                | C1+C2  | Calculation formula for main module C1: $\{(50 \times n3) + (20 \times n4) + nds\} \times 8 + 14000 + nh + nrp$  |
|                     |  | Calculation formula for extension module C2: $\{(50 \times en3) + (20 \times en4) + ends\} \times 8$   |
| No.4                | D1+D2  | Calculation formula for main module D1: $\{(50 \times n5) + (20 \times n6) + ndl\} \times 8 + (Sn - 1) \times 830 + 14000 + nh + nrp$                    |
|                     |  | Calculation formula for extension module D2: $\{(50 \times en5) + (20 \times en6) + endl\} \times 8$   |
| No.5                | E×n7   | E: $(Sn-1) \times 830 + 39102$   |
| No.6                | The largest value among the maximum response times during the time-managed polling of the CC-Link IE TSN Class A device stations set to "Basic Period" or "Normal-Speed" |  |

### Point

For the maximum response time when the RJ71GN11-T2 is used during the time-managed polling for the device stations, refer to the user's manual for the device station used.

- $\alpha_{sc}$ :  $\{(30 \times sn1) + (16 \times sn2) + sndm\} \times 4 + (1661 \times sn1)$

### ■Cyclic processing time

Cyclic processing time [ $\mu\text{s}$ ] is  $\alpha_p + \alpha_{sp}$  for the RJ71GN11-T2,  $\alpha_p$  for the RJ71GN11-SX.

- $\alpha_p$ :  $p1 + p2 + p3 + kp + kuu$  for the RJ71GN11-T2,  $p1 + p2 + p3 + kp$  for the RJ71GN11-SX.
- $\alpha_{sp}$ :  $p4$

## Variable

For each variable to be used, round it up to one decimal point before assigning to the calculation formula.

The parts enclosed in double quotation marks ( " ") in the description are the setting values for "Network Configuration Settings".

| Name of variable | Description  |
|------------------|--|
| n1               | $(ndm + (16 \times n2)) / 1488$ or $S_n$ , whichever is larger   |
| n2               | $S_n \times (RY_b + RW_{wb}) + L_n \times (LB_{mb} + LW_{mb})$<br>RY <sub>b</sub> : Value of (Total number of points of "RY setting" of main modules) / (11776 × S <sub>n</sub> ) rounded up to the nearest integer<br>RW <sub>wb</sub> : Value of (Total number of points of "RWw setting" of main modules) / (736 × S <sub>n</sub> ) rounded up to the nearest integer<br>LB <sub>mb</sub> : Value of (Number of points of "LB Setting" set in the master station) / 11776 rounded up to the nearest integer<br>LW <sub>mb</sub> : Value of (Number of points of "LW Setting" set in the master station) / 736 rounded up to the nearest integer   |
| sn1              | $(sndm + (16 \times sn2)) / 1488$ or $SS_n$ , whichever is larger  |
| sn2              | $SS_n \times SRY_b$<br>SRY <sub>b</sub> : The number of connections of "Safety Communication Setting" in "Basic Settings" set in the master station / (18.4 × SS <sub>n</sub> ) rounded up to the nearest integer  |
| ndm              | $((\text{Total number of points of "RY setting" of main modules} / 8) + ((\text{Total number of points of "RWw Setting" of main modules} \times 2) + (\text{Number of points of "LB Setting" set in the master station} / 8) \times L_n + ((\text{Number of points of "LW Setting" set in the master station} \times 2) \times L_n$  |
| sndm             | The number of connections of "Safety Communication Setting" in "Basic Settings" set in the master station × 80   |
| S <sub>n</sub>   | Number of device stations  |
| SS <sub>n</sub>  | Number of device stations using safety communications  |
| L <sub>n</sub>   | Number of local stations   |
| nh               | Switching hub delay time × Number of switching hubs connected to the network<br>Switching hub delay time: 50000 <sup>1</sup>   |

| kp  | 78000   |
| kuu: Inter-module synchronization processing time (unicast) | $1800 \times (\text{Number of device stations}) + 10000$ <p>However, if the inter-module synchronization is not performed in the master station<sup>*4</sup>, then kuu=0.</p>   |

\*1 The switching hub delay time changes depending on the hub models and settings.

\*2 This is the device station with the largest calculation value when, for each device station (including extension modules),  $((\text{"RX Setting"} + \text{"LB Setting"})/8) + ((\text{"RWr Setting"} + \text{"LW Setting"}) \times 2)$  is calculated.

\*3 Calculate by rounding up each calculation result in brackets.

\*4 In "Inter-module Synchronization Setting" under "System Parameter" of the master station, "Use Inter-module Synchronization Function in System" is set to "Not Use" or "Select Inter-module Synchronization Target Module" is set to "Do Not Synchronize".

## Communication cycle interval: Unicast/100Mbps (RJ71GN11-T2 only)

The calculation formula for the communication cycle interval [ $\mu\text{s}$ ] is  $\alpha_c + \alpha_p + \alpha_{sc} + \alpha_{sp}$ .

Round up values of  $\alpha_c$ ,  $\alpha_p$ ,  $\alpha_{sc}$ ,  $\alpha_{sp}$  that are less than  $1\mu\text{s}$ .

### ■Cyclic transmission time

Cyclic transmission time [ $\mu\text{s}$ ] is  $\alpha_c + \alpha_{sc}$ .

- $\alpha_c$ : Varies in the following cases.

| Item  | Calculation formula   |
|---|---|
| When a CC-Link IE TSN Class A device station set to "Basic Period" or "Normal-Speed" does not exist | The largest value in items No.1 to No.3 + No.4                        |
| When a CC-Link IE TSN Class A device station set to "Basic Period" or "Normal-Speed" exists         | No.1 + (the value in No.2 or No.3, whichever is larger) + No.4 + No.5 |

| Calculation formula |  |  |
|---------------------|--|--|
| No.1                | A1+A2  | Calculation formula for main module A1: $\{(42 \times n1) + (16 \times n2) + ndm\} \times 80 + (Sn - 1) \times 5150 + 14000 + nh + nrp$<br>Calculation formula for extension module A2: $\{(42 \times en1) + (16 \times en2) + endm\} \times 80$ |
| No.2                | B1+B2  | Calculation formula for main module B1: $\{(42 \times n3) + (20 \times n4) + nds\} \times 80 + 14000 + nh + nrp$<br>Calculation formula for extension module B2: $\{(42 \times en3) + (20 \times en4) + ends\} \times 80$                        |
| No.3                | C1+C2  | Calculation formula for main module C1: $\{(42 \times n5) + (20 \times n6) + ndl\} \times 80 + (Sn - 1) \times 5150 + 14000 + nh + nrp$<br>Calculation formula for extension module C2: $\{(42 \times en5) + (20 \times en6) + ndl\} \times 80$  |
| No.4                | D×n7   | D: $(Sn-1) \times 5150 + 187440$   |
| No.5                | The largest value among the maximum response times during the time-managed polling of the CC-Link IE TSN Class A device stations set to "Basic Period" or "Normal-Speed" |  |

### Point

For the maximum response time when the RJ71GN11-T2 is used during the time-managed polling for the device stations, refer to the user's manual for the device station used.

- $\alpha_{sc}$ :  $\{(42 \times sn3) + (20 \times sn4) + sndm\} \times 80$

### ■Cyclic processing time

Cyclic processing time [ $\mu\text{s}$ ] is  $\alpha_p + \alpha_{sp}$  or 340000, whichever is larger.

- $\alpha_p$ :  $p1 + p2 + p3 + kp + kuu$ .
- $\alpha_{sp}$ :  $p4$

## Variable

For each variable to be used, round it up to one decimal point before assigning to the calculation formula.

The parts enclosed in double quotation marks ( " ") in the description are the setting values for "Network Configuration Settings".

| Name of variable | Description  |
|------------------|--|
| n1               | $(ndm + (16 \times n2))/1488$ or Sn, whichever is larger   |
| n2               | $Sn \times (RYb + RWwb) + Ln \times (LBmb + LWmb)$<br>RYb: Value of (Total number of points of "RY Setting" of main modules)/(11776 × Sn) rounded up to the nearest integer<br>RWwb: Value of (Total number of points of "RWw Setting" of main modules)/(736 × Sn) rounded up to the nearest integer<br>LBmb: Value of (Number of points of "LB Setting" set in the master station)/11776 rounded up to the nearest integer<br>LWmb: Value of (Number of points of "LW Setting" set in the master station)/736 rounded up to the nearest integer   |
| ndm              | $((\text{Total number of points of "RY Setting" of main modules}/8) + ((\text{Total number of points of "RWw Setting" of main modules} \times 2) + ((\text{Number of points of "LB Setting" set in the master station}/8) \times Ln + ((\text{Number of points of "LW Setting" set in the master station} \times 2) \times Ln$   |
| sndm             | The number of connections of "Safety Communication Setting" in "Basic Settings" set in the master station × 80   |
| Sn               | Number of device stations  |
| SSn              | Number of device stations using safety communications  |

\*1 The switching hub delay time changes depending on the hub models and settings.

\*2 This is the device station with the largest calculation value when, for each device station (including extension modules),  $((\text{"RX Setting"} + \text{"LB Setting"})/8) + ((\text{"RWr Setting"} + \text{"LW Setting"}) \times 2)$  is calculated.

\*3 Calculate by rounding up each calculation result in brackets.

\*4 In "Inter-module Synchronization Setting" under "System Parameter" of the master station, "Use Inter-module Synchronization Function in System" is set to "Not Use" or "Select Inter-module Synchronization Target Module" is set to "Do Not Synchronize".

## Calculation formula for communication cycle interval: Multicast/1Gbps

Communication cycle interval [ $\mu$ s] for the RJ71GN11-T2 is  $\alpha_c + \alpha_p + \alpha_{sc} + \alpha_{sp}$  or 125000, whichever is larger.

Communication cycle interval [ $\mu$ s] for the RJ71GN11-SX is  $\alpha_c + \alpha_p$  or 125000, whichever is larger.

Round up values of  $\alpha_c$ ,  $\alpha_p$ ,  $\alpha_{sc}$ ,  $\alpha_{sp}$  that are less than 1 $\mu$ s.

### ■Cyclic transmission time

Cyclic transmission time [ $\mu$ s] is  $\alpha_c + \alpha_{sc}$  for the RJ71GN11-T2,  $\alpha_c$  for the RJ71GN11-SX.

- $\alpha_c$ : Varies in the following cases.

| Item  | Calculation formula   |
|---|---|
| When the RJ71GN11-T2 is used and a CC-Link IE TSN Class A device station set to "Basic Period" or "Normal-Speed" does not exist | The larger of No.1 or No.2 + No.5   |
| When the RJ71GN11-T2 is used and a CC-Link IE TSN Class A device station set to "Basic Period" or "Normal-Speed" exists         | The larger of No.1 or No.2 + No.5 + No.6  |
| When the RJ71GN11-SX is used  | The largest value among the following four calculation formulae <ul style="list-style-type: none"> <li>• <math>\{(50 \times n1) + (16 \times n2) + ndml\} \times 8 + (Sn - 1) \times 830 + 14000 + nrp</math></li> <li>• <math>\{(30 \times n1) + (16 \times n2) + ndml\} \times 4 + (1661 \times n1) + (Sn - 1) \times 830 + 14300 + nrp</math></li> <li>• <math>\{(50 \times n3) + (20 \times n4) + nds\} \times 8 + 14000</math></li> <li>• <math>\{(50 \times n5) + (20 \times n6) + ndl\} \times 8 + (Sn - 1) \times 830 + 14000</math></li> </ul> |

| Calculation formula |  |   |
|---------------------|--|---|
| No.1                | A1 + A2 + (No.3 or No.4, whichever is larger)  | Calculation formula for main module A1: $\{(50 \times (n1r + n1l)) + (16 \times (n2r + n2l)) + (ndmr + ndml)\} \times 8 + (Sn - 1) \times 830 + 14000 + nh + nrp$                             |
|                     |  | Calculation formula for extension module A2: $\{(50 \times en1r) + (16 \times en2r) + endmr\} \times 8$   |
| No.2                | B1 + B2 + (No.3 or No.4, whichever is larger)  | Calculation formula for main module B1: $\{(30 \times (n1r + n1l)) + (16 \times (n2r + n2l)) + (ndmr + ndml)\} \times 4 + (1661 \times (n1r + n1l)) + (Sn - 1) \times 830 + 14300 + nh + nrp$ |
|                     |  | Calculation formula for extension module B2: $\{(30 \times en1r) + (16 \times en2r) + endmr\} \times 4 + (1661 \times en1r)$  |
| No.3                | C1+C2  | Calculation formula for main module C1: $\{(50 \times n3) + (20 \times n4) + nds\} \times 8 + 14000 + nh$   |
|                     |  | Calculation formula for extension module C2: $\{(50 \times en3) + (20 \times en4) + ends\} \times 8$  |
| No.4                | D1+D2  | Calculation formula for main module D1: $\{(50 \times n5) + (20 \times n6) + ndl\} \times 8 + (Sn - 1) \times 830 + 14000 + nh$   |
|                     |  | Calculation formula for extension module D2: $\{(50 \times en5) + (20 \times en6) + endl\} \times 8$  |
| No.5                | $E \times n7$  | $E: (Sn - 1) \times 830 + 39102$  |
| No.6                | The largest value among the maximum response times during the time-managed polling of the CC-Link IE TSN Class A device stations set to "Basic Period" or "Normal-Speed" |   |

### Point

For the maximum response time when the RJ71GN11-T2 is used during the time-managed polling for the device stations, refer to the user's manual for the device station used.

- $\alpha_{sc}$ :  $\{(30 \times (sn1r + sn1l)) + (16 \times (sn2r + sn2l)) + (sndmr + sndml)\} \times 4 + (1661 \times (sn1r + sn1l))$

### ■Cyclic processing time

Cyclic processing time [ $\mu$ s] is  $\alpha_p + \alpha_{sp}$  for the RJ71GN11-T2,  $\alpha_p$  for the RJ71GN11-SX.

- $\alpha_p$ :  $p1 + p2 + p3 + p5 + kp + kum$  for the RJ71GN11-T2,  $p1 + p2 + p3 + p5 + kp$  for the RJ71GN11-SX.
- $\alpha_{sp}$ :  $p4$

### ■Variable

For each variable to be used, round it up to one decimal point before assigning to the calculation formula.

The parts enclosed in double quotation marks ( " ") in the description are the setting values for "Network Configuration Settings".

| Name of variable | Description   |
|------------------|---|
| n1r              | $(ndmr + (16 \times n2r)) / 1488$ or $Rn$ , whichever is larger                             |
| n1l              | Round up the calculated value to the nearest integer of $(ndml + (16 \times n2l)) / 1488$   |
| sn1r             | $(sndmr + (16 \times sn2r)) / 1488$ or $SRn$ , whichever is larger                          |
| sn1l             | Round up the calculated value to the nearest integer of $(sndml + (16 \times sn2l)) / 1488$ |

| Name of variable | Description  |

- \*1 The switching hub delay time changes depending on the hub models and settings.
- \*2 Total number of points is the smallest value set in "Start" to the largest value set in "End" of "Network Configuration Settings".
- \*3 As a result of totaling the five values below for each device station (including extension modules), this is the station with the largest total value. (Calculation including extension modules is only applicable to the RJ71GN11-T2)
- "RX Setting" / 8
  - "LB Setting" / 8 / Value rounded up to the nearest multiple of two of BWCs (i)
  - "RWrl Setting" × 2
  - "LW Setting" × 2 / Value rounded up to the nearest multiple of two of BWCs (i)
  - When "Communication Period Setting LB/LW" on the applicable station is set to "Normal-Speed" or "Low-Speed" during an extension of link points: 8, otherwise 0
- \*4 Calculate by rounding up each calculation result in brackets.
- \*5 In "Inter-module Synchronization Setting" under "System Parameter" of the master station, "Use Inter-module Synchronization Function in System" is set to "Not Use" or "Select Inter-module Synchronization Target Module" is set to "Do Not Synchronize".
- \*6 Set the value to 0 when "Communication Period Setting LB/LW" of the applicable station is "Basic Period".

## Communication cycle interval: Multicast/100Mbps (RJ71GN11-T2 only)

The calculation formula for the communication cycle interval [ $\mu\text{s}$ ] is  $\alpha_c + \alpha_p + \alpha_{sc} + \alpha_{sp}$ .

Round up values of  $\alpha_c$ ,  $\alpha_p$ ,  $\alpha_{sc}$ ,  $\alpha_{sp}$  that are less than  $1\mu\text{s}$ .

### ■Cyclic transmission time

Cyclic transmission time [ $\mu\text{s}$ ] is  $\alpha_c + \alpha_{sc}$ .

- $\alpha_c$ : Varies in the following cases.

| Item  | Calculation formula |
|---|---------------------|
| When a CC-Link IE TSN Class A device station set to "Basic Period" or "Normal-Speed" does not exist | No.1 + No.4         |
| When a CC-Link IE TSN Class A device station set to "Basic Period" or "Normal-Speed" exists         | No.1+No.4+No.5      |

| Calculation formula |  |   |
|---------------------|--|---|
| No.1                | A1 + A2 + (the value obtained by the calculation formula in No.2 or No.3, whichever is larger)   | Calculation formula for main module A1: $\{(42 \times (n1r + n1l)) + (16 \times (n2r + n2l)) + (ndmr + ndml)\} \times 80 + (Sn - 1) \times 5150 + 14000 + nh + nrp$<br>Calculation formula for extension module A2: $\{(42 \times en1r) + (16 \times en2r) + endmr\} \times 80$ |
| No.2                | B1+B2  | Calculation formula for main module B1: $\{(42 \times n3) + (20 \times n4) + nds\} \times 80 + 14000 + nh$<br>Calculation formula for extension module B2: $\{(42 \times en3) + (20 \times en4) + ends\} \times 80$   |
| No.3                | C1+C2  | Calculation formula for main module C1: $\{(42 \times n5) + (20 \times n6) + ndl\} \times 80 + (Sn - 1) \times 5150 + 14000 + nh$<br>Calculation formula for extension module C2: $\{(42 \times en5) + (20 \times en6) + endl\} \times 80$                                      |
| No.4                | D×n7   | D: $(Sn-1) \times 5150 + 187440$  |
| No.5                | The largest value among the maximum response times during the time-managed polling of the CC-Link IE TSN Class A device stations set to "Basic Period" or "Normal-Speed" |   |

### Point

For the maximum response time when the RJ71GN11-T2 is used during the time-managed polling for the device stations, refer to the user's manual for the device station used.

- $\alpha_{sc}$ :  $\{(42 \times (sn1r + sn1l)) + (16 \times (sn2r + sn2l)) + (sndmr + sndml)\} \times 80$

| Calculation formula   |
|---|
| $\{(42 \times (sn1r+sn1l)) + (16 \times (sn2r+sn2l)) + (sndmr+sndml)\} \times 80$ |

### ■Cyclic processing time

Cyclic processing time [ $\mu\text{s}$ ] is  $\alpha_p + \alpha_{sp}$  or 340000, whichever is larger.

- $\alpha_p$ :  $p1 + p2 + p3 + kp + kum$
- $\alpha_{sc}$  is calculated by p4.

### ■Variable

For each variable to be used, round it up to one decimal point before assigning to the calculation formula.

The parts enclosed in double quotation marks (") in the description are the setting values for "Network Configuration Settings".

| Name of variable | Description  |
|------------------|--|
| n1r              | $(ndmr + (16 \times n2r))/1488$ or $Rn$ , whichever is larger  |
| n1l              | Value of $(ndml + (16 \times n2l))/1488$ rounded up to the nearest integer   |
| sn1r             | $(sndmr + (16 \times sn2r))/1488$ or $SRn$ , whichever is larger   |
| sn1l             | Value of $(sndml + (16 \times sn2l))/1488$ rounded up to the nearest integer   |
| n2r              | $Rn \times (RYrb + RWwrb)$<br>RYrb: Value of (Total number of points of "RY Setting" set in the remote station (main modules))/( $11776 \times Rn$ ) rounded up to the nearest integer<br>RWwrb: Value of (Total number of points of "RWw Setting" set in the remote station (main modules))/( $736 \times Rn$ ) rounded up to the nearest integer   |
| n2l              | $RYlb + RWwlb + LBmb + LWmb + 1$<br>RYlb: Value of (Total number of points of "RY Setting" <sup>2</sup> )/ $11776$ rounded up to the nearest integer<br>RWwlb: Value of (Total number of points of "RWw Setting" <sup>2</sup> )/ $736$ rounded up to the nearest integer<br>LBmb: Value of (Number of points of "LB Setting" set in the master station)/ $11776$ rounded up to the nearest integer<br>LWmb: Value of (Number of points of "LW Setting" set in the master station)/ $736$ rounded up to the nearest integer |

| Name of variable | Description  |
|------------------|--|
| sn2r             | SRn × SRYrb<br>SRYrb: The number of connections in the remote stations of "Safety Communication Setting" in "Basic Settings" set in the master station/(18.4 × SRn) rounded up to the nearest integer  |
| sn2l             | The number of connections of "Safety Communication Setting" in "Basic Settings" set in the master station/18.4 rounded up to the nearest integer   |
| ndmr             | ((Total number of points of "RY Setting" set in the remote station (main modules))/8) + ((Total number of points of "RWw Setting" set in the remote station (main modules)) × 2)   |

\*1 The switching hub delay time changes depending on the hub models and settings.

\*2 Total number of points is the smallest value set in "Start" to the largest value set in "End" of "Network Configuration Settings".

\*3 This is the device station with the largest calculation value when, for each device station (including extension modules),  $((\text{"RX Setting"} + \text{"LB Setting"})/8) + ((\text{"RWr Setting"} + \text{"LW Setting"}) \times 2)$  is calculated.

\*4 Calculate by rounding up each calculation result in brackets.

\*5 In "Inter-module Synchronization Setting" under "System Parameter" of the master station, "Use Inter-module Synchronization Function in System" is set to "Not Use" or "Select Inter-module Synchronization Target Module" is set to "Do Not Synchronize".

# Interlink transmission time

The following is the formula to calculate the time required for interlink transmission. Interlink transmission does not affect the sequence scan time.

## Interlink transmission time to completely transmit all set points

$$\alpha_{DL} = KM4 \times ((RX + RY) \div 16 + RWr + RWw) \text{ [ms]}$$

$\alpha_{DL}$ : Interlink transmission time

RX: Total number of source "RX/RX" or "RX/LB" points set in "Interlink Transmission Settings" of "Application Settings".

RY: Total number of source "LB/RX" or "LB/LB" points set in "Interlink Transmission Settings" of "Application Settings".

RWr: Total number of source "RWr/RWw" or "RWr/LW" points set in "Interlink Transmission Settings" of "Application Settings".

RWw: Total number of source "LW/RWw" or "LW/LW" points set in "Interlink Transmission Settings" of "Application Settings".

- Constant (KM4)

| Base unit to which the network module is mounted |                       | KM4( $\times 10^{-3}$ ) |
|--|-----------------------|-------------------------|
| Source   | Destination           |                         |
| Main base unit                                   | Main base unit        | 0.175                   |
| Main base unit                                   | Extension base unit*1 | 0.202                   |
| Extension base unit*1                            | Main base unit        | 0.242                   |
| Extension base unit*1                            | Extension base unit*1 | 0.271                   |

\*1 RJ71GN11-T2 only

## Precautions

The interlink transmission time may become longer due to the following causes.

- Communication with the engineering tool (such as CC-Link IE TSN/CC-Link IE Field diagnostics, module diagnostics)
- Execution of a link dedicated instruction
- Link refresh
- Interlink transmission between other modules

# Transmission delay time of safety communications (RJ71GN11-T2 only)

The following are the formulas to calculate transmission delay time of safety communications.

## Point

- When "Communication Period Setting" of the communication destination in "Network Configuration Settings" has been set to an option other than "Basic Period", multiply the LS: communication cycle intervals by the multiplier corresponding to the set option, which is specified in "Multiple Period Setting" under "Communication Period Setting".
- When "Communication Destination" is set to "CR800-R" in "Safety Communication Setting" under "Basic Settings" of the master station, the formula to calculate the transmission delay time of safety communications differs. In this case, refer to the manual of the communication destination.

## Calculation formula for transmission delay time

### ■ Master station (safety station) ↔ local station (safety station)

The following table lists the time between a safety device of the Safety CPU on the sending station turning on or off and that on the receiving station turning on or off.

| Calculation value | Formula  |
|-------------------|--|
| Normal value      | $SCsnd + LS + SCrcv + TMsnd$                       |
| Maximum value     | $SCsnd + (LS \times 2) + (SCrcv \times 2) + TMsnd$ |

SCsnd: Safety cycle time of the sending station (📖 MELSEC iQ-R CPU Module User's Manual (Application))

LS: Communication cycle intervals (can be checked in the SW0060) (📖 Page 322 Communication cycle intervals)

SCrcv: Safety cycle time of the receiving station (📖 MELSEC iQ-R CPU Module User's Manual (Application))

TMsnd: Transmission interval monitoring time of the sending station (📖 Page 344 Monitoring time for safety communications (RJ71GN11-T2 only))

### ■ Master station (safety station) ← remote station (safety station)

The following table lists the time between a signal input to the remote station (safety station) and a safety device of the Safety CPU on the master station (safety station) turning on or off.

| Calculation value | Formula   |
|-------------------|---|
| Normal value      | $SCmst + LS + SRref + TMrmt + SRin$                       |
| Maximum value     | $(SCmst \times 2) + (LS \times 2) + SRref + TMrmt + SRin$ |

SCmst: Safety cycle time of the master station (safety station) (📖 MELSEC iQ-R CPU Module User's Manual (Application))

LS: Communication cycle intervals (can be checked in the SW0060) (📖 Page 322 Communication cycle intervals)

SRref: Safety remote station refresh response processing time (📖 Manual for the remote station used)

TMrmt: Transmission interval monitoring time of the remote station (safety station) (📖 Manual for the remote station used)

SRin: Safety remote station input response time (📖 Manual for the remote station used)

### ■ Master station (safety station) → remote station (safety station)

The following table lists the time between a safety device of the Safety CPU on the master station (safety station) turning on or off and the output of the remote station (safety station) turning on or off.

| Calculation value | Formula  |
|-------------------|--|
| Normal value      | $SCmst + LS + SRref + TMmst + SRout$                       |
| Maximum value     | $SCmst + (LS \times 2) + (SRref \times 2) + TMmst + SRout$ |

SCmst: Safety cycle time of the master station (safety station) (📖 MELSEC iQ-R CPU Module User's Manual (Application))

LS: Communication cycle intervals (can be checked in the SW0060) (📖 Page 322 Communication cycle intervals)

SRref: Safety remote station refresh response processing time (📖 Manual for the remote station used)

TMmst: Transmission interval monitoring time of the master station (safety station) (📖 Page 344 Monitoring time for safety communications (RJ71GN11-T2 only))

SRout: Safety remote station output response time (📖 Manual for the remote station used)

## Safety response time (RJ71GN11-T2 only)

---

The safety response time is the maximum value of the time between a safety input of the remote station (safety station) turning off and a safety output of the remote station (safety station) turning off (including an error detection time).

For calculation method of the safety response time, refer to the following.

 Mitsubishi Safety Programmable Controller MELSEC iQ-R Series Machinery Directive (2006/42/EC) Compliance

### **Point**

---

When "Communication Destination" is set to "CR800-R" in "Safety Communication Setting" under "Basic Settings" of the master station, the formula to calculate the safety response time differs. In this case, refer to the manual of the communication destination.

---

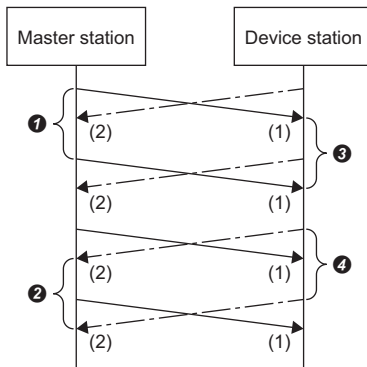

# Monitoring time for safety communications (RJ71GN11-T2 only)

This section describes the monitoring time for the safety communications.

The monitoring time is set for each safety connection. If the time exceeds the monitoring time, a safety communication timeout is detected and the safety communications are stopped.

| Setting station | Item                                  | Description   | Station using setting time |
|-----------------|---------------------------------------|---|----------------------------|
| Master station  | Transmission Interval Monitoring Time | <ul style="list-style-type: none"> <li>A device station monitors the transmission interval ❶ that the master station sends safety data.</li> <li>The master station sends data to the device station at the start of the safety communications.</li> <li>The transmission time information with safety data received on the device station is monitored as compared with the last value.</li> </ul> | Device station             |
|                 | Safety Refresh Monitoring Time*1      | The master station monitors the receiving interval ❷ that safety data is received from a device station.  | Master station             |
|                 |                                       | <ul style="list-style-type: none"> <li>A device station monitors the receiving interval ❸ that safety data is received from the master station.</li> <li>The master station sends data to the device station at the start of the safety communications.</li> </ul>  | Device station             |
| Device station  | Transmission Interval Monitoring Time | <ul style="list-style-type: none"> <li>The master station monitors the transmission interval ❹ of safety data sent by a device station.</li> <li>The device station sends data to the master station at the start of the safety communications.</li> <li>The transmission time information with safety data received on the master station is monitored as compared with the last value.</li> </ul> | Master station             |

\*1 The safety refresh monitoring time uses a common value between the master station and device stations.

- (1) Safety data sent from the master station to a device station
- (2) Safety data sent from a device station to the master station
- ❶ to ❹: Transmission/receiving intervals of safety data

## Transmission interval monitoring time

The value of transmission interval monitoring time set in the master/local module must satisfy all of the following conditions.

| Communication destination   | Condition   |
|---|---|
| Master station (safety station) or local station (safety station) | <ul style="list-style-type: none"><li>• <math>TM \geq SC_{own} \times 3</math></li><li>• <math>TM \geq SC_{oth} \times 2 + LS \times 2</math></li></ul> |
| Remote station (safety station)                                   | <ul style="list-style-type: none"><li>• <math>TM \geq SC_{own} \times 3</math></li><li>• <math>TM \geq SR_{ref} \times 2 + LS \times 2</math></li></ul> |

TM: Transmission interval monitoring time

SC<sub>own</sub>: Safety cycle time of the own station (📖 MELSEC iQ-R CPU Module User's Manual (Application))

SC<sub>oth</sub>: Safety cycle time of the communication destination

LS: Communication cycle intervals (can be checked in the SW0060) (📖 Page 322 Communication cycle intervals)

SR<sub>ref</sub>: Safety remote station refresh response processing time of the communication destination (📖 Manual for the remote station used)

### Point

- If the Safety CPU detects a safety communication timeout, check that the transmission interval monitoring time satisfies the above formula.
- The Safety CPU may detect a safety communication timeout if the safety communications are affected by noise. If required, add an integral multiple of the safety cycle time on the own station to the transmission interval monitoring time.
- When the transmission interval monitoring time has changed, the safety refresh monitoring time must also be changed to meet the conditions specified for the safety refresh monitoring time. (📖 Page 346 Safety refresh monitoring time)
- When "Communication Period Setting" of the communication destination in "Network Configuration Settings" is set to an option other than "Basic Period", multiply the LS: communication cycle intervals by the multiplier corresponding to the set option, which is specified in "Multiple Period Setting" under "Communication Period Setting".

A

## Safety refresh monitoring time

Set the safety refresh monitoring time at the Active side station.

Set a value that satisfies all of the following conditions.

- Master station (safety station) ↔ local station (safety station) ↔ remote station (safety station)

### Condition

- $RM \geq TMact + (TMpas \div 2) + (LS \times 2) - a$
- $RM \geq (TMact \div 2) + TMpas + (LS \times 2) - c$
- $RM > TMact$
- $RM > TMpas$

RM: Safety refresh monitoring time

TMact: Transmission interval monitoring time of the Active side (☞ Page 345 Transmission interval monitoring time)

TMpas: Transmission interval monitoring time of the Passive side (☞ Page 345 Transmission interval monitoring time)

LS: Communication cycle intervals (can be checked in the SW0060) (☞ Page 322 Communication cycle intervals)

a:  $TMact - b$  (CC-Link IE TSN-compatible MELSEC products are on the Active side. Otherwise this value is 0.)

b: A smallest multiple of safety cycle time which is greater than  $TMact \div 2$

c:  $TMpas - d$  (CC-Link IE TSN-compatible MELSEC products are on the Passive side. Otherwise this value is 0.)

d: A smallest multiple of safety cycle time (safety remote station refresh response processing time for the safety remote I/O module) which is greater than the calculation result of  $TMpas \div 2$

### Ex.

Calculation example of b when the transmission interval monitoring time (TMact) is 24ms and the safety cycle time is 10ms.

$$24 \div 2 = 12$$

The safety refresh monitoring time is 20, the smallest multiple of safety cycle time (10ms) which is greater than 12.

### Ex.

Calculation example of d when the transmission interval monitoring time (TMact) is 24ms and the safety remote station refresh response processing time is 2ms.

$$24 \div 2 = 12$$

The value is the multiple of safety remote station refresh response processing time (2ms) so the safety refresh monitoring time is 12.

### Point

- Calculate the communication cycle interval used in the calculation of the safety refresh monitoring time in accordance with the conditions of the system used.
- When "Communication Destination" is set to "CR800-R" in "Safety Communication Setting" under "Basic Settings" of the master station, the formula to calculate the safety refresh monitoring time differs. In this case, refer to the manual of the communication destination.
- The Safety CPU may detect a safety communication timeout if the safety communications are affected by noise. If required, add an integral multiple of  $((TMact \div 2) + (TMpas \div 2))$  to the safety refresh monitoring time.
- When "Communication Period Setting" of the communication destination in "Network Configuration Settings" is set to an option other than "Basic Period", multiply the LS: communication cycle intervals by the multiplier corresponding to the set option, which is specified in "Multiple Period Setting" under "Communication Period Setting".

## Setting examples of the monitoring times

The following table lists setting examples of the transmission interval monitoring time and the safety refresh monitoring time of the communication cycle intervals when the safety cycle time of the master station is set to 10ms and the safety remote station refresh response processing time of the safety remote I/O module is set to 2.3ms.

| Condition                               |   |   | Setting value in the master station                 |  | Setting value in the Device station                 |
|---|---|---|---|--|---|
| Safety cycle time of the master station | Safety remote station refresh response processing time of the device station (safety remote I/O module) <sup>*1</sup> | Actual communication cycle interval <sup>*2</sup> | Transmission interval monitoring time <sup>*3</sup> | Safety refresh monitoring time <sup>*3</sup> | Transmission interval monitoring time <sup>*4</sup> |
| 10ms                                    | 2.3ms   | 4ms   | 35ms  | 60ms   | 35ms  |
|   |   | 8ms   | 50ms  | 80ms   | 50ms  |
|   |   | 16ms  | 60ms  | 100ms  | 60ms  |
|   |   | 32ms  | 100ms   | 300ms  | 100ms   |

\*1 A local station uses the safety cycle time.

\*2 Actual communication cycle intervals indicate actual intervals of the communications with the target device station. Each interval is determined by multiplying the value set in "Communication Period Interval Setting" by the value set in "Multiple Period Setting". When "Communication Period Interval Setting" is set to 2ms and the communications with the target device station are performed at a normal speed ( $\times 4$ )

Actual communication cycle interval [ms] =  $2 \times 4 = 8$ ms

\*3 For the calculation method of the monitoring time to be set to the master station, refer to the following.

Transmission interval monitoring time  Page 345 Transmission interval monitoring time

Safety refresh monitoring time  Page 346 Safety refresh monitoring time

\*4 For the calculation method of the transmission interval monitoring time to be set to the safety remote I/O module, refer to the following.

 CC-Link IE TSN Remote I/O Module (With Safety Functions) User's Manual

### Point

- Note that the given setting values are reference values. Set the setting values greater than the calculation values.
- The greater the setting value, the lower the probability of a safety communication time out occurring due to noise or other factors.

A

# Appendix 8 Port Number

A port number for the system cannot be specified.

Use a port number according to the content of and the method for communications with the communication destination.

| Port number    |                 | Applications   |
|----------------|-----------------|--|
| Decimal        | Hexadecimal     |  |
| 20 to 21       | 14H to 15H      | For system   |
| 161 to 162     | A1H to A2H      | For system   |
| 5000           | 1388H           | Auto-open UDP port (Used for connection with an SLMP-compatible device using UDP/IP)                 |
| 5001           | 1389H           | MELSOFT transmission port (UDP/IP) (Used for connection with a MELSOFT product and GOT using UDP/IP) |
| 5002           | 138AH           | MELSOFT transmission port (TCP/IP) (Used for connection with a MELSOFT product and GOT using TCP/IP) |
| 5003 to 5009   | 138BH to 1391H  | For system   |
| 5010           | 1392H           | SLMP transmission port (UDP/IP) (Used for connection with an SLMP-compatible device using UDP/IP)    |
| 5011           | 1393H           | SLMP transmission port (TCP/IP) (Used for connection with an SLMP-compatible device using TCP/IP)    |
| 45237 to 45239 | B0B5H to B0B7H  | For system   |
| 61440 to 61442 | F000H to F002H  | For system   |
| 61448          | F008H           | For system   |
| 61460 to 61464 | F014H to F018H  | For system   |
| 61500 to 61501 | F03CH to F03DH  | For system   |
| 62000 to 65534 | F230H to FFFE H | For system   |

# Appendix 10 Added and Enhanced Functions

The following table lists the added and enhanced functions in the RJ71GN11.

| RJ71GN11-T2   |                  |
|---|------------------|
| Added and enhanced functions  | Firmware version |
| Updated the firmware using the engineering tool <sup>*1</sup>   | "01" or later    |
| Multicast function to the communication mode under the application settings                                     | "04" or later    |
| Communication speed of 100Mbps  | "04" or later    |
| TSN hub   | "05" or later    |
| CC-Link IE TSN network synchronous communication function <sup>*2</sup>   | "10" or later    |
| Safety communications in a system using the Safety CPU <sup>*2</sup>  | "10" or later    |
| Station information list  | "10" or later    |
| Loopback function   | "10" or later    |
| Remote device test  | "10" or later    |
| Ring topology   | "10" or later    |
| CANopen communications  | "11" or later    |
| Watchdog counter  | "11" or later    |
| Increase in the number of inter-module synchronization target modules   | "11" or later    |
| CC-Link IE TSN Communication Software   | "12" or later    |
| Restriction cancellation on CC-Link IE TSN Class A devices/Ethernet devices in multicast mode                   | "14" or later    |
| Supports the protocol version 2.0   | "14" or later    |
| Improvement of detection of connected/disconnected devices function   | "15" or later    |
| Connection with a CC-Link IE TSN Class A device that supports the CANopen profile with the protocol version 2.0 | "15" or later    |
| Co-recording  | "17" or later    |
| Supports the IP address setting of the device station   | "18" or later    |

\*1 For details on firmware update, refer to the following.

 MELSEC iQ-R Module Configuration Manual

\*2 There are restrictions on the CPU module to be used. For details, refer to the following.

 MELSEC iQ-R CPU Module User's Manual (Application)

| RJ71GN11-SX   |                  |
|---|------------------|
| Added and enhanced functions                                  | Firmware version |
| Updated the firmware using the engineering tool <sup>*1</sup> | "01" or later    |
| Supports the master station switch function                   | "02" or later    |

\*1 For details on firmware update, refer to the following.

 MELSEC iQ-R Module Configuration Manual

# WARRANTY

---

Please confirm the following product warranty details before using this product.

## **1. Gratis Warranty Term and Gratis Warranty Range**

If any faults or defects (hereinafter "Failure") found to be the responsibility of Mitsubishi occurs during use of the product within the gratis warranty term, the product shall be repaired at no cost via the sales representative or Mitsubishi Service Company.

However, if repairs are required onsite at domestic or overseas location, expenses to send an engineer will be solely at the customer's discretion. Mitsubishi shall not be held responsible for any re-commissioning, maintenance, or testing on-site that involves replacement of the failed module.

[Gratis Warranty Term]

The gratis warranty term of the product shall be for one year after the date of purchase or delivery to a designated place. Note that after manufacture and shipment from Mitsubishi, the maximum distribution period shall be six (6) months, and the longest gratis warranty term after manufacturing shall be eighteen (18) months. The gratis warranty term of repair parts shall not exceed the gratis warranty term before repairs.

[Gratis Warranty Range]

- (1) The range shall be limited to normal use within the usage state, usage methods and usage environment, etc., which follow the conditions and precautions, etc., given in the instruction manual, user's manual and caution labels on the product.
- (2) Even within the gratis warranty term, repairs shall be charged for in the following cases.
  1. Failure occurring from inappropriate storage or handling, carelessness or negligence by the user. Failure caused by the user's hardware or software design.
  2. Failure caused by unapproved modifications, etc., to the product by the user.
  3. When the Mitsubishi product is assembled into a user's device, Failure that could have been avoided if functions or structures, judged as necessary in the legal safety measures the user's device is subject to or as necessary by industry standards, had been provided.
  4. Failure that could have been avoided if consumable parts (battery, backlight, fuse, etc.) designated in the instruction manual had been correctly serviced or replaced.
  5. Failure caused by external irresistible forces such as fires or abnormal voltages, and Failure caused by force majeure such as earthquakes, lightning, wind and water damage.
  6. Failure caused by reasons unpredictable by scientific technology standards at time of shipment from Mitsubishi.
  7. Any other failure found not to be the responsibility of Mitsubishi or that admitted not to be so by the user.

## **2. Onerous repair term after discontinuation of production**

- (1) Mitsubishi shall accept onerous product repairs for seven (7) years after production of the product is discontinued. Discontinuation of production shall be notified with Mitsubishi Technical Bulletins, etc.
- (2) Product supply (including repair parts) is not available after production is discontinued.

## **3. Overseas service**

Overseas, repairs shall be accepted by Mitsubishi's local overseas FA Center. Note that the repair conditions at each FA Center may differ.

## **4. Exclusion of loss in opportunity and secondary loss from warranty liability**

Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to:

- (1) Damages caused by any cause found not to be the responsibility of Mitsubishi.
- (2) Loss in opportunity, lost profits incurred to the user by Failures of Mitsubishi products.
- (3) Special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than Mitsubishi products.
- (4) Replacement by the user, maintenance of on-site equipment, start-up test run and other tasks.

## **5. Changes in product specifications**

The specifications given in the catalogs, manuals or technical documents are subject to change without prior notice.
