SAFETY PRECAUTIONS

(Read these precautions before using this product.)

Before using MELSEC iQ-R series programmable controllers, please read the manuals for the product and the relevant manuals introduced in those manuals carefully, and pay full attention to safety to handle the product correctly. If products are used in a different way from that specified by manufacturers, the protection function of the products may not work properly. In this manual, the safety precautions are classified into two levels: "⚠️ WARNING" and "⚠️ CAUTION".

 WARNING	Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.
 CAUTION	Indicates that incorrect handling may cause hazardous conditions, resulting in minor or moderate injury or property damage.

Under some circumstances, failure to observe the precautions given under "⚠️ CAUTION" may lead to serious consequences.

Observe the precautions of both levels because they are important for personal and system safety.

Make sure that the end users read this manual and then keep the manual in a safe place for future reference.

[Design Precautions]

WARNING

- Configure safety circuits external to the programmable controller to ensure that the entire system operates safely even when a fault occurs in the external power supply or the programmable controller. Failure to do so may result in an accident due to an incorrect output or malfunction.
 - (1) Emergency stop circuits, protection circuits, and protective interlock circuits for conflicting operations (such as forward/reverse rotations or upper/lower limit positioning) must be configured external to the programmable controller.
 - (2) When the programmable controller detects an abnormal condition, it stops the operation and all outputs are:
 - Turned off if the overcurrent or overvoltage protection of the power supply module is activated.
 - Held or turned off according to the parameter setting if the self-diagnostic function of the CPU module detects an error such as a watchdog timer error.
 - (3) All outputs may be turned on if an error occurs in a part, such as an I/O control part, where the CPU module cannot detect any error. To ensure safety operation in such a case, provide a safety mechanism or a fail-safe circuit external to the programmable controller. For a fail-safe circuit example, refer to "General Safety Requirements" in the MELSEC iQ-R Module Configuration Manual.
 - (4) Outputs may remain on or off due to a failure of a component such as a relay and transistor in an output circuit. Configure an external circuit for monitoring output signals that could cause a serious accident.
 - In an output circuit, when a load current exceeding the rated current or an overcurrent caused by a load short-circuit flows for a long time, it may cause smoke and fire. To prevent this, configure an external safety circuit, such as a fuse.
 - Configure a circuit so that the programmable controller is turned on first and then the external power supply. If the external power supply is turned on first, an accident may occur due to an incorrect output or malfunction.
 - Configure a circuit so that the external power supply is turned off first and then the programmable controller. If the programmable controller is turned off first, an accident may occur due to an incorrect output or malfunction.
 - For the operating status of each station after a communication failure, refer to manuals for the network used. For the manuals, please consult your local Mitsubishi representative. Failure to do so may result in an accident due to an incorrect output or malfunction.
 - When connecting an external device with a CPU module or intelligent function module to modify data of a running programmable controller, configure an interlock circuit in the program to ensure that the entire system will always operate safely. For other forms of control (such as program modification, parameter change, forced output, or operating status change) of a running programmable controller, read the relevant manuals carefully and ensure that the operation is safe before proceeding. Improper operation may damage machines or cause accidents.
-

[Design Precautions]

WARNING

- Especially, when a remote programmable controller is controlled by an external device, immediate action cannot be taken if a problem occurs in the programmable controller due to a communication failure. To prevent this, configure an interlock circuit in the program, and determine corrective actions to be taken between the external device and CPU module in case of a communication failure.
 - Do not write any data to the "system area" and "write-protect area" of the buffer memory in the module. Also, do not use any "use prohibited" signals as an output signal from the CPU module to each module. Doing so may cause malfunction of the programmable controller system. For the "system area", "write-protect area", and the "use prohibited" signals, refer to the user's manual for the module used.
 - If a communication cable is disconnected, the network may be unstable, resulting in a communication failure of multiple stations. Configure an interlock circuit in the program to ensure that the entire system will always operate safely even if communications fail. Incorrect output or malfunction due to a communication failure may result in an accident.
-

[Design Precautions]

CAUTION

- Do not install the control lines or communication cables together with the main circuit lines or power cables. Doing so may result in malfunction due to electromagnetic interference. Keep a distance of 100mm or more between those cables.
 - During control of an inductive load such as a lamp, heater, or solenoid valve, a large current (approximately ten times greater than normal) may flow when the output is turned from off to on. Therefore, use a module that has a sufficient current rating.
 - After the CPU module is powered on or is reset, the time taken to enter the RUN status varies depending on the system configuration, parameter settings, and/or program size. Design circuits so that the entire system will always operate safely, regardless of the time.
 - Do not power off the programmable controller or reset the CPU module while the settings are being written. Doing so will make the data in the flash ROM and SD memory card undefined. The values need to be set in the buffer memory and written to the flash ROM and SD memory card again. Doing so also may cause malfunction or failure of the module.
 - When changing the operating status of the CPU module from external devices (such as the remote RUN/STOP functions), select "Do Not Open by Program" for "Opening Method" of "Module Parameter". If "Open by Program" is selected, an execution of the remote STOP function causes the communication line to close. Consequently, the CPU module cannot reopen the line, and external devices cannot execute the remote RUN function.
-

[Security Precautions]

WARNING

- To maintain the security (confidentiality, integrity, and availability) of the programmable controller and the system against unauthorized access, denial-of-service (DoS) attacks, computer viruses, and other cyberattacks from external devices via the network, take appropriate measures such as firewalls, virtual private networks (VPNs), and antivirus solutions.
-

[Installation Precautions]

WARNING

- Shut off the external power supply (all phases) used in the system before mounting or removing the module. Failure to do so may result in electric shock or cause the module to fail or malfunction.
-

[Installation Precautions]

CAUTION

- Use the programmable controller in an environment that meets the general specifications in the Safety Guidelines (IB-0800525). Failure to do so may result in electric shock, fire, malfunction, or damage to or deterioration of the product.
 - To mount a module, place the concave part(s) located at the bottom onto the guide(s) of the base unit, and push in the module until the hook(s) located at the top snaps into place. Incorrect interconnection may cause malfunction, failure, or drop of the module.
 - To mount a module with no module fixing hook, place the concave part(s) located at the bottom onto the guide(s) of the base unit, push in the module, and fix it with screw(s). Incorrect interconnection may cause malfunction, failure, or drop of the module.
 - When using the programmable controller in an environment of frequent vibrations, fix the module with a screw.
 - Tighten the screws within the specified torque range. Undertightening can cause drop of the component or wire, short circuit, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction. For the specified torque range, refer to the MELSEC iQ-R Module Configuration Manual.
 - When using an extension cable, connect it to the extension cable connector of the base unit securely. Check the connection for looseness. Poor contact may cause malfunction.
 - When using an SD memory card, fully insert it into the SD memory card slot. Check that it is inserted completely. Poor contact may cause malfunction.
 - Securely insert an extended SRAM cassette or a battery-less option cassette into the cassette connector of the CPU module. After insertion, close the cassette cover and check that the cassette is inserted completely. Poor contact may cause malfunction.
 - Beware that the module could be very hot while power is on and immediately after power-off.
 - Do not directly touch any conductive parts and electronic components of the module, SD memory card, extended SRAM cassette, battery-less option cassette, or connector. Doing so can cause malfunction or failure of the module.
-

[Wiring Precautions]

WARNING

- Shut off the external power supply (all phases) used in the system before installation and wiring. Failure to do so may result in electric shock or cause the module to fail or malfunction.
- After installation and wiring, attach a blank cover module (RG60) to each empty slot before powering on the system for operation. Also, attach an extension connector protective cover^{*1} to each unused extension cable connector as necessary. Directly touching any conductive parts of the connectors while power is on may result in electric shock.

*1 For details, please consult your local Mitsubishi Electric representative.

[Wiring Precautions]

CAUTION

- Individually ground the FG and LG terminals of the programmable controller with a ground resistance of 100 ohms or less. Failure to do so may result in electric shock or malfunction.
 - Use applicable solderless terminals and tighten them within the specified torque range. If any spade solderless terminal is used, it may be disconnected when the terminal screw comes loose, resulting in failure.
 - Check the rated voltage and signal layout before wiring to the module, and connect the cables correctly. Connecting a power supply with a different voltage rating or incorrect wiring may cause fire or failure.
 - Connectors for external devices must be crimped or pressed with the tool specified by the manufacturer, or must be correctly soldered.
 - Securely connect the connector to the module. Poor contact may cause malfunction.
 - Do not install the control lines or communication cables together with the main circuit lines or power cables. Doing so may result in malfunction due to noise. Keep a distance of 100mm or more between those cables.
 - Place the cables in a duct or clamp them. If not, dangling cables may swing or inadvertently be pulled, resulting in malfunction or damage to modules or cables.
In addition, the weight of the cables may put stress on modules in an environment of strong vibrations and shocks.
Do not clamp the extension cables with the jacket stripped. Doing so may change the characteristics of the cables, resulting in malfunction.
 - Check the interface type and correctly connect the cable. Incorrect wiring (connecting the cable to an incorrect interface) may cause failure of the module and external device.
 - Tighten the terminal screws or connector screws within the specified torque range. Undertightening can cause drop of the screw, short circuit, fire, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction.
 - When disconnecting the cable from the module, do not pull the cable by the cable part. For the cable with connector, hold the connector part of the cable. For the cable connected to the terminal block, loosen the terminal screw. Pulling the cable connected to the module may result in malfunction or damage to the module or cable.
-

[Wiring Precautions]

CAUTION

- Prevent foreign matter such as dust or wire chips from entering the module. Such foreign matter can cause a fire, failure, or malfunction.
 - When a protective film is attached to the top of the module, remove it before system operation. If not, inadequate heat dissipation of the module may cause a fire, failure, or malfunction.
 - Programmable controllers must be installed in control panels. Connect the main power supply to the power supply module in the control panel through a relay terminal block. Wiring and replacement of a power supply module must be performed by qualified maintenance personnel with knowledge of protection against electric shock. For wiring, refer to the MELSEC iQ-R Module Configuration Manual.
 - For Ethernet cables to be used in the system, select the ones that meet the specifications in the user's manual for the module used. If not, normal data transmission is not guaranteed.
-

[Startup and Maintenance Precautions]

WARNING

- Do not touch any terminal while power is on. Doing so will cause electric shock or malfunction.
 - Correctly connect the battery connector. Do not charge, disassemble, heat, short-circuit, solder, or throw the battery into the fire. Also, do not expose it to liquid or strong shock. Doing so will cause the battery to produce heat, explode, ignite, or leak, resulting in injury and fire.
 - Shut off the external power supply (all phases) used in the system before cleaning the module or retightening the terminal screws, connector screws, or module fixing screws. Failure to do so may result in electric shock.
-

[Startup and Maintenance Precautions]

CAUTION

- When connecting an external device with a CPU module or intelligent function module to modify data of a running programmable controller, configure an interlock circuit in the program to ensure that the entire system will always operate safely. For other forms of control (such as program modification, parameter change, forced output, or operating status change) of a running programmable controller, read the relevant manuals carefully and ensure that the operation is safe before proceeding. Improper operation may damage machines or cause accidents.
 - Especially, when a remote programmable controller is controlled by an external device, immediate action cannot be taken if a problem occurs in the programmable controller due to a communication failure. To prevent this, configure an interlock circuit in the program, and determine corrective actions to be taken between the external device and CPU module in case of a communication failure.
 - Do not disassemble or modify the modules. Doing so may cause failure, malfunction, injury, or a fire.
 - Use any radio communication device such as a cellular phone or PHS (Personal Handy-phone System) 25cm or more away in all directions from the programmable controller. Failure to do so may cause malfunction.
 - Shut off the external power supply (all phases) used in the system before mounting or removing the module. Failure to do so may cause the module to fail or malfunction.
 - Tighten the screws within the specified torque range. Undertightening can cause drop of the component or wire, short circuit, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction.
 - After the first use of the product, do not perform each of the following operations more than 50 times (IEC 61131-2/JIS B 3502 compliant). Exceeding the limit may cause malfunction.
 - Mounting/removing the module to/from the base unit
 - Inserting/removing the extended SRAM cassette or battery-less option cassette to/from the CPU module
 - Mounting/removing the terminal block to/from the module
 - Connecting/disconnecting the extension cable to/from the base unit
 - After the first use of the product, do not insert/remove the SD memory card to/from the CPU module more than 500 times. Exceeding the limit may cause malfunction.
 - Do not touch the metal terminals on the back side of the SD memory card. Doing so may cause malfunction or failure of the module.
 - Do not touch the integrated circuits on the circuit board of an extended SRAM cassette or a battery-less option cassette. Doing so may cause malfunction or failure of the module.
 - Do not drop or apply shock to the battery to be installed in the module. Doing so may damage the battery, causing the battery fluid to leak inside the battery. If the battery is dropped or any shock is applied to it, dispose of it without using.
 - Use a clean and dry cloth to wipe off dirt on the module.
-

[Startup and Maintenance Precautions]

CAUTION

- Startup and maintenance of a control panel must be performed by qualified maintenance personnel with knowledge of protection against electric shock. Lock the control panel so that only qualified maintenance personnel can operate it.
 - Before handling the module, touch a conducting object such as a grounded metal to discharge the static electricity from the human body. Wearing a grounded antistatic wrist strap is recommended. Failure to discharge the static electricity may cause the module to fail or malfunction.
-

[Operating Precautions]

CAUTION

- When changing data and operating status, and modifying program of the running programmable controller from an external device such as a personal computer connected to an intelligent function module, read relevant manuals carefully and ensure the safety before operation. Incorrect change or modification may cause system malfunction, damage to the machines, or accidents.
 - Do not power off the programmable controller or reset the CPU module while the setting values in the buffer memory are being written to the flash ROM in the module. Doing so will make the data in the flash ROM and SD memory card undefined. The values need to be set in the buffer memory and written to the flash ROM and SD memory card again. Doing so also may cause malfunction or failure of the module.
-

[Computer Connection Precautions]

CAUTION

- When connecting a personal computer to a module having a USB interface, observe the following precautions as well as the instructions described in the manual for the personal computer used. Failure to do so may cause the module to fail.
 - (1) When the personal computer is AC-powered
 - When the personal computer has a 3-pin AC plug or an AC plug with a grounding wire, connect the plug to a grounding receptacle or ground the grounding wire. Ground the personal computer and the module with a ground resistance of 100 ohms or less.
 - When the personal computer has a 2-pin AC plug without a grounding wire, connect the computer to the module by following the procedure below. For power supplied to the personal computer and the module, using the same power source is recommended.
 1. Unplug the personal computer from the AC receptacle.
 2. Check that the personal computer is unplugged. Then, connect the personal computer to the module with a USB cable.
 3. Plug the personal computer into the AC receptacle.
 - (2) When the personal computer is battery-powered
 - The personal computer can be connected to the module without taking specific measures. For details, refer to the following.

Cautions When Using Mitsubishi Programmable Controllers or GOTs Connected to a Personal Computer With the RS-232/USB Interface (FA-A-0298)

When the USB cable used is the GT09-C30USB-5P manufactured by Mitsubishi Electric, specific measures are not required to connect the AC-powered personal computer to the module. However, note that the signal ground (SG) is common for the module and its USB interface. Therefore, if an SG potential difference occurs between the module and the connected devices, it causes failures of the module and the connected devices.

[Disposal Precautions]

CAUTION

- When disposing of this product, treat it as industrial waste.
- When disposing of batteries, separate them from other wastes according to the local regulations. For details on battery regulations in EU member states, refer to the MELSEC iQ-R Module Configuration Manual.

[Transportation Precautions]

CAUTION

- When transporting lithium batteries, follow the transportation regulations. For details on the regulated models, refer to the MELSEC iQ-R Module Configuration Manual.
- The halogens (such as fluorine, chlorine, bromine, and iodine), which are contained in a fumigant used for disinfection and pest control of wood packaging materials, may cause failure of the product. Prevent the entry of fumigant residues into the product or consider other methods (such as heat treatment) instead of fumigation. The disinfection and pest control measures must be applied to unprocessed raw wood.

INTRODUCTION

Thank you for purchasing the Mitsubishi Electric MELSEC iQ-R series programmable controllers.

This manual describes the procedures before operation, specifications, functions, devices, parameters, and troubleshooting of the relevant products listed below.

Before using this product, please read this manual and the relevant manuals carefully and develop familiarity with the functions and performance of the MELSEC iQ-R series programmable controller to handle the product correctly.

When applying the program examples provided in this manual to an actual system, ensure the applicability and confirm that it will not cause system control problems.

Note that the menu names and operating procedures may differ depending on an operating system in use and its version.

When reading this manual, replace the names and procedures with the applicable ones as necessary.

Please make sure that the end users read this manual.

Relevant products

Item	Model
CPU module	R00CPU, R01CPU, R02CPU, R04CPU, R04ENCPU, R08CPU, R08ENCPU, R16CPU, R16ENCPU, R32CPU, R32ENCPU, R120CPU, R120ENCPU

Point

When using the R00CPU, R01CPU, and R02CPU, replace terms of some LEDs as follows to read this manual.

- PROGRAM RUN LED → P RUN LED
 - CARD READY LED → C RDY LED
 - CARD ACCESS LED → C ACS LED
 - FUNCTION LED → FUNC LED

23.1 Write-Protect Function for Device Data (from Outside the CPU Module)	403
CHAPTER 24 SEQUENCE SCAN SYNCHRONIZATION SAMPLING FUNCTION	407
CHAPTER 25 ROUTING SETTING	409
25.1 Setting Method.	409
25.2 Setting Example.	410
25.3 Precautions	410
CHAPTER 26 FIRMWARE UPDATE FUNCTION	411
PART 7 DEVICES, LABELS, AND CONSTANTS	
CHAPTER 27 DEVICES	414
27.1 Device List	414
27.2 Device Setting	416
Range of use of device points	417
27.3 User Device	418
Input (X)	418
Output (Y)	418
Internal relay (M)	419
Latch relay (L)	419
Link relay (B)	419
Annunciator (F)	419
Link special relay (SB)	421
Edge relay (V)	422
Step relay (S)	422
Timer	423
Counter	431
Data register (D)	434
Link register (W)	434
Link special register (SW)	434
27.4 System Device	435
Function device (FX/FY/FD)	435
Special relay (SM)	436
Special register (SD)	436
27.5 Link Direct Device	436
Specification method	436
Specification range	437
Difference from link refresh	438
27.6 Module Access Device	439
Precautions	439
27.7 CPU Buffer Memory Access Device	440

Specification method	440
27.8 Index Register (Z/LZ)	441
16-bit index modification	441
32-bit index modification	441
Device for which index modification can be performed	442
Index register setting	442
Combination of index modification	443
Precautions	443
27.9 File Register (R/ZR)	445
Specification method	445
Setting file registers	446
Clearing file registers	446
27.10 Refresh Data Register (RD)	447
Refresh memory setting	447
27.11 Nesting (N)	448
27.12 Pointer (P)	449
Global pointer	449
Local pointer	450
Pointer setting	451
27.13 Interrupt Pointer (I)	451
Interrupt factors of the interrupt pointer numbers	452
The priority for the interrupt pointer numbers and interrupt factors	452
27.14 Network No. Specification Device (J)	453
27.15 I/O No. Specification Device (U)	453
27.16 SFC Block Device (BL)	453
27.17 SFC Transition Device (TR)	453
27.18 Global Device	453
27.19 Local Device	453
27.20 Indirect Specification	458

CHAPTER 28 LABELS **459**

28.1 Global Labels	459
28.2 Local Labels	459
28.3 Classes	460
28.4 Data Types	461
28.5 Arrays	464
28.6 Structures	468
28.7 Label Access Setting from External Device	470
Configuration procedure	472
Label communication data storage location and operation at the time of each setting operation	472
File operation	472
28.8 Precautions	473

CHAPTER 29 LATCH FUNCTION **475**

29.1 Latch with Battery	475
Types of latch	475
Applicable devices and labels	476
Setting latch on devices	477
Setting latch on labels	481
Clearing latch range data	481

Precautions	481
29.2 Latch with Battery-less Option Cassette.	482
Usage procedure	482
Precautions	484

CHAPTER 30 DEVICE/LABEL INITIAL VALUE SETTINGS 485

30.1 Setting Initial Device/Label Values.	486
Setting initial device values	486
Setting initial label values	487
30.2 Applicable Devices/Labels	488
30.3 Precautions	488

CHAPTER 31 CONSTANTS 489

31.1 Decimal Constant (K)	489
31.2 Hexadecimal Constant (H)	489
31.3 Real Constant (E).	490
Setting range for real numbers	490
Processing when operation is in progress.	490
31.4 Character String Constant	490
31.5 Notation of Constants	491

PART 8 TROUBLESHOOTING

CHAPTER 32 TROUBLESHOOTING PROCEDURE 494

32.1 Troubleshooting with LED Indicators	495
LED status of the CPU module	495
32.2 Troubleshooting Using the Engineering Tool.	496
System monitor	496
Module diagnostics	496
Event history	497

CHAPTER 33 TROUBLESHOOTING BY SYMPTOM 498

33.1 When the POWER LED of the Power Supply Module Turns Off	498
33.2 When the READY LED of the CPU Module Turns Off.	498
33.3 When the Specific Extension Base Unit Cannot Be Recognized	499
33.4 When the Specific Q Series Extension Base Unit Cannot Be Recognized	499
33.5 When Data Cannot Be Written to the Programmable Controller	499
33.6 When Data Cannot Be Read from the Programmable Controller	500
33.7 When the Operating Status of the CPU Module Cannot Be Changed	500
33.8 When the Ethernet Function Cannot Be Used	500
33.9 When the CC-Link IE Field Network Basic Function Cannot Be Used.	500
33.10 When the CPU Module Database Access Function Cannot Be Used.	501
When the data source name cannot be set.	501
When the connection test fails.	501
When the ODBC server of the CPU module cannot be connected.	501
When the connection is disconnected.	501

CHAPTER 34 ERROR CODES	502
34.1 Error Code System	502
34.2 Operation When an Error Occurs	504
34.3 How to Clear Errors	504
34.4 List of Error Codes	504
Codes of errors detected by the self-diagnostic function (1000H to 3FFFH)	504
Codes of errors detected by other than the self-diagnostic function (4000H to 4FFFH)	539
Codes of errors detected by other than the self-diagnostic function (C000H to CFFFH)	562
 CHAPTER 35 EVENT LIST	 563
35.1 How to Read the Event List	563
35.2 Event List	565
 APPENDICES	 573
Appendix 1 External Dimensions	573
Appendix 2 Compliance with EMC and Low Voltage Directives	578
Appendix 3 Functional Availability by CPU Module Model	579
Appendix 4 List of Special Relay Areas	581
Diagnostic information	582
System information	584
SFC information	586
System clock	587
Fixed scan function information	590
Drive information	591
Instruction related	593
Latch area	596
Data logging function	597
CPU module data backup/restoration function	599
iQ Sensor Solution data backup/restoration function	599
File transfer function (FTP client)	600
Global label assignment information	600
Memory dump function	600
Event history function	601
CPU module database access function	601
Ethernet function	602
CC-Link IE Field Network Basic function	603
Appendix 5 List of Special Register Areas	604
Diagnostic information	605
System information	612
SFC information	616
System clock	616
Fixed scan function information	617
Drive information	619
Instruction related	622
Firmware update function	624
Latch area	626
Data logging function	628
CPU module data backup/restoration function	630
Data backup/restoration function of iQ Sensor Solution	630
Interrupt pointer mask pattern	634

Event history function	634
Memory dump function	635
Real-time monitor function.	635
Debug function	635
CPU module database access function.	636
Ethernet function	637
CC-Link IE Field Network Basic function.	640
System monitoring information	641
Appendix 6 Buffer Memory	644
List of buffer memory addresses	644
Details on buffer memory addresses.	645
Appendix 7 Processing Time	649
Instruction execution time	649
Program execution time.	649
END processing time.	651
Data logging function processing time	665
Memory dump function processing time	672
Real-time monitor function processing time	673
Database function processing time	674
SFC program processing time.	676
SFC program switching.	677
Processing time until the file operation is completed.	678
Appendix 8 Parameter List	680
System parameters	680
CPU Parameters	681
Memory card parameters	682
Module parameters	683
Appendix 9 Target List and Operation Details of the Device/Label Access Service Processing Setting	685
Target list	685
Operation details	687
Appendix 10 Program Restoration Information Write Selection	691
Checking the program restoration information write status	691
Precautions	693
Appendix 11 List of Available SQL Commands for CPU Module Database Access Function	694
Data definition	694
Data operation.	696
Clause	698
Aggregate function	700
Arithmetic function.	701
Appendix 12 Added and Enhanced Functions	705

COPYRIGHTS.	716

RELEVANT MANUALS

Manual name [manual number]	Description	Available form
MELSEC iQ-R Programmable Controller CPU Module User's Manual [SH-082488ENG] (this manual)	Procedures before operation, specifications, devices, memory, functions, parameters, and troubleshooting of the programmable controller CPU	Print book e-Manual PDF
MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup) [SH-081256ENG]	Specifications, procedures before operation, system configuration, wiring, and communication examples of Ethernet, CC-Link IE Controller Network, and CC-Link IE Field Network	Print book e-Manual PDF
MELSEC iQ-R Ethernet User's Manual (Application) [SH-081257ENG]	Functions, parameter settings, programming, troubleshooting, I/O signals, and buffer memory of Ethernet	Print book e-Manual PDF
MELSEC iQ-R CPU Module Function Block Reference [BCN-P5999-0374]	Specifications of the MELSEC iQ-R series CPU module FBs	e-Manual PDF
MELSEC iQ-R Ethernet, CC-Link IE, and MELSECNET/H Function Block Reference [BCN-P5999-0381]	Specifications of the following MELSEC iQ-R series module FBs: Ethernet-equipped module FBs, CC-Link IE TSN module FBs, CC-Link IE Controller Network module FBs, CC-Link IE Field Network module FBs, and MELSECNET/H network module FBs	e-Manual PDF
MELSEC iQ-R Programming Manual (Program Design) [SH-081265ENG]	Program specifications (ladder, ST, FBD/LD, and SFC programs)	e-Manual PDF
MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks) [SH-081266ENG]	Instructions for the CPU module and standard functions/function blocks	e-Manual PDF
MELSEC iQ-R Programming Manual (Module Dedicated Instructions) [SH-081976ENG]	Dedicated instructions for the intelligent function modules	e-Manual PDF
GX Works3 Operating Manual [SH-081215ENG]	System configuration, parameter settings, and online operations of GX Works3	e-Manual PDF
CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series) [SH-082478ENG]	System configuration and operation/setting procedures when using CPU Module Logging Configuration Tool	e-Manual PDF

This manual does not include detailed information on the following:

- General specifications
- Applicable combinations of CPU modules and the other modules, and the number of mountable modules
- Installation

For details, refer to the following.

 MELSEC iQ-R Module Configuration Manual

This manual does not include information on the module function blocks.

For details, refer to the Function Block Reference for the module used.

Point

e-Manual refers to the Mitsubishi Electric FA electronic book manuals that can be browsed using a dedicated tool.

e-Manual has the following features:

- Required information can be cross-searched in multiple manuals.
- Other manuals can be accessed from the links in the manual.
- The hardware specifications of each part can be found from the product figures.
- Pages that users often browse can be bookmarked.
- Sample programs can be copied to an engineering tool.

TERMS

Unless otherwise specified, this manual uses the following terms.

Term	Description
Buffer memory	Memory in an intelligent function module for storing data such as setting values and monitored values. When integrated into the CPU module, this memory refers to a memory for storing data such as setting values and monitored values of the Ethernet function, and data used for data communication of the multiple CPU system function.
Control CPU	A CPU module that controls connected I/O modules and intelligent function modules. The multiple CPU system allows the user to assign this control to any CPU module on a module-by-module basis.
CPU Module Logging Configuration Tool	Software to configure data logging settings and to manage collected data
Dedicated instruction	An instruction that simplifies programming for using functions of intelligent function modules
Device	A memory of a CPU module to store data. Devices such as X, Y, M, D, and others are provided depending on the intended use.
Engineering tool	A tool used for setting up programmable controllers, programming, debugging, and maintenance.
FB instance	A function block that is inserted to a sequence program
Global label	A label that is valid for all the program data when multiple program data are created in the project. There are two types of global label: a module specific label (module label), which is generated automatically by GX Works3, and an optional label, which can be created for any specified device.
GX LogViewer	Software to display data collected by data logging
Intelligent function module	A module that has functions other than input and output, such as an A/D converter module and D/A converter module
Label	A variable consisting of a specified string used in I/O data or internal processing
Module label	A label that represents one of memory areas (I/O signals and buffer memory areas) specific to each module in a given character string. For the module used, GX Works3 automatically generates this label, which can be used as a global label.
POU	A unit that configures a program. Units are categorized and provided in accordance with functions. A program that is composed of POUs (program organization units) allows the lower-layer processing, when the program is multi-layered, to be divided into several units by processing and function, enabling the creation of programs based on each unit.
Program block	A group of POUs that configure a program
Signal flow	The execution status that the last time an operation of a program or an FB is executed in each step.

GENERIC TERMS AND ABBREVIATIONS

Unless otherwise specified, this manual uses the following generic terms and abbreviations.

Generic term and abbreviation	Description
Base unit	A main base unit, an extension base unit, an RQ extension base unit
CC-Link IE Controller Network-equipped module	An RJ71GP21-SX CC-Link IE Controller Network module, an RJ71GP21S-SX CC-Link IE Controller Network module, and the following modules when the CC-Link IE Controller Network function is used: <ul style="list-style-type: none"> • RJ71EN71 • RnENCPU
CC-Link IE Field Network-equipped master/local module	An RJ71GF11-T2 CC-Link IE Field Network master/local module and the following modules when the CC-Link IE Field Network function is used: <ul style="list-style-type: none"> • RJ71EN71 • RnENCPU
CC-Link IE TSN master/local module	RJ71GN11-T2, RJ71GN11-SX, RJ71GN11-EIP (CC-Link IE TSN part)
CPU module	R00CPU, R01CPU, R02CPU, R04CPU, R04ENCPU, R08CPU, R08ENCPU, R16CPU, R16ENCPU, R32CPU, R32ENCPU, R120CPU, R120ENCPU
Device supporting iQSS	A device which supports iQ Sensor Solution. For iQ Sensor Solution, refer to the following.  iQ Sensor Solution Reference Manual
Ethernet interface module with built-in CC-Link IE	RJ71EN71
Ethernet-equipped module	The following modules when the Ethernet function is used: <ul style="list-style-type: none"> • RJ71EN71 • CPU module
I/O module	An input module, an output module, an I/O combined module, and an interrupt module
Motion module	RD78G4, RD78G8, RD78G16, RD78G32, RD78G64, RD78GHV, RD78GHW
Network module	Includes the following: <ul style="list-style-type: none"> • Ethernet interface module • CC-Link IE TSN master/local module • CC-Link IE Controller Network module • CC-Link IE Field Network master/local module • MELSECNET/H network module • MELSECNET/10 network module • RnENCPU (network part)
Power supply module	A MELSEC iQ-R series power supply module
Programmable controller CPU	R00CPU, R01CPU, R02CPU, R04CPU, R04ENCPU, R08CPU, R08ENCPU, R16CPU, R16ENCPU, R32CPU, R32ENCPU, R120CPU, R120ENCPU
RAS	Reliability, Availability, Serviceability. This term refers to the overall usability of automated equipment.
Remote head module	An RJ72GF15-T2 CC-Link IE Field Network remote head module
RJ71GN11-EIP (CC-Link IE TSN part)	An RJ71GN11-EIP when it performs communications on CC-Link IE TSN
RJ71GN11-EIP (EtherNet/IP part)	An RJ71GN11-EIP when it performs communications on EtherNet/IP
RnCPU	R00CPU, R01CPU, R02CPU, R04CPU, R08CPU, R16CPU, R32CPU, R120CPU
RnENCPU	R04ENCPU, R08ENCPU, R16ENCPU, R32ENCPU, R120ENCPU
RnENCPU (CPU part)	A module on the left-hand side of the RnENCPU ( MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup))
RnENCPU (network part)	A module on the right-hand side of the RnENCPU ( MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup))
Station sub ID number	An ID number of a sensor connected to a CC-Link-compatible communication module
Windows® 7 or later	Windows®7, Windows®8, Windows®8.1, Windows®10

PART 1

PART NAMES

This part consists of the following chapters.

1 CPU MODULE

2 EXTENDED SRAM CASSETTE AND BATTERY-LESS OPTION CASSETTE

1 CPU MODULE

This chapter describes the part names of the CPU module.

1.1 R00CPU

No.	Name	Description
(1)	READY LED	Indicates the operating status of the CPU module and the error level. (☞ Page 495 LED status of the CPU module)
(2)	ERROR LED	<ul style="list-style-type: none"> ● READY LED—ERROR LED status On—off: Normal operation On—on: Minor error On—flashing: Moderate error Flashing—on: Minor error Flashing (every 2s)—off: Initial processing Off—on/flashing: Major error
(3)	P RUN LED	Indicates the operating status of the program. On: Being executed (RUN state) Flashing: Being suspended (PAUSE state) Off: Stopped (STOP state) or stop error
(4)	USER LED	Indicates the status of the annunciator (F). (☞ Page 419 Annunciator (F)) On: Annunciator (F) ON Off: Normal operation
(5)	FUNC LED	Turns on or flashes when the following functions are used: <ul style="list-style-type: none"> • LED setting • External input/output forced on/off function • Program restoration information write • Device test with execution condition For the LED status, refer to the description of each function. ☞ Page 172 LED display setting
(6)	SPEED LED	Refer to the following.
(7)	SD/RD LED	☞ MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)
(8)	RUN/STOP/RESET switch	A switch for controlling the operating status of the CPU module. (☞ Page 55 Executing the Program) RUN: Executes the program. STOP: Stops the program. RESET: Resets the CPU module. (Keep the switch in the RESET position for approximately one second.) Operate the RUN/STOP/RESET switch with your fingers. To prevent the switch from being damaged, do not use any tool such as a screwdriver.
(9)	USB port ^{*1}	A connector for a USB-compatible peripheral (connector type: miniB)
(10)	Ethernet port	Refer to the following. ☞ MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)
(11)	Battery compartment	A compartment for storing the body of the battery (FX3U-32BL) when the battery is connected.
(12)	Battery connector	A connector for connecting to the battery (FX3U-32BL)
(13)	LED cover	A cover for the LEDs, USB port, and battery. Open this cover and connect/disconnect a USB-compatible peripheral or the battery. Otherwise, keep the cover closed to prevent entry of foreign matter such as dust.
(14)	Switch cover	A cover for the RUN/STOP/RESET switch. Open this cover and set the RUN/STOP/RESET switch. Otherwise, keep the cover closed to prevent entry of foreign matter such as dust.
(15)	Production information marking	Shows the production information (16 digits) of the module.

*1 When a cable is connected to the USB connector at all times, clamp the cable to prevent a poor connection, moving, and disconnection by unintentional pulling.

1.2 R01CPU, R02CPU

The R01CPU is used as an example.

No.	Name	Description
(1)	READY LED	Indicates the operating status of the CPU module and the error level. (☞ Page 495 LED status of the CPU module)
(2)	ERROR LED	<ul style="list-style-type: none"> ● READY LED—ERROR LED status On—off: Normal operation On—on: Minor error On—flashing: Moderate error Flashing—on: Minor error Flashing (every 2s)—off: Initial processing Off—on/flashing: Major error
(3)	P RUN LED	Indicates the operating status of the program. On: Being executed (RUN state) Flashing: Being suspended (PAUSE state) Off: Stopped (STOP state) or stop error
(4)	USER LED	Indicates the status of the annunciator (F). (☞ Page 419 Annunciator (F)) On: Annunciator (F) ON Off: Normal operation
(5)	C RDY LED	Indicates the availability of the SD memory card. On: Available Flashing: Ready Off: Not available or not inserted
(6)	C ACS LED	Indicates the access status of the SD memory card. On: Being accessed Off: Not accessed
(7)	FUNC LED	Turns on or flashes when the following functions are used: <ul style="list-style-type: none"> • LED setting • External input/output forced on/off function • Program restoration information write • Device test with execution condition For the LED status, refer to the description of each function. ☞ Page 172 LED display setting
(8)	SPEED LED	Refer to the following.
(9)	SD/RD LED	☞ MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)
(10)	RUN/STOP/RESET switch	A switch for controlling the operating status of the CPU module. (☞ Page 55 Executing the Program) RUN: Executes the program. STOP: Stops the program. RESET: Resets the CPU module. (Keep the switch in the RESET position for approximately one second.) Operate the RUN/STOP/RESET switch with your fingers. To prevent the switch from being damaged, do not use any tool such as a screwdriver.
(11)	SD CARD OFF button	A switch for disabling access to the SD memory card to remove it from the CPU module (☞ Page 42 Inserting and Removing an SD Memory Card)
(12)	SD memory card slot	A slot where an SD memory card is inserted
(13)	USB port ^{*1}	A connector for a USB-compatible peripheral (connector type: miniB)
(14)	Ethernet port	Refer to the following. ☞ MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)
(15)	Battery compartment	A compartment for storing the body of the battery (FX3U-32BL) when the battery is connected.
(16)	Battery connector	A connector for connecting to the battery (FX3U-32BL)
(17)	LED cover	A cover for the LEDs, USB port, and battery. Open this cover and connect/disconnect a USB-compatible peripheral or the battery. Otherwise, keep the cover closed to prevent entry of foreign matter such as dust.
(18)	Switch cover	A cover for the RUN/STOP/RESET switch and SD memory card slot. Open this cover and set the RUN/STOP/RESET switch or insert or remove an SD memory card. Otherwise, keep the cover closed to prevent entry of foreign matter such as dust.
(19)	Production information marking	Shows the production information (16 digits) of the module.

*1 When a cable is connected to the USB connector at all times, clamp the cable to prevent a poor connection, moving, and disconnection by unintentional pulling.

1.3 RnCPU (Except for R00CPU, R01CPU, and R02CPU)

The R04CPU is used as an example.

No.	Name	Description
(1)	READY LED	Indicates the operating status of the CPU module and the error level. (☞ Page 495 LED status of the CPU module) ● READY LED—ERROR LED status On—off: Normal operation On—on: Minor error On—flashing: Moderate error Flashing (every 2s)—off: Initial processing Off—on/flashing: Major error
(2)	ERROR LED	
(3)	PROGRAM RUN LED	Indicates the operating status of the program. On: Being executed (RUN state) Flashing: Being suspended (PAUSE state) Off: Stopped (STOP state) or stop error
(4)	USER LED	Indicates the status of the annunciator (F). (☞ Page 419 Annunciator (F)) On: Annunciator (F) ON Off: Normal operation
(5)	BATTERY LED	Indicates the battery status. Flashing: Battery low Off: Normal operation
(6)	CARD READY LED	Indicates the availability of the SD memory card. On: Available Flashing: Ready Off: Not available or not inserted
(7)	CARD ACCESS LED	Indicates the access status of the SD memory card. On: Being accessed Off: Not accessed
(8)	FUNCTION LED	Turns on or flashes when the following functions are used: <ul style="list-style-type: none"> • LED setting • External input/output forced on/off function • Program restoration information write • Device test with execution condition For the LED status, refer to the description of each function. ☞ Page 172 LED display setting
(9)	SPEED LED	Refer to the following.
(10)	SD/RD LED	☞ MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)
(11)	RUN/STOP/RESET switch	A switch for controlling the operating status of the CPU module. (☞ Page 55 Executing the Program) RUN: Executes the program. STOP: Stops the program. RESET: Resets the CPU module. (Keep the switch in the RESET position for approximately one second.) Operate the RUN/STOP/RESET switch with your fingers. To prevent the switch from being damaged, do not use any tool such as a screwdriver.
(12)	SD CARD OFF button	A switch for disabling access to the SD memory card to remove it from the CPU module (☞ Page 42 Inserting and Removing an SD Memory Card)
(13)	SD memory card slot	A slot where an SD memory card is inserted
(14)	USB port ^{*1}	A connector for a USB-compatible peripheral (connector type: miniB)
(15)	Ethernet port	Refer to the following. ☞ MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)
(16)	Battery	A backup battery to hold clock data and to use the backup power function for the device/label memory
(17)	Battery connector pin	A pin for connecting a lead wire of the battery (To save the battery, the lead wire is disconnected from the connector before shipment.)
(18)	Cassette cover	A cover for the connector where an extended SRAM cassette or a battery-less option cassette is inserted (☞ Page 35 EXTENDED SRAM CASSETTE AND BATTERY-LESS OPTION CASSETTE, ☞ Page 41 Inserting or Removing an Extended SRAM Cassette)
(19)	LED cover	A cover for the LED indicators, SD memory card slot, and switches. Open this cover and insert or remove an SD memory card or set the RUN/STOP/RESET switch. Otherwise, keep the cover closed to prevent entry of foreign matter such as dust.
(20)	USB cover	A cover for the USB port. Open this cover and connect a USB-compatible peripheral. Otherwise, keep the cover closed to prevent entry of foreign matter such as dust.
(21)	Production information marking	Shows the production information (16 digits) of the module.

*1 When a cable is connected to the USB connector at all times, clamp the cable to prevent a poor connection, moving, and disconnection by unintentional pulling.

1.4 RnENCPU

The R04ENCPU is used as an example.

No.	Name	Description
(1)	READY LED	Indicates the operating status of the CPU module and the error level. (☞ Page 495 LED status of the CPU module) ● READY LED—ERROR LED status On—off: Normal operation On—on: Minor error On—flashing: Moderate error Flashing—off: Initial processing Off—on/flashing: Major error
(2)	ERROR LED	
(3)	PROGRAM RUN LED	Indicates the operating status of the program. On: Being executed (RUN state) Flashing: Being suspended (PAUSE state) Off: Stopped (STOP state) or stop error
(4)	USER LED	Indicates the status of the annunciator (F). (☞ Page 419 Annunciator (F)) On: Annunciator (F) ON Off: Normal operation
(5)	BATTERY LED	Indicates the battery status. Flashing: Battery low Off: Normal operation
(6)	CARD READY LED	Indicates the availability of the SD memory card. On: Available Flashing: Ready Off: Not available or not inserted
(7)	CARD ACCESS LED	Indicates the access status of the SD memory card. On: Being accessed Off: Not accessed
(8)	FUNCTION LED	Turns on or flashes when the following functions are used: <ul style="list-style-type: none"> • LED setting • External input/output forced on/off function • Program restoration information write • Device test with execution condition For the LED status, refer to the description of each function. ☞ Page 172 LED display setting
(9)	SPEED LED	Refer to the following.
(10)	SD/RD LED	☞ MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)
(11)	RUN/STOP/RESET switch	A switch for controlling the operating status of the CPU module. (☞ Page 55 Executing the Program) RUN: Executes the program. STOP: Stops the program. RESET: Resets the CPU module. (Keep the switch in the RESET position for approximately one second.) Operate the RUN/STOP/RESET switch with your fingers. To prevent the switch from being damaged, do not use any tool such as a screwdriver.
(12)	SD CARD OFF button	A switch for disabling access to the SD memory card to remove it from the CPU module (☞ Page 42 Inserting and Removing an SD Memory Card)
(13)	SD memory card slot	A slot where an SD memory card is inserted
(14)	USB port*1	A connector for a USB-compatible peripheral (connector type: miniB)
(15)	Ethernet port (CPU P1)	Refer to the following. ☞ MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)
(16)	Battery	A backup battery to hold clock data and to use the backup power function for the device/label memory
(17)	Battery connector pin	A pin for connecting a lead wire of the battery (To save the battery, the lead wire is disconnected from the connector before shipment.)
(18)	Cassette cover	A cover for the connector where an extended SRAM cassette or a battery-less option cassette is inserted (☞ Page 35 EXTENDED SRAM CASSETTE AND BATTERY-LESS OPTION CASSETTE, ☞ Page 41 Inserting or Removing an Extended SRAM Cassette)
(19)	LED cover	A cover for the LED indicators, SD memory card slot, and switches. Open this cover and insert or remove an SD memory card or set the RUN/STOP/RESET switch. Otherwise, keep the cover closed to prevent entry of foreign matter such as dust.
(20)	USB cover	A cover for the USB port. Open this cover and connect a USB-compatible peripheral. Otherwise, keep the cover closed to prevent entry of foreign matter such as dust.
(21)	Production information marking	Shows the production information (16 digits) of the module.
(22)	Network part	Refer to the following. ☞ MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)

*1 When a cable is connected to the USB connector at all times, clamp the cable to prevent a poor connection, moving, and disconnection by unintentional pulling.

MEMO

2 EXTENDED SRAM CASSETTE AND BATTERY-LESS OPTION CASSETTE

This chapter describes the part names of the extended SRAM cassette and the battery-less option cassette.

No.	Name	Description
(1)	Tab for cassette insertion/removal	A part which is held when an extended SRAM cassette or a battery-less option cassette is inserted or removed (☞ Page 41 Inserting or Removing an Extended SRAM Cassette)

MEMO

PART 2

PROCEDURES BEFORE OPERATION

This part consists of the following chapter.

3 START-UP PROCEDURE

3 START-UP PROCEDURE

This chapter describes the procedures before operation.

3.1 Overview

This section describes an outline of the procedure before operation for each CPU module.

1. Installing a Battery

Install a battery to the CPU module. (☞ Page 40 Installing a Battery)

Point

R00CPU, R01CPU, and R02CPU are the CPU modules that do not need a battery for holding data.

Use the battery (FX3U-32BL) to save clock data in the event of a long-term (10 days or more) power failure.

(☞ Page 40 FX3U-32BL)

2. Inserting a cassette (an extended SRAM cassette or a battery-less option cassette) or an SD memory card

Insert a cassette (an extended SRAM cassette or a battery-less option cassette) or an SD memory card into the CPU module as needed. (☞ Page 41 Inserting or Removing an Extended SRAM Cassette, ☞ Page 42 Inserting and Removing an SD Memory Card)

Point

When inserting a battery-less option cassette, refer to "Latch with Battery-less Option Cassette". (☞ Page 482 Latch with Battery-less Option Cassette)

3. Mounting modules and connecting cables

Mount modules on the base unit, and connect cables. (📖 MELSEC iQ-R Module Configuration Manual)

4. Powering on the system

Check the following before powering on the system.

- A cable is correctly connected to the power supply.
- Power supply voltage is within the specified range.
- The CPU module is in the STOP state.
- A personal computer on which an engineering tool has been installed is connected to the CPU module. (☞ Page 45 Connecting a Personal Computer)

5. Powering on the personal computer

Power on the personal computer on which the engineering tool has been installed (the personal computer connected to the CPU module).

6. Starting up the engineering tool

Start up the engineering tool that has been installed on the personal computer connected to the CPU module.

7. Initializing the CPU module

Initialize the CPU module using the engineering tool. (📖 Page 46 Initializing the CPU Module)

8. Setting parameters

The following table shows which parameters are required when changing the number of slots/the number of occupied points of a module, using an SD memory card, or using specific functions.

When	Required parameter	Reference
Changing the number of slots or the number of occupied points of a module	<ul style="list-style-type: none"> • System parameters • CPU parameters 	📖 Page 46 Setting Parameters
Using an SD memory card	<ul style="list-style-type: none"> • Memory card parameters 	📖 Page 191 BOOT OPERATION 📖 Page 470 Label Access Setting from External Device
Using the Ethernet function of the CPU module	<ul style="list-style-type: none"> • Module parameters Some intelligent function modules require multiple module parameters and module extension parameters.	📖 MELSEC iQ-R Ethernet User's Manual (Application)
Using the CC-Link IE Field Network Basic function of the CPU module		📖 CC-Link IE Field Network Basic Reference Manual
Using an intelligent function module		📖 User's manual for the module used

When the RnENCPU is used, set network parameters to the network part as well. (📖 User's Manual (Application) for the network used)

System parameters are automatically set by loading an actual system configuration to the Module Configuration window of the engineering tool.

9. Programming

Create a program using the engineering tool. (📖 Page 49 Programming)

10. Writing data to the programmable controller

Write the parameters set and the program created by using the engineering tool to the CPU module. (📖 Page 53 Writing Data to the Programmable Controller)

11. Resetting the CPU module

Restart the system in either of the following ways.

- Power off and on the system.
- Reset the CPU module. (📖 Page 54 Resetting the CPU Module)

12. Checking for errors

Check the status of the READY LED and ERROR LED of the CPU module. If an error is detected, identify the error using the engineering tool, and eliminate the error cause. (📖 Page 494 TROUBLESHOOTING PROCEDURE)

13. Executing the program

Run the CPU module, and check that the PROGRAM RUN LED (P RUN LED) turns on. (📖 Page 55 Executing the Program)

14. Monitoring the program

Check that the program operates normally using the engineering tool. (📖 Page 56 Monitoring the Program)

3.2 Installing a Battery

Install a battery to the CPU module.

Installation procedure

Q6BAT

The connector plug of the Q6BAT is disconnected from the jack of the CPU module before shipment. To use the battery, connect the connector plug of the Q6BAT and the jack of the CPU module by following the procedure below.

1. Open the battery cover located on the bottom of the CPU module.
2. Check that the Q6BAT (1) is correctly installed.
3. Check the direction and securely insert the connector plug (2) of the Q6BAT to the jack (3) of the CPU module.
4. Close the battery cover.

■Precautions

- When using the CPU module with the battery removed, check that the jack (3) of the CPU module is inserted in the socket on the battery cover located on the bottom of the CPU module.
- Do not drop or apply strong shock to the module and the battery.

FX3U-32BL

To use the battery in the R00CPU, R01CPU, or R02CPU, connect the battery, following the procedure below.

1. Open the LED cover on the front side of the CPU module.
2. Connect the lead connectors to the battery connector (1) in the right orientation. Insert the battery in the battery compartment (2).
3. Close the LED cover.

■Battery error detection setting in the engineering tool

The following setting is required to use the battery in the R00CPU, R01CPU, or R02CPU.

 [CPU Parameter] ⇒ [RAS Setting] ⇒ [Error Detection Setting] ⇒ [Battery Error]

Set the parameter to "Detect". (The default setting is "Not Detected".)

Item	Setting
Error Detection Setting	
<i>Battery Error</i>	Detect
Module Verification Error	Detect
Fuse Blown	Not Detected
Redundant Power Supply System Error	Detect

3.3 Inserting or Removing an Extended SRAM Cassette

Insert an extended SRAM cassette to the CPU module as needed.

Insertion procedure

Insert an extended SRAM cassette while the programmable controller is powered off.

1. Open the cassette cover (1) located on the side of the CPU module.
2. Hold the top and bottom of the tab (2) of an extended SRAM cassette (with the notched edge facing to the right), and insert the cassette straight into the connector. After inserting the cassette, check that it is inserted completely.
3. Close the cover, and mount the CPU module on the base unit.
4. Power on the programmable controller.
5. Set the capacity of the inserted cassette to "Extended SRAM Cassette Setting" in "CPU Parameter" using the engineering tool.
[CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Device/Label Memory Area Setting] ⇒ [Cassette Setting] ⇒ [Extended SRAM Cassette Setting]
6. Using the engineering tool, check that SM626 (Extended SRAM cassette insertion flag) is on.

Precautions

- The availability of the extended SRAM cassette differs depending on the CPU module used. For the availability, refer to the performance specifications of the extended SRAM cassette. (Page 67 Extended SRAM Cassette)
- When the extended SRAM cassette is inserted or removed, all the data such as devices and the file register stored in the device/label memory are erased. Back up the data in the programmable controller before replacing the cassette.
- If the capacity of the extended SRAM cassette differs before and after the replacement, the ERROR LED of the CPU module may flash. But, it is not an error. Change the capacity setting in the CPU parameters. (Refer to step 5 above.)

Restriction

- The extended SRAM cassette for the Universal model QCPU (Q4MCA-□MBS) cannot be used.

Removal procedure

Remove the extended SRAM cassette while the programmable controller is powered off.

1. Read the data on the device/label memory from the CPU module, and save it in advance using the engineering tool. (When the extended SRAM cassette is removed, all of the data on the device/label memory are erased.)
2. Power off the programmable controller.
3. Remove the CPU module from the base unit, and open the cassette cover located on the side of the CPU module.
4. Hold the top and bottom of the tab of the extended SRAM cassette, and pull the cassette straight out of the connector.
5. Close the cover, and mount the CPU module back on the base unit.
6. Power on the programmable controller.
7. Set the "Extended SRAM Cassette Setting" in "CPU Parameter" to "Not Mounted".

3.4 Inserting and Removing an SD Memory Card

Insert an SD memory card to the CPU module as needed.

Insertion procedure

Check the direction and insert an SD memory card, following the procedure below.

For the R01CPU and R02CPU, insert an SD memory card as shown below.

- 1.** Insert an SD memory card (1) into the card slot until it clicks with the notched edge in the direction as illustrated. After inserting the cassette, check that it is inserted completely. Poor contact may cause malfunction.
- 2.** The CARD READY LED (C RDY LED) (2) starts flashing. When the card is ready to be used, the CARD READY LED (C RDY LED) stops flashing and turns on.
- 3.** If the CARD READY LED (C RDY LED) does not turn on even after the card is inserted, check that SM606 (SD memory card forced disable instruction) and SM607 (SD memory card forced disable status flag) are off.

Removal procedure

For the R01CPU and R02CPU, remove an SD memory card as shown below.

1. Press the SD CARD OFF button (1) for one second or longer to disable access to the SD memory card.*¹
2. The CARD READY LED (C RDY LED) (2) flashes during the access stop processing, and turns off upon completion of the processing.
3. Push in and release the SD memory card (3), and then pull the card out of the slot.

*1 SM606 (SD memory card forced disable instruction) can also disable access to an SD memory card. For details, refer to the following.
☞ Page 132 How to forcibly disable the SD memory card with a special relay

Precautions

- Do not drop or apply strong shock to the module and SD memory cards.
- Follow the procedure above when inserting or removing the SD memory card while the system is powered on. If not, the data on the SD memory card may corrupt.
- If any function that accesses the SD memory card is being executed when the SD CARD OFF button is pressed to remove the card, the CARD READY LED turns off after the processing of the function is completed. For this reason, the time required until the LED turns off differs depending on the function being executed.
- If SM605 (Memory card remove/insert prohibit flag) is on, the CARD READY LED does not turn off even if the SD CARD OFF button is pressed. If not, turn on SM606 (SD memory card forced disable instruction) to forcibly disable access to the card.

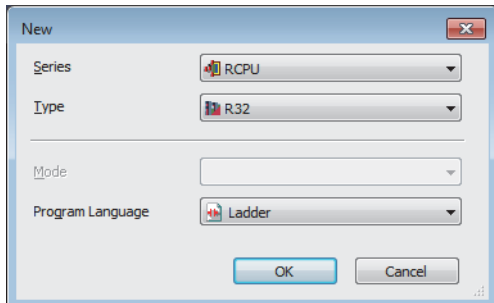

3.5 Creating a Project

Activate the engineering tool and create a project.

 [Project] ⇒ [New]

Procedure

Create a program, following the procedure below. The procedure is for the program described in ladder diagrams.

1. Select "RCPU" in "Series", and the CPU module model to use in "Type". Then, select a programming language to use in the project in "Program". Select "Ladder", and click the [OK] button.

2. Click the [OK] button when the window for adding the module appears.

Point

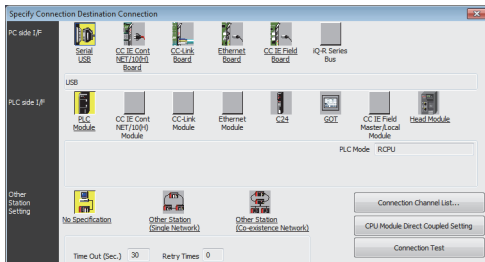

- Module labels are the labels where the I/O signals and buffer memory areas of a module are predefined. Using module labels allows the user to create programs without considering module internal addresses.
- Sample comments are the comments where system devices (special relay/special register) and buffer memory areas of a module are predefined. Using sample comments saves the time of inputting the comments.

3.6 Connecting a Personal Computer

Connect a personal computer where an engineering tool has been installed to the CPU module.

Procedure

Connect a personal computer directly to the CPU module, following the procedure below.

1. Connect a personal computer to the CPU module using a USB cable or Ethernet cable.
2. Select [Online] ⇒ [Current Connection Destination] on the menu bar of the engineering tool.
3. Click the [CPU Module Direct Coupled Setting] button on the "Specify Connection Destination Connection" window.
4. Select the connection method, and click the [Yes] button.
5. Click the [Connection Test] button, and check if the personal computer is connected to the CPU module.

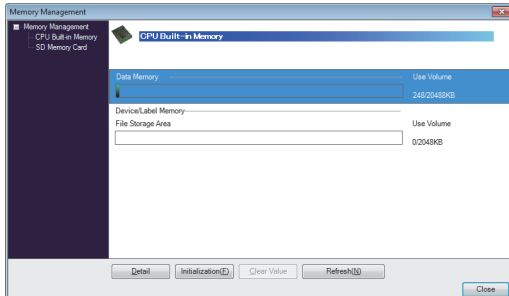

Install a USB driver to use a USB cable for the first time. (📖 GX Works3 Operating Manual)

3.7 Initializing the CPU Module

Initialize the CPU module.

 [Online] ⇒ [CPU Memory Operation]

Procedure

1. Select "Data Memory" on the "Memory Management" window, and click the [Initialization] button.
2. Select "File Storage Area", and click the [Initialization] button.
3. After the initialization processing completes, click the [Close] button.

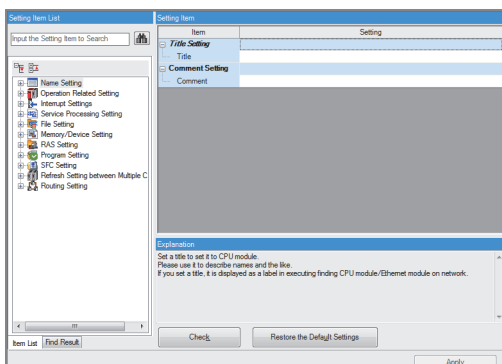

3.8 Setting Parameters

Set system parameters and parameters for each module.

When the engineering tool is connected to the actual system

Set parameters by loading an actual system configuration to the Module Configuration window of the engineering tool.

 [Navigation window] ⇒ [Module Configuration]

1. Open the Module Configuration window, and select [Online] ⇒ [Read Module Configuration from PLC] on the menu bar.
2. Click the [Yes] button when the window for adding module labels of the mounted modules appears.
3. The system parameters are automatically set, and the actual system configuration is displayed on the Module Configuration window.
4. Double-click each module (CPU module, I/O module, or intelligent function module) to display the corresponding module parameter editor.
5. Set parameters, and click the [Apply] button to close the window.

■Precautions

The RQ extension base units, MELSEC-Q series extension base units, and modules mounted on those base units cannot be loaded. For those cannot be loaded, select the units and modules on the Element Selection window, and drag and drop them to the system configured on the Module Configuration window.

When the engineering tool is not connected to the actual system

Set parameters by configuring a system manually on the Module Configuration window of the engineering tool.

1. Select a base unit on the Element Selection window, and drag and drop it to the Module Configuration window.
2. Drag and drop modules to be used on the base unit placed.

3. Select [Edit] ⇒ [Parameter] ⇒ [Fix] on the menu bar.
4. Click the [Yes] button when the window for adding module labels of the configured modules appears.
5. Open the parameter editor of each module by double-clicking the module.
6. Set parameters, and click the [Apply] button to close the window.

3

Point

To use the RnENCPU, the modules can be found from different categories. Select each module from the following categories on the Element Selection window.

- RnENCPU (CPU part): "PLC CPU"
- RnENCPU (network part): "CPU Extension"

Setting parameters from the Navigation window

Set the following parameters from the Navigation window.

■ System parameters

These parameters need to be set from the Navigation window in the following cases: to change the number of slots on the base unit or the number of occupied points of the module; for a multiple CPU system; and for module synchronization operations.

 [Navigation window] ⇒ [Parameter] ⇒ [System Parameter]

■ Module parameters of the CPU module

These parameters are required to execute the Ethernet function or CC-Link IE Field Network Basic function of the CPU module.

 [Navigation window] ⇒ [Parameter] ⇒ [Module model name] ⇒ [Module Parameter]

■ Memory card parameters

These parameters are required to execute functions that access the SD memory card.

 [Navigation window] ⇒ [Parameter] ⇒ [Module model name] ⇒ [Memory Card Parameter]

■ Multiple module parameters and module extension parameters

Some intelligent function modules require multiple module parameters and module extension parameters.

 [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [Intelligent function module] ⇒ [Module Parameter] or [Module Extended Parameter]

Point

System parameters can be set on the following windows. Select the window depending on their application purposes.

- Module Configuration window: Use this window when using the module specific data (such as number of occupied points) as is.
- System Parameter window: Use this window when changing the number of slots or the number of occupied points.

3.9 Programming

Create a program. This section describes how to create a program using the following program example.

Program example

- When Start1 turns on, Timer1 starts counting, and Lamp1 turns on.
- When the current value of Timer1 reaches 1000, Lamp1 turns off.
- When Stop1 turns on, Lamp1 turns off.

Registering labels

Label is a variable whose name and data type can be declared by a user.

Use of labels allows programming without being aware of devices and buffer memory addresses. For this reason, programs using labels can be used in other systems where the module configuration is different.

Labels can be registered on the label editor.

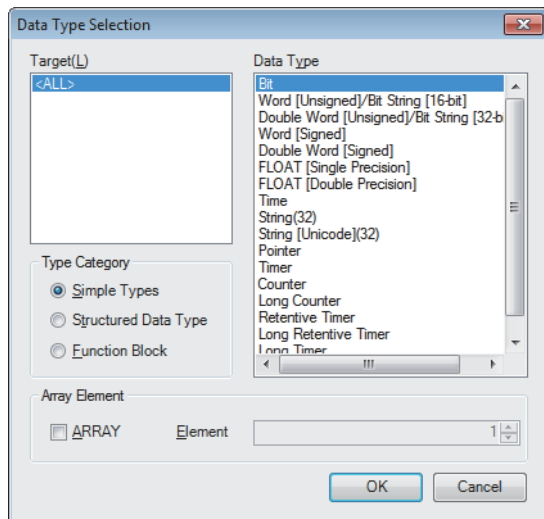

[Navigation window] ⇒ [Program] ⇒ [Scan] ⇒ [MAIN] ⇒ [ProgPou] ⇒ [Local Label]

Procedure

Register the label "Start1" in the program example, following the procedure below.

1. Enter the name, "Start1", in the "Label Name" field (1).
2. Click the button (2) on the right of the "Data Type" field to open the "Data Type Selection" window.
3. Specify the data type. Select "Bit", and click the [OK] button.

Register other labels in the program example in the same way.

Point

- The class, initial value, and constant of labels can be set as needed by clicking the [Show Details] button on the label editor.
- Labels can also be registered while programming without opening the label editor. (👉 Page 52 Inserting POU's by key input)
- Devices can be assigned to global labels. Open the global label editor, and enter a device in the "Assign (Device/Label)" field.

Inserting program elements

Drag and drop required program elements to the ladder editor.

[Navigation window] ⇒ [Program] ⇒ [Scan] ⇒ [MAIN] ⇒ [ProgPou] ⇒ [ProgramBody]

Procedure

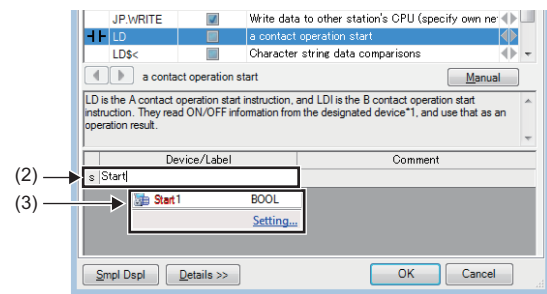

Insert a normally open contact of "Start1" in the program example, following the procedure below.

1. Select a program element from the Element Selection window, and drag and drop (1) it to the desired position on the ladder editor. In this example, drag and drop "LD[1]".

2. Double-click the inserted program element, and click the [ExtDsp] button to open the ladder entry window.

3. Specify the operand. In this example, enter "Start" for "s" (2) in the "Device/Label" field.

4. Select an item from the displayed list (3). In this example, select "Start1".

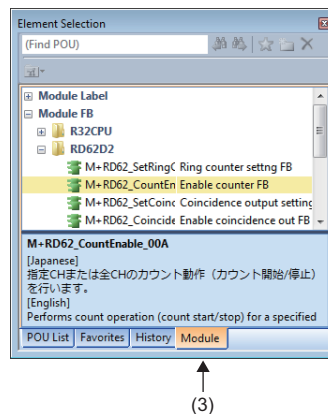

5. The normally open contact of "Start1" is inserted to the program.

Insert other program elements in the program example in the same way.

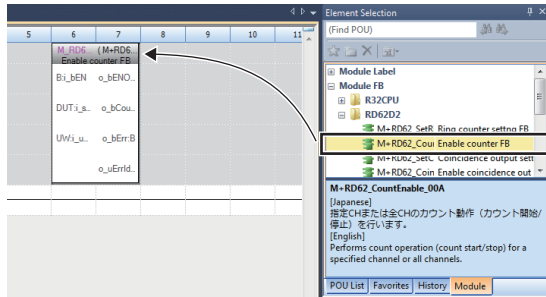

Point

- Common instructions, such as contacts and coils, standard functions/function blocks, and user-defined function blocks/functions can be found in the [POU List] (1) in the Element Selection window. Narrow the list using the drop-down menu (2) for "Display Target", and select program elements.
- Module labels and module function blocks can be found in the [Module] list (3). Programs are efficiently created only by dragging and dropping the module labels and module function blocks on the editor.

■Inserting function blocks

Insert function blocks, following the procedure below.

1. Select a function block from the Element Selection window, and drag and drop it to the desired position on the ladder editor.

2. The "FB Instance Name" window opens. Select the target label (global label or local label), and enter an instance name.

3. Select [Convert] ⇔ [Convert] on the menu bar. The ladder is converted, and the rungs are connected to the input and output labels of the FB instance.

4. Add the input and output parts of the inserted function block to complete the program. For details on the input and output parts, refer to the following.

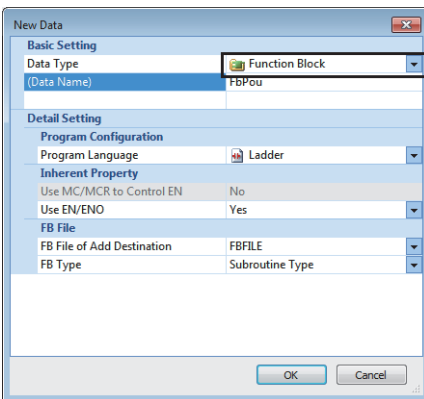

Function Block Reference for the module used

■Creating function blocks/functions

User-defined function blocks/functions must be created before inserted to the program.

1. Right-click "FB/FUN" (1) on the Navigation window, and select "Add New Data" (2) to open the setting window.

2. To create a function block, set the data type to "Function Block" using the drop-down list. To create a function, set the data type to "Function". Then, click the [OK] button.

3. Program the operation of the function block or function in "ProgramBody".

Inserting POU's by key input

POUs can be inserted by key input.

Procedure

Inserting a normally open contact of "Start1" in the program example, following the procedure below.

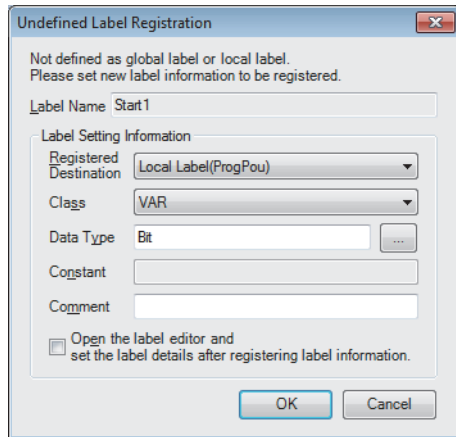

1. Click the insertion position on the ladder editor, and press **[F5]**.
2. Enter the name, "Start", in the entry field (1). Select "Start1" from the displayed list (2).

3. The normally open contact of "Start1" is inserted to the program.

Point

A new label can be registered during insertion. Enter the name of a new label on the ladder entry window, and click the [OK] button. Then, specify the registered destination, class, and data type of the label on the "Undefined Label Registration" window, and click the [OK] button.

3.10 Converting the Program

Determine the input ladder blocks.

Procedure

1. Select [Convert] ⇒ [Convert] on the menu bar.
2. When the conversion processing completes and the input ladder blocks are determined, the color of those ladder blocks changes from gray to white.

3.11 Saving the Project

Save the created project.

 [Project] ⇒ [Save as]

3.12 Writing Data to the Programmable Controller

Write the set parameters and the created program to the CPU module.

 [Online] ⇒ [Write to PLC]

Procedure

1. Select the system parameter file, CPU parameter file, module parameter file, and program file on the "Online Data Operation" window. If any function block is used, select the corresponding FB/FUN file as well.
2. Click the [Execute] button.
3. After the write processing completes, click the [Close] button.

Point

- For the operation of the CPU module, the system parameter file, CPU parameter file, and program file must be written. For the operation of the I/O modules and intelligent function modules, the module parameter files and module extension parameter file must be written as well.
- When a parameter setting is changed, reset the CPU module. ( Page 54 Resetting the CPU Module)
- Use of the [Select Favorites] button enables users to easily select frequently-used files, such as the system parameter file, CPU parameter file, and program file. Register items as favorites on the window opened by selecting [Setting] ⇒ [Register Favorites Selection] on the menu bar.

3.13 Resetting the CPU Module

Reset the CPU module using the RUN/STOP/RESET switch located on the front of the CPU module.

Procedure

1. Set the RUN/STOP/RESET switch (1) to the RESET position for a second or longer.
2. Check that the ERROR LED (2) flashes for several times and turns off.
3. Set the switch back to the STOP position.

For the R00CPU, R01CPU, and R02CPU, the switch and LED are located as shown below.

Point

Operate the RUN/STOP/RESET switch with your fingers. Use of a tool such as a screwdriver may damage the switch.

3.14 Executing the Program

Execute the program written to the programmable controller by using the RUN/STOP/RESET switch.

Procedure

1. Set the RUN/STOP/RESET switch (1) to the RUN position.
2. Check that the PROGRAM RUN LED (P RUN) (2) turns on.

For the R00CPU, R01CPU, and R02CPU, the switch and LED are located as shown below.

3.15 Monitoring the Program

Monitor the program operation using the engineering tool.

Monitoring on the monitor status bar

For the monitor status bar, refer to the following.

GX Works3 Operating Manual

Monitoring on the ladder editor

The on/off states of contacts and coils and the current values of word devices and labels can be monitored on the ladder editor.

- (1) The on/off states of the contacts and coils are displayed.
- (2) The current value of the word/double word type data is displayed.

1. Select [Online] ⇒ [Monitor] ⇒ [Start Monitoring] on the menu bar.
2. Monitor the on/off states of contacts and coils and the current values of word devices and labels.

■On/off state display

The on/off states are displayed on the editor as follows:

■Changing the current value

To change the current value, select the cell on the ladder editor, and press **[Shift]** + double-click the cell or press **[Shift]** + **[Enter]** while the program is being monitored.

Point

The program can also be monitored on the Device/Buffer Memory Batch window or the Watch window. (GX Works3 Operating Manual)

PART 3

SYSTEM CONFIGURATION

This part consists of the following chapter.

4 SYSTEM CONFIGURATION

4 SYSTEM CONFIGURATION

For system configurations using the MELSEC iQ-R series modules, applicable combinations of CPU modules and the other modules, the number of mountable modules, installation, and wiring, refer to the following.

 MELSEC iQ-R Module Configuration Manual

MEMO

PART 4

SPECIFICATIONS

This part consists of the following chapter.

5 PERFORMANCE SPECIFICATIONS

5 PERFORMANCE SPECIFICATIONS

5.1 CPU Module

This section describes the specifications of the CPU module.

Hardware specifications

Item		R00	R01	R02	R04 R04EN	R08 R08EN	R16 R16EN	R32 R32EN	R120 R120EN		
Operation control method		Stored program cyclic operation									
I/O control mode		Refresh mode (The direct access input/output is available by specifying the direct access input/output (DX, DY).)									
Instruction processing time	LD instruction	31.3ns		3.92ns	0.98ns						
	MOV instruction	62.7ns		7.84ns	1.96ns						
Instruction processing time (structured text language)	IF	31.3ns		3.92ns	1.96ns						
	CASE	31.3ns		3.92ns	1.96ns

	Backup power time*8	10 days			Three minutes				
	Data retained	Clock data			Device/label memory, clock data				
Allowable momentary power failure time		The time differs depending on the power supply module used. ( MELSEC iQ-R Module Configuration Manual)							
Internal current consumption (5VDC)		0.67A			• RnCPU: 0.67A*9 • RnENCPU: 1.49A*9				
External dimensions	Height	106mm (Base unit mounting side: 98mm)							
	Width	27.8mm			• RnCPU: 27.8mm • RnENCPU: 56mm				
	Depth	110mm							
Weight		0.20kg			• RnCPU: 0.20kg • RnENCPU: 0.40kg				

*1 The capacity of device area, label area, latch label area, and file storage area can be changed in parameter. The capacity of the device/label memory can be increased by inserting an extended SRAM cassette. ( Page 127 Device/label memory area setting)

*2 For the programmable controller CPU with the firmware version "27" or earlier, the memory capacity is 20K bytes.

*3 This is the total capacity of the device area and module label area.

*4 System files are included.

*5 The number indicates the number of files and folders (including system files and system folders) can be created in the root directory on the condition that the number of characters in the file or folder name is 13 or less. In a subdirectory, up to 32767 folders can be created. Note that the number of storable files and folders will decrease if many folders with a long name, more than 13 characters (including an extension), are created.

*6 The number indicates the number of files and folders (including system files and system folders) can be created in the root directory on the condition that the number of characters in the file or folder name is 13 or less. In a subdirectory, up to 2482 folders can be created.

*7 One FB file can store 64 function blocks.

*8 These backup power times apply under the ambient temperature of 25°C.

*9 The internal current consumption increases by 0.15A maximum when a battery-less option cassette is inserted.

10 The following characters cannot be used for file or folder names: A space, "%+/,;<=>?[\\]{}&~@^".

*11 The capacity differs depending on the firmware version and the production information of the CPU module. ( Page 705 Added and Enhanced Functions)

Point

For the hardware specifications of the RnENCPU (network part), refer to the following.

 MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)

*1 For the setting range, refer to the following.

 Page 416 Device Setting

*2 These are the maximum points that can be handled in the CPU module. The number of points actually used differs depending on the module used.

*3 The maximum point differs depending on the parameter setting (Multiple CPU Setting).

*4 These devices are used in SFC programs. For details on SFC programs, refer to the following.

 MELSEC iQ-R Programming Manual (Program Design)

*5 If using the devices with the RnCPU, check the versions of the CPU module and engineering tool used. ( Page 705 Added and Enhanced Functions)

*6 The RnENCPU does not support the use of this interrupt.

*7 The maximum number of points differs depending on the "Link Direct Device Setting" of the engineering tool. Before using the "Link Direct Device Setting", check the version of the CPU module and engineering tool used. ( Page 705 Added and Enhanced Functions)

Point

For the programming specifications of the RnENCPU (network part), refer to the following.

 MELSEC iQ-R Ethernet/CC-Link IE User's Manual (Startup)

5.2 Extended SRAM Cassette

This section describes the performance specifications of the extended SRAM cassette.

Item	NZ2MC-1MBS	NZ2MC-2MBS	NZ2MC-4MBS	NZ2MC-8MBS	NZ2MC-16MBS*1
Capacity	1M bytes	2M bytes	4M bytes	8M bytes	16M bytes
Number of insertions and removals	Limited to 50 times				
External dimensions	Height	49mm			
	Width	32mm			
	Depth	18.5mm			
Weight	20g				

*1 Check the versions of the CPU module and engineering tool used. (☞ Page 705 Added and Enhanced Functions)

Restriction

The R00CPU, R01CPU, and R02CPU do not support the use of these devices.

5.3 Battery-less Option Cassette

This section describes the performance specifications of the battery-less option cassette.

Item	NZ1BLC*1	
Number of insertions and removals	Limited to 50 times	
Internal current consumption (5VDC)	0.15A	
External dimensions	Height	49mm
	Width	32mm
	Depth	18.5mm
Weight	20g	

*1 Check the versions of the CPU module and engineering tool used. (☞ Page 705 Added and Enhanced Functions)

Restriction

The R00CPU, R01CPU, and R02CPU do not support the use of these devices.

PART 5

CPU MODULE OPERATION

This part consists of the following chapters.

6 RUNNING A PROGRAM

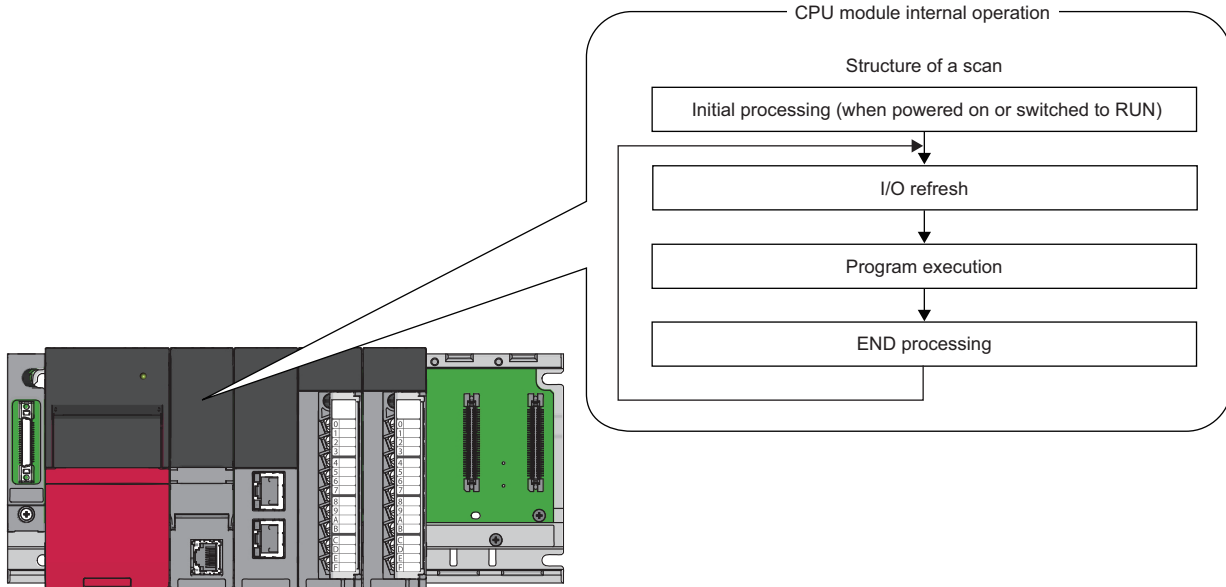

7 CPU MODULE OPERATION PROCESSING

8 MEMORY CONFIGURATION OF THE CPU MODULE

6 RUNNING A PROGRAM

6.1 Scan Configuration

The following shows the scan configuration of the CPU module.

Initial processing (when powered on or switched to RUN)

For the initial processing (when powered on or switched to RUN), the following processes are performed:

○: Performed, ×: Not performed

Item	Initial processing	Initial processing (when switched to RUN)
Booting from an SD memory card	○	×
Checking each parameter and program*1	○	○
Checking the consistency of parameters for the multiple CPU system configuration	○	○
Assigning the I/O number to the mounted module	○	○
Initializing and setting the information of each module	○	×
Initializing a device/label outside the latch range (Bit device: Off, Others: 0)	○	×
Setting the device/label initial value	○	○

*1 Checking each parameter and program takes time depending on the parameter setting and the number of programs, and thus the CPU module may take time to respond to the peripheral.

When functions that require an SD memory card are enabled and the status of the SD memory card is as follows, the initial processing (when powered on or switched to RUN) takes time, and thus the CPU module may take time to respond to the peripheral.

- A large number of files is stored in the SD memory card.
- The SD memory card is close to the end of life or it has reached the end of life.

I/O refresh

The module performs the following before starting program operation.

- ON/OFF data input from the input module/intelligent function module to the CPU module.
- ON/OFF data output from the CPU module to the output module/intelligent function module.

Point

While constant scan is in progress, I/O refresh is performed after the waiting time for constant scan expires.

Program operation

According to the program settings, the module executes from step 0 through the END/FEND instruction for each program.

This program is referred to as a main routine program. A main routine program can be divided into subroutine programs. ( Page 98 Subroutine Program)

END processing

The CPU module performs the following processing.

- Network module link refresh
- Link refresh of CC-Link IE Field Network Basic
- Intelligent function module refresh
- Instruction end processing (including dedicated instruction for the module)
- Device latch processing
- Service processing such as read and write of devices, labels, and program access files ( Page 685 Target List and Operation Details of the Device/Label Access Service Processing Setting)
- Watchdog timer reset ( Page 166 Watchdog timer reset)
- Refresh between CPU modules (for the multiple CPU system configuration)
- Data collection by the data logging function (when the collection interval is set to "Each scanning cycle" or "Sample data at the next END processing after the specified time has elapsed")
- Sequence scan synchronization sampling function
- Recording function (when the sampling method is set to "Each scanning cycle" or "Time specification")
- Self-diagnostics processing
- Sets a value to the special relay/special register (for those with the set timing specified as the END processing timing)

Point

Even during the END processing, an interrupt program, fixed scan execution type program, or event execution type program (when the trigger type is set to at interrupt occurrence) is executed. To prevent the execution of an interrupt program during the END processing, disable an interrupt by the DI instruction immediately before the END processing, and enable an interrupt by the EI instruction at the head of the interrupt program.

6.2 Scan Time

The CPU module repeats the following processing. The scan time is the sum of the following processing and execution time.

*1 The initial scan time includes this processing.

Initial scan time

The first scan time after the CPU module becomes in the RUN state.

How to check the initial scan time

See below.

- Values stored in SD518 (Initial Scan Time) and SD519 (Initial Scan Time)
- Program List Monitor (📖 GX Works3 Operating Manual)

Initial scan time monitoring

Monitoring is performed with the initial scan time monitoring time. (📖 Page 166 Scan time monitoring time setting)

■Precautions on the initial scan time monitoring time

- Set the initial scan time monitoring time longer than the execution time of the initial scan time.

Constant scan

Scan time is different for each scan because its processing time varies depending on whether instructions used in a program are executed or not. By setting constant scan, the I/O refresh interval can be kept constant even when the program execution time varies because the program can be executed repeatedly by keeping the scan time constant.

- When constant scan is set (Setting value = 7ms)

- When constant scan is not set

Setting constant scan

Constant scan can be set.

[CPU Parameter] ⇒ [RAS Setting] ⇒ [Constant Scan Setting]

Window

Displayed items

Item	Description	Setting range	Default
Constant Scan	Sets the constant scan time.	<ul style="list-style-type: none"> • R00CPU, R01CPU, R02CPU: 0.5 to 2000ms (in increments of 0.1ms) • Other CPU modules: 0.2 to 2000ms (in increments of 0.1ms) 	—

Point

The setting time for the constant scan must be a value that satisfies the relational expression below.
 "Watchdog timer setting time" > "Constant scan setting time" > "Maximum scan time of the program"
 If the maximum scan time of the program is longer than the constant scan setting time, it is assumed as an error to ignore the constant scan, and the scan time of the program is applied.

Accuracy of constant scan

The accuracy of the constant scan is 0.01ms. However, if processing, which should be executed during the waiting time from the completion of the END processing to the start of the next scan, is being executed, the constant scan cannot finish even if the constant scan time is reached. The constant scan may increase by the program execution time of the interrupt factor.

( Page 74 Precautions)

Precautions

Processing of the program is stopped during the waiting time from the time the END processing is completed for the program until the next scan starts. If any of the following processing requests is received during the waiting time, the corresponding processing is executed.

- Interrupt program
- Fixed scan execution type program
- Event execution type program which uses occurrence of an interrupt as a trigger
- Device/label access service processing

Device/label access service processing setting

The user can specify the time or the execution timing of the device/label access service processing which is performed during the END processing.

A request to the CPU module from a peripheral is processed by the device/label access service processing. A communication response to a request from a peripheral varies depending on the scan time and the state of communication load. To create the service processing environment suitable for the system, change the device/label access service processing setting as shown below.

- Set a longer time for the device/label access service processing to improve a communication response to a peripheral.
- Set a shorter time for the device/label access service processing to reduce a scan time extension due to service processing.

Note that communications to the CPU module from multiple peripherals may lower a communication response to each peripheral. Thus, consider the performance of communication responses and the extension of scan time, and adjust the service processing environment according to the system by methods such as setting a longer time for the device/label access service processing or changing the parameter settings of peripherals so that the timeout time becomes longer.

Point

For functions to which the device/label access service processing setting can be applied, refer to the list targeted for device/label access service processing setting. (📖 Page 685 Target list)

Setting method

The device/label access service processing can be configured as follows.

 [CPU Parameter] ⇒ [Service Processing Setting] ⇒ [Device/Label Access Service Processing Setting]

Window

Item	Setting
Device/Label Access Service Processing Setting	
Specifying Method	Execute the Process as Scan Time Proceeds
Rate	10 %
Time	0.1 ms
Counts	1 Times

Displayed items

Item	Description	Setting range	Default
Specifying Method	Select a method for specifying the service processing for access to devices/labels.	<ul style="list-style-type: none"> Execute the Process as Scan Time Proceeds Set Processing Time Set Processing Counts Execute END Processing between Programs 	Execute the Process as Scan Time Proceeds
Rate	Set the ratio of the device/label access service processing to execute during a single scan when "Execute the Process as Scan Time Proceeds" is enabled. The device/label access service processing time is determined based on the scan time.	1 to 99% (unit: 1%)	10%
Time	Set the device/label access service processing time per scan when "Set Processing Time" is enabled.	0.1 to 1000ms (unit: 0.1ms)	0.1ms
Counts	Set the number of executions of the device/label access service processing per scan when "Set Processing Counts" is enabled.	1 to 10 times (unit: 1 time)	1 time

Operations enabled by setting details

Operations enabled by setting details of the device/label access service processing setting are as follows.

Item	Scan performance		Device/label access service process performance		Inter-program monitoring ^{*5}	Application
	Increase ^{*1}	Stability ^{*2}	Response time ^{*3}	Stability ^{*4}		
Execute the Process as Scan Time Proceeds	Medium	Medium	Medium	Medium	None	<p>This setting is useful to execute the device/label access service processing in a way commensurate with the system size. It allows the system to be designed without considering the device/label access service processing time because it is determined as a function of the scan time.</p> <p>Multiple requests are processed until the specified ratio is exceeded. If exceeded, the remaining requests are processed in the END processing of the next scan.</p> <p>When no request data is received in the current scan, the scan time is shortened by the specified ratio as the CPU module proceeds to the next scan without waiting for requests.</p>
Set Processing Time	Medium	High	Medium	High	None	<p>This setting is useful to give priority to the device/label access service processing. It allows for stable communication because the CPU module can always process a constant amount of the device/label access service processing without affecting the scan time.</p> <p>Multiple requests are processed until the specified processing time is exceeded. If exceeded, the remaining requests are processed in the END processing of the next scan. When no request data is received in the current scan, the scan time is shortened by the specified processing time as the CPU module proceeds to the next scan without waiting for requests.</p>
Set Processing Counts	Large	Low	Medium	High	None	<p>This setting is useful to stably execute the device/label access service processing in a system where requests come from multiple peripherals. It provides stable communication in a system where multiple peripherals exist because the CPU module can execute the device/label access service processing based on the number of request sources.</p> <p>Multiple requests are processed until the specified number of executions of the service processing is reached. When no request data is received in the current scan, the CPU module proceeds to the next scan without waiting for requests.</p>
Execute END Processing between Programs	Large	Medium	Quick	High	Yes	<p>This setting is useful to give priority to the device/label access service processing in a system with a large number of programs. It improves the communication response as it enables the device/label access service processing to be executed multiple times during a single scan.</p> <p>When no request data is received between program executions and/or during the END processing, the CPU module proceeds to the next program or scan without waiting for requests.</p>

*1 This term indicates how long the scan time will be extended at its maximum due to the device/label access service processing.

*2 This term indicates how much the scan time will be varied due to the device/label access service processing.

*3 This term indicates how long the response time will take after a request for the device/label access service processing is received from an engineering tool or the like.

*4 This term indicates how much the response time will be varied depending on the contents of requests for the device/label access service processing from engineering tools or the like.

*5 When this function is enabled, monitoring is performed between execution of programs, and therefore values of ongoing operation may be read out. (Page 78 When "Execute END Processing between Programs" is enabled)

For what operation is enabled by setting each item, refer to the following.

Page 687 Operation details

Precautions

This section describes the precautions on the device/label access service processing setting.

■Functions that may prolong the scan time

For the following functions, the scan time may become longer than the specified time during processing even when this setting is applied.

- Online change
- Device/buffer memory batch monitor
- Real-time monitor function
- Data logging function
- Sequence scan synchronization sampling function
- Recording function
- File register write or read*¹

*¹ The scan time becomes longer when the size of data to write or read is large.

■When constant scan is set

The CPU module always processes one request during the END processing, and processes the remaining requests during the wait time for the next constant scan. Set constant scan setting time considering the time required for the device/label access service processing to execute.

■When "Execute END Processing between Programs" is enabled

When "Execute END Processing between Programs" is enabled, the device/label access service processing, such as device access, is performed between program executions and during the END processing. Therefore, when monitoring and current value change are performed in the situation where a device value is processed across programs, values of ongoing operation may be read or written.*¹

Also, when "Execute END Processing between Programs" is enabled, if monitoring and current value change are performed for the file register where "Use File Register of Each Program" is enabled, unintended data may be obtained or written. In this case, the value of the file register may not fall into the range depending on whether the file register is used for each program and the size of the file register.*²

The target timing of monitoring or current value change can be specified by using the specified program monitor. ( Page 202 Specified Program Monitor)

*¹ Because the timing of monitoring or current value change (during execution of a program or the END processing) cannot be specified, values of ongoing operation may be read or written.

*² Because monitoring is performed between programs and the operation is executed during the END processing, a file register to be registered and whose current value is to be changed cannot be specified.

6.3 Data Communication and I/O Processing

Data communication

In data communication, data such as I/O signals, buffer memory, and link device of the CPU module and intelligent function module are communicated.

There are two modes for data communication: refresh mode which automatically sends/receives the module data into the device or label of the CPU module at END processing and direct mode which accesses when an instruction is executed in a program.

When data communication is conducted for the module where a major error occurs, the following operation is performed:

- When access by the contact instruction is executed for the controlled module, non-running, rather than an error, is returned. When direct access by other instructions is executed, "Major error in module" (error code: 2450) occurs.
- No error occurs when direct access for the non-controlled module is executed.

I/O processing and response delay

The CPU module performs the I/O processing in the refresh mode. Using the direct access input/output in a program, however, allows the CPU module to perform I/O processing in the direct mode at the time of each instruction execution. This section describes these I/O processing modes of the CPU module and response delays.

Refresh mode

The CPU module performs I/O processing collectively at a specified timing. The following table lists the refresh timing which can be specified. (☞ Page 80 Refresh mode)

Refresh timing	Description
When END processing is performed	The refresh processing is performed in every END processing*1.
At the execution time of specified program	The refresh processing is performed before and after specified program execution. (☞ Page 97 Group setting for refresh)

*1 There are modules which performs the refresh processing at a specified END processing rather than at every END processing. (☞ User's manual for the module used)

Direct mode

The CPU module performs I/O processing when each instruction is executed in a program. To access input/output modules in the direct mode, use the direct access input or direct access output in a program. (☞ Page 82 Direct mode)

Differences between refresh mode and direct mode

The direct mode directly accesses I/O modules at execution of an instruction. Therefore, data is input faster than when it is input in refresh mode. Processing time required for each instruction, however, takes longer. The following table lists the availability of the refresh mode and the direct mode for each input and output.

Item	Refresh mode	Direct mode
Input/output modules	Enabled	Enabled
Input/output of intelligent function modules		Disabled
Remote input/output in CC-Link IE Controller Network, CC-Link IE Field Network, CC-Link IE Field Network Basic, MELSECNET/H, or CC-Link		

Refresh mode

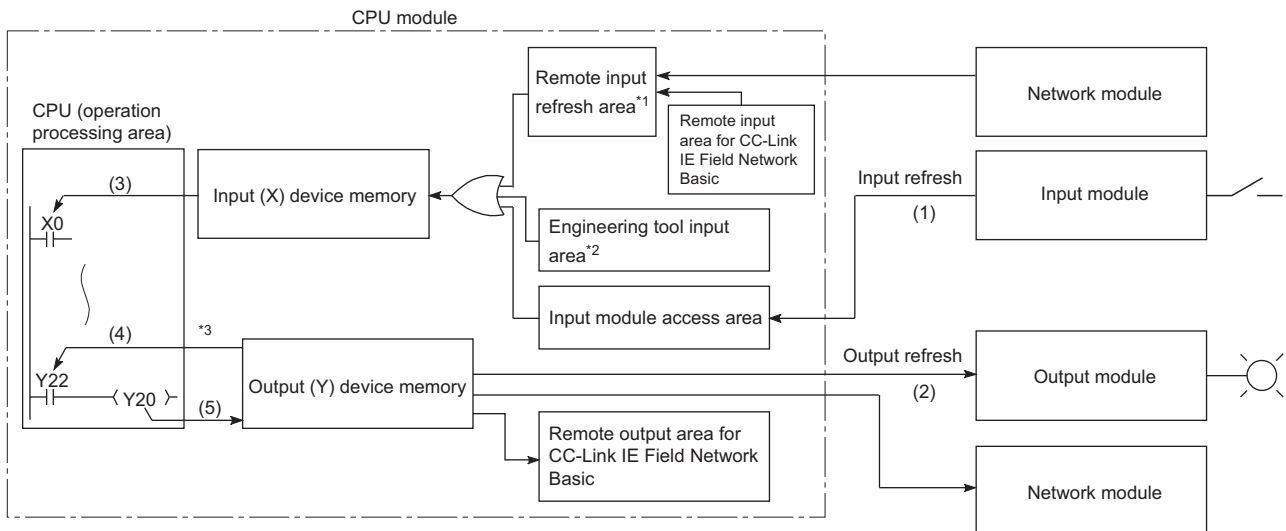

The CPU module performs I/O processing collectively at a specified timing.

The timing of the input refresh and output refresh follows the specified refresh timing setting.

Outline of the processing

The following describes the details of the refresh mode.

*1 The remote input refresh area indicates the area to be used when refresh is set to the input (X) in CC-Link IE Controller Network, CC-Link IE Field Network, CC-Link IE Field Network Basic, MELSECNET/H, or CC-Link.

*2 Data in the engineering tool input area can be turned on or off by the following:

- Test operation of an engineering tool
- Writing data from the network module
- Writing data from an external device using SLMP

*3 Data in the output (Y) device memory can be turned on or off by the following:

- Test operation of an engineering tool
- Writing data from the network module
- Writing data from an external device using SLMP

Item	Description
Input refresh	At a specified timing (at END instruction execution or before specified program execution), input data are collectively read out from the input modules (1), the OR processing with the engineering tool input area and remote input refresh area is executed, and then the data are stored in the input (X) device memory.

Item	Description
Output refresh	At a specified timing (at END instruction execution or before specified program execution), data in the output (Y) device memory (2) are collectively output to the output module.
Execution of an input contact instruction	Input data in the input (X) device memory (3) are read out and the program is executed.
Execution of an output contact instruction	Output data in the output (Y) device memory (4) are read out and the program is executed.
Execution of the OUT instruction	The operation result of the program (5) are stored to the output (Y) device memory.

Input

On/off data of an input module are batch-input to the area for communication with the input module in the CPU module at a specified timing (at END instruction execution or before specified program execution). The CPU module performs program operations using the on/off data stored in the input (X) device memory.

Output

The operation results of the program is output to the output (Y) device memory in the CPU module every time program operation is performed. Then, the CPU module batch-outputs the on/off data in the output (Y) device memory to an output module at a specified timing (at END instruction execution or before specified program execution).

Response delay

An output response which corresponds to the status change in the input module delays for two scans (maximum) depending on the on timing of an external contact.

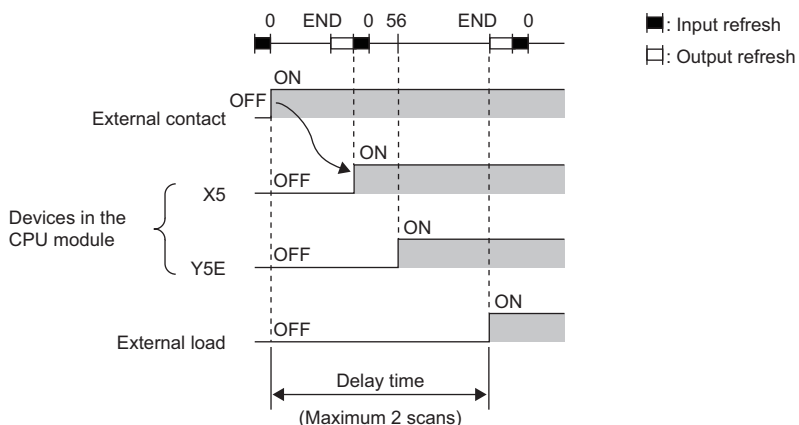

[Example] A program that turns on the output Y5E when the input X5 turns on

- Y5E turns on the earliest

- Y5E turns on the latest

Direct mode

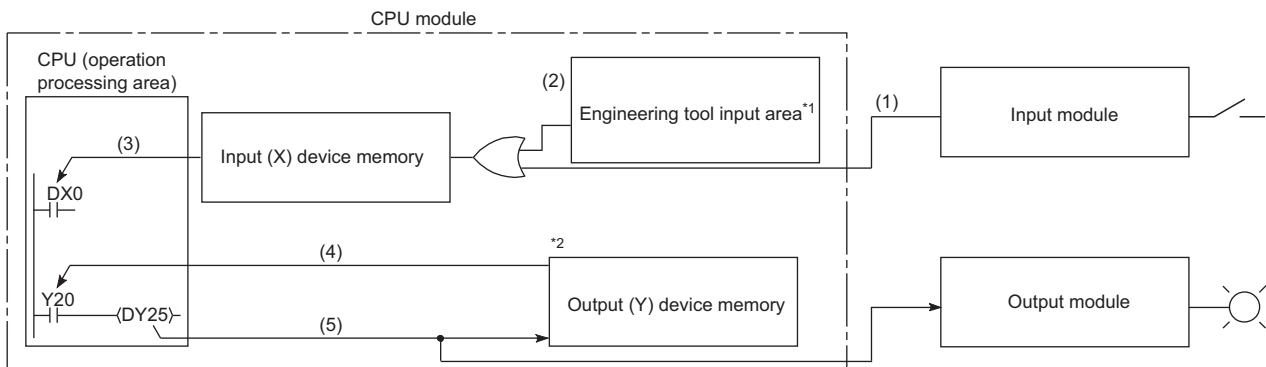

The CPU module performs I/O processing when each instruction is executed in a program.

With this mode, the CPU module uses the direct access input (DX) and direct access output (DY) to perform I/O processing.

Outline of the processing

The following describes the details of the direct mode.

*1 Data in the engineering tool input area can be turned on or off by the following:

- Test operation of an engineering tool
- Writing data from the network module
- Writing data from an external device using SLMP

*2 Data in the output (Y) device memory can be turned on or off by the following:

- Test operation of an engineering tool
- Writing data from the network module
- Writing data from an external device using SLMP

Item	Description
Execution of an input contact instruction	The OR processing is executed with the input information of the input module (1) and the input data of the engineering tool input area (2) or remote input refresh area. The result is stored in the input (X) device memory and is used as input data (3) to execute the program.
Execution of an output contact instruction	Output data in the output (Y) device memory (4) are read out and the program is executed.
Execution of the OUT instruction	The operation result of the program (5) are output to the output module, and stored in the output (Y) device memory.

Response delay

An output response which corresponds to the status change in the input module delays for one scan (maximum) depending on the on timing of an external contact.

[Example] A program that turns on the output DY5E when the input DX5 turns on

- Y5E turns on the earliest

- Y5E turns on the latest

6.4 Program Flow

Programs are executed in order when the CPU module is switched to the RUN state according to the program execution type and execution sequence settings ( Page 85 Program Execution Type,  Page 96 Execution type change).

Point 

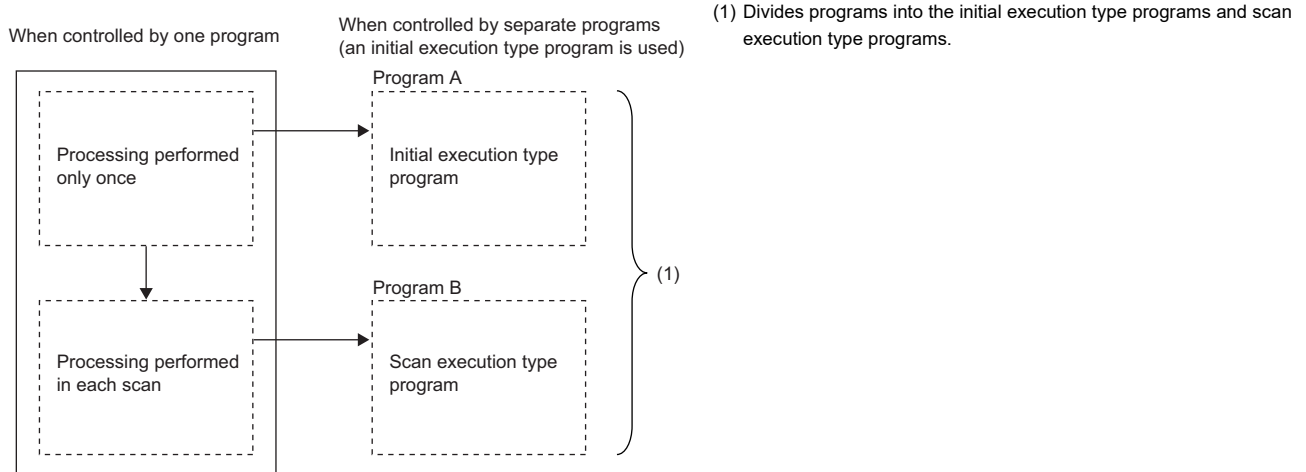

Programs with the same execution type are executed according to the execution sequence settings.

6.5 Program Execution Type

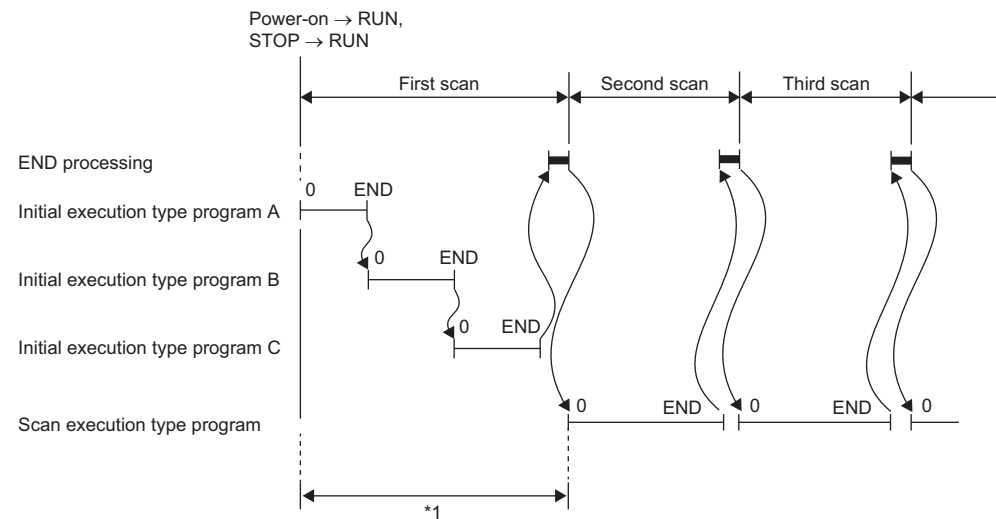

Set the execution condition of the program. (📖 Page 96 Execution type change)

Initial execution type program

Initial execution type program is executed only once when the CPU module has been powered off and on, or switched from the STOP state to the RUN state. Use this execution type for a program, for example, initial processing for the intelligent function module, which does not need execution after executed once in the initial scan.

Note that the execution time of the initial execution type program is the same as the initial scan time. (📖 Page 72 Initial scan time) When multiple initial execution type programs are executed, the execution time of the initial execution type program will be the total time until all the initial execution type programs finish execution.

*1 The sum of the initial execution type program execution time and END processing time is the initial scan time.

Precautions

The following lists the precautions for the initial execution type programs.

■Restrictions on program creation

In the initial execution type program, do not use an instruction which requires several scans to complete (i.e., an instruction with a completion device).

Ex.

e.g. SEND and RECV instructions

Scan execution type program

Scan execution type program is executed only once per every scan starting from the scan following the scan in which the initial execution type program was executed.

When multiple scan execution type programs are executed, the execution time of the scan execution type program will be the total time until all the scan execution type programs finish execution. Note that if interrupt program, fixed scan execution type program, and/or event execution type program are executed before the scan execution type program finishes execution, the execution time for these programs is also included.

Fixed scan execution type program

An interrupt program which is executed at a specified time interval. Differently from the normal interrupt program, this type of program does not require the interrupt pointer (I) and the IRET instruction and is executed for each program file unit.

To execute a fixed scan execution type program, the EI instruction must be used to enable interrupts.

Fixed scan interval setting

Set the execution condition of the fixed scan execution type program.

Specified Time Intervals	Sets the fixed scan interval to execute the fixed scan execution type program.	<ul style="list-style-type: none"> • When "ms" is selected: 0.5 to 60000ms (in increments of 0.5ms) • When "s" is selected: 1 to 60s (in increments of 1s) 	—
Unit	Selects the unit for the fixed scan interval.	<ul style="list-style-type: none"> • ms • s 	ms

Operation when the execution condition is satisfied

The following describes operation of the program.

■If the execution condition is satisfied before the interrupt is enabled by the EI instruction

The program enters the waiting status and is executed when the interrupt is enabled. Note that if the execution condition for this fixed scan execution type program is satisfied more than once during the waiting status, the program is executed only once when the interrupt is enabled.

■If there are multiple fixed scan execution type programs

If the specified time comes simultaneously for these programs, they are executed in order according to the specified execution sequence.

■If another or the same execution condition is satisfied while the fixed scan execution type program is being executed

The program is executed according to the fixed scan execution mode setting.

■If the execution condition is satisfied while the interrupt is disabled by the system

The program is executed according to the fixed scan execution mode setting.

■If an interrupt factor occurs during link refresh

The link refresh is suspended and the fixed scan execution type program is executed. Even while the station-based block data assurance is enabled for cyclic data during refresh of such links as CC-Link IE Field Network, if the fixed scan execution type program uses a device specified as the refresh target, the station-based block data assurance for cyclic data is not available.

(1) The link refresh is suspended and the fixed scan execution type program is executed.

■If an interrupt factor occurs during the waiting time after END processing in constant scan execution

The fixed scan execution type program is executed.

*1 If processing does not finish during the waiting time, the scan time is extended.

■If another interrupt occurs while the fixed scan execution type program is being executed

If an interrupt program (including an interrupt which triggers the event execution type program) is triggered while the fixed scan execution type program is being executed, the program operates in accordance with the interrupt priority. (☞ Page 114 Multiple interrupt function)

Processing when the fixed scan execution type program starts

The same processing as when the interrupt program starts. (☞ Page 111 Processing at interrupt program startup)

Fixed scan execution mode

For fixed scan interrupts (I28 to I31, I48, I49) triggered by the fixed scan execution type program or the internal timer of the CPU module, this mode specifies the program execution operation that is performed when more than one interrupt occurs. (☞ Page 100 Operation upon occurrence of an interrupt factor) However, an execution cause which occurs while the interrupt is disabled by the DI instruction is excluded from the fixed scan execution mode target.

■Operation in the fixed scan execution mode

This section describes the operation which can be performed in the fixed scan execution mode.

- Execution Count Takes Priority

The program is executed for all the pending number of executions so that it can be executed the same number of times as execution causes.

(1) The program is executed just three times, which is the pending number of executions, as soon as interrupt becomes available.

- Precede Fixed Scan

When a pending execution exists, it is performed within the delay limit value behind a cycle. (☞ Page 90 Delay limit value behind a cycle) Note that, even if more than one pending execution exists, only one execution is performed.

■Fixed scan execution mode setting

Use the fixed scan execution mode setting.

☞ [CPU Parameter] ⇒ [Interrupt Settings] ⇒ [Fixed Scan Execution Mode Setting]

Window

Displayed items

Item	Description	Setting range	Default
Fixed Scan Execution Mode	When fixed scan characteristics are prioritized, an execution is performed within the delay limit value behind a cycle. When the number of executions is prioritized, all the pending executions are performed.	<ul style="list-style-type: none"> • Precede Fixed Scan • Execution Count Takes Priority 	Precede Fixed Scan

■ Delay limit value behind a cycle

This value indicates the allowable period of time for a delay (a time lag) behind a cycle and a waiting program is executed if an interrupt is enabled within the period. If an interrupt is enabled outside the period, the program is not executed.

The delay limit value behind a cycle differs as follows.

- For the fixed scan execution type program

The value is the greatest common divisor of the fixed scan intervals of all the fixed scan execution type programs. For example, if there are fixed scan execution type programs with 2ms, 4ms, and 12ms scan periods, the delay limit value behind a cycle is 2ms.

- For fixed scan interrupts (I28 to I31, I48, I49) using the internal timer of the CPU module

The value is fixed to the same value as the fixed scan interval. For example, if the periods are I28: 100ms and I29: 20ms, the delay limit value behind a cycle is 100ms for I28, and 20ms for I29.

Event execution type program

This type of program starts execution when triggered by a specified event. (☞ Page 91 Trigger type) The program is executed at the execution turn specified in the program settings of the CPU parameters, and if execution conditions of the specified trigger are met when the execution turn of the event execution type program comes, the program is executed.

*1 Measurement of elapsed time is 10ms or more because it is determined depending on the scan time.

Trigger type

The following lists the triggers for the event execution type programs. (☞ Page 94 Trigger setting)

■Interrupt occurrence by the interrupt pointer (I)

When the specified interrupt factor occurs, the program is immediately executed once. However, before that, interrupt must be enabled by executing the EI instruction. Enabling programs to be independently executed as interrupt programs, this method eliminates the need to write the FEND instruction, interrupt pointers, and the IRET instruction within scan execution type programs.

(1) When an interrupt occurs, the event execution type program C is executed immediately.

Interrupt pointers (I) which can be specified are I0 to I15, I28 to I31, I44, I45, I48, I49, I50 to I1023.

Execution conditions for the event execution type program which is triggered by interrupt occurred by the interrupt pointer (I) are the same as those for general interrupt programs. (☞ Page 100 Operation upon occurrence of an interrupt factor)

■Bit data ON (TRUE)

The program is executed at the execution turn specified in program setting of the CPU parameters, and if the specified bit data is ON (TRUE) when the execution turn of the event execution type program comes, the program is executed. The current values of the output (Y), timer (T), and long timer (LT) used in this program can be cleared at the execution turn that comes after the specified bit data is changed from ON (TRUE) to OFF (FALSE).

- (1) If Y50 is on when the execution turn of the event execution type program C comes, the program is executed. If Y50 is OFF, the program is not executed.
 (2) When "Clear Output and Current Value of Timer" is set, the current values of the output (Y), timer (T), and long timer (LT) used in this program are cleared at the execution turn of the event execution type program that comes after Y50 is off.

Applicable devices are as follows.

Item	Description	
Device*1	Bit device	X(DX), Y, M, L, F, SM, B, SB, Jn\X, Jn\Y, Jn\B, Jn\SB
	Bit specification of word device	D, SD, W, SW, R ² , ZR ² , RD, Un\G, Jn\W, Jn\SW

*1 A local device or index-modified device cannot be specified.

*2 This is not available when "Use File Register of Each Program" is enabled. However, if no file register is assigned or if specification is out of the range, interrupt is not be turned on (TRUE).

Point

To measure the timer and the retentive timer continuously even when the trigger execution condition of the event execution type program is not met, use the long timer (LT) and the long retentive timer (LST). The timer (T) and the retentive timer (ST) can be used in the event execution type program. However, they do not measure time when the trigger execution condition of the event execution type program is not met. Set "Clear Output and Current Value of Timer" to "Clear" when using the timer (T) and the retentive timer (ST). (Page 94 Trigger setting)

Note that if the above parameter is set, the use of the long timer (LT) and the long retentive timer (LST) is limited to the same as that of the timer (T) and the retentive timer (ST). (They do not measure time continuously when the trigger execution condition of the event execution type program is not met.)

■ Passing time

After the status of the CPU module is changed into the RUN state, programs are executed in execution turn specified in "Program Setting" of "CPU Parameter". If the specified time passes, the event execution type program is executed once when the execution turn of the program comes. The time is measured again starting from the program execution and the above operation is repeated. This method can be used when the processing is executed regularly after the specified time passes. This method is not for the interrupt execution which another program execution is interrupted and processed to secure the punctuality. The current values of the output (Y), timer (T), and long timer (LT) used in this program can be cleared at the execution turn that comes after the specified time passes.

(1) After the specified time elapses, the event execution type program C is executed when the execution turn of the program comes.

(2) When "Clear Output and Current Value of Timer" is set, the current values of the output (Y), timer (T), and long timer (LT) used in this program are cleared at the execution turn of the event execution type program that comes after the specified time elapses.

Point

- Even though "Clear Output and Current Value of Timer" is set to "Clear" in the CPU parameters, the output value and the current value of the timer are not cleared if the scan time is longer than the value set to "Passing Time".
- To measure time when the trigger type is set to "Passing Time", use the long timer (LT) and the long retentive timer (LST).

Trigger setting

Use the event execution type detail setting.

*1 It cannot be set in the R00CPU, R01CPU, and R02CPU.

Standby type program

This type of program is executed only when its execution is requested.

Librarization of programs

Set a subroutine program and/or an interrupt program as a standby type program to manage them separately from the main routine program. In a single standby type program, multiple subroutine programs and interrupt programs can be created.

Program arrangement change

Prepare programs available in all systems to use them only when necessary. For example, a program set in advance as the standby type with a parameter can be changed to scan execution type and executed. (📖 Page 96 Using an instruction)

Execution method

The standby type program is executed as follows.

- Create a subroutine program and interrupt program within the standby type program, and then call them when an interrupt occurs or by specifying with a pointer.
- Switch to another execution type program.

Execution type change

This section describes how to change the execution type of programs.

Using parameter settings

"Program Setting" can be used to specify the execution type of programs.

[CPU Parameter] ⇨ [Program Setting] ⇨ [Detailed Setting]

Operating procedure

"Program Setting" window

Item	Setting

"Detailed Setting" window

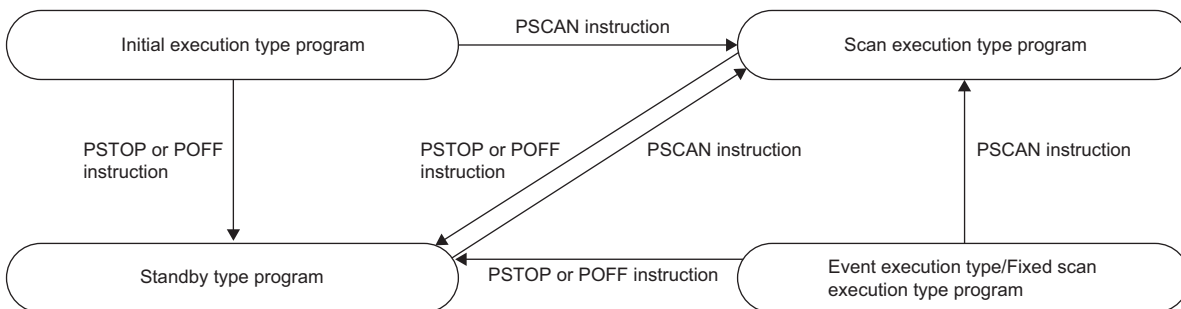

Execute Order	Program Name	Execution Type		Refresh Group Setting	Device/File Use or not
		Type	Detailed Setting Information		
1	MAIN	Scan		(Do not Set)	<Detailed Setting>
2	MAIN1	Fixed Scan		(Do not Set)	<Detailed Setting>
3	MAIN2	Standby		(Do not Set)	<Detailed Setting>

1. Click "Detailed Setting" on the "Program Setting" window.
2. For each program, select the execution type in "Type" of "Execution Type".

Using an instruction

Use the following instructions.

- PSCAN
- PSTOP
- POFF

Change timing

The execution type change timing is shown below.

Execution type before change	Execution instruction		
	PSCAN	PSTOP	POFF
Initial	Switches to "Scan" at the next scan.	Switches to "Standby" at the next scan.	Turns off the output at the next scan and switches to "Standby" at the scan after that.
Scan	Non-processing (does not change from "Scan")		
Fixed scan/event	Switches to "Scan" at the next scan.	Non-processing (does not change from "Standby")	Turns off the output at the next scan and switches to "Standby" at the scan after that.*1
Standby			Non-processing (does not change from "Standby")

*1 This instruction stops the execution of the program at END processing after instruction execution.

■Precautions

The following lists the precautions when changing the execution type.

- If a fixed scan execution type program or event execution type program is changed to another execution type, it cannot be restored to the original execution type.
- If an instruction is executed multiple times in a single scan for a single program, the program operates for the instruction executed last.
- For details on operation if an SFC program is specified, refer to the following.

 MELSEC iQ-R Programming Manual (Program Design)

Group setting for refresh

Refresh can be performed when a specified program is executed*1 by setting a group number to each program and specifying the number for each module.

*1 Input refresh (load of analog input, Input (X)) is performed before execution of a program, and output refresh (analog output, Output (Y)) is performed after execution of a program.

Refresh group setting

A group number is set to each program.

 [CPU Parameter] ⇒ [Program Setting] ⇒ [Program Setting] ⇒ [Detailed Setting]

Point

When the specified group number is not set in the refresh settings of each module, the program is executed, but the refresh of the relevant group number is not executed.

Refresh setting of each module

Select "At the execution time of specified program" in "Refresh Setting" of each module, and type the group number of the program to be refreshed.

 [Module Parameter] ⇒ [Refresh Setting]

Window

Item	Setting Value
<ul style="list-style-type: none"> Refresh by the Set Timing <ul style="list-style-type: none"> Refresh Timing Refresh Group[n](n:1-64) 	Set refresh timing. At the Execution Time of Specified Program 1

(Example: The "Refresh Setting" window for an I/O module)

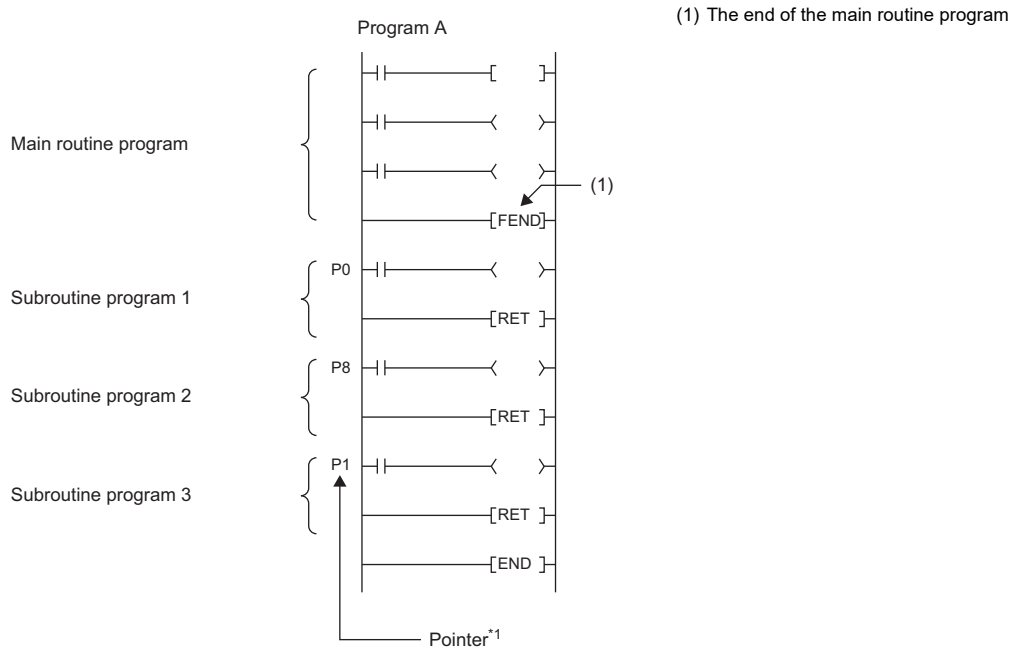

Point

For refresh of each module, refer to the manual for the module used.

6.6 Subroutine Program

Subroutine program is a program that is executed from a pointer (P) through the RET instruction. It is executed only when called by a subroutine call instruction (such as the CALL instruction or the ECALL instruction). A pointer type label can also be used instead of a pointer (P). The subroutine program is used for the following purposes.

- By grouping programs executed multiple times in a single scan into a single subroutine program, the total number of steps in a single program can be decreased.
- By making a program which is only executed in a certain condition a subroutine program, the scan time can be shortened for that program execution.

*1 The pointers are not required to be defined in an ascending order.

Point

- Making a program a standby type allows it to be managed as a separate program. (☞ Page 95 Standby type program) Use the ECALL instruction and other similar instructions to call program files.
- For details on nesting (nesting structure) of subroutine programs, refer to the nesting (N). (☞ Page 448 Nesting (N))

Precautions

The following lists the precautions when using the subroutine program.

- When using a local device, setting of SM776 (Local device setting at CALL) allows for using a local device of a program file at the storage location of the subroutine program.
- Do not use the timer (T, ST). However, the timer can be used if the timer coil (the OUT T□ instruction) is executed only once per scan.
- If the RET instruction is not used to return to the calling program and then the program is terminated, an error will occur.
- If a pointer (P) or pointer type global label exists within FB or FUN, an error will occur.

6.7 Interrupt Program

A program from an interrupt pointer (I) through the IRET instruction.

*1 Only one interrupt program can be created with a single interrupt pointer number.

*2 The interrupt pointers are not required to be defined in an ascending order.

When an interrupt factor occurs, the interrupt program corresponding to its interrupt pointer number is executed. (Page 452 The priority for the interrupt pointer numbers and interrupt factors) However, before that, interrupt must be enabled by using the EI instruction.

I0: Interrupt factor for I0

I29: Interrupt factor for I29

Point

Making a program a standby type allows it to be managed as a separate program. (Page 95 Standby type program)

Operation upon occurrence of an interrupt factor

The following shows the operation when an interrupt factor occurs.

■If an interrupt factor occurs during link refresh

The link refresh is suspended and the interrupt program is executed. Even though the station-based block data assurance is enabled for cyclic data during refresh of such links as CC-Link IE Field Network, if the interrupt program uses a device specified as the refresh target, the station-based block data assurance for cyclic data is not available.

(1) The link refresh is suspended and the interrupt program is executed.

■If an interrupt factor occurs during the waiting time after END processing in constant scan execution

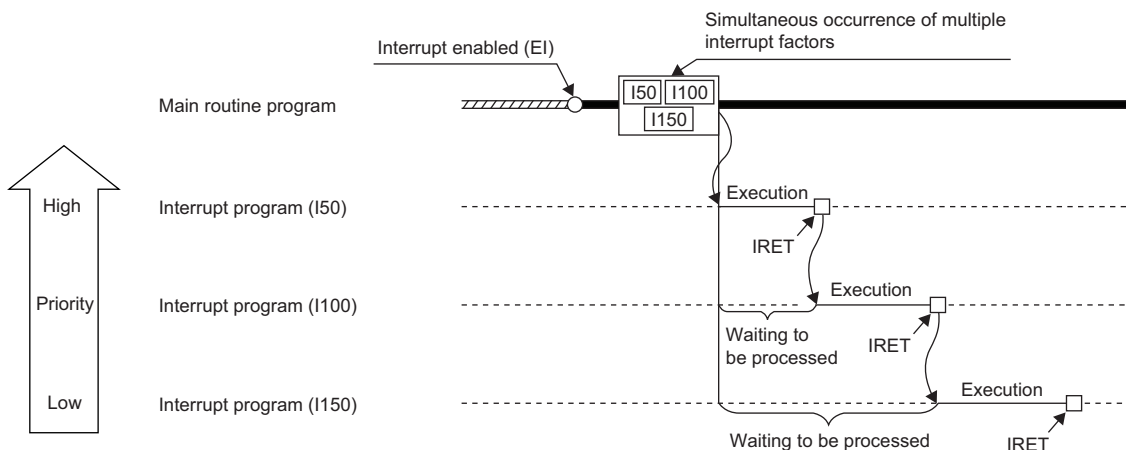

The interrupt program for the interrupt factor is executed.

■If another interrupt occurs while the interrupt program is being executed

If an interrupt such as a fixed scan execution type program (including an interrupt which triggers the event execution type program) is triggered while an interrupt program is being executed, the program operates in accordance with the interrupt priority. (☞ Page 114 Interrupt priority)

■If multiple interrupt factors occur simultaneously while the interrupt is enabled

The interrupt programs are executed in the order of priority. If multiple interrupts with the same interrupt priority occur simultaneously, the interrupt programs are executed in the order of interrupt priority. (☞ Page 117 Multiple interrupt execution sequence)

■ If an interrupt factor occurs while interrupt is disabled (DI)

- For I0 to I15, I28 to I31, I48, I49, and I50 to I1023

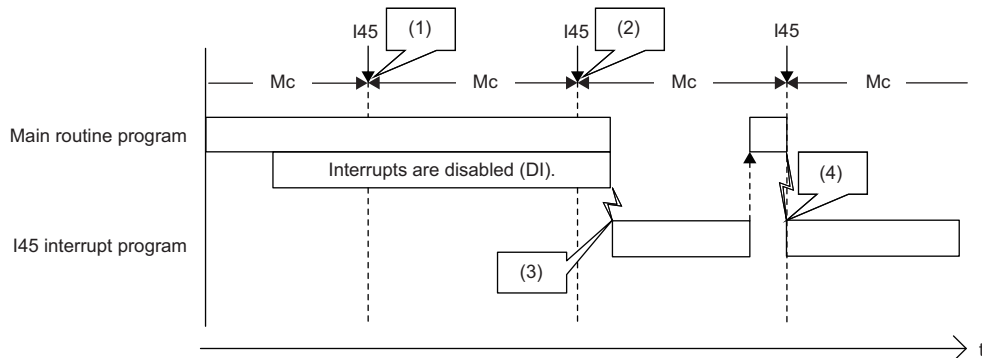

The interrupt factor that has occurred is memorized, and the interrupt program corresponding to the factor will be executed when the interrupt is enabled. Even if the same interrupt factor occurs multiple times, it will be memorized only once. If the IMASK instruction and SIMASK instruction are used to disable the interrupt, all the memorized factors will be discarded.

- (1) The second and following interrupt factors that occur while interrupts have been disabled (DI) are not memorized.
- (2) When interrupts are enabled, interrupts are executed in order from I49 because it has a higher priority.
- (3) I28 is executed. (I49 is not executed for the second time.)

- For I45

The interrupt factor that has occurred is memorized, and the I45 interrupt program will be executed when the interrupt is enabled. Even if the I45 interrupt occurs multiple times, its interrupt factor will be memorized only once. If the IMASK instruction and SIMASK instruction are used to disable the interrupt, all the memorized factors will be discarded.

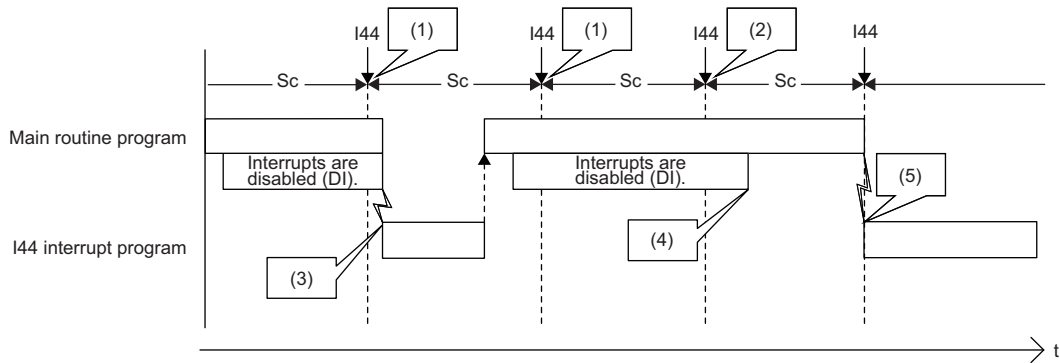

Mc: Multiple CPU synchronization cycle

- (1) The interrupt factor is memorized.
- (2) The second and following interrupt factors that occur while interrupts have been disabled (DI) are not memorized.
- (3) The interrupt is executed.
- (4) The interrupt is executed because interrupts are enabled.

- For I44

If interrupt is enabled before the next cycle, the I44 interrupt program will be executed when the interrupt is enabled. If interrupt continues to be disabled beyond the start of the next cycle (the second cycle), the memorized information will be discarded (even when the interrupt is enabled, the I44 interrupt program will not be executed). Also, if the I44 interrupt program for this cause cannot be executed, SM480 (Cycle overrun flag for inter-module synchronization program (I44)) is turned on, and SD480 (Number of cycle overrun events for inter-module synchronization cycle program (I44)) reaches its upper limit. If the IMASK instruction and SIMASK instruction are used to disable the interrupt, all the memorized factors will be discarded.

Sc: Inter-module synchronization cycle

- (1) The interrupt factor is memorized.
- (2) Because an interrupt does not occur, the memorized information is discarded in the second cycle.
- (3) The interrupt is executed when interrupts are enabled.
- (4) I44 is not executed because interrupts continue to be disabled (DI) beyond the second cycle of I44.
- (5) The interrupt is executed because interrupts are enabled.

■ If an interrupt factor with the same or a lower priority occurs while the interrupt program is being executed

- For I0 to I15 and I50 to I1023

The interrupt factor that has occurred is memorized. After the running interrupt program finishes, the interrupt program corresponding to the factor will be executed. Even if the same interrupt factor occurs multiple times, it will be memorized only once.

- (1) The second and following interrupt factors that occur while interrupts have been disabled (DI) are not memorized.
- (2) After the interrupt in execution is completed, interrupts are executed in order from I50 because it has a higher priority. Although both I50 and I80 have the same priority level, I50 is executed ahead of I80 because I50 has a higher priority order.
- (3) I80 is executed. (I50 is not executed for the second time.)
- (4) I100 is executed. (I80 is not executed for the second time.)

- For I45

The interrupt factor that has occurred is memorized. After the running interrupt program finishes, the I45 interrupt program will be executed. Even if the I45 interrupt occurs multiple times, its interrupt factor will be memorized only once.

Mc: Multiple CPU synchronization cycle

- (1) The interrupt factor is memorized.
- (2) The second and following interrupt factors that occur while interrupts have been disabled (DI) are not memorized.
- (3) After I49 that has a higher priority level is completed, I45 is executed.
- (4) Because both I44 and I45 have the same priority level, the interrupt is executed after I44 is completed.
- (5) The interrupt is executed because I49 and I44 have been completed.

- For I28 to I31, I48, and I49

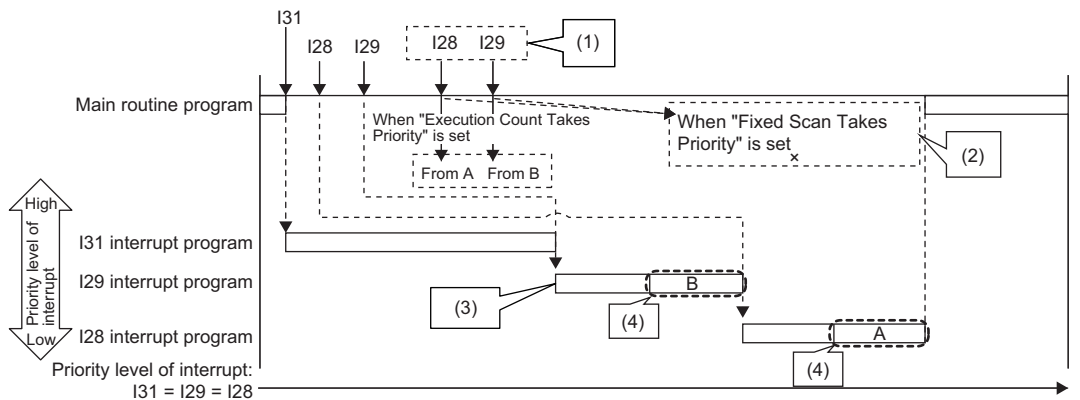

The interrupt factor that has occurred is memorized. After the running interrupt program finishes, the interrupt program corresponding to the factor will be executed. If the same interrupt factor occurs multiple times, it will be memorized once but operation at the second and later occurrences depends on setting of the fixed scan execution mode (Page 89 Fixed scan execution mode). When "Execution Count Takes Priority" is enabled, the interrupt program corresponding to the memorized interrupt factor will be executed after the running interrupt program finishes. When "Precede Fixed Scan" is enabled, the second and later occurrences will not be memorized.

When interrupts with lower priority level than the one being executed occur

- (1) The second and following interrupt factors that occur while interrupts are being executed operate according to the setting of the fixed scan execution mode.
- (2) The program is not executed for the second time.
- (3) After the interrupt in execution is completed, interrupts are executed in order from I29 because it has a higher priority.
- (4) The second interrupt is executed.

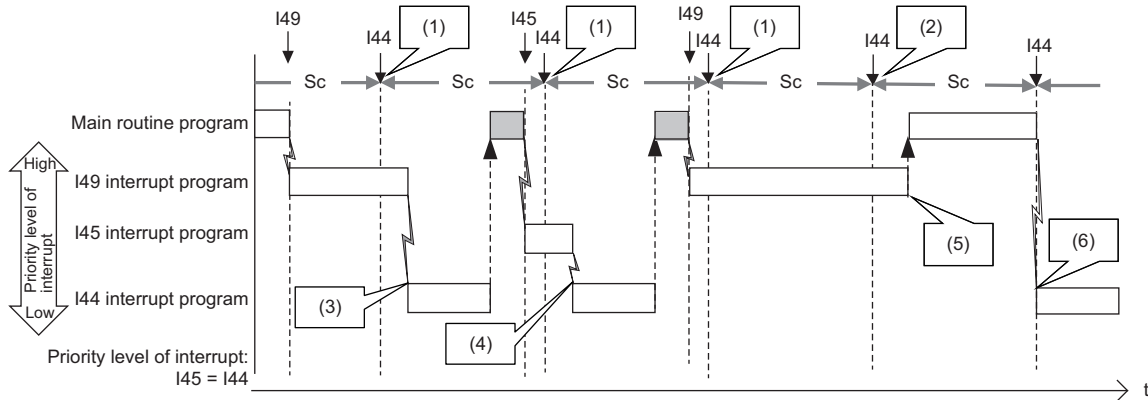

When interrupts with the same priority level as the one being executed occur

- (1) The second and following interrupt factors that occur while interrupts are being executed operate according to the setting of the fixed scan execution mode.
- (2) The program is not executed for the second time.
- (3) After the interrupt in execution is completed, interrupts are executed in order from I29 because it has a higher priority.
- (4) The second interrupt is executed.

- For I44

If the running interrupt program finishes before the next cycle, the I44 interrupt program will be executed when the running interrupt program finishes. If the running interrupt program continues beyond the start of the next cycle (the second cycle), the memorized information will be discarded (even when the running interrupt program finishes, the I44 interrupt program will not be executed). Also, if the I44 interrupt program for this cause cannot be executed, SM480 (Cycle overrun flag for inter-module synchronization program (I44)) is turned on, and SD480 (Number of cycle overrun events for inter-module synchronization cycle program (I44)) reaches its upper limit.

Sc: Inter-module synchronization cycle

- (1) The interrupt factor is memorized.
- (2) Because an interrupt does not occur, the memorized information is discarded in the second cycle.
- (3) After I49 that has a higher priority level is completed, I44 is executed.
- (4) After I45 that has the same priority level and a higher priority order is completed, the interrupt is executed.
- (5) I44 is not executed because the termination of I49 or I45 is in the second cycle for I44.
- (6) The interrupt is executed because I49 and I45 have been completed.

■ If the same interrupt factor occurs while the interrupt program is being executed

- For I0 to I15 and I50 to I1023

The interrupt factor that has occurred is memorized, and the interrupt program corresponding to the factor will be executed when the interrupt is enabled. Even if the same interrupt factor occurs multiple times, it will be memorized only once.

- (1) The second and following interrupt factors that occur while interrupts are executed are not memorized.
 (2) After the interrupt in execution is completed, the first interrupt program is executed.

- For I45

If an interrupt factor which is the same as that for the running interrupt program occurs, the factor is not memorized. Therefore, the corresponding interrupt program will not be executed after the running interrupt program finishes. Also, if the I45 interrupt program for this cause cannot be executed, SM481 (Cycle overrun flag for multiple CPU synchronization program (I45)) is turned on, and SD481 (Number of cycle overrun events for multiple CPU synchronization program (I45)) reaches its upper limit.

Mc: Multiple CPU synchronization cycle

- (1) The interrupt factor is discarded because the same interrupt (I45) is being executed.
 (2) The interrupt is not executed.
 (3) The interrupt is executed.

- For I28 to I31, I48, and I49

The interrupt factor that has occurred is memorized. After the running interrupt program finishes, the interrupt program corresponding to the factor will be executed. If the same interrupt factor occurs multiple times, it will be memorized once but operation at the second and later occurrences depends on setting of the fixed scan execution mode (Page 89 Fixed scan execution mode). When "Execution Count Takes Priority" is enabled, the interrupt program corresponding to the memorized interrupt factor will be executed after the running interrupt program finishes. When "Precede Fixed Scan" is enabled, the second and later occurrences will not be memorized.

- (1) The second and following interrupt factors that occur while interrupts are being executed operate according to the setting of the fixed scan execution mode.
 (2) The program is not executed for the second time.
 (3) The second interrupt is executed.

- For I44

If an interrupt factor which is the same as that for the running interrupt program occurs, the factor is not memorized. Therefore, the corresponding interrupt program will not be executed after the running interrupt program finishes. Also, if the I44 interrupt program for this cause cannot be executed, SM480 (Cycle overrun flag for inter-module synchronization program (I44)) is turned on, and SD480 (Number of cycle overrun events for inter-module synchronization cycle program (I44)) reaches its upper limit.

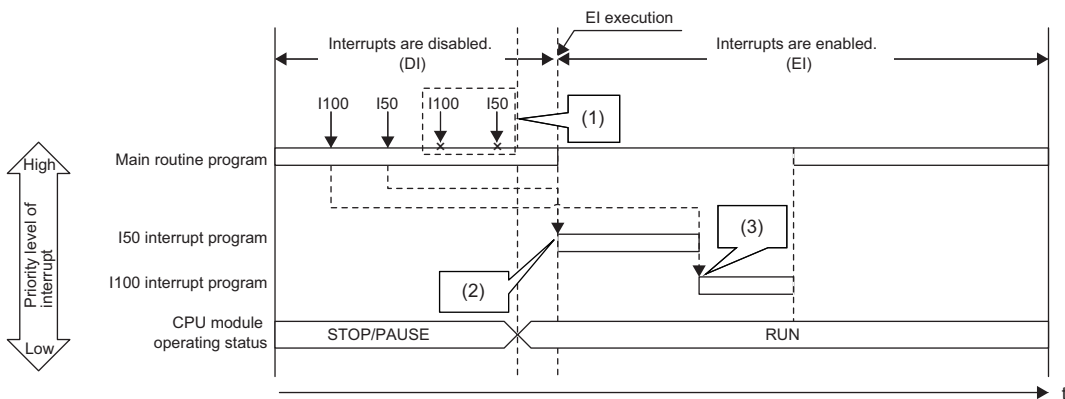

Sc: Inter-module synchronization cycle

- (1) The interrupt factor is discarded because the same interrupt (I44) is being executed.
- (2) The interrupt is not executed.
- (3) The interrupt is executed.

■ If an interrupt factor occurs in the STOP/PAUSE status

- For I0 to I15, I28 to I31, I48, I49, and I50 to I1023

The interrupt factor that has occurred is memorized, and the corresponding interrupt program will be executed when the CPU module switches to the RUN state and the interrupt is enabled. Even if the same interrupt factor occurs multiple times before switching to the RUN state, it will be memorized only once.

- (1) The second and following interrupt factors that occur while the CPU module is in the STOP state are not memorized.
- (2) When interrupts are enabled by changing the operating status of the CPU module from STOP to RUN, interrupts are executed in order from I50 that has a higher priority level.
- (3) I100 is executed. (I50 is not executed for the second time.)

- For I45

The interrupt factor that has occurred is not memorized, and therefore the corresponding interrupt program will not be executed even when the CPU module switches to the RUN state and the interrupt is enabled. The interrupt program will be executed when the CPU module switches to the RUN state and then the first interrupt factor occurs.

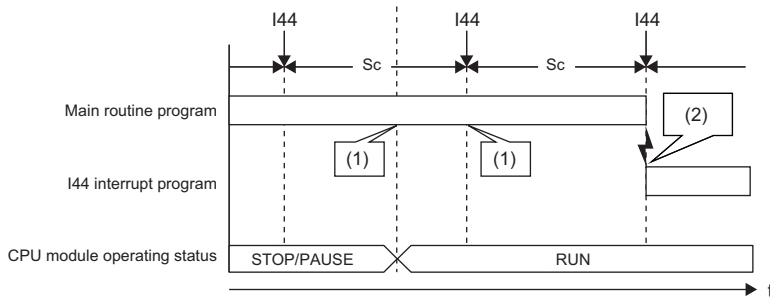

Mc: Multiple CPU synchronization cycle

- (1) The interrupt is not executed.
- (2) The interrupt is executed.

- For I44

The interrupt factor that has occurred is not memorized, and therefore the corresponding interrupt program will not be executed even when the CPU module switches to the RUN state and the interrupt is enabled. Instead, startup of interrupt is prepared when the CPU module switches to the RUN state and the interrupt is enabled (the interrupt program will not be executed upon occurrence of the first interrupt factor). Then, the interrupt program will be executed during the second cycle after the switch to the RUN state.

Sc: Inter-module synchronization cycle

(1) The interrupt is not executed.

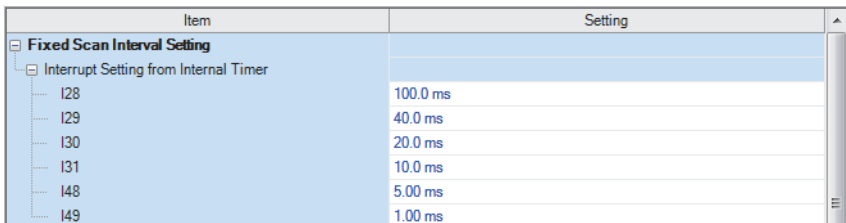

(2) The interrupt is executed.

Interrupt period setting

The interrupt cycle based on the internal timer can be specified.

 [CPU Parameter] ⇒ [Interrupt Settings] ⇒ [Fixed Scan Interval Setting]

Window

Item	Setting
Fixed Scan Interval Setting	
Interrupt Setting from Internal Timer	
I28	100.0 ms
I29	40.0 ms
I30	20.0 ms
I31	10.0 ms
I48	5.00 ms
I49	1.00 ms

Displayed items

Item	Item	Description	Setting range	Default
Interrupt Setting from Internal Timer	I28	Sets the execution interval of I28.	0.5 to 1000ms (in units of 0.5ms)	100.0ms
	I29	Sets the execution interval of I29.		40.0ms
	I30	Sets the execution interval of I30.		20.0ms
	I31	Sets the execution interval of I31.		10.0ms
	I48 ^{*1}	Sets the execution interval of I48.	0.05 to 1000ms (in units of 0.05ms)	5.00ms
	I49 ^{*1}	Sets the execution interval of I49.		1.00ms

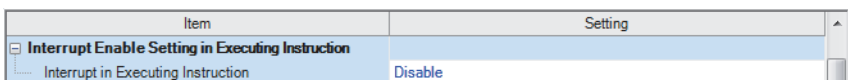

*1 This item is not displayed on the R00CPU, R01CPU, and R02CPU.

Interrupt enabled during instruction execution

Sets whether or not to enable or disable execution of an interrupt program during execution of an instruction. By enabling the interrupt during instruction execution, an interrupt can occur even while an instruction with a long processing time is being executed, resulting in higher interrupt accuracy.

 [CPU Parameter] ⇒ [Interrupt Settings] ⇒ [Interrupt Enable Setting in Executing Instruction]

Window

Item	Setting
Interrupt Enable Setting in Executing Instruction	
Interrupt in Executing Instruction	Disable

Displayed items

Item	Description	Setting range	Default
Interrupt in Executing Instruction	Sets whether or not to enable or disable execution of an interrupt program during execution of an instruction. For the precautions with "Enable" set, refer to the precautions for an interrupt program. ( Page 118 Precautions)	<ul style="list-style-type: none"> • Disable • Enable 	Disable

Processing at interrupt program startup

The processing shown below is performed when the interrupt program starts.

- Saving/restoring of the file register (R) block number
- Saving/restoring of the index register (Z, LZ)

Saving/restoring of the file register (R) block number

When an interrupt program starts, the block number of the file register (R) of the running program is saved and passed to the interrupt program. Also, when the interrupt program finishes, the saved block number is restored to the running program.

 [CPU Parameter] ⇒ [Interrupt Settings] ⇒ [Block No. Save/Recovery Setting]

Window

Displayed items

Item	Description	Setting range	Default
File Register (R) Block No.	Sets whether or not the block number of the file register (R) is saved/restored when an interrupt program is being executed.	<ul style="list-style-type: none">• Not Saved/Recovered• Save/Recover	Save/Recover

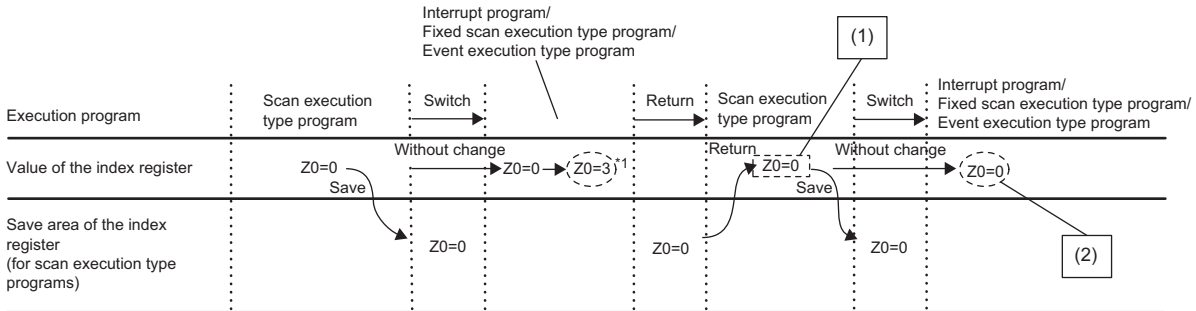

Point

When the block number of the file register (R) is not changed during execution of an interrupt program, enabling "Not Saved/Recovered" can reduce the startup time and the termination time of the interrupt program. ( Page 650 Overhead time when executing the interrupt program). To change the block number of the file register (R) while "Not Saved/Recovered" is enabled, the block number of that file register (R) must be saved/restored by the program.

Saving/restoring of the index register (Z, LZ)

When an interrupt program starts, the value of the index register (Z, LZ) of the running program is saved. When the interrupt program finishes, and the saved value is restored to the running program. Note that when an interrupt program starts, the local index register (Z, LZ) is not switched to the different one. When the local index register (Z, LZ) is used for the interrupt program/fixed scan execution type program/event execution type program which uses occurrence of an interrupt as a trigger, the register which has been used for the previous program is continuously used. Thus, the local index register (Z, LZ) cannot be used independently.

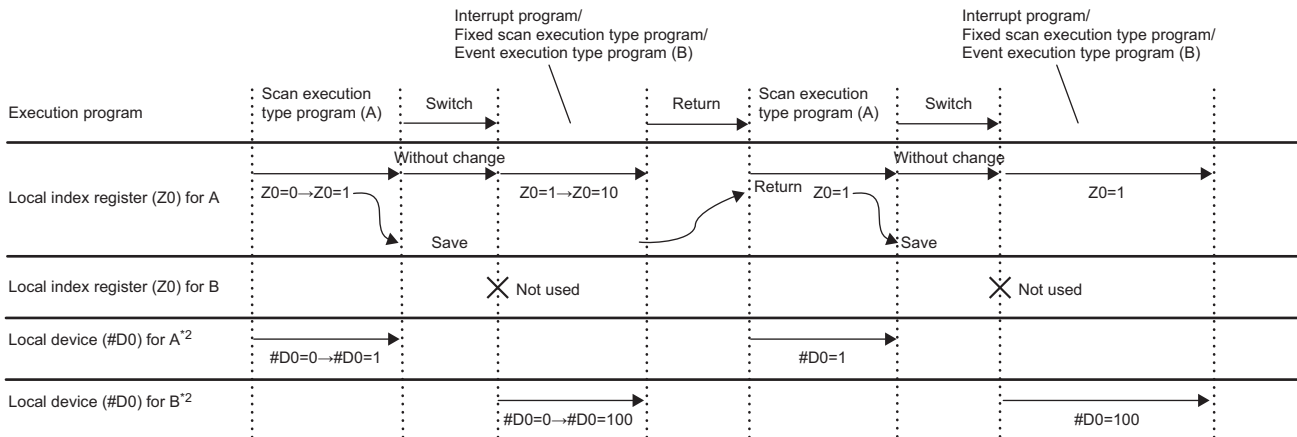

• Saving/restoring of the index register

(1) This value can be used as a value specific to the scan execution type program. (Using the value in an interrupt program is not needed to be concerned.)

(2) This value can be used only at the moment an interrupt program, fixed scan execution type program, or event execution type program is executed. (The value cannot be used continuously.)

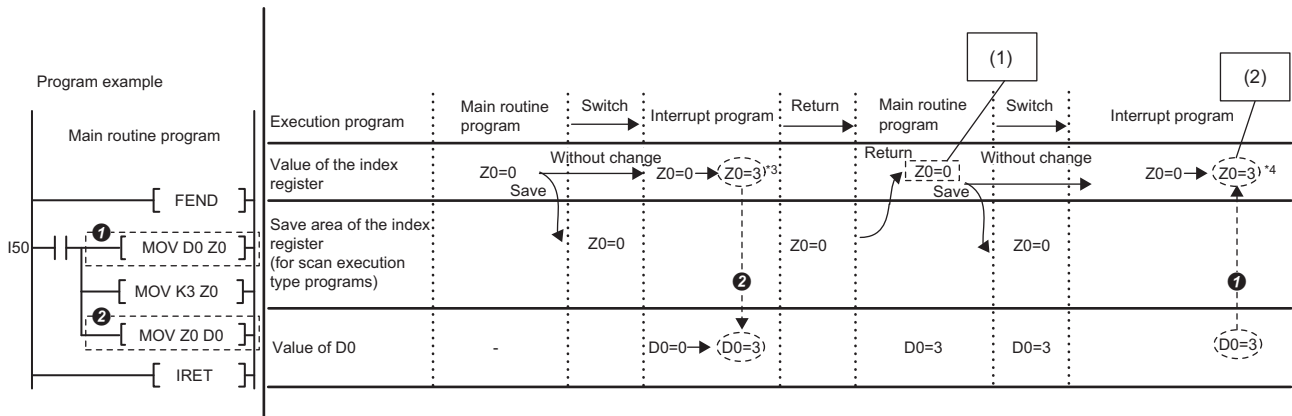

• Operations of the local index register and local device

*1 The value of Z0 is changed by the interrupt program, fixed scan execution type program, or event execution type program.

*2 For when SM777 is on (when using the local device of the program file of storage location)

If the value of the index register used for the interrupt program is continuously used for the next interrupt program, the value of the index register for the interrupt program must be saved or restored. Create a program to add the MOV instruction and the ZPUSH/ZPOP instruction.

*3 A value in Z0 changes at MOV D0 Z0.

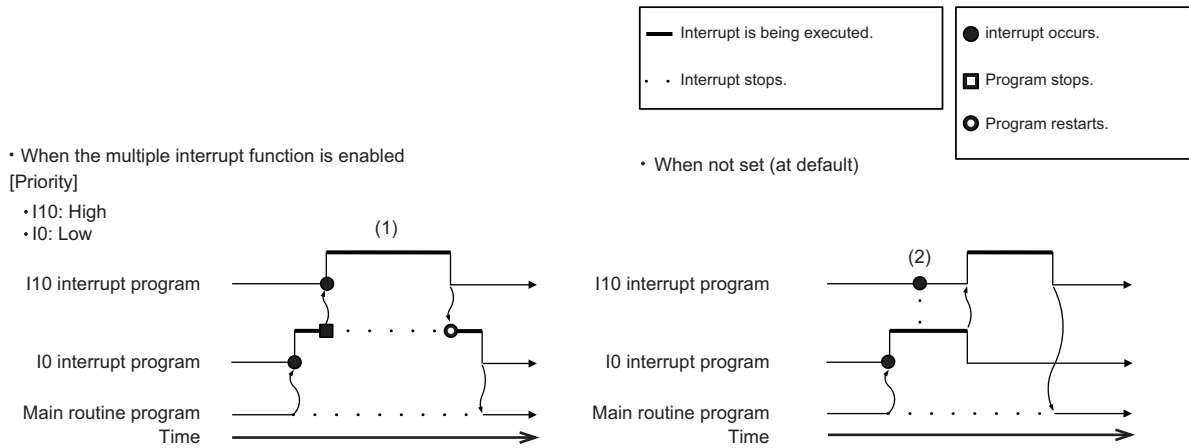

*4 Z is zero when the program ① and ② are not added.

(1) This value can be used as a value specific to the main routine program.

(2) This value can be used as a value specific to the interrupt program. (This value can be used continuously.)

Multiple interrupt function

When a new interrupt triggered by another factor occurs during execution of an interrupt program, the running program will be suspended if its priority is lower than that of the new interrupt. A program with higher priority is executed based on the set priority whenever its execution condition is satisfied.

- (1) A high-priority interrupt is executed by interrupting a low-priority interrupt.
- (2) Even if a high-priority interrupt occurs, it enters the waiting status until the interrupt in execution is completed.

Interrupt priority

If the interrupt priority of a program for which its execution condition has been satisfied is higher than that of the running program, the programs are executed in accordance with their interrupt priority. If the interrupt priority of the new program is the same or lower, it enters the waiting status until the running program finishes. The interrupt priorities 1 to 4 listed below cannot be changed, whereas the interrupt priorities 5 to 8 can. (📖 Page 115 Interrupt priority setting)

Interrupt priority	Interrupt factor (Interrupt pointer)	Execution sequence at simultaneous occurrence	Changeability
High ↑ ↓ Low	1	High-speed interrupt by internal timer 1 (I49)	Unchangeable (Fixed)
	2	High-speed interrupt by internal timer 2 (I48)	
3	Inter-module synchronous interrupt (I44), Multiple CPU synchronous interrupt (I45)	I45 → I44	
4	Interrupt by internal timer (I28 to I31), Fixed scan execution type program	I31 → I30 → I29 → I28 → Fixed scan execution type program	
5 to 8	Interrupt from module (I0 to I15, I50 to I1023)	I0 ... → ... I1023	Changeable

Interrupt priority setting

The interrupt priority (5 to 8) of interrupts from modules can be changed.

 [CPU Parameter] ⇒ [Interrupt Settings] ⇒ [Interrupt Priority Setting from Module]

Operating procedure

"Interrupt Settings" window

Item	Setting
<input type="checkbox"/> Interrupt Priority Setting from Module <ul style="list-style-type: none"> <input type="checkbox"/> Multiple Interrupt <input type="checkbox"/> Interrupt Priority 	Enable <Detailed Setting>

1. Set "Multiple Interrupt" to "Enable" on the "Interrupt Settings" window, and click "Detailed Setting".

"Detailed Setting" window

Interrupt Pointer	Priority
I0	8
I1	8
I2	8
I3	8
I4	8
I5	8
I6	8
I7	8
I8	8
I9	8
I10	8
I11	8
I12	8
I13	8
I14	8
I15	8

2. Change the priority of each interrupt pointer.

Displayed items

Item	Description	Setting range	Default
Multiple Interrupt	Sets whether or not to enable multiple interrupt.	<ul style="list-style-type: none"> • Disable • Enable 	Disable
Interrupt priority	Detailed Setting	Sets the priority of the interrupt pointers I0 to I15 and I50 to I1023.	5 to 8

Disabling/enabling interrupts with a specified or lower priority

Interrupts with a priority equal or lower than that specified by the DI or EI instruction can be disabled or enabled even when multiple interrupts are present.

Ex.

Order of interrupt occurrence: ③ → ② → ①

Order of interrupt execution: ③ → ① → ②

Order of interrupt completion: ③ → ① → ②

Priority		Interrupt pointer
High ↑	1	I49
	2	I48
↓ Low	3	I44, I45
	4	I28, I29, I30, I31
	5	I101
	6	I0, I50, I100
	7	I1020
	8	An interrupt pointer among I50 to I1023 with the priority other than 5 to 7

- (1) Interrupt is enabled.
- (2) Interrupts with priority 3 to 8 are disabled.
- (3) I28 is not executed because interrupts with priority 3 to 8 are disabled.
- (4) I48 is executed because its interrupt priority is higher.
- (5) Return from interrupt. Execution of the interrupted I10 resumes.
- (6) High-priority interrupt I28 is executed because interrupts with priority 3 to 8 have been enabled.

Point

Disabled interrupt priorities and the current interrupt priority can be checked in SD758 (Interrupt disabling for each priority setting value) and SD757 (Current interrupt priority) respectively.

Multiple interrupt execution sequence

When multiple interrupts occur, the interrupt program with the highest priority is executed. Then, the interrupt program with the highest priority among those interrupted and in waiting status as a result of interrupts will be executed next when the previous is finished.

Ex.

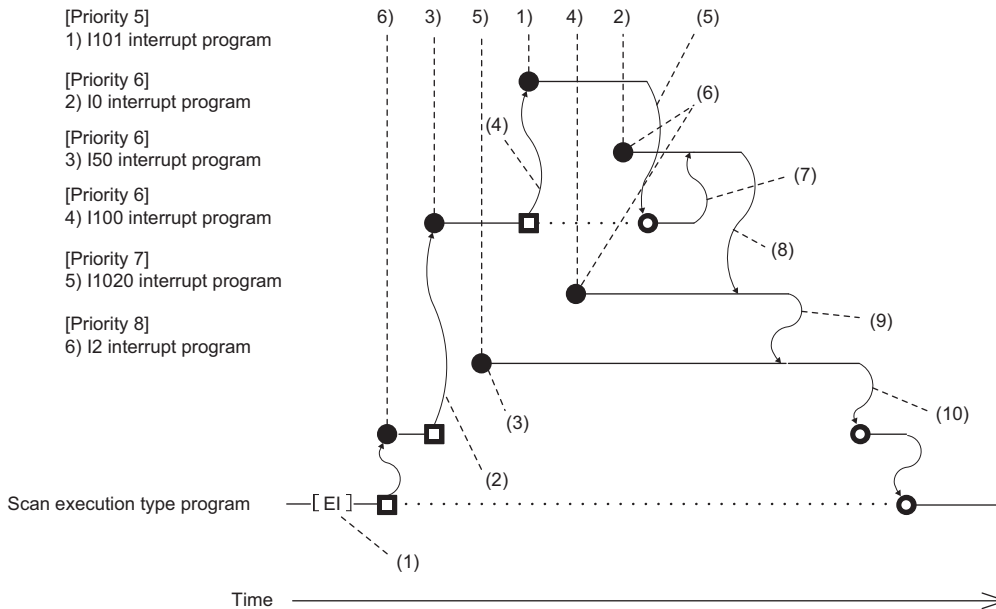

Order of interrupt occurrence: 6 → 3 → 5 → 1 → 4 → 2

Order of interrupt execution: 6 → 3 → 1 → 2 → 4 → 5

Order of interrupt completion: 1 → 3 → 2 → 4 → 5 → 6

Priority		Interrupt pointer
High ↑	1	I49
	2	I48
↓ Low	3	I44, I45
	4	I28, I29, I30, I31
	5	I101
	6	I0, I50, I100
	7	I1020
	8	An interrupt pointer among I50 to I1023 with the priority other than 5 to 7

6

- (1) Interrupt is enabled.
- (2) I50 is executed because its interrupt priority is higher.
- (3) Enters waiting status because its interrupt priority is lower.
- (4) I101 is executed because its interrupt priority is higher.
- (5) Return from interrupt. Execution of the interrupted I50 resumes.
- (6) Enters the waiting status until the execution of I50 completes because its interrupt priority is the same as that of I50 by setting.
- (7) I0 is executed before I100 because its interrupt pointer is smaller.
- (8) Return from interrupt. I1020 is executed because its interrupt priority is higher than those of I1020 and I0.
- (9) Return from interrupt. I1020 is executed because its interrupt priority is higher than that of I2.
- (10) Return from interrupt. Execution of the interrupted I2 resumes.

Precautions

The precautions for the interrupt program are mentioned below.

Restrictions on program creation

- The PLS/PLF instruction performs OFF processing in the scan after the instruction execution. The device turned on remains on until the interrupt program starts again and the instruction is executed.
- The timer (T, ST) and the counter (C) cannot be used for interrupt programs.

Data inconsistency

When the interrupt during instruction execution is set to "Enable", processing of an instruction may be suspended and the interrupt program may be executed. Accordingly, if the interrupted program and the interrupt program both use the same device, data may become inconsistent. Take the following preventive measures.

- Use the DI instruction to disable the interrupt for an instruction that causes inconsistency when interrupted.
- In an interrupt program, before accessing the device shared by overlapping programs, transfer data to another device in batch to use, and then write back to the shared device in batch.
- When using the bit data, be careful so that the interrupted program and the interrupt program shall not use the same bit data.

If the interrupt accuracy does not increase

If the interrupt accuracy does not increase even when the interrupt during instruction execution is set to "Enable", it may increase by taking the following measures:

- Limit each character string used in a program to 32 characters or less in length.
- Decrease the multiplex interrupts.
- Reduce the number of times to access the Q series module or the number of points.
- Do not access the Q series module from multiple CPU modules when the multiple CPU system is configured.

Monitoring the interrupt program execution time

The execution time of the interrupt program can be monitored with the interrupt program in which the inter-module synchronous interrupt (I44) and multiple CPU synchronous interrupt (I45) are used. (🔗 Page 169 Error detection setting)

When the start-up of an interrupt program is delayed

If the execution interval of the interrupt program is short, the start-up of the interrupt program may be delayed when the instruction with a long processing time is executed, the online ladder block change is performed, or a Q series module is accessed simultaneously from multiple CPU modules using instructions in the multiple CPU system configuration. Therefore, when the execution time is monitored for the interrupt program that uses the inter-module synchronous interrupt (I44) and multiple CPU synchronous interrupt (I45), an error may be detected in the CPU module. (🔗 Page 169 Error detection setting)

Consideration when using the data logging function and the recording function

When occurrence of an interrupt is specified as the data collection condition of data logging or when the sampling method of the recording function is set to use the trigger instruction in an interrupt program, set the fixed scan interval of the interrupt program, taking into consideration the processing time for these functions. (🔗 Page 301 Using together with interrupt programs)

Interrupt processing with FB/FUN

FB/FUN consists of multiple instructions. When an interrupt occurs during execution of the FB/FUN, the execution will be suspended and an interrupt program will be executed even though "Interrupt Enable Setting in Executing Instruction" of the CPU parameter has been set to "Disable".

To disable the execution of the interrupt program during execution of FB/FUN, use the DI instruction to disable the interrupt before the FB/FUN is called and use the EI instruction to enable the interrupt after execution of the FB/FUN.

In ST programs and FBD/LD programs, each of the following elements and program elements consists of multiple instructions.

- Instruction (manufacturer-defined FB/FUN)
- Arithmetic operations in ST programs (Example: $D0 := D1 + D2 - D3;$)
- Logical operations in ST programs (Example: $M0 := M1 \text{ AND } M2 \text{ OR } M3;$)

To disable the interrupt during execution of an ST program or an FBD/LD program, use the DI instruction and the EI instruction before and after each element or program element regardless of the setting of "Interrupt Enable Setting in Executing Instruction".

Extended interrupt program processing time

If interrupts during instruction execution are set to "Enable" in the interrupt enabled during instruction execution setting, and the interrupt program is executed when the following conditions are met, the interrupt program processing time will take longer. (☞ Page 110 Interrupt enabled during instruction execution)

- If accessing the refresh data register (RD), a module label, or labels, or using FB/ST/FBD in the interrupt program while executing an instruction involving the transfer of a significant amount of data to the device/label memory, or during refresh processing.
- If accessing the device/label memory in the interrupt program when using FB/ST/FBD while executing an instruction involving the transfer of a significant amount of data to the refresh data register (RD), a module label, or a label, or during refresh processing to the refresh data register (RD) or a module label.

Delay in interrupt programs

Completing low-priority interrupt programs may take time if high-priority interrupt programs are executed frequently when the multiple interrupt function is used. Adjust the processing of high-priority interrupt programs to allow execution of low-priority interrupts.

Devices and labels used by interrupt programs

Do not use the same global devices and labels in multiple interrupt programs because it may cause data inconsistency when the multiple interrupt function is used.

7 CPU MODULE OPERATION PROCESSING

Here is a list of the operating status of the CPU module:

- RUN state
- STOP state
- PAUSE state

7.1 Operation Processing by Operating Status

This displays operation processing according to the operating status of the CPU module.

Operation processing in RUN state

In RUN state, the program operation is repeatedly performed in the following order: Step 0 → END/FEND instruction → Step 0.

■Output at the time of entering RUN state

Depending on the setting of output (Y) at the time of change from STOP state to RUN state, either of the following is output.

(☞ Page 122 Output mode at operating status change (STOP to RUN))

- Status of the output (Y) that was saved during the STOP state
- Operation result after the completion of one scan

The device memory other than the output (Y) holds the status immediately before the RUN state. However, if a device initial value is set up, this initial value is set. In addition, the local devices are cleared.

Operation processing in STOP state

In STOP state, the operation is stopped (state with a stop error included).

■Output at the time of entering STOP state

All points are turned off with the output status immediately before the STOP state saved. The device memory other than the output (Y) holds the status immediately before the STOP state.

Operation processing in PAUSE state

In PAUSE state, the program operation is suspended holding the status of the output and the device memory after the completion of one scan.

7.2 Operation Processing When Operating Status Is Changed

This displays operation processing when the operating status of the CPU module is changed.

CPU module operating status	CPU module processing			
	Program	External output	Device memory	
			Other than Y	Y
STOP → RUN	Executes the program from the start.	Determines the status depending on the setting of "Output Mode Setting at STOP to RUN" in the CPU parameter. (☞ Page 122 Output mode at operating status change (STOP to RUN))	Retains the device memory status immediately before the RUN state. However, if a device/label initial value has been set, this initial value is set. Clears local devices.	Determines the status depending on the setting of "Output Mode Setting at STOP to RUN" in the CPU parameter. (☞ Page 122 Output mode at operating status change (STOP to RUN))
RUN → STOP	Executes the program up to the END instruction and then stops.	Saves the output (Y) status immediately before the STOP state, and all points turn off.	Retains the device memory status immediately before the STOP state.	Saves the output (Y) status immediately before the STOP state, and all points turn off.
RUN → PAUSE	Stops the operation after the execution of one scan.	Retains the output (Y) status immediately before the PAUSE state.	Retains the device memory status immediately before the PAUSE state.	Retains the output (Y) status immediately before the PAUSE state.
PAUSE → RUN	Executes the program from the start.	Retains the output (Y) status immediately before the RUN state.	Retains the device memory status immediately before the RUN state. Clears local devices.	Retains the output (Y) status immediately before the RUN state.
PAUSE → STOP	Operation remains stopped.	Saves the output (Y) status immediately before the STOP state, and all points turn off.	Retains the device memory status immediately before the STOP state.	Saves the output (Y) status immediately before the STOP state, and all points turn off.
STOP → PAUSE	Operation remains stopped.	Retains the output (Y) status immediately before the PAUSE state.	Retains the device memory status immediately before the PAUSE state.	Retains the output (Y) status immediately before the PAUSE state.

Output mode at operating status change (STOP to RUN)

When the operating status changes from RUN to STOP, for example, the CPU module internally stores the status of the outputs (Y) to turn them all off.

Operation when the operating status is changed from STOP to RUN

Select whether or not to resume from the previous output status when the operation status of the CPU module is changed from STOP to RUN by using a holding circuit.

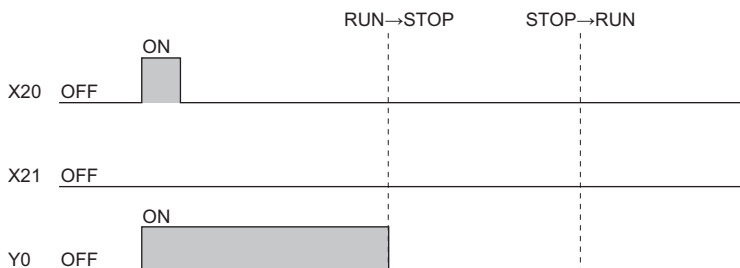

■Outputting the output (Y) status before STOP

The program operation is resumed after outputting the output (Y) status immediately before the operating status of the CPU module is changed to the STOP state. If the output (Y) is forcibly turned on in the STOP state, the status prior to the STOP state is output. If the output (Y) was off before entering the STOP state, the status when it was on is not retained. (In the following figure, X20 represents the start button, X21 represents the stop button, and Y represents an output.)

■Clearing the output (Y) (output after one scan)

All outputs are turned off, and the output (Y) is output after the program operations are executed. If the output (Y) is forcibly turned on when the operating state is STOP, the ON state is retained. (In the following figure, X20 represents the start button, X21 represents the stop button, and Y represents an output.)

Setting the output mode

Set the mode in "Output Mode Setting of STOP to RUN".

[CPU Parameter] ⇒ [Operation Related Setting] ⇒ [Output Mode Setting of STOP to RUN]

Window

Displayed items

Item	Description	Setting range	Default
Output Mode of STOP to RUN	Set the operation of the output (Y) when the operating status is changed from STOP to RUN.	<ul style="list-style-type: none"> Output the Output (Y) Status before STOP Clear (Output is 1 scan later) the Output (Y) 	Output the Output (Y) Status before STOP

7.3 Operation Processing at Momentary Power Failure

When an input power supply voltage supplied to the power supply module falls below the specified range, a momentary power failure is detected and the following operation processing is performed.

Momentary power failure not exceeding the allowable momentary power failure time

If a momentary power failure occurs, the event history is registered to suspend the operation processing. Note however that measurement of the timer device continues. In addition, the output status is held.

■When the momentary power failure is cleared

Once the momentary power failure is cleared, the operation processing continues.

■Measurement of the watchdog timer (WDT) at a momentary power failure

Even if the operation is suspended due to a momentary power failure, measurement of the watchdog timer continues. For example, assuming that the monitoring time of scan time is set to 200ms and the scan time is 190ms, a momentary power failure of 15ms causes a WDT error. (☞ Page 166 Scan time monitoring time setting)

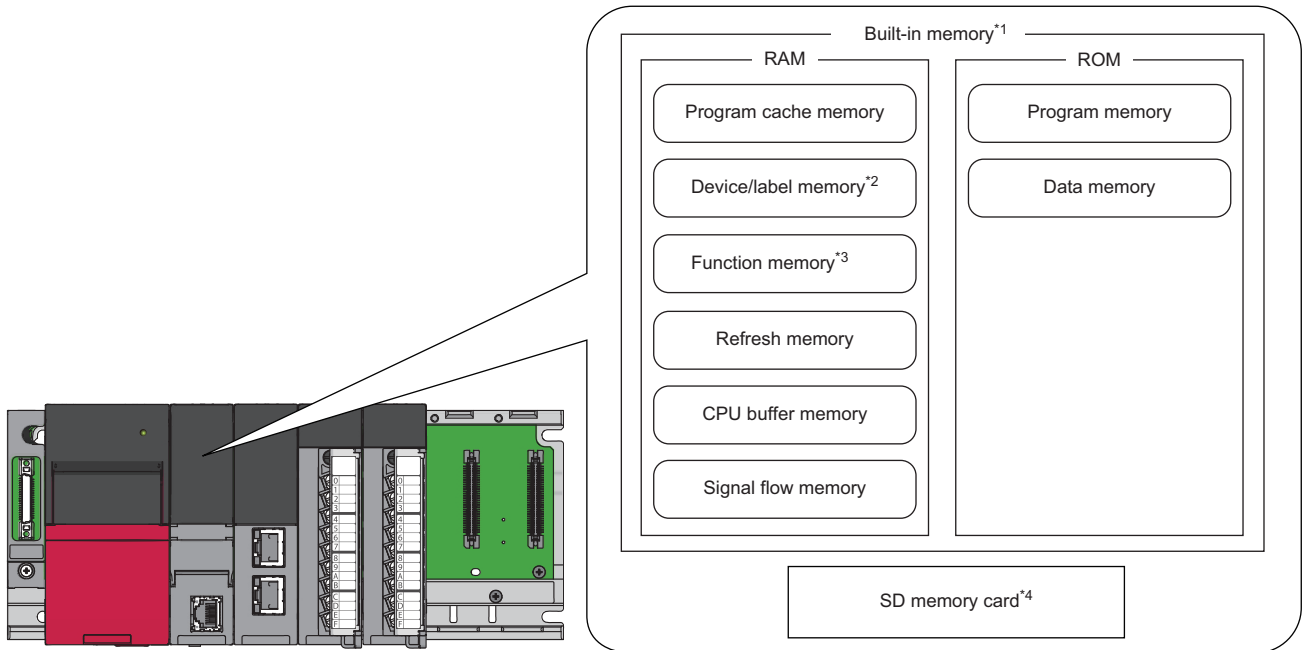

Momentary power failure exceeding the allowable momentary power failure time

This case results in initial start, the same operation processing as when the CPU module is powered on or is reset.

8 MEMORY CONFIGURATION OF THE CPU MODULE

8.1 Memory Configuration

The following shows the memory configuration of the CPU module.

*1 The built-in memory is a generic term of the memory built in the CPU module.

*2 The R00CPU, R01CPU, and R02CPU retain the data in each device/label with latch setting without a battery during power failure. (☞ Page 475 Latch with Battery)

The other programmable controller CPUs retain the data in each device/label with latch setting without a battery during power failure by inserting a battery-less option cassette to the CPU module. (☞ Page 482 Latch with Battery-less Option Cassette)

*3 This memory can be used in the R04CPU, R08CPU, R16CPU, R32CPU, R120CPU, R04ENCPU, R08ENCPU, R16ENCPU, R32ENCPU, and R120ENCPU.

*4 An SD memory card cannot be used in the R00CPU.

Point

- The usage of the memory can be checked from the engineering tool. (☞ GX Works3 Operating Manual)
- The number of writes for the program memory and data memory is limited to 100000 times. When using the function that the target file is written, pay attention to the number of writes. (☞ Page 136 File types and storage memory) The current number of writes for the program memory and data memory can be checked in the special register (SD630/SD631 and SD634/SD635). (☞ Page 619 Drive information)

Program memory/program cache memory

The program memory and program cache memory store necessary programs for the CPU module to perform operations. At the following timing, data in the program memory is transferred to the program cache memory*¹ and an operation is performed.

*¹ This memory is used for program operations.

- Powered-on
- Reset operation

Application

The program memory and program cache memory store execution programs of program files and FB (function block) files. Execution programs include instruction codes, statements, and notes.

Data to be allocated

The file header area*¹ and the execution program area (including reserved area for online change) that exist in program files and FB files are allocated to the program memory.

*¹ Depending on the model and firmware version of the CPU module, the file header area is allocated to the data memory. (☞ Page 126 Destination of the file header area)

Data allocation and procedure of read/write operations

The following figure shows the data allocation of the program memory and program cache memory and the procedure of read/write operations from/to the programmable controller.

*¹ Program restoration information includes the information required to read a program from the programmable controller with the engineering tool.

- (1) When data is written to the programmable controller, the file header, execution program, and reserved area for online change are written to the program cache memory, and program restoration information is written to the data memory.
- (2) After being written to the program cache memory, the data is automatically transferred to the program memory.
- (3) When data is read from the programmable controller, the file header, execution program, and reserved area for online change are read from the program memory, and the program restoration information is read from the data memory.
- (4) After the CPU module is powered off and on or is reset, the data in the program memory is transferred to the program cache memory and operations are executed.

*² Depending on the model and firmware version of the CPU module, the destination of the file header area is the data memory. (☞ Page 126 Destination of the file header area)

Point

For read/write operations from/to the programmable controller, refer to the following.

☞ GX Works3 Operating Manual

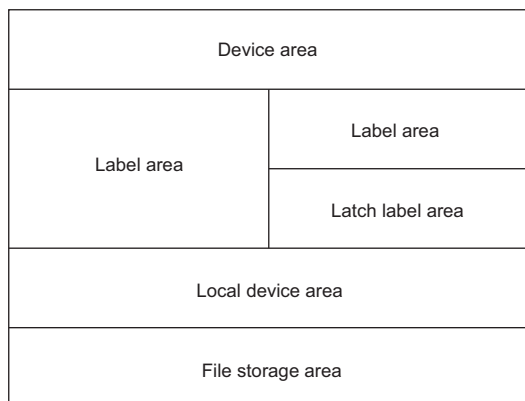

■ Destination of the file header area

For the following CPU modules, the destination of the file header area is the data memory.

CPU module	Firmware version
R04CPU, R08CPU, R16CPU, R32CPU, R120CPU R04ENCPU, R08ENCPU, R16ENCPU, R32ENCPU, R120ENCPU	"30" or earlier

Device/label memory

The device/label memory has the following areas.

The capacity of each area can be changed with the setting of the CPU parameter. ( Page 127 Device/label memory area setting)

Data to be allocated

The following table lists the data allocated to each area.

Area	Application	
Device area	User device	
Label area	Label area	Global label and local label
	Latch label area	Global label and local label with latch specified
Local device area	Local device (excluding index register)	
File storage area	File register file and other data ^{*1}	

*1 File register files which are stored in the area for storing file register files can be written or read in file unit.

Point

Free space of areas can be checked in "Device/Label Memory Area Capacity Setting". ( Page 127 Device/label memory area setting)

Device/label memory area setting

The capacity of each data area allocated within the device/label memory can be changed. (☞ Page 126 Device/label memory)

☞ [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Device/Label Memory Area Setting]

Operating procedure

"Device/Label Memory Area Setting" window

Item	Setting

	Label Area	Label Area Capacity	Sets the capacity of the label area to be used for global labels and local labels.		
		Latch Label Area Capacity	Sets the capacity of the latch label area to be used for latch type labels.		
	File Storage Area Capacity ^{*2}		Sets the capacity of the file storage area to be used for storing register files and others.		
Device/Label Memory Area Capacity Setting			Shows the device/label memory configuration.		

*1 Check the versions of the CPU module and engineering tool used. (☞ Page 705 Added and Enhanced Functions)

*2 When using 16MB extended SRAM cassettes (NZ2MC-16MBS), precautions apply when setting the file register capacity. (☞ Page 446 Setting file registers)

*3 This item is not displayed on the R00CPU, R01CPU, and R02CPU.

*4 This item is not displayed for CPU modules for which the latch with the battery-less option cassette cannot be used.

Point

- Please note that the total of the capacity of each area (including the capacity of the local device area) should not exceed the capacity of the device/label memory (☞ Page 62 Hardware specifications). The total of the capacity of each area can be checked in "Device/Label Memory Area Capacity Setting".
- When the capacity of the file storage area is changed, files (file register files) stored in the area are deleted, and therefore it is required to write file register files. Also, when files are stored in the CPU module, they must be read to other place before the capacity of the file storage area is changed and written back to the CPU module after the change.

Default capacity of each area

The default capacity of each area is as follows.

Item	R00CPU, R01CPU, R02CPU	R04CPU, R04ENCPU	R08CPU, R08ENCPU	R16CPU, R16ENCPU	R32CPU, R32ENCPU	R120CPU, R120ENCPU
Device area	30K words	40K words	40K words	40K words	40K words	40K words
Label area	30K words	30K words	40K words	50K words	90K words	110K words
Latch label area	2K words	2K words	2K words	2K words	4K words	4K words
Local device area	0K word	0K word	0K word	0K word	0K word	0K word
File storage area	64K words	128K words	512K words	768K words	1024K words	1536K words

Point

The capacity of the local device area to be set is obtained by deducting the total capacity of the device area, label area, latch label area, and file storage area from the total capacity of the device/label memory of each model. However, even if the total capacity of the device area and label area is smaller than the following, the capacity cannot be assigned to the local device area. (The area which is smaller than the following is the area not used.)

- R00CPU, R01CPU, R02CPU: 30K words
- R04CPU, R04ENCPU: 40K words
- R08CPU, R08ENCPU: 50K words
- R16CPU, R16ENCPU: 60K words
- R32CPU, R32ENCPU: 70K words
- R120CPU, R120ENCPU: 90K words

The setting range of the capacity of each area

The following tables list the setting range of the capacity of each area on the device/label memory.*¹

The availability of an extended SRAM cassette varies depending on the CPU module used. For the availability, check the performance specifications of the extended SRAM cassette. (Page 67 Extended SRAM Cassette)

*1 The rest of other areas are automatically set as the capacity of the local device area.

■R00CPU, R01CPU, R02CPU

To check which CPU modules can be used with extended SRAM cassettes, refer to the following.

☞ Page 67 Extended SRAM Cassette

Data memory

This memory is used to store the parameter file, device comment file, and/or the user's folder/file. Data such as the parameter file and the device comment files written by the engineering tool is stored in the "\$MELPRJ\$" folder. The "\$MELPRJ\$" folder is created after memory initialization. Note that the "\$MELPRJ\$" folder cannot be deleted. (Folders under the "\$MELPRJ\$" folder can be deleted.)

Point

For details on how to create and delete user folders, refer to the following.

GX Works3 Operating Manual

Precautions

Do not delete or rename the folders or files being accessed or those being executed by a function.

Function memory

This memory is temporarily used for the specific function.

The following is the function that uses the function memory.

Function	Reference
Data logging function (when "CPU built-in memory (function memory)" is selected for "Data storage destination memory")	Page 226 DATA LOGGING FUNCTION

Also, data can be deleted or transferred to the data memory by using the special relay. (Page 591 Drive information)

Precautions

Do not delete or rename the folders or files being accessed or those being executed by a function.

Refresh memory

This memory is used to store data used to refresh communication with the intelligent function module. (Page 447 Refresh Data Register (RD))

CPU buffer memory

This memory is used by the Ethernet function or in data communication between multiple CPUs. (Page 644 Buffer Memory)

Signal flow memory

This memory is used to memorize the execution status of the instruction in the last scan. The CPU module judges whether to execute a rising/falling edge execution instruction by referring to the signal flow memory.

The execution status of the last instruction is stored in the signal flow memory in two ways: executed or not executed. The instructions that refer to the signal flow memory judge whether to execute a rising/falling edge execution instruction depending on the input condition of the instruction and the execution status of the last instruction stored in the signal flow memory.

- For a program, the same number of areas as steps of the program are assigned to the signal flow memory (for program).
- For a function, the signal flow memory is not assigned since the instructions that refer to the last execution status of the signal flow memory cannot be used in the function.
- For a subroutine type function block, the same number of areas as instructions that refer to the signal flow memory in the function block are assigned to the signal flow memory (for FB). Different areas are assigned to each instance. When the macro type function block is called from the subroutine type function block, the areas including the ones used for the macro type function block are assigned.
- For a macro type function block, the same number of areas as the number of steps of the macro type function block are assigned to the signal flow memory (for program).

For instances of the function block, refer to the following.

📖 MELSEC iQ-R Programming Manual (Program Design)

Point

The following shows the instructions that refer to the last execution status of the signal flow memory.

- Contact instruction: LDP, LDF, ANDP, ANDF, ORP, ORF, LDPI, LDFI, ANDPI, ANDFI, ORPI, and ORFI
- Association instruction: MEP, MEF
- Output instruction: SET F, RST F, PLS, PLF, FF
- Rising edge execution instruction: $\square P$ (such as INCP and MOVP), SP. \square , ZP. \square , GP. \square , JP. \square , DP. \square , MP. \square , UDCNT1, UDCNT2, TTMR, STMR, RAMPQ, SPD, PLSY, PWM, MTR, SORTD(_U), DSORTD(_U), LEDR, DUTY, LOGTRG, LOGTRGR, TIMCHK, HOURM, DHOURLM, PID, XCALL, SCJ

SD memory card

This memory is used to store the folder/file created by a function using the SD memory card as well as the user's folder/file. The folder configuration is the same as the data memory. However, in the case of the SD memory card, the "\$MELPRJ\$" folder will be created when the SD memory card becomes available (when the SD memory card is mounted).

Point

For details on how to insert or remove the SD memory card, refer to the following.

Page 41 Inserting or Removing an Extended SRAM Cassette

How to forcibly disable the SD memory card with a special relay

If the SD memory card is removed while the CPU module is powered on, data in the SD memory card may be corrupted.

Use a special relay to forcibly disable access to the SD memory card without turning off the power.

The following shows how to forcibly disable the SD memory card with a special relay.

1. Turn on SM606 (SD memory card forced disable instruction). After an instruction by SM606, and until SM607 changes, an instruction by the ON/OFF state change of SM606 is disabled. Note that after SM607 changes, an instruction by the ON/OFF state change of SM606 is enabled, and operation is performed based on the ON/OFF state of SM606.

- (1) Forced disable instruction by the ON state
- (2) Instruction to cancel forced disable status by the OFF state enabled

2. Check that the CARD READY LED is off or SM607 (SD memory card forced disable status flag) is on.
3. Remove the SD memory card.

Point

After the SD memory card is disabled, to cancel the disabled status, insert the SD memory card again and power off and on or reset the CPU module.

When the SD memory card is inserted again, the CARD READY LED changes from flashing to on.

■ Operation of each function accessing the SD memory card

Disabling the SD memory card affects the operation of each function accessing the SD memory card. For the functions shown below, the following table shows the operations when the SD memory card forced disable instruction is executed during access to the SD memory card and when access is made to the SD memory card after the SD memory card is disabled.

Function being executed	SD memory card forced disable instruction executed during access to the SD memory card	Access made to the SD memory card after the SD memory card is disabled
Boot operation	—	—
<ul style="list-style-type: none"> • Access to device comment or label in SD memory card • Device/label initial value operation at status change from STOP to RUN 	The SD memory card becomes disabled after the executed function is completed.	An error occurs in the CPU module.*1
Access to SD memory card by engineering tool, SLMP, FTP function	The function is responded to with an error.	The function is responded to with an error.
Instruction to access SD memory card	The SD memory card becomes disabled after the instruction is completed.	The instruction is completed with an error.
CPU module data backup/restoration function	When the processing for the file being backed up/restored is completed, the SD memory card is disabled, the executed function is completed with an error, and the error cause is stored in the special register.	The error cause is stored in the special register.
iQ Sensor Solution data backup/restoration function	After the backup or restore operation is completed, the SD memory card is disabled.	The function is responded to with an error.
File transfer function (FTP client)	When the processing for the file during file transfer execution is completed, the SD memory card is disabled, the file transfer function instruction is completed with an error, and the error cause is stored in the completion status.	The file transfer function instruction is completed with an error, and the error cause is stored in the completion status.

*1 Same as the operation when the SD memory card is not inserted

Precautions

Do not delete or rename the folders or files being accessed or those being executed by a function.

■ Precautions when forcibly disabling the SD memory card

- When forced disable operation with the SD CARD OFF button and forced disable operation by SM606 are executed together, the operation executed earlier is enabled, and the operation executed later is disabled. For example, after the SD memory card is forcibly disabled with the SD CARD OFF button, when SM606 is turned off without removing the SD memory card, the disabled status of the SD memory card can be canceled. However, after forcibly disabling the SD memory card with the SD CARD OFF button, even by removing the SD memory card, turning on SM606, and inserting the SD memory card, the SD memory card is not enabled. To enable the SD memory card, after it is inserted again, SM606 must be turned off.
- If this function is executed while an external device is writing a file to the SD memory card, writing of the file may fail. Cancel the SD memory card disable status, then write the file again.

8.2 File Size Unit in Memory

The minimum unit of capacity for storing a file in the memory is referred to as the file size unit (cluster size).

File size unit based on memory area

CPU module	File size unit			
	Program memory	Device/label memory	Data memory	Function memory
R00CPU, R01CPU, R02CPU	4 bytes	512 bytes	1024 bytes	—
R04CPU, R04ENCPU			8192/2048 bytes* ¹	
R08CPU, R08ENCPU			2048 bytes	
R16CPU, R16ENCPU			4096 bytes	
R32CPU, R32ENCPU			8192 bytes	
R120CPU, R120ENCPU			16384 bytes	

*1 The file size unit (cluster size) differs depending on the firmware version and production information of the CPU module. ( Page 705 Added and Enhanced Functions)

Point

Data is written in the unit of the file size (cluster size). For example, when 464 bytes of CPU parameter is written to the data memory on R04CPU, it is written as 1024 bytes of data because the file size unit of the data memory is 1024 bytes.

File size unit of each SD memory card

SD memory card	File size unit
NZ1MEM-2GBSD	32K bytes
NZ1MEM-4GBSD	
NZ1MEM-8GBSD	
NZ1MEM-16GBSD	

8.3 Memory Operation

Initialization and value clear

Each memory can be initialized and cleared to zero by using the engineering tool. For details on the operation method, refer to the following.

 GX Works3 Operating Manual

Items to be specified in the engineering tool			Target	
Initialization	Data memory		Deletes all the folders and files in the program memory and data memory.	
	Device/label memory		Deletes all the files in the file storage areas in the device/label memory. The battery-less option cassette is initialized.	
	SD memory card		Deletes all the folders and files in the SD memory card.	
Value clear	Device, label	Zero clear	Excluding devices and labels with latch specified, clears the following to zero: X, Y, M, B, F, SB, V, S, T, ST, LT, LST, C, LC, D, W, SW, FX, FY, FD, Z, LZ, RD, and all labels (including module labels).	
		Zero clear (including Latches (1) and (2))	Including devices and labels with latch specified, clears the following to zero: X, Y, M, B, F, SB, V, S, T, ST, LT, LST, C, LC, D, W, SW, FX, FY, FD, Z, LZ, RD, and all labels (including module labels).	
	File register	Zero clear	All files	Clears the contents of all the file registers to zero.
			File specification	Clears only the contents of the specified file register(s) to zero.
		Zero clear excluding Latch (2)	Clears the file registers other than Latch (2) to zero.	
	Device / label / file register latch clear			Clears devices, labels, and file registers other than Latch (2) to zero.

Point

If the power goes off during initialization or zero clear, the memory is left in the state of that point, and it is necessary to re-execute the memory operation.

8

Memory initialization during execution of another function

No memory can be initialized during execution of the following functions. Check that the following functions are not being executed and then initialize the memory.

- CPU module data backup/restoration function
- iQ Sensor Solution data backup/restoration function

Clearing values during execution of another function

■ CPU module data backup/restoration function

During execution of the CPU module data backup/restoration function, devices, labels, file register areas, and latch areas cannot be cleared to zero. Check that the CPU module data backup/restoration function is not being executed and then clear devices, labels, file register areas, and latch areas to zero.

■ iQ Sensor Solution data backup/restoration function

During execution of the iQ Sensor Solution data backup/restoration function, file register areas cannot be cleared to zero. Check that the iQ Sensor Solution data backup/restoration function is not being executed and then clear file register areas to zero.

8.4 Files

This section lists the files used by the CPU module.

File types and storage memory

This table lists the types of files, which are generated by parameter settings and functions in use, as well as their storage memory.

◎: Can be stored (Mandatory), ○: Can be stored, ×: Cannot be stored

File type		CPU built-in memory			SD memory card	File name and extension
		Program memory	Device/label memory	Data memory		
		Drive 0	Drive 3	Drive 4	Drive 2	
Program		◎ ⁴	×	◎ ⁴	○	ANY_STRING.PRG

Firmware update prohibited file		×	×	○	○ ³	FWUPDP.SYU
Faulty database check file		×	×	×	○	ErrorDB.txt
Database path file		×	×	×	○	dbmaintainpath.txt
System file for backing up CPU module data		×	×	×	○	\$BKUP_CPU_INF.BSC
Backup data file for backing up CPU module data		×	×	×	○	BKUP_CPU.BKD
Device/label data file for backing up CPU module data		×	×	×	○	BKUP_CPU_DEVLAB.BKD
System file for the iQ Sensor Solution data backup/restoration function		×	×	×	○	\$BKUP_UNIT_INF.BSI
Backup data file for the iQ Sensor Solution data backup/restoration function		×	×	×	○	Depends on a connected device.QBR ⁶
ODBC server setting file		×	×	○	×	netserver.cfg
Slave station parameter file		×	×	○ ⁹	○ ⁹	SLAVEmmmmnnxxxx.NSP ⁸

File type	CPU built-in memory			SD memory card	File name and extension
	Program memory	Device/label memory	Data memory		
	Drive 0	Drive 3	Drive 4	Drive 2	
Recording setting file	×	×	○	○	RECCFGn.RSI
User Web page file	×	×	×	○	Files that support the Web server function ^{*10}

*1 mmm represents the start I/O number (first three digits in four-digit hexadecimal representation) of each module. For the CPU module, it will be 3FFH. Also, nn represents the serial number (two-digit hexadecimal representation) of module extension parameter files or module-specific backup parameter files of each module.

*2 nn corresponds to the setting number and is 01 through 10.

*3 Can be stored but cannot operate as a function.

*4 When this file is stored in the built-in memory of the CPU module, it is divided into program memory and data memory and stored. ( Page 142 Configuration of a program file)

*5 The module extension parameter for the protocol setting is a file for storing protocol setting information in the predefined protocol support function.

*6 This file name depends on the connection type of the iQ Sensor Solution data backup/restoration function. For the file name, refer to the following.

 iQ Sensor Solution Reference Manual

*7 The parameter cannot be written to the CPU modules on other stations via MELSECNET/H of the Q series.

*8 mmm represents the start I/O number (first three digits in four-digit hexadecimal representation) of the master station of CC-Link IE TSN, nnn represents the number of units in network configuration setting, and xxxx represents the serial number (four-digit hexadecimal representation) of the parameter.

*9 Up to 1024 parameters can be stored.

*10 For files that support the Web server function, refer to the following.

 MELSEC iQ-R Ethernet User's Manual (Application)

File operation available

The following lists the file operations which can be executed to each file in the CPU module by external devices.

○: Available, —: N/A

File type		Operation from engineering tool			Operation with SLMP and FTP server function			Operation via instruction ^{*1}	
		Write	Read	Delete	Write	Read	Delete	Write	Read
Program		○ ^{*2*7}	○	○ ^{*4}	○ ^{*3*6}	○	○ ^{*3*6}	—	—

- *1 Modification of data in files, such as read/write from/to file register and execution of the FWRITE/FREAD instruction
- *2 When the CPU module is in the STOP state, the file operation is performed by writing the FB file to the programmable controller. In the RUN state, it is performed by online change. Note that only programs and FB files that are registered in the parameter can be written when the operating status of the CPU module is RUN.
- *3 Available only when the CPU module operation status is STOP/PAUSE. A communication error occurs when operated in the RUN state.
- *4 Available only when the CPU module operation status is STOP/PAUSE. When a program tries to perform memory operation while the CPU module is RUN, the operation is continued after the operation status is changed through remote STOP.
- *5 Operation on CPU Module Logging Configuration Tool.
- *6 When the operation target is the SD memory card, the operation can be performed even while the CPU module is RUN.
- *7 The availability of the online change (the file batch online change of FB files and the global label setting file) differs depending on the model and firmware version.
For supported models and firmware versions, refer to the following.
 Page 705 Added and Enhanced Functions
For executable conditions of the file batch online change, refer to the following.
 GX Works3 Operating Manual
For the modules that do not support the online change mentioned above, the operation continues after the operating status is changed by the remote STOP function if the operation is performed during RUN state.
- *8 If the global label that can be accessed from the external device is set and the CPU module is in the RUN state, only read operation is available.
- *9 When the CPU module is in the RUN state, the file operation is available only when the target file is already written to the CPU module.
- *10 When the recording function is in the process of saving, the file operation is not available.
- *11 When the recording function is in one of the following states, the file operation is not available.
 - Preparing
 - Operating
 - Save trigger established
 - Saving
- *12 For supported models and firmware versions, refer to the following.
 MELSEC iQ-R Ethernet User's Manual (Application)

File size

The following table lists the size of files that can be stored in the CPU module.

File type		File size
Program		Approx. 4050 bytes minimum (only the END instruction + 500 steps reserved for online program change)
FB file		Approx. 4900 bytes minimum (non-processing FB + 500 steps reserved for online program change)
CPU parameter		744 bytes minimum
System parameter		112 bytes minimum
Module parameter		Differs depending on the module used. For example, the size is 1036 bytes at minimum when the Ethernet function is used.
Module extension parameter		Differs depending on the module used. For example, the size is 65572 bytes when the predefined protocol support function is used with the Ethernet function.
Module-specific backup parameter		Differs depending on the module used.
Memory card parameter		124 bytes minimum
Device comment		220 bytes minimum (when a device comment with 20 characters is set in a device)
Initial device value		Approx. 140 bytes minimum (when the initial value of a word device is set)
Global label setting file		Approx. 660 bytes minimum (when a word-type global label is set)
Initial label value file	Initial global label value file	Approx. 140 bytes minimum (when the initial value of a word-type global label is set)
	Initial local label value file	
File register file		2048 bytes minimum (when the setting capacity is 1K words)
Event history		1024 bytes minimum (when the setting capacity is 1K bytes (default setting is 131072 bytes))
Device data storage file		2048 bytes minimum (when the setting capacity is 1K words)
General-purpose data		The size differs depending on the size of the file to be written.
Data logging setting file	Common setting file	142 bytes (When the setting is configured so that one-word data is collected in a binary file at each scan in continuous logging)
	Individual setting file	1192 bytes (When the setting is configured so that one-word data is collected in a binary file at each scan in continuous logging only for setting No.1)
Memory dump setting file		1224 bytes (when the save file name is "MEMDUMP_00")
Remote password		224 bytes minimum
Firmware update file		6816338 bytes minimum
Firmware update prohibited file		92 bytes minimum
Faulty database check file		Total number of characters in the file path × 2 bytes + number of databases × 4 bytes
Database path file		Total number of characters in the file path × 2 bytes + number of databases × 4 bytes
System file for backing up CPU module data		$20 + 12 + ((N1 \times 34) + (N2 \times 34) + (N3 \times 34)) + M + 8$ bytes · N1: Number of target drives · N2: Number of target files · N3: Number of target folders · M: Total name size of target files/folders (bytes) (including ".", extensions, but no drive symbols)
Backup data file for backing up CPU module data		<ul style="list-style-type: none"> When the data logging setting has been registered: 30608 bytes When the data logging setting has not been registered: 30200 bytes
Device/label data file for backing up CPU module data		<ul style="list-style-type: none"> ■When local devices are not set <ul style="list-style-type: none"> $20 + 20 + (N1 \times 142) + 16 + (N2 \times 134) + (16 + (162 + (N3 \times 18) + 1087104 + M1)) + 28 + M3 + M4 + M5 + 8$ bytes^{*1} ■When local devices are set <ul style="list-style-type: none"> $20 + 20 + (N1 \times 142) + 16 + (N2 \times 134) + (16 + (162 + (N3 \times 18) + 1087104 + M1)) + (16 + N1 \times (8 + ((N4 \times 18) + M2))) + 28 + M3 + M4 + M5 + 8$ bytes^{*1} · N1: Number of programs · N2: Number of file register files · N3: Number of set device types (excluding SM, SD, FX, FY, FD, X, Y, and G/HG) · N4: Number of local device settings (Number of device types) · M1: Total size of set devices (bytes) (excluding SM, SD, FX, FY, FD, X, Y, and G/HG) · M2: Total size of local devices (bytes) · M3: Module label size (bytes) · M4: Label area size (bytes) · M5: Latch label area size (bytes)
System file for the iQ Sensor Solution data backup/restoration function		<ul style="list-style-type: none"> ■CC-Link 36 + 20 × N bytes (N: No. of devices supporting iQSS whose data has successfully been backed up) ■Built-in Ethernet 52 + M bytes (M: Backup data file name size^{*1}) The file name size differs depending on the device supporting iQSS.

File type	File size
Backup data file for the iQ Sensor Solution data backup/restoration function	The size differs depending on the device supporting iQSS.
ODBC server setting file	236 bytes (when the IP address of the CPU module is 192.168.3.39)
Slave station parameter file	The size differs depending on the slave station used.
Recording setting file	920 bytes (when only one recording setting (setting No.1) is made and the settings are configured as follows) <ul style="list-style-type: none"> • Recording Period Setting: "Recording Method" is set to "File Saving Trigger Only", "Saving Period Before Trigger" is set to 30 seconds, and "Saving Period After Trigger" is set to 5 seconds. • Device/Label Sampling Target Setting: "Specify Device/Label in batch" is not set and only M0 (32 words) is set in "Device Individual Specification". • Sampling Interval Setting: "Each Scan" • File Saving Trigger Setting: None • Saving Path Setting: Not changed • Program: REC only (The number of texts for the file name is three.) • Device comment: Common device comments • FB/FUN: None

*1 Up to 3 bytes are added to the total file size so that the size will be a multiple of 4 bytes.

*2 S4 is added only when local devices are used.

*3 When the number of device points that is assigned to local devices is 0, N5 is 0.

Restriction

When the CPU module versions are different, a program which can be written to a CPU module with a certain version may not be written to the one with another version due to overcapacity. In this case, delete the steps reserved for online program change (default: 500 steps) and write the program to the CPU module.

 GX Works3 Operating Manual

Configuration of a program file

The following figure shows the configuration of a program.

■ Configuration of a program

This file consists of a file header, execution program, reserved area for online change, and program restoration information.

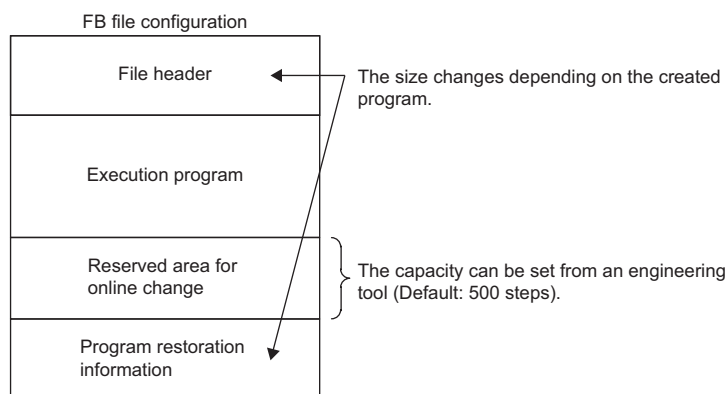

When the program is stored in the CPU module, file header, execution program, and reserved area for online change are allocated to the program memory. Program restoration information is allocated to the data memory. The following table shows the destination memory to which each area is allocated when a program is stored in the CPU module.

Area	Destination memory	Description
File header	Program memory	This area stores the configuration of the file, and the labels and information of FBs used in the program. The size differs depending on the created program.
Execution program		This area stores the execution program of the created program.
Reserved area for online change		This area is used when the online program change which increases the number of steps is executed (default: 500 steps (2000 bytes)). At writing to the programmable controller or at online ladder block change, the capacity of the area can be changed from the engineering tool.
Program restoration information	Data memory	This area stores information required for reading the program from the programmable controller.

■ FB file

This file consists of a file header, execution program, reserved area for online change, and program restoration information.

When an FB file is stored in the CPU module, the file header, execution program, and reserved area for online change are allocated to the program memory. Program restoration information is allocated to the data memory. The destination memory to which each area is allocated when an FB file is stored in the CPU module is the same as that for programs.

PART 6 FUNCTIONS

This part consists of the following chapters.

9 FUNCTION LIST

10 CLOCK FUNCTION

11 WRITING DATA TO THE CPU MODULE

12 RAS FUNCTIONS

21 CPU MODULE DATA BACKUP/RESTORATION FUNCTION

22 MULTIPLE CPU SYSTEM FUNCTION

23 SECURITY FUNCTION

24 SEQUENCE SCAN SYNCHRONIZATION SAMPLING FUNCTION

25 ROUTING SETTING

26 FIRMWARE UPDATE FUNCTION

9 FUNCTION LIST

The following table lists the functions of the CPU module.

Some functions have restrictions on the firmware version and the production information of the CPU module used or the version of the engineering tool used. (📖 Page 705 Added and Enhanced Functions)

Function		Description	Availability			Reference
			R00 CPU	R01/R02 CPU	Rn(EN)CPUs other than the left ones	
Constant scan		Repeatedly runs a program while retaining the scan time constant.	○	○	○	📖 Page 73 Constant scan
Device/label access service processing setting		Sets the time or execution timing of the device/label access service processing performed in the END processing in parameter.	○	○	○	📖 Page 75 Device/label access service processing setting
Interrupt function	Multiple interrupt function	When an interrupt occurs while an interrupt program triggered by another cause is running, stops the program if its priority is lower than that of the new interrupt, and runs the higher-priority program whenever its execution condition is satisfied.	○	○	○	📖 Page 114 Multiple interrupt function
Output mode setting when the status changed from STOP to RUN		Sets the output (Y) status when the operating status of the CPU module is switched from STOP to RUN.	○	○	○	📖 Page 122 Output mode at operating status change (STOP to RUN)
Device/label memory area setting		Sets the capacity of each area in the device/label memory.	○	○	○	📖 Page 127 Device/label memory area setting
Internal buffer capacity setting		Sets the capacity of the area (internal buffer) used by the system to temporarily store the results of data logging and memory dump processing.	×	○	○	📖 Page 266 Internal buffer capacity setting
SD memory card forced disable		Forcibly disables an access to the SD memory card without powering off the system even when the function that accesses the SD memory card is being executed.	×	○	○	📖 Page 132 How to forcibly disable the SD memory card with a special relay
Clock function		Manages time for the system functions such as time stamps for the event history function and date information for the data logging function.	○	○	○	📖 Page 148 CLOCK FUNCTION
Writing data to the CPU module	Writing data to the programmable controller	Writes the specified data of the project with the engineering tool to the memory of the CPU module.	○	○	○	<ul style="list-style-type: none"> 📖 Page 155 Writing Data to the Programmable Controller 📖 GX Works3 Operating Manual
	Online change (ladder block)	Writes the part of a program edited on the ladder editor using the engineering tool to the running CPU module in units of ladder blocks. Edited contents spanning multiple files or multiple portions can be written to the CPU module at once.	○	○	○	<ul style="list-style-type: none"> 📖 Page 155 Online change (ladder block) 📖 GX Works3 Operating Manual
	Online change (files)	Writes programs and other data to the running CPU module in units of files.	○	○	○	<ul style="list-style-type: none"> 📖 Page 159 File batch online change 📖 GX Works3 Operating Manual

Function		Description	Availability			Reference
			R00 CPU	R01/R02 CPU	Rn(EN)CPUs other than the left ones	
RAS function	Scan monitoring function	Detects a hardware failure or program error by monitoring that the END processing is performed within a set scan time.	○	○	○	☞ Page 166 Scan Monitoring Function
	Self-diagnostics function	Self-diagnoses the CPU module to see whether an error exist or not.	○	○	○	☞ Page 168 Self-Diagnostics Function
	FB hierarchy information	Displays the FB hierarchy information of the function block with an error in the "Module Diagnostics" window.	○	○	○	📖 GX Works3 Operating Manual
	Error clear	Batch-clears all the continuation errors being detected.	○	○	○	☞ Page 174 Error Clear
	Event history function	Collects operations executed and errors detected from the modules, and saves them in the CPU module. The saved logs can be checked in chronological order.	○	○	○	☞ Page 177 Event History Function
	Program cache memory auto recovery function	Automatically detects and recovers the data stored in the program cache memory of the CPU module at the time of program execution if the data is overwritten due to the factors such as excessive electrical noise.	○	○	○	☞ Page 186 Program Cache Memory Auto Recovery Function
Remote operation		Remotely controls the operating status of the CPU module without switch operation.	○	○	○	☞ Page 187 REMOTE OPERATION
Boot operation		Transfers files in the SD memory card to the built-in memory of the CPU module when the CPU module is powered off and on or reset.	×	○	○	☞ Page 191 BOOT OPERATION
Monitor function	Circuit monitor	Checks the status of a running program on the program editor.	○	○	○	📖 GX Works3 Operating Manual
	Device/buffer memory batch monitor	Monitors values in devices and buffer memory using the engineering tool connected.	○	○	○	📖 GX Works3 Operating Manual
	Watch	Registers devices and labels, and checks the current values.	○	○	○	📖 GX Works3 Operating Manual
	Program monitor list	Monitors the execution time of each program and the number of executions using the engineering tool connected.	○	○	○	📖 GX Works3 Operating Manual
	Interrupt program monitor list	Monitors the number of executions of interrupt programs using the engineering tool connected.	○	○	○	📖 GX Works3 Operating Manual
	Real-time monitor function	Monitors the data in the specified device of the CPU module at a specified interval or at a desired timing in real time.	○	○	○	📖 GX Works3 Operating Manual
	Scan time measurement	Measures the processing time of the set program section using the engineering tool.	○	○	○	<ul style="list-style-type: none"> ☞ Page 197 Scan Time Measurement 📖 GX Works3 Operating Manual
	Scan time clear	Clears values of the scan time at a desired timing without stopping the CPU module.	○	○	○	📖 GX Works3 Operating Manual
	Specified program monitor	Checks (monitors) device/label values in the program specified by the engineering tool on the program editor and changes current values.	○	○	○	<ul style="list-style-type: none"> ☞ Page 202 Specified Program Monitor 📖 GX Works3 Operating Manual
Test function	External input/output forced on/off function	Forcibly turns on/off the external input/output from the engineering tool.	○	○	○	<ul style="list-style-type: none"> ☞ Page 204 External Input/Output Forced On/Off Function 📖 GX Works3 Operating Manual
	Device test with execution condition	Changes a device value for the specified step of a program, using the engineering tool.	○	○	○	<ul style="list-style-type: none"> ☞ Page 212 Device Test with Execution Conditions 📖 GX Works3 Operating Manual
Data logging function		Collects data at a specified interval or a desired timing, and stores them as a file.	×	○	○	<ul style="list-style-type: none"> ☞ Page 226 DATA LOGGING FUNCTION 📖 CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series)

Function		Description	Availability			Reference
			R00 CPU	R01/R02 CPU	Rn(EN)CPUs other than the left ones	
Recording function		Saves the device/label data set in the engineering tool into an SD memory card in the recorder module at the specified timing.	×	×	○	<ul style="list-style-type: none"> • MELSEC iQ-R System Recorder User's Manual (Startup) • MELSEC iQ-R System Recorder User's Manual (Application)

	Update using an SD memory card	Enables users to update firmware versions of CPU modules and intelligent function modules using an SD memory card.	×	○	○	📖 MELSEC iQ-R Module Configuration Manual

10 CLOCK FUNCTION

The CPU module internally maintains clock data and uses it to manage time for the system functions such as time stamp for the event history and the data logging function.

10.1 Time Setting

The clock continues operating with the internal battery of the CPU module while the CPU module is powered off or during power failure longer than the allowable momentary power failure time.

Point

The R00CPU, R01CPU, and R02CPU continue the clock operation for 10 days without a battery in power failure state.

Clock data

The following table lists the details of clock data in the CPU module.

Data name	Description
Year	Four digits (from 1980 to 2079)
Month	1 to 12
Day	1 to 31 (Automatic leap year detection)
Hour	0 to 23 (24 hours)
Minute	0 to 59
Second	0 to 59
Day of Week	0: Sunday, 1: Monday, 2: Tuesday, 3: Wednesday, 4: Thursday, 5: Friday, 6: Saturday
1/1000 seconds ^{*1}	0 to 999

*1 Data can be read from the S(P).DATERD instruction. (MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks))

Changing the clock data

The clock data can be changed in one of the following methods:

- Using the engineering tool
- Using SM/SD
- Using the instruction
- Automatic change using the SNTP server

Point

When the clock data is changed, the following operation is performed:

- The millisecond value is reset to zero. Depending on the millisecond value immediately before the reset, the second value can be rounded up. Considering that the second value can increase by one second maximum when the clock data is changed, configure the system.
- Clock setting (Event code: 24000) is logged in the event history.

Using the engineering tool

Choose "Set Clock" from the menu. (GX Works3 Operating Manual)

Using SM/SD

After SM210 (Clock data set request) is turned on, values stored in SD210 (Clock data) to SD216 (Clock data) are written to the CPU module. Once the write operation is finished, SM210 is turned off. If values in SD210 to SD216 are out of the effective range, SM211 (Clock data set error) turns on and the values in SD210 to SD216 are not written to the CPU module.

Using the instruction

Use the DATEWR instruction to write the clock data to the CPU module. (📖 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks))

Automatic change using the SNTP server

The time of CPU module is automatically set by collecting clock data from the time information server (SNTP server) connected to the LAN at the specified timing. (📖 MELSEC iQ-R Ethernet User's Manual (Application))

Reading the clock data

The clock data can be read in one of the following methods:

- Using SM/SD
- Using the instruction

Using SM/SD

When SM213 (Clock data read request) is turned on, the clock data is read to SD210 to SD216.

Using the instruction

Use the DATERD(P)/S(P).DATERD instructions to read the clock data from the CPU module. (📖 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks))

Precautions on the clock data

The following lists the precautions on the clock data.

When using the product for the first time

Since the clock data is not set at the factory, be sure to set the correct data.

Modifying the clock data

Even if a portion of the clock data is changed, be sure to write all the data to the CPU module again.

Range of the clock data

The clock data must be written within the following range.

📖 Page 148 Clock data

Even within the range, the clock function does not operate normally if data outside the clock range is written to the CPU module.

Ex.

Operating status of the CPU module when impossible date is set

Date	Write operation to the CPU module	CPU module operating status
February 30	Executed	An error is not detected.
32nd of month 13	Not executed	<ul style="list-style-type: none"> • When the DATEWR instruction is executed, "Operation error" (error code: 3405H) is detected. • When SM210 is on, SM211 turns on.

10.2 Setting Time Zone

The time zone used for the CPU module can be specified. Specifying the time zone enables the clock of the programmable controller to work in the local time zone.

 [CPU Parameter] ⇒ [Operation Related Setting] ⇒ [Clock Related Setting]

Window

Item	Setting
<ul style="list-style-type: none"> □ Clock Related Setting <ul style="list-style-type: none"> Time Zone Comment 	UTC+9

Item	Description	Setting range	Default
Time Zone	Sets the time zone used by the CPU module.	<ul style="list-style-type: none"> • UTC+13 • UTC+12 • UTC+11 • UTC+10 • UTC+9:30 • UTC+9 • UTC+8 • UTC+7 • UTC+6:30 • UTC+6 • UTC+5:45 • UTC+5:30 • UTC+5 • UTC+4:30 • UTC+4 • UTC+3:30 • UTC+3 • UTC+2 • UTC+1 • UTC • UTC-1 • UTC-2 • UTC-3 • UTC-3:30 • UTC-4 • UTC-4:30 • UTC-5 • UTC-6 • UTC-7 • UTC-8 • UTC-9 • UTC-10 • UTC-11 • UTC-12 	UTC+9
Comment	Enters a comment for a time zone (e.g., name of the city).	32 characters or less	—

Point

- To reflect the time zone setting on the CPU module, the module must be restarted. If no parameter is set for the CPU module, it operates with "UTC+9".
- On the multiple CPU system, the time zone setting of the CPU No.1 is used for other CPU modules. (the time zone setting of CPUs No.2 to 4 is not applied even when it is specified.)

10.3 Daylight Saving Time Function

The daylight saving time function is used to adjust the CPU module time to daylight saving time. This function advances the CPU module time by one hour on the starting date of daylight saving time, and reverses the time by 1 hour on the ending date.

Ex.

If daylight saving time starts from 2.00 on the second Sunday in March, and ends at 2.00 on the first Sunday in November

Restriction

Before executing the daylight-saving time function, check the versions of the CPU module and engineering tool used. (☞ Page 705 Added and Enhanced Functions)

Daylight saving time setting

Sets the starting date and ending date for daylight saving time.

☞ [CPU Parameter] ⇒ [Operation Related Setting] ⇒ [Clock Related Setting] ⇒ [Setting to Adjust Clock for Daylight Saving Time]

		Week		<ul style="list-style-type: none"> • 1st Week • 2nd Week • 3rd Week • 4th Week • The Last Week 	2nd Week	
		Day of Week		<ul style="list-style-type: none"> • Sunday • Monday • Tuesday • Wednesday • Thursday • Friday • Saturday 	Sunday	
		Time		0:00 to 23:00	2:00	
		End		Month	Sets the daylight saving time ending date.	1 to 12
	Week	<ul style="list-style-type: none"> • 1st Week • 2nd Week • 3rd Week • 4th Week • The Last Week 	1st Week			
	Day of Week	<ul style="list-style-type: none"> • Sunday • Monday • Tuesday • Wednesday • Thursday • Friday • Saturday 	Sunday			
	Time	0:00 to 23:00	2:00			
	Date	Start	Month	Sets the daylight saving time starting date.		1 to 12
	Date		Day		1 to 31, The Last Date	1
Time			0:00 to 23:00		2:00	
End			Month		Sets the daylight saving time ending date.	1 to 12
Day	1 to 31, The Last Date		1			
Time	0:00 to 23:00		2:00			

Point

With the multiple CPU system, the "Setting to Adjust Clock for Daylight Saving Time" for CPU No.1 is used for other CPU modules. (The "Setting to Adjust Clock for Daylight Saving Time" will not be valid for CPU Nos. 2 to 4.)

Restriction

- The same month cannot be specified for the start and end of the timing of the switch.
- February 29 cannot be specified directly. If specifying February 29, the date can be substituted by entering "Last Date in February".

Timing of daylight saving time adjustment

Daylight saving time is adjusted at the following times.

- ON the starting date and ending date of daylight saving time
- When the CPU module is powered off and on
- When the CPU module is reset

Daylight saving time function operation check

The daylight saving time function operation can be checked as follows.

Special relay

SM217 (Daylight saving time status flag) can be used to check whether the date lies inside or outside the daylight saving time period. (☞ Page 581 List of Special Relay Areas)

Event history

The history for the start and end of daylight saving time can be checked in the event history for the date set in "Setting to Adjust Clock for Daylight Saving Time" (☞ Page 565 Event List)

Operation of other functions using clock data during daylight saving time

Functions using CPU module clock data operate as follows during the daylight saving time period.

Item	Description
Clock data reading	Reads clock data following adjustment for daylight saving time.
Clock data writing	Writes as clock data following adjustment for daylight saving time.

Precautions

This section describes precautions on the daylight saving time function.

- The clock data cannot be changed to data less than one hour from the starting time of the daylight saving time. Furthermore, if the "Setting to Adjust Clock for Daylight Saving Time" for CPU No.1 in a multiple CPU system is enabled, it will not be possible to change the clock data to data less than one hour from the starting time of the daylight saving time for CPU modules for CPU Nos. 2 to 4.
- For the period less than one hour from the starting time or less than one hour until the ending time of daylight saving time, the function that is triggered by time may not work or may work twice.
- When the "Setting to Adjust Clock for Daylight Saving Time" is enabled, functions operate based on date information after adjustment for daylight saving time. For this reason, dates and times output by functions that uses clock data are reversed ((before adjustment) ≥ (after adjustment)) and therefore the order (No.) in which events occur and the sorting order for the date on which events occur may not match. Consequently, when checking output results in chronological order, sort not in the order for the date on which events occur, but in the order (No.) in which events occur.

Ex.

Event history

No.	Occurrence Date	Event Type	Status	Event Code	Overview	Source
00001	2016/11/06 1:11:28.373	Operation	🕒	24100	Operating status change (RUN)	R08CPU
00002	2016/11/06 1:11:27.253	System	🕒	00400	Power-on and reset	R08CPU
00003	2016/11/06 1:11:13.962	System	⚠️	01000	Power shutoff	R08CPU
00004	2016/11/06 1:10:32.001	Operation	🕒	24000	Clock setting	R08CPU
00005	2016/11/06 1:00:00.052	System	🕒	00450	Daylight saving time start/end	R08CPU
00006	2016/11/06 1:58:26.000	Operation	🕒	24000	Clock setting	R08CPU
00007	2016/11/06 1:50:14.000	Operation	🕒	24000	Clock setting	R08CPU

Since the time goes back one hour at No.00005 where the daylight saving time ends, the dates and times on which events occurred are reversed at the upper and lower side of the broken line ((time of new event history) < (time of old event history)).

10.4 System Clock

The system clock is turned on/off by the system or turns on/off automatically at the interval specified by the user.

Special relay used for system clock

Special relay used for system clock are as follows ( Page 587 System clock)

SM number	Name
SM400	Always On
SM401	Always Off
SM402	After RUN, ON for 1 scan only
SM403	After RUN, OFF for 1 scan only
SM409	0.01 second clock
SM410	0.1 second clock
SM411	0.2 second clock
SM412	1 second clock
SM413	2 second clock
SM414	2n second clock
SM415	2n millisecond clock
SM420	User timing clock No.0
SM421	User timing clock No.1
SM422	User timing clock No.2
SM423	User timing clock No.3
SM424	User timing clock No.4
SM440	On only initial I44 execution after RUN
SM441	On only initial I45 execution after RUN

Precautions

- SM409 to SM415 (System clock) start to measure the time before the CPU module is switched to RUN. Therefore, the time from the first scan after the CPU module has been switched to RUN until switching of the on/off state of the system clock may not match the measurement time of the system clock.
- The on/off status of SM409 to SM415 (System clock) changes even during execution of a program. For this reason, when one program has multiple processes that are performed based on the on/off status of the system clock, these processes are not performed in the execution order of the program. If these processes are required to be performed in the execution order of the program, write a program such that the on/off status of the system clock is transferred to an internal relay at the start of every scan and each processing is performed based on the status in the internal relay.

Special register used for system clock

Special register used for system clock are as follows ( Page 616 System clock)

SD number	Name
SD412	One second counter
SD414	2n second clock setting
SD415	2n ms clock setting
SD420	Scan counter

11 WRITING DATA TO THE CPU MODULE

This chapter describes the functions relating to writing data to the CPU module.

11.1 Writing Data to the Programmable Controller

This function writes data specified by the project of the engineering tool to the memory of the CPU module. For details, refer to the following.

 GX Works3 Operating Manual

11.2 Online Change

The following table lists the types of the online change.

Type	Description	Reference
Online change	Online change (ladder block)	<ul style="list-style-type: none"> Page 155 Online change (ladder block) GX Works3 Operating Manual
	Online change (SFC block)	<ul style="list-style-type: none"> GX Works3 Operating Manual MELSEC iQ-R Programming Manual (Program Design)
File batch online change	Writes data in file units online.	<ul style="list-style-type: none"> Page 159 File batch online change GX Works3 Operating Manual

Online change (ladder block)

This function writes the part of a program edited on the ladder editor using the engineering tool to the running CPU module in units of ladder blocks. Edited contents spanning multiple files or multiple portions can be written to the CPU module at once.

- (1) Portion edited in the engineering tool
- (2) The changed ladder block is written to the running CPU module.
- (3) The program contents in the program cache memory are changed.
- (4) After changing the program contents in the program cache memory, they are automatically transferred to the program memory.

Point

For details on the operating procedure of the online change (ladder block) on engineering tools, refer to the following.

 GX Works3 Operating Manual

Editable contents

Within a program block, instructions and pointers (P, I) can be added, changed, or deleted. Also, for each program component, program blocks can be added, changed, or deleted. However, if the user try to edit a label, FB, or FUN, the following limitations are applied.

■ Editable contents within a program block

To change or delete global label definition and global label, all the programs and FB files using them must match both on the engineering tool and in the CPU module.

■ Editable contents within FB definition

- To add or change instructions that refer to a local label or the signal flow memory, the size of the instructions cannot exceed the reserved area capacity^{*1}. The same applies to the standard function blocks and module function blocks because those function blocks also have local labels. For details, refer to the following.

Item	Reference
Precautions for adding a local label	 Precautions when local labels are added into the MELSEC iQ-R series function blocks (FA-A-0232)
Instructions that refer to the signal flow memory	 Page 131 Signal flow memory

- To add a local label, all the programs and FB files referencing the FB file which stores the FB definition to be modified must match both on the engineering tool and in the CPU module.
- For input and output labels (VAR_INPUT, VAR_OUTPUT, and VAR_IN_OUT) and public labels, to add, change, or delete subroutine type FB and FUN interface information^{*2}, all the programs and FB files referencing the FB file storing the FB definition to modify must match both on the engineering tool and in the CPU module.

*1 Reserved area refers to the area used for adding or changing a local label or a local instance when a program is changed online. The area is 48 words for non-latch type local labels, 16 words for latch type labels, and 4 words for signal flow memory by default. The reserved area can be changed for each function block definition. ( GX Works3 Operating Manual)

*2 The subroutine type FB and FUN interface information means:

- All FB definition, FUN definitions, and their definition numbers contained in FB files
- Definition names
- The number of all input labels, and their data types
- The number of all output labels, and their data types
- The number of all I/O labels, and their data types
- The number of public local labels in FB definition and their data types
- The implementation method of FB definition

■ Editable contents within FUN definition

For input and output labels (VAR_INPUT and VAR_OUTPUT), to add, change, or delete subroutine type FB and FUN interface information, all the programs and FB files referencing the FB file storing the FB definition to modify must match both on the engineering tool and in the CPU module.

■ Editable contents for each program component

To add or delete FB or FUN definition to or from an FB file, all the programs and FB files referencing the target FB file must match both on the engineering tool and in the CPU module.

Range changeable in a single session

The following shows the number of steps and number of ladder blocks which can be changed in a single session.

- Number of ladder blocks in a file: 64 blocks
- Maximum number of steps in a ladder block: 65535 steps
- Total number of steps for all blocks (steps before changes + steps after changes): 364K steps

Reserved area for online change

Reserved area for online change can be set in a program file to address the online change (ladder block) which causes a change in the program file size. (📖 GX Works3 Operating Manual)

In addition, if the changed program exceeds the program file capacity (including reserved area for online change) during the online change (ladder block), the reserved area for online change can be set again if there is space available in the program memory.

Required free space in the data memory

If the data memory does not have enough free space when the online change (ladder block) is executed, an error occurs. The free space of the data memory required for the execution of the online change (ladder block) depends on the size of program files to be changed or the usage of labels.

CPU module	Firmware version	Required data memory space
R00CPU, R01CPU, R02CPU	All firmware versions	Total increased size of the relevant program restoration information ^{*1}
R04CPU, R08CPU, R16CPU, R32CPU, R120CPU	"31" or later	
R04ENCPU, R08ENCPU, R16ENCPU, R32ENCPU, R120ENCPU	"30" or earlier	Size of the program restoration information

*1 When the setting of [Convert] ⇒ [Online Program Change] ⇒ [Write Program Restore Information] is "Write with Execution Program", the required free space is equal to the size of the program restoration information.

The size of the program restoration information can be checked from the memory capacity calculation of the engineering tool.

 [Tool] ⇒ [Confirm Memory Size (Offline)]

Ex.

The following table lists required free space of the data memory (size of program restoration information) for the online change (ladder block) in the R120CPU with a firmware version "30" or earlier.

Target program of online change (ladder block)	Required free space in the data memory	
	When labels are not used	When labels are used (200 global labels and 200 local labels are used)
Ladder program of 1K steps	Approx. 20K bytes	Approx. 40K bytes
Ladder program of 10K steps	Approx. 80K bytes	Approx. 140K bytes
Ladder program of 100K steps	Approx. 550K bytes	Approx. 1000K bytes

Online change (ladder block) during the boot operation

When the online change (ladder block) is performed while booting from the SD memory card, the corresponding files on the booting SD memory card can also be changed.

Setting the initial value for registering/changing label definition

The initial value used when registering/changing label definition can be set. (📖 GX Works3 Operating Manual)

■Initial value setting availability

Indicates whether or not the initial value can be set when adding or changing a label.

○: Available, △: Conditionally available, ×: Not available

Label type		Label addition	Label change
Program block	Global label	○	△*1
	Local label	○	△*1
FB definition	Local label	○*2	△*1
FUN definition	Local label	×*3	×*3

*1 The initial value can be set only when a new area is assigned again.

*2 A different initial value can be set for each instance.

*3 Since the local label in FUN definition is an undefined value, initialize it by a program in the FUN definition before using it in a program.

Point

When using GX Works3 version 1.000A

- When the label definition (the initial value or any other value) is changed, write the initial label value file to the CPU module after the online change (ladder block). Otherwise, an error occurs when the CPU module is powered off and on or reset, or the module operating status is changed from STOP to RUN.
- To clear all the initial values, delete the initial label value files in the CPU module. If the boot operation is being performed, the initial label value files are stored on the SD memory card. Delete the initial label value files on the SD memory card, and also delete the files set in the module card parameters ("Boot File Setting"). Otherwise, an error occurs when the CPU module is powered off and on or reset, or the module operating status is changed from STOP to RUN.

File batch online change

This function writes programs and other data to the running CPU module in units of files.

For the operating procedure and the execution condition of the file batch online change, refer to the following.

 GX Works3 Operating Manual

Writing FB files and the global label setting file

The file batch online change of FB files and the global label setting file is available depending on the model and firmware version of the CPU module. ( Page 705 Added and Enhanced Functions)

When executing the file batch online change of FB files and the global label setting file, configure the setting of the write target file described below before system operation.

However, the setting is not required when the R00CPU, R01CPU, or R02CPU is used.

■Setting of the file to be written

1. Check that SM388 (File batch online change operation setting status) is off.
2. Set "AFBFH" to SD384 (System operation setting).
3. Turn on SM384 (System operation setting request). SM384 automatically turns off. If writing has failed, SM385 (System operation setting error) turns on and an error is stored in SD385 (System operation setting error cause).
4. Check that SM385 is off, and turn off or reset the CPU module.
5. SM388 turns on.

Point

- This setting requires powering off the system or resetting the CPU module. For this reason, configure this setting before system operation when executing the file batch online change of FB files and the global label setting file.
- If the file batch online change is executed after this setting is configured (while SM388 is on), the scan time may increase compared with the case when the file batch online change is executed before this setting is configured (while SM388 is off).

■Procedure for clearing the setting (how to reset the write target file setting)

1. Check that SM388 (File batch online change operation setting status) is on.
2. Set "AFB0H" to SD384 (System operation setting).
3. Turn on SM384 (System operation setting request). SM384 automatically turns off. If writing has failed, SM385 (System operation setting error) turns on and an error is stored in SD385 (System operation setting error cause).
4. Check that SM385 is off, and turn off or reset the CPU module.
5. SM388 turns off.

11.3 Precautions

This section describes the precautions on writing data to the CPU module.

Prohibited operation (Turning off or resetting the CPU modules)

- When writing data to the programmable controller or executing the online change (ladder block), do not turn off or reset the CPU module. Otherwise, the operation does not complete successfully. If doing so, write the data to the programmable controller again.
- Do not power off and on or reset the CPU module when the program memory transfer is not completed. Otherwise, a stop error occurs.

Operation from engineering tools

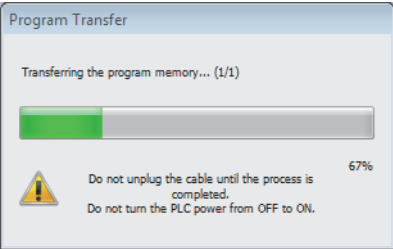

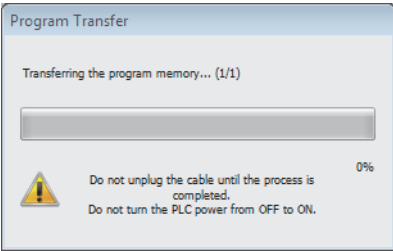

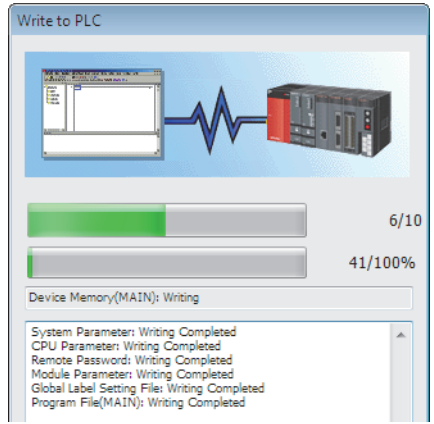

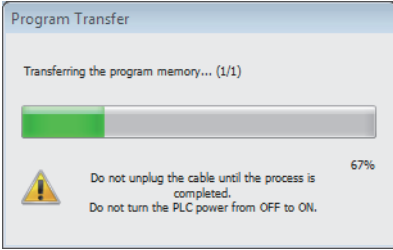

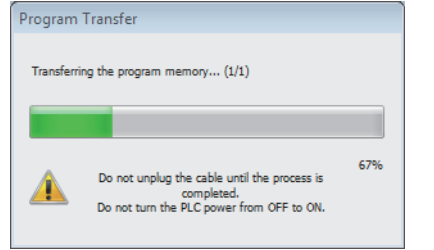

■Operations cannot be executed simultaneously

The file batch online change or online change (ladder block) cannot be executed simultaneously with the following operations from the engineering tool.

- Write to the programmable controller (excluding device, local device, global label, or local label data).
- File batch online change or online change (ladder block)
- Memory initialization

■Writing during the program memory transfer

When the program memory transfer starts during writing to the programmable controller or the online change from an engineering tool, writing to the programmable controller or the online change from another engineering tool can be executed. However, if this operation is performed, the progress of the ongoing transfer is reset to 0%. The transfer progress which is reset to 0% resumes when the program memory transfer from another engineering tool starts.

Engineering tool 1	Engineering tool 2	Description
		<p>The program memory transfer from the engineering tool 1 starts.</p>
		<p>Writing from the engineering tool 2 starts during the transfer from the engineering tool 1. The progress of the transfer from the engineering tool 1 is reset to 0%.</p>
		<p>When the program memory transfer from the engineering tool 2 starts, the transfer from the engineering tool 1 progresses as well.</p>

If the later program memory transfer (from the engineering tool 2) has completed with an error, the former program memory transfer (from the engineering tool 1) does not complete. In such a case, write the data again instead of powering off and on or resetting the CPU module.

When the online change (ladder block) is used

The following describes the precautions on using the online change (ladder block).

■When deleting the OUT instruction which is on

When deleting the OUT instruction (coil) which is not necessary for control, check that the OUT instruction is off before deleting it. If the OUT instruction is deleted without turning it off in advance, the output will be retained.

■Program file not registered in program setting

A program file which is not registered in parameter setting cannot be written.

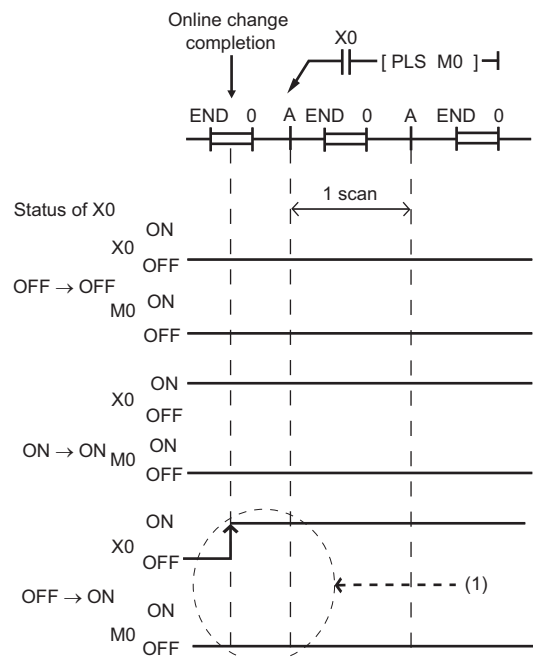

■Instructions which do not operate correctly

The following table lists the instructions which do not operate correctly during the online change (ladder block) or writing data to the programmable controller. In the SFC program, these instructions do not operate correctly only when they are in active steps.

Instructions which do not operate correctly	Description
Rising instruction (PLS and □P instructions)	When a rising instruction exists within the range to be changed, the rising instruction will not be executed even if the execution condition (OFF to ON) is taken at completion of online program change.
Falling instruction (PLF and □F instructions)	When a falling instruction exists within the range to be changed, the falling instruction will not be executed even if the execution condition (ON to OFF) is taken at completion of online program change.
SCJ instruction	If an SCJ instruction exists within the range to be changed and the execution condition is taken, the program will jump without waiting for a single scan.
STMR instruction	If an STMR instruction exists within the range to be changed, the STMR instruction will be executed.

• Rising instruction

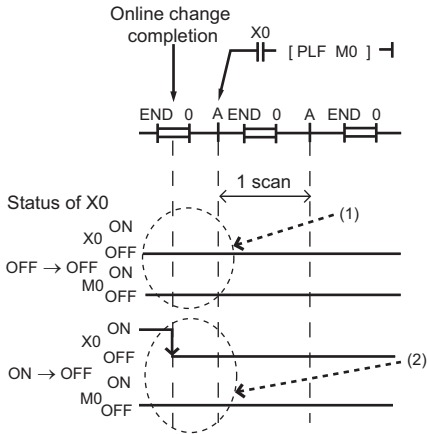

When a rising instruction exists within the range to be changed, the rising instruction will not be executed even if the execution condition (OFF to ON) is satisfied after completion of the online change (ladder block) or writing data to the programmable controller.

(1) The rising instruction will not be executed even if the execution condition is OFF to ON.

• Falling instruction

When a falling instruction exists within the range to be changed, the falling instruction will not be executed even if the execution condition (ON to OFF) is satisfied after completion of the online change (ladder block) or writing data to the programmable controller.

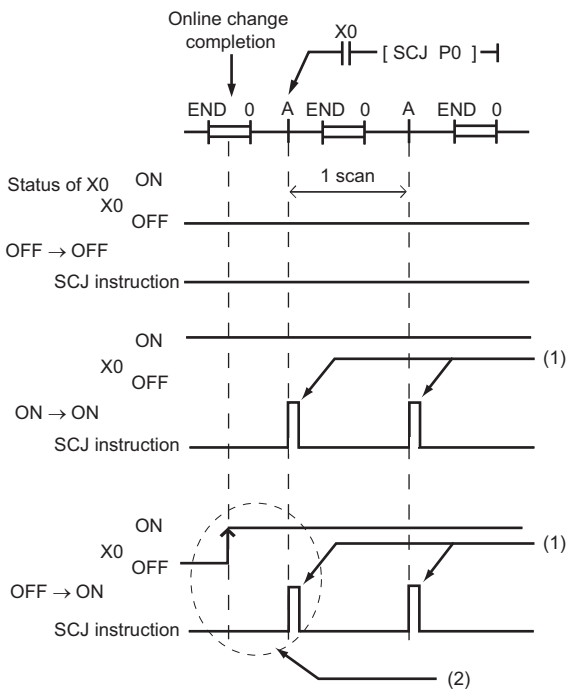

(1) The falling instruction will not be executed even if the execution condition is OFF to OFF.

(2) If a completion of the online program change and a timing of satisfying the execution condition (ON to OFF) occur simultaneously, the falling instruction will not be executed.

• SCJ instruction

If an SCJ instruction exists within the range to be changed and the execution condition is satisfied at the completion of the online change (ladder block) or writing data to the programmable controller, the program will jump without waiting for a single scan.

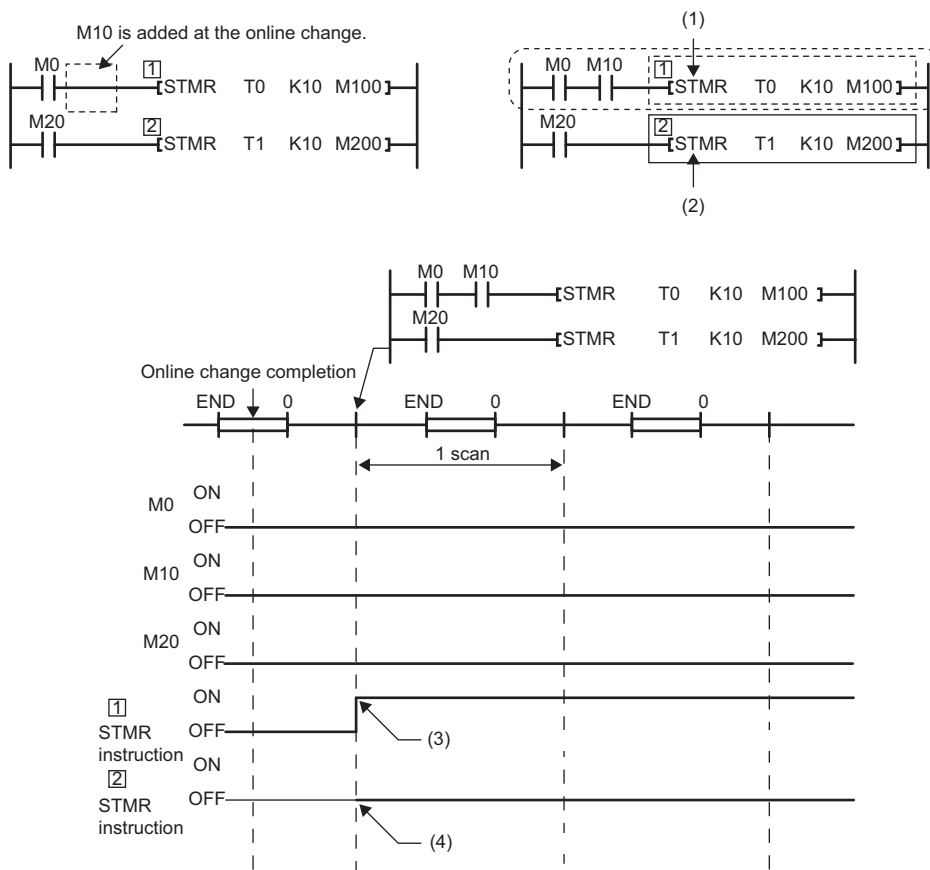

(1) The program jumps to the specified pointer.

(2) The program jumps to the specified pointer without waiting for a single scan.

- STMR instruction

If an STMR instruction exists within the range to be changed, the STMR instruction will be executed.

- (1) The STMR instruction functions because the STMR instruction is included in the ladder block where the online change has been executed.
- (2) The STMR instruction does not function because the STMR instruction is not included in the ladder block where the online change is executed.
- (3) The instruction functions even when M0 and M10 are off.
- (4) The instruction does not function.

■Initializing the last execution if the ladder at the online change (ladder block) has an FB call

If a subroutine type FB is called within the changed ladder block, information of the last execution, such as the rising instruction and the falling instruction within the FB definition of the called subroutine type FB, is not initialized.

■When the start-up of an interrupt program is delayed

When the online change (ladder block) is performed, the start-up of the interrupt program may be delayed. Therefore, when the execution time is monitored for the interrupt program that uses the inter-module synchronous interrupt (I44) and multiple CPU synchronous interrupt (I45), an error may be detected in the CPU module. (Page 169 Error detection setting)

■Scan monitoring function during online changes

Some sections are not targeted for the scan monitoring while online changes are being performed, and therefore a WDT error may not be detected if the scan time set in the scan time monitoring time (WDT) setting is exceeded.

■Increase in scan time of the online change (ladder block)

When global labels and local labels are added, or when there are many programs and FB files to be changed or many changes, the scan time may be increased by several dozen milliseconds.

■Online change (ladder block) of when another function is performed

The online change (ladder block) cannot be performed during execution of the following functions. Check that the following functions are not being executed and then perform the online change (ladder block).

- CPU module data backup/restoration function
- iQ Sensor Solution data backup/restoration function

■When multiple users execute the online change function to one CPU module

Note the following:

- Use engineering tools with the same version.
- Make the option settings the same in all the engineering tools.
- To prevent program block names from duplicating due to debugs by multiple users when adding a program block or changing a program block name, select "Yes" for "Duplication Check for POU" under [Convert] ⇒ [Online Program Change] in the "Options" window of the engineering tool.
- For editable contents, refer to the following.

 Page 156 Editable contents

- Do not make any changes that affect other programs (for example, editing the same program by multiple users, editing FBs/FUNs/global labels, or having a duplicate program block name or a duplicate global pointer). If one user makes such a change to a program and execute the online program change function of the engineering tool, and after that, another user execute the online program change function for another program, the engineering tool will detect a mismatch of data in the programmable controller. In this case, verify the data in the changed program and data in the CPU module, and check the mismatched data. Match the data and write the program by using the write to PLC function of the engineering tool, if needed.

Note that after debugging by multiple users, an appointed person must perform the following operations: Read the project from the CPU module by using the read from PLC function of the engineering tool, rebuild (reassign) all the data, and write the project back to the CPU module.

During the file batch online change

The following describes the precautions on the file batch online change.

■Writing the label data

Write labels using the file batch online change only when new label data is added. When the label data is changed or deleted, write data to the programmable controller or execute the online change (ladder block) after the data is rebuilt (reassigned).

■Falling instruction in the subroutine type FB program

When writing an FB file online, do not use falling instructions in the subroutine type FB program while SM388 (File batch online change operation setting status) is on.

■File batch online change during execution of another function

The file batch online change cannot be executed during execution of the following functions. An error occurs at execution.

- Data logging function (when the storage location is the function memory)
- Data logging file transfer (when the storage location is the function memory)

12 RAS FUNCTIONS

12.1 Scan Monitoring Function

This function detects hardware and program errors of the CPU module by monitoring the scan time. The watchdog timer, an internal timer of the CPU module, is used to monitor the following scan.

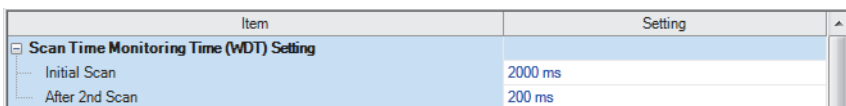

- Initial scan (first scan)
- Second and later scans

Scan time monitoring time setting

Set the scan time monitoring time.

 [CPU Parameter] ⇒ [RAS Setting] ⇒ [Scan Time Monitoring Time (WDT) Setting]

Window

Item	Setting
Scan Time Monitoring Time (WDT) Setting	
Initial Scan	2000 ms
After 2nd Scan	200 ms

Displayed items

Item	Description	Setting range	Default
Initial Scan	Sets the scan-time monitoring time (WDT) for the initial scan (first scan).	10 to 2000ms (in units of 10ms)	2000ms
After 2nd Scan	Sets the scan-time monitoring time (WDT) for the second and later scans.	10 to 2000ms (in units of 10ms)	200ms

Watchdog timer reset

The watchdog timer is reset when the END/FEND instruction is executed. While the CPU module is running correctly, if the END/FEND instruction is executed within the set time of the watchdog timer, the watchdog timer does not count up. If the END/FEND instruction cannot be executed within the set time of the watchdog timer due to a hardware error of the CPU module or increase in program execution time due to an interrupt or other causes, the watchdog timer counts up.

Precautions

The following lists the precautions on the scan monitoring function.

Measurement error of watchdog timer

Since the watchdog timer produces an error within the range of 0 to 10ms, take this into consideration when setting the scan time monitoring time. For example, if the scan time monitoring time is set to 100ms, an error will occur when the scan time falls within the range $100\text{ms} < t < 110\text{ms}$.

Resetting the watchdog timer when repeatedly executing a program

The watchdog timer can be reset by executing the WDT reset instruction from the program. If the watchdog timer counts up while a program is being repeatedly executed by the FOR instruction and NEXT instruction, use the WDT reset instruction to reset the watchdog timer.

Scan time when the WDT reset instruction is used

Even when the watchdog timer is reset by the WDT reset instruction, the scan time is not reset. The scan time is accumulated until the END instruction is executed.

12.2 Self-Diagnostics Function

This function (the CPU module itself) checks if a problem exists in the CPU module.

Self-diagnostics timing

If an error occurs when the CPU module is powered on or while it is in the RUN/STOP state, the CPU module detects, and displays it, and stops operation. However, depending on the error occurrence status or the instruction to execute, the CPU module may not be able to detect the error. Configure safety circuits external to the programmable controller to ensure that the entire system operates safely even in such a case.

Check method of error

This section describes the check methods when error occurs.

Check method using the special relay and special register

When the CPU module detects an error, it turns SM0 (Latest self-diagnostic error (including annunciator ON)) and SM1 (Latest self-diagnostic error (not including annunciator ON)) on and stores the error code corresponding to the error definition in SD0 (Latest self-diagnostics error code). If multiple errors are detected, the latest error code is stored in SD0. Use SM0, SM1, and SD0 on the program for the CPU module or mechanical interlock. Besides, the error code up to 16 pieces for the error contents being currently generated will be stored into SD10 to SD25 (Self-diagnostic error number). (The error code for the error content of 17th piece on and after will not be stored.)

Check method using LED

The error occurrence conditions can be checked through the lighting conditions of ERROR LED. (☞ Page 495 LED status of the CPU module)

Check method using the engineering tool

The error conditions for the overall system, error or event history being currently generated can be checked on the Module diagnostics window. (☞ GX Works3 Operating Manual)

■Existing errors

Up to 16 errors (descriptions of errors) currently existing on the CPU module can be displayed.*1 However, even when an additional error occurs after a stop error, the error information is not updated.

*1 The maximum number of displayable errors is 15 for continuation errors and 1 for stop errors. When 15 continuation errors are displayed and another one occurs, description of the new error is not displayed. Also, when an error with the same code has already been displayed, the date and time of occurrence and detailed information of the relevant error are not updated.

■Error history

Occurred errors are logged in the event history. (☞ Page 177 Event History Function)

The event history is updated only when a battery error occurs, independent of the operating status of the CPU module. Also, when a battery error is detected after the occurrence of a stop error, the information on existing errors is not refreshed, and only the event history is updated.

CPU module operation upon error detection setting

Configure each CPU module operation setting when an error is detected.

Mode when an error is detected

If the self-diagnostic function of the CPU module detects an error, the CPU module can be in one of the following operation status:

■ Mode for stopping the operation of CPU module

Operation stops when an error has been detected. During stopping the operation may vary depending on the output mode setting when module parameter error occurs.

- When "Clear" is set: Output for the corresponding module is turned off.
- When "Hold" is set: Output for the corresponding module is held.

For the setting method of module parameter, refer to the manual for each module.

■ Mode for continuing the operation of CPU module

If an error has been detected, the program other than programs (instruction) where an error was generated is executed.

Error detection setting

Set whether or not to detect errors.

[CPU Parameter] ⇒ [RAS Setting] ⇒ [Error Detection Setting]

Window

Displayed items

Item	Description	Setting range	Default
Battery Error	Sets whether or not to detect the battery error.	<ul style="list-style-type: none"> • Detect • Not Detected 	<ul style="list-style-type: none"> • R00CPU, R01CPU, and R02CPU: Not Detected^{*3} • Other CPU modules: Detect
Module Verification Error ^{*1}	Sets whether or not to detect a module verification error.		Detect
Fuse Blown	Sets whether or not to detect a fuse blown of the controlled module.		
Redundant Power Supply System Error ^{*2}	Sets whether or not to detect a power supply module error (power off or power supply failure in either system) in the redundant power supply system.		
Synchronous Interrupt Program (I44, I45) Executing Time Excessive	Execution Interval Excess (I44, I45)	Sets whether or not to detect the excessive execution time of synchronous interrupt program (I44, I45).	Not Detected
	Program Execution Section Excess (I45)	Sets whether or not to detect the program execution section excess errors of synchronous interrupt program (I45).	

*1 When "Not Detected" is set and an operating module is removed, a module verification error is not detected, but a stop error may occur if a program tries to access the removed module. The removed module will not be accessible even when it is re-installed. Therefore, if an access to the re-installed module occurs by switching the operating status of the CPU module from STOP to RUN.

*2 When "Not Detected" is set, values are stored in the special relay and special register (SM150 to SM154/SD150 to SD154) that indicate the status of the redundant power supply module.

*3 When a battery is installed, change the setting to "Detect". Otherwise, the installation status and replacement period of the battery cannot be checked because the battery error cannot be detected.

■Applicable errors to the error detection setting

The following table lists errors for which whether or not to detect the errors can be set.

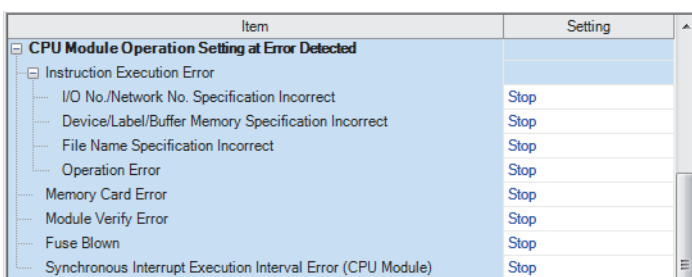

Error name	Error code
Battery error	1090H
Module verification error	2400H, 2401H
Fuse blown	2420H
Redundant power supply system error	1010H, 1020H
Synchronous interrupt execution interval error (CPU module)	1240H, 1241H, 1260H, 1262H

CPU module operation upon error detection setting

Set the CPU module operation upon error detection.

 [CPU Parameter] ⇒ [RAS Setting] ⇒ [CPU Module Operation Setting at Error Detected]

Window

Displayed items

Item	Description	Setting range	Default
Instruction Execution Error	I/O No./Network No. Specification Error	<ul style="list-style-type: none"> • Stop • Continue 	Stop
	Device/Label/Buffer Memory Specification Incorrect		
	File Name Specification Incorrect		
	Operation Error		
Memory Card Error ^{*1}	Sets the CPU module operation upon a memory card error.		
Module Verify Error	Sets the CPU module operation upon a module verification error.		
Fuse Blown	Sets the CPU module operation upon a fuse blown error of controlled module.		
Synchronous Interrupt Execution Interval Error (CPU Module)	Sets the CPU module operation upon a detection of a synchronization signal error on the CPU module.		

*1 This item is not displayed on the R00CPU.

■Applicable errors to the CPU module operation upon error detection setting

The following table lists the applicable errors to the setting that specifies the CPU module operation of when the specific errors are detected.

Error name	Error code	
Instruction Execution Error	I/O number or network number specification error	2800H, 2801H, 2802H, 2803H, 2804H, 2805H, 2806H, 2807H, 2810H
	Device, label, or buffer memory specification error	2820H, 2821H, 2822H, 2823H, 2824H
	File name specification error	2840H, 2841H, 2842H
	Operation error	3400H, 3401H, 3402H, 3403H, 3404H, 3405H, 3406H, 3420H, 3421H, 3422H, 3423H, 3424H, 3425H, 3426H, 3427H, 3430H, 3440H, 3441H, 34A0H
Memory card error	2120H, 2121H	
Module verification error	2400H, 2401H	
Fuse Blown	2420H	
Synchronous Interrupt Execution Interval Error (CPU Module)	2610H, 2630H	

CPU module operation setting

Specify the operation which the CPU module should perform when an error occurs on each intelligent function module.

 [System Parameter] ⇒ [I/O Assignment] tab ⇒ [I/O Assignment Setting]

Window

Slot	Module Name	Module Status Setting	Points	Start XY	Control PLC Settings	CPU Module Operation Setting at Error Detection
Base						
CPU	R16CPU(Host Station)			3E00		
0(*-0)	RX10	No Setting	16 Points	0000		
1(*-1)	R60AD4	No Setting	16 Points	0010		Critical: Stop, Moderate: Continue
2(*-2)	RJ71EN71(COIEF)	No Setting	32 Points	0020		Critical: Stop, Moderate: Continue

Displayed items

Item	Description	Setting range	Default
CPU Module Operation Setting at Error Detection	Set the CPU module operation upon the detection of Major or Moderate errors in the configured module.	<ul style="list-style-type: none"> • Critical: Stop, Moderate: Continue • Critical: Stop, Moderate: Stop • Critical: Continue, Moderate: Continue 	Critical: Stop, Moderate: Continue

■Applicable errors to the CPU module operation setting

The following table lists the applicable errors to the setting that specifies the CPU module operation of when the specific errors have occurred in each intelligent function module.

Error name	Error code
Module moderate error	1200H
Module major error	2441H, 2442H, 2450H

Stop setting

For the multiple CPU system configuration, it can be specified whether or not to stop all CPU modules when a major or moderate error occurs on a CPU module. ( Page 374 Stop setting)

LED display setting

Set whether to display or hide the ERROR LED, USER LED, BATTERY LED, and FUNCTION LED.

 [CPU Parameter] ⇒ [RAS Setting] ⇒ [LED Display Setting]

Window

Displayed items

Item	Description	Setting range	Default	
ERROR LED	Minor Error (Continue Error)	Set whether or not to display the ERROR LED when a minor error occurs.	<ul style="list-style-type: none"> • Display • Do Not Display 	Display
USER LED	Annunciator ON	Set whether the USER LED is displayed or not when annunciator (F) ON is detected.		
BATTERY LED ^{*2}	Battery Error	Set whether the BATTERY LED is displayed or not when a battery error occurs.		
FUNCTION LED ^{*1*3}	Function to use FUNCTION LED	Set the function that uses FUNCTION LED. If FUNCTION LED is not used, set "None".	<ul style="list-style-type: none"> • Data logging function • Memory dump function • None 	Data logging function

*1 To specify whether to display or hide the FUNCTION LED, verify the versions of the CPU module and the engineering tool. ( Page 705 Added and Enhanced Functions)

*2 This item is not displayed on the R00CPU, R01CPU, or R02CPU. When the battery error is detected in the R00CPU, R01CPU, and R02CPU, the ERROR LED turns on.

*3 For the R00CPU, the parameter is fixed to "None".

For the FUNCTION LED display, the following cases have priority over the function that is set in the LED display setting.

- When the external input/output forced on/off function is executed (in registration) ( Page 209 FUNCTION LED)
- When program restoration information is not written ( Page 691 Checking the program restoration information write status)
- When the device tests with execution conditions are registered ( Page 212 Device Test with Execution Conditions)

Error detection invalidation setting

Turning on the target bit of SD49 (Error detection invalidation setting) disables detection of the corresponding continuation error.* 1 ( Page 605 Diagnostic information)

*1 When using the error detection invalidation setting, check the version of the CPU module used. ( Page 705 Added and Enhanced Functions)

The following operations are not disabled even when the detection of the applicable continuation error is disabled in this setting.

- Storage in buffer memory (Un\G770 to Un\G792) ( MELSEC iQ-R Ethernet User's Manual (Application))
- Setting of the completion status of the built-in Ethernet function instruction ( MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks))

Data is not retained in SD49 during power failure. Therefore, register this setting again after turning off and on or resetting the CPU module.

Applicable errors to the error detection invalidation setting

The following table lists errors for which the detection of the continuation error can be disabled.

Error name	Error code
Connection establishment failed	112EH
Socket communications response send error	1133H
TCP connection timeout	1134H
Connection number acquisition error	1155H
Receive buffer securement error	1157H
UDP/IP send failed	1165H
TCP/IP send failed	1166H

12.3 Error Clear

This function clears all the existing continuation errors at once.

Errors that can be cleared

This function can be used to clear only the continuation errors listed in the following table.

Error name	Error code
Power shutoff	1000H
Power shutoff (either of the redundant power supply modules)	1010H
Failure (either of the redundant power supply modules)	1020H
Invalid power supply module	1030H
Power supply module configuration error	1031H
ROM write count error	1080H
Battery error	1090H
Memory card access error	1100H
SNTP clock setting error	1120H
Default gateway/gateway IP address error	1124H
Own node port number error	1128H
Open specification port number error	1129H
Specified IP address error	112DH
Connection establishment failed	112EH
Socket communications response send error	1133H
TCP connection timeout	1134H
IP address error	1152H
Connection number acquisition error	1155H
Receive buffer securement error	1157H
UDP/IP send failed	1165H
TCP/IP send failed	1166H
Unsend data send error	1167H
PID operation error	11A0H to 11B8H
Module moderate error	1200H, 1210H
Another CPU module moderate error	1220H
Inter-module synchronization processing error	1240H, 1241H
Multiple CPU synchronization processing error	1260H, 1262H
Annunciator ON	1800H
Operation continuation error	1810H
Receive queue full	1830H
Receive processing error	1831H
Transient data error	1832H
Constant scan time error	1900H
Network configuration mismatch	1B00H
Extension cable failure	1B48H, 1B4AH

Error name	Error code
File name specification error	1BB0H
Program execution time error	1BC0H
Memory card error	2120H, 2121H
Module verification error	2400H, 2401H
Fuse blown error	2420H
Module major error	2441H, 2442H, 2450H
Another CPU module major error	2461H, 2462H, 2470H
Inter-module synchronization signal error	2610H
Multiple CPU synchronization signal error	2630H
I/O number or network number specification error	2800H, 2801H, 2802H, 2803H, 2804H, 2805H, 2806H, 2807H, 2810H
Device, label, or buffer memory specification error	2820H, 2821H, 2822H, 2823H, 2824H
File name specification error	2840H, 2841H, 2842H
Operation error	3400H, 3401H, 3402H, 3403H, 3404H, 3405H, 3406H, 3420H, 3421H, 3422H, 3423H, 3426H, 3430H, 3460H, 3461H, 34A0H

Point 

When the write protect switch of the SD memory card is enabled, an error of the memory card access error, which is generated when an event history is held, can be cleared. Note that an error will not be detected again even if the event history is stored due the occurrence of event after resetting an error.

How to clear errors

Errors can be cleared in two ways:

■Using the engineering tool

Clear errors with the module diagnostics function of GX Works3. ( GX Works3 Operating Manual)

The event history of error clear using the engineering tool is stored in the CPU module connected.

■Using SM/SD

Clear errors by operating SM/SD.

1. Check SD0 (Latest self-diagnostic error code) to identify what errors are detected.
2. Clear the cause of each of the currently detected continuation errors.
3. Turn on SM50 (Error reset) to clear the errors. When multiple continuation errors have occurred, all the errors are cleared at once.

Precautions

This section describes some precautions to take when using the error clear function:

- Since the function clears all of the currently detected continuation errors at once, errors that should not yet be cleared may be cleared.
- Use the RST instruction to reset each annunciator individually.
- Running the error clear function does not remove the cleared errors from the event history.
- The cause of an error which occurred in a module other than the target CPU module for the error clear cannot be eliminated even though the error is cleared using this function. For example, when "Module verification error" (error code: 2400) or "Module major error" (error code: 2450) occurred, the error cause cannot be eliminated even though the error is cleared in the CPU module using this function. To eliminate the error cause, clear the error of the target module and reset the CPU module.

12.4 Event History Function

The CPU module collects and stores event information from each module, such as errors detected by the module, operations performed on the module, device/label data write operations^{*1}, and network errors.^{*2}

Once errors and operations are stored, they can be checked chronologically. This function helps to determine the causes of problems that have occurred in the equipment/devices, check the update status of the programmable controller control data, and detect unauthorized access.

- *1 When "Save Device/Label Operations" is set in Event History Setting, device/label data write operations are saved. (☞ Page 183 Device/label data write operation saving)
Before using the device/label operation save setting, check the versions of the CPU module and engineering tool. (☞ Page 705 Added and Enhanced Functions)
- *2 If the CPU module is operated online using the engineering tool, there are times when processing performed automatically by the system is saved as an event.

Point

The event history information is constantly collected regardless of the operating state of the CPU module. There are occasions, however, when the event history information cannot be collected due to a major error in a module, a base unit error, a cable failure, or some other cause.

Event history setting

Under normal circumstances, the event history function can be used with its default settings and need not be manually configured. The storage memory and size settings for event history files can be changed as needed. (☞ Page 179 Event history file)

☞ [CPU Parameter] ⇒ [RAS Setting] ⇒ [Event History Setting]

Window

Event History Setting	
Save Destination	Data Memory
Storage Capacity Setting per File	128 K Byte
Save Device/Label Operations	Not to Save

Displayed items

Item	Description	Setting range	Default
Save Destination	Specify the storage location of event history files. (☞ Page 179 Storage memory)	<ul style="list-style-type: none"> Data Memory Memory Card*1 	Data Memory
Set Save Volume of Per File	Specify the storage capacity per event history file. (☞ Page 179 File size)	1 to 2048K bytes (in 1K bytes)	128K Byte
Save Device/Label Operations*2	Specify this item when saving device/label data write operations. (☞ Page 183 Device/label data write operation saving)	<ul style="list-style-type: none"> Not to Save Save 	Not to Save

*1 It cannot be set in the R00CPU.

*2 This item is not displayed on the R00CPU, R01CPU, or R02CPU.

Point

For use in any of the following environments, use of an SD memory card for the save destination memory is recommended because the number of events that occur becomes large.

- When file data write operations and device/label data write operations are performed frequently
- When the communication status changes frequently
- When device data write operations are periodically performed from a programmable controller of another station or from another CPU module*3

The number of writes to the data memory is limited to 100000 times. In any of the above cases, when data memory is used for the save destination memory, be careful about the number of writes to data memory.

*3 When "Save Device/Label Operations" is set in Event History Setting. Note that when device data write operations are performed periodically, the number of events registered in the history becomes large, and event history logging may be restricted. (☞ Page 182 Event history logging restriction)

Logging of the event history

This section describes events saving for the event history.

Event history file

The storage memory and file size for event history files can be changed in event history setting. (☞ Page 178 Event history setting)

■Storage memory

Choose either the data memory or SD memory card.* 1

If the storage memory is the SD memory card: when the write protect switch of the SD memory card is enabled, an event history will not be stored. (It is possible to read the event history file in SD memory card using the engineering tool.) Therefore, if the write protect switch of the SD memory card is changed into "Disabled → Enabled" during operation, the write error to the SD memory card occurs when the event for storing into event history is generated (SD memory card available event is registered) after the write protect switch is enabled. An error that has occurred can be checked by using the module diagnostics of the engineering tool immediately after its occurrence. However, these errors are not stored in the event history after powering off and on or reset of the CPU module.

*1 For the R00CPU, only the data memory can be selected as the storage memory.

■File size

The size for event history files can be changed in event history setting (☞ Page 178 Event history setting). If the storage size exceeds the specified size, records are deleted in order from the oldest one and the latest one is stored. An event history file size is obtained from the following calculation formula.

Event history file size = File header size + Event history management information size + (Number of records × Size per event history record)

Element	Size
File header size	20 bytes
Event history management information size	12 bytes
Size per event history record	40 bytes minimum*1

*1 Because the contents of detailed information may differ depending on the event to be saved or the detailed information may include a variable-length file name, the size per event history record is variable.

The number of events to be saved in the event history file differs depending on the event type to be saved. When the event history file size is 128K bytes (default), 1365 events can be registered if programs (whose program name is 8 characters (12 characters including a period and extension)) are written to the CPU module using the engineering tool.

[Calculation formula]

- $128 \text{ bytes} \times 1024 = 131072 \text{ bytes}$
- $131072 \text{ bytes} - (20 \text{ bytes} + 12 \text{ bytes}) = 131040 \text{ bytes}$
- $131040 \text{ bytes} \div 96 \text{ bytes} = 1365 \text{ events}$

Ex.

The table below shows the size of each element when 100 programs (whose program name is 8 characters (12 characters including a period and extension)) are written to the CPU module by the following operating procedure.

Operating procedure

1. Turn on the power in the STOP state.
2. Write the system parameter, CPU parameter, module parameter, and 100 programs (whose program name is 8 characters (12 characters including a period and extension)) to the CPU module using the engineering tool.
3. Switch the CPU module to the RUN state.

Element		Size (byte)
File header		20
Event history management information		12
Event to be saved	Power-on and reset	40
	Operating status change (STOP)	40
	Writing files/folders (SYSTEM.PRM)	96
	Writing files/folders (CPU.PRM)	88
	Writing files/folders (UNIT.PRM)	88
	Writing files/folders (MAIN_001.PRG to MAIN_100.PRG)	9600
	Operating status change (RUN)	40
Total		10024

■When files are created

An event history file is created when:

- The CPU module is turned off and on (if there is no event history file or after the event history settings are changed).
- The CPU module is reset (if there is no event history file or after the event history settings are changed).
- Initialization of the SD memory card (when no event history file exists)^{*1}
- Write of parameters (when no event history file exists, or after an event history setting is changed).

*1 When a parameter is stored in the data memory, the event history file is created on the SD memory card, according to the event history setting.

Point

When a new event history file is generated, the "Event history file generation" (00420) is logged. When a new event history file is generated during the logging restriction of the event history, the "Event history logging restriction" (00421) is also logged.

The following table shows how the event history is treated depending on operation.

Operation	Operation for the event history
Memory initialization	When this event occurs, the event history is stored into the internal memory. If the internal memory reaches the maximum number of event history records it can store, all subsequent events are lost. (Page 181 Loss of event history information)
Event history creation	The event history, which has been stored in the internal memory during absence of the event history file, is stored into the data memory or the SD memory card (If any event was lost, it is logged as "**HST LOSS**").

The following table shows how the event history is treated at removal and installation of an SD memory card when the SD memory card is specified as the storage memory.

Operation	Operation for the event history
Removal of the SD memory card	When this event occurs, the event history is stored into the internal memory. If the internal memory reaches the maximum number of event history records it can store, all subsequent events are lost. (Page 181 Loss of event history information)
Installation of the SD memory card	The event history, which have been stored in the internal memory during absence of the SD memory card, is stored to the SD memory card. If the re-inserted SD memory card contains an event history file of the same file size, the CPU module continues to store the event history information. If the file size is different, the CPU module removes the existing event history file and creates a new event history file.

■When parameters take effect

Any changed parameters take effect when:

- The CPU module is powered off and on
- The CPU module is reset

Point

Any changed parameters written in the storage memory with the CPU module in the STOP state does not take effect when the CPU module operating state is changed from STOP to RUN. In this case, the changed parameters will take effect the next time the CPU module is powered off and on or is reset.

Loss of event history information

If events are detected frequently, or the CPU module is powered off or reset immediately after the detection of events, some events may not be collected and lost. When event loss occurs, "**HST LOSS**" appears in the "Event Code" field of the engineering tool.

Event history logging restriction

When the number of minor events from the CPU module or intelligent function module such as link-up and link-down exceeds the upper limit value, event history logging is restricted (stopped).^{* 1*2}

When the number of events for which logging is restricted decreases to the lower limit value or below, event history logging is restarted.

The error codes of moderate and major errors that occur in the CPU module are logged in the event history.

Item	Condition
Upper limit value	600 events/minute
Lower limit value	300 events/minute

*1 For models and firmware versions that support the event history logging restriction, refer to the following.

☞ Page 705 Added and Enhanced Functions

*2 Event history logging is not restricted (stopped) in CPU module events for the following CPU modules.

- The R00CPU, R01CPU, and R02CPU with firmware version "11" or earlier
- The programmable controller CPU with firmware version "43" or earlier (except for R00CPU, R01CPU, and R02CPU)

■Events not supported by the logging restriction

The following events are not subject to the logging restriction.^{* 1}

- Events of the self-diagnostics for major errors from the intelligent function module

*1 For the following CPU modules, CPU module events are not subjected to the logging restriction, either.

- The R00CPU, R01CPU, and R02CPU with firmware version "11" or earlier
- The programmable controller CPU with firmware version "43" or earlier (except for R00CPU, R01CPU, and R02CPU)

■How to check whether event history logging is restricted

When event history logging is restricted, SM1464 (Event history logging restriction status) turns on. SM1466 turns on when the event history logging of the CPU module is restricted and the event category is error (minor error), and SM1467 turns on when the event history logging of the CPU module is restricted and the event category is information or warning.

Modules on which event history logging is restricted can be identified in SD1464 to SD1467 (Module information on event history logging restriction).

Modules from which event history information is collected

Event history information is collected from the CPU module and other modules installed on the same base unit (i.e., the main base unit plus any additional extension base units). Event history information may or may not be collected from devices on the network depending on the specifications of the network modules used to connect to them. Refer to the manuals of the respective modules for more information including the coverage of event history collection regarding devices on the network. For a multi-CPU system, note that each CPU module logs only events detected on the modules under its control. On Q series modules, only errors of which even type is "System" are stored. (The above applies only to Q series modules that support the module error collection (function).)

Events logged by the CPU module

Information logged in the event history includes operation initiator and other detailed information for troubleshooting purposes. For events that are logged in the event history on the CPU module, refer to the event history. (☞ Page 565 Event List)

Device/label data write operation saving

• This function cannot be used in the R00CPU, R01CPU, and R02CPU.

When "Save Device/Label Operations" is enabled in Event History Setting, device/label data write operations are saved. (Page 178 Event history setting)

Restriction

- Before using the device/label operation save setting, check the versions of the CPU module and engineering tool. (Page 705 Added and Enhanced Functions)
- When multiple device points or multiple devices/labels are written, some device/label names and written values may not be shown.

Target operations

The device/label data write operations of the following operations and functions are saved.

Operation and function		Remarks
Operation from the engineering tool	Changing current values of devices and labels from the watch window or with the other methods	The written values are saved up to 128 words.
	Changing the status (active/inactive) of blocks and steps of an SFC program	
	Writing data to the device memory	
Operation using SLMP	Writing device/label data	
Operation using a GOT	Writing device/label data	
Other operations	Writing device data from a programmable controller of another station ^{*1} , reading data from programmable controller of another station (with read notification) ^{*2} , and writing device data from another CPU module	
	Writing device data using the simple CPU communication function	
	Writing device data using the predefined protocol support function	

*1 When writing the data with write notification, the write notification device is also saved.

*2 The read notification device is saved.

- Applicable commands for writing device/label data through SLMP

The following table shows the applicable commands for writing device/label data through SLMP.

Type	Operation	Command	Subcommand	Remarks
Device	Write	1401	00□1	The written values are saved up to 128 words.
			00□3	
			00□0	
	Write Random	1402	00□1	
			00□3	
			00□0	
Write Block	1406	00□0		
		00□2		
Label	Array Label Write	141A	0000	The written element data are saved up to 128 words. The number of data sets to be saved varies depending on the number of array points specified.
	Label Write Random	141B	0000	The number of data sets to be saved varies depending on the label assignment destination. The written strings are saved up to 128 words.
Extend Unit	Write	1601	0000	The written values are saved up to 128 words.

- Applicable instructions for writing device data from a programmable controller of another station or from another CPU module

The following table shows the applicable instructions for writing device data from a programmable controller of another station or from another CPU module.

Major classification	Classification	Instruction name	Remarks	
Writing device data from another station	Module dedicated instructions	Writing data to programmable controller of another station	JP.WRITE, GP.WRITE	The written values are saved up to 128 words.
		Writing data to program controller of another station (with write notification)	JP.SWRITE, GP.SWRITE	
		Reading data from programmable controller of another station (with read notification)	JP.SREAD, GP.SREAD	
		Writing data to target station	J(P).RIWT, G(P).RIWT	
Writing device data from another CPU module	Multiple CPU dedicated instructions	Writing device data to another CPU module	D(P).DDWR, M(P).DDWR	

*3 For the display of detailed information, refer to the following.

 Page 184 Detailed information

■Target device

The following table shows the target devices. The write operations are also saved when writing data with index modification or indirect specification.

Type	Device
Bit device	X, DX, Y, DY, M, L, F, SM, V, B, SB, T (contact), T (coil), ST (contact), ST (coil), C (contact), C (coil), LT (contact), LT (coil), LST (contact), LST (coil), LC (contact), LC (coil), FX, FY, Jn\X, Jn\Y, Jn\SB, Jn\B, BLn\S, SA\X, SA\Y, SA\I, SA\B, SA\T(contact), SA\T(coil), SA\ST(contact), SA\ST(coil), SA\C(contact), SA\C(coil)
Word device	T (current value), ST (current value), C (current value), D, SD, W, SW, RD, R, ZR, Z, FD, Un\G, Jn\W, Jn\SW, U3En\G, U3En\HG SA\I, SA\W
Double-word device	LT (current value), LST (current value), LC (current value), LZ

Note that for write operation by specifying label names, label memory areas (such as GV, LV, LLV, and UV) may be displayed as device names. For details on the label memory, refer to the following.

 GX Works3 Operating Manual

■Target label

The labels to be saved are all labels that can be specified by the engineering tool and SLMP.

■Detailed information

The detailed information of an event history displays a device/label name, the number of write points, and written values.

 Page 563 Detailed information

Item	Name displayed on window	Description
Device/Label	Device name information	A specified device name is displayed.
	Device name information (user-specified)	
	Device name information (target device)	The name and address of a device actually accessed is displayed. When a device is specified with index modification, if the accessed device is within the specified device range, the device name is displayed. If out of the specified device range, the address is displayed. When a device is specified with indirect specification, the accessed address is displayed.
	Label name information	A specified label name is displayed.
	Label name information (user-specified)	
	Target bit No.	When a bit of a word device is specified with indirect specification, the accessed bit number is displayed. The same applies when a bit is specified with index modification and the accessed bit is out of the specified device range, the accessed bit number is displayed.
Number of write points	Number of points	The number of write points is displayed.
Written value	Written value	The written values for the number of write points is displayed.

Viewing the event history

The event history can be viewed using the menus of the engineering tool. For operating procedures and how to interpret the displayed information, refer to the following:

 GX Works3 Operating Manual

Clearing the event history

The event history can be cleared from the event history window. Once the event history is cleared, the CPU module deletes all the event history information stored in the specified storage memory. For operating procedures and other details, refer to the following:

 GX Works3 Operating Manual

Point

When clearing of the event history is executed, the "Event history clear" (20200) is logged. When an event history file is executed clear during the logging restriction of the event history, the "Event history logging restriction" (00421) is also logged.

Precautions

Clearing the event history during execution of another function

No event history can be cleared during execution of the following functions. Check that the following functions are not being executed and then clear the event history.

- CPU module data backup/restoration function
- iQ Sensor Solution data backup/restoration function

Reading the event history during execution of another function

No event history can be read during execution of the following function. Check that the following function is not being executed and then read the event history.

- CPU module data restoration function

Logging of event history

When event history logging is restricted, the relevant special relay ( Page 182 How to check whether event history logging is restricted) turns on. Eliminate the event causes from the target module. The target module can be identified in SD1464 to SD1467 (Module information on event history logging restriction).

Whether event history logging is restricted or not can also be checked in "Event history logging restricted" (00421) in "Event History" window of the engineering tool.

Execution of other functions while event history logging is restricted

When the CPU module is restored by turning on SM1354 while event history logging is restricted, event history logging is restarted after the completion of the restoration.

When event history logging is restarted and event history from a module is frequently logged again, logging the history of events occurring on the target module is stopped (restricted).

Change of the event history setting

The following table shows the operation when the event history setting is changed after the CPU module starts, and written to the CPU module.

Changed item	Operation
Save Destination	With the original file left as is, an event history file is generated in the enabled save destination (drive).
Set Save Volume of Per File	The event history file is discarded and regenerated.
Save Device/Label Operations	With the original file left as is, EVENT.LOG is generated when the file is not saved, and EVEN2.LOG is generated when the file is saved.

Therefore, to save a past event history, before changing the event history setting, save data by using the [Create File] button in the event history window of the engineering tool.

 [Diagnostics] ⇒ [System Monitor] ⇒ [Event History] button ⇒ [Create File] button

Device data write operation from another station or another CPU module

When "Save Device/Label Operations" is set in Event History Setting, many event updates occur. Depending on the timing, events that occurred cannot be checked with the engineering tool.

12.5 Program Cache Memory Auto Recovery Function

If the contents of memory of the CPU module have been rewritten by itself due to the factors such as excessive electrical noise, the program cache memory recovers the corresponding areas automatically during the run of the program. This function becomes active with RUN state of the CPU module and works during the run of the program. No special settings are required as the system performs this task automatically.

13 REMOTE OPERATION

The operating status of the CPU module can be changed using an engineering tool or program, or dedicated instructions from the module.

The following types of remote operation are available:

- Remote RUN/STOP
- Remote PAUSE
- Remote RESET

13.1 Remote RUN/STOP

This function externally changes the CPU module status to RUN or STOP with the RUN/STOP/RESET switch of the CPU module set to RUN. This function is useful to RUN or STOP a CPU module located in an inaccessible place, or to RUN or STOP a CPU module located on the control panel by using an external signal.

13

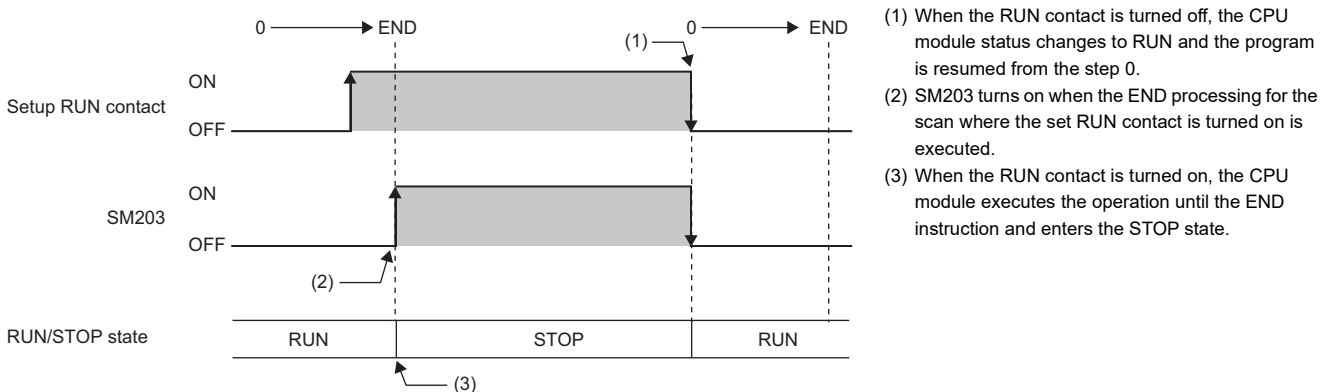

Executing method

The following methods are available to execute remote RUN/STOP:

Using a contact

Set RUN contact in the RUN-PAUSE contact setting. (Page 189 Setting RUN-PAUSE Contacts)

When the END processing for the scan where the RUN contact is turned on is executed, SM203 (STOP contact) turns on to change the CPU module status to STOP and stop the operation. When the RUN contact is turned off, the CPU module exits the STOP state and resumes the program operation from the step 0.

Using an engineering tool

Perform remote RUN/STOP with the remote operation of the engineering tool. (GX Works3 Operating Manual)

By an external device using SLMP

Perform remote RUN/STOP with the SLMP command. (SLMP Reference Manual)

Using the module dedicated instructions

Perform remote RUN/STOP with the dedicated instructions of a network module. (MELSEC iQ-R Programming Manual (Module Dedicated Instructions))

Precautions

This section describes the precautions on using remote RUN/STOP.

- When remote RUN is performed during execution of the data logging function, it may fail. In that case, wait for a while and retry remote RUN. If remote RUN still cannot be executed, check whether remote RUN is acceptable and retry remote RUN (📖 Page 300 About remote operation)
- When the RUN contact, which is specified in the RUN-PAUSE contact setting, is turned off during execution of the data logging function, it may take time to return to the RUN state.

13.2 Remote PAUSE

This function externally changes the CPU module status to PAUSE with the RUN/STOP/RESET switch of the CPU module set to RUN. Use this in a process control and other situations to keep the CPU module status in RUN even when changing the status of the output (Y) to STOP.

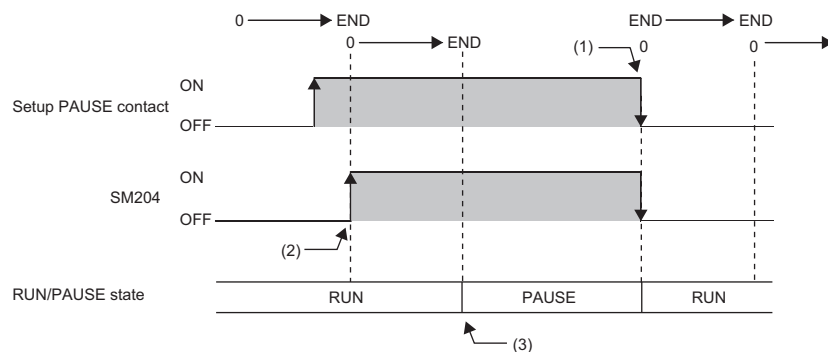

Executing method

The following methods are available to execute remote PAUSE:

Using a contact

Set PAUSE contact in "RUN-PAUSE Contact Setting". (📖 Page 189 Setting RUN-PAUSE Contacts)

When the END processing for the scan where the PAUSE contact is turned on is executed, SM204 (PAUSE contact) turns on. When the CPU module executes until the END instruction for the scan next to that where the PAUSE contact is turned on, its status changes to PAUSE, and the operation stops. When the PAUSE contact is turned off, the CPU module exits the PAUSE status and resumes the program operation from the step 0.

- (1) When the PAUSE contact is turned off, the CPU module exits the PAUSE state and resumes the program operation from the step 0.
- (2) SM204 turns on when the END processing for the scan where the set PAUSE contact is turned on is executed.
- (3) When the CPU module executes until the END instruction for the scan next to that where the PAUSE contact is turned on, its status changes to PAUSE, and the operation stops.

Using an engineering tool

Perform remote PAUSE with the remote operation of the engineering tool. (📖 GX Works3 Operating Manual)

By an external device using SLMP

Perform remote PAUSE with the SLMP command. (📖 SLMP Reference Manual)

13.3 Setting RUN-PAUSE Contacts

RUN-PAUSE contacts can be set. RUN-PAUSE contacts are used to perform remote RUN or STOP, or remote PAUSE using a contact.

 [CPU Parameter] ⇒ [Operation Related Setting] ⇒ [RUN-PAUSE Contact Setting]

Window

Displayed items

Item	Description	Setting range	Default
RUN	Set the contact that controls RUN for the CPU module.	<ul style="list-style-type: none">• R00CPU, R01CPU, and R02CPU: X0 to X1FFF• Other CPU modules: X0 to X2FFF	—
PAUSE	Set the contact that controls PAUSE for the CPU module.	<ul style="list-style-type: none">• R00CPU, R01CPU, and R02CPU: X0 to X1FFF• Other CPU modules: X0 to X2FFF	—

Point

When setting the PAUSE contact, be sure to also set the RUN contact. (The PAUSE contact cannot be set alone.)

13.4 Remote RESET

This function externally resets a CPU module in the STOP state (including that stopped due to an error). Even when the RUN/STOP/RESET switch of a CPU module is set to RUN, the CPU module can be reset in the STOP state.

Point

To perform the remote RESET operation when "Execution Target" of the remote operation is set to "All Stations Specified" or "Specify Group No.", ensure that the CPU module set in "Specify Connection Destination Connection" of the engineering tool is in the STOP state. (Even if a CPU module in the STOP state exists on the specified network, the remote RESET does not operate.)

Enabling remote RESET

Performing remote RESET requires setting for enabling remote reset.

[CPU Parameter] ⇒ [Operation Related Setting] ⇒ [Remote Reset Setting]

Window

Displayed items

Item	Description	Setting range	Default
Remote RESET	Set whether or not to enable the remote RESET.	<ul style="list-style-type: none">• Disable• Enable	Disable

Executing method

Using an engineering tool

Perform remote RESET with the remote operation of the engineering tool. (📖 GX Works3 Operating Manual)

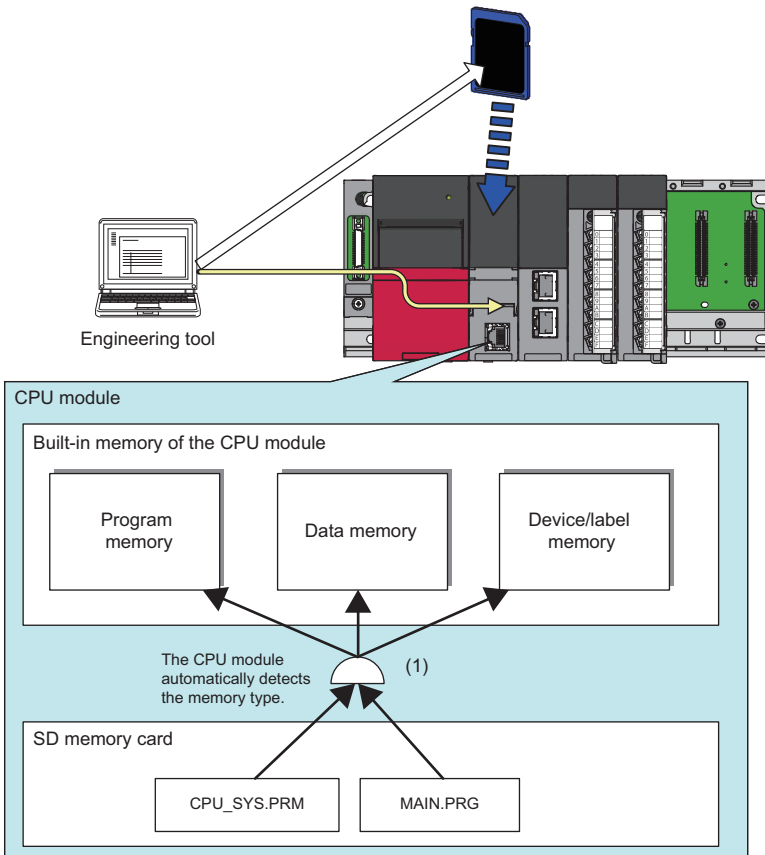

By an external device using SLMP

Perform remote RESET with the SLMP command. (📖 SLMP Reference Manual)

14 BOOT OPERATION

The files stored on the SD memory card are transferred to the storage memory which is automatically determined by the CPU module when the CPU module is powered off and on or is reset.

(1) The boot operation is executed according to the boot file setting when the CPU module is powered off and on or is reset.

Restriction

This function cannot be used in the R00CPU.

14.1 Boot Operation Procedure

The boot operation procedure is as follows.

1. Configure the boot setting. (☞ Page 193 Configuring the Boot Setting)
2. Insert an SD memory card to the CPU module.
3. Write the boot setting and boot file to the SD memory card. (☞ Page 194 Writing Boot Settings and Boot Files)
4. Power off and on, or reset the CPU module.

14.2 Specifiable File Types

The files which can be booted are as follows.

- System parameter
- CPU parameter
- Module parameter
- Module extension parameter
- Module extension parameter for protocol setting
- Remote password
- Global label setting file
- Initial global label value file
- Program file
- Initial local label value file
- FB/FUN file
- Device comment file
- Initial device value file

14.3 Allowed Maximum Number of Boot Files

The maximum number of boot file settings which can be specified is 512. However, because more than one file is bootable for a single setting, the maximum number of boot files is the same as the number of files which can be stored in the transfer destination memory.

14.4 Configuring the Boot Setting

Configure the necessary settings for the boot operation.

[Memory Card Parameters] ⇒ [Boot Setting]

Operating procedure

"Boot Setting" window

Item	Setting
Boot Setting	
Operation Setting at CPU Built-in Memory Boot	Do Not Clear
Boot File Setting	<Detailed Setting>

"Boot File Setting" window

No.	Type	Data Name
1		
2		
3		

"Add Type" window

"Boot File Setting" window

No.	Type	Data Name
1	System Parameter	SYSTEM
2	CPU Parameter	CPU
3	Module Extended Parameter for Protocol Setting(R16CPU)	UEX3FF00
4	Module Extended Parameter for Protocol Setting(0000:RJ71)	UEX00000
5	Remote Password	00000001
6	Global Label	GLBLINF
7	Global Label Initial Value	GLBLINF
8	Label Initial Value by Program	MAIN
9	Program File	MAIN
10	FB/FUN File	FBFILE
11	Device Comment	COMMENT
12	Device Initial Value	MAIN

1. Click "Detailed Setting" on the "Boot File Setting" window.
2. Click the "Type" column. The maximum number of boot files that can be specified is the same as the number of files that can be stored in the storage memory.
3. Select type for the boot file. (Multiple selection is possible.)

4. Set the data name (file name).

Displayed items

Item	Description	Setting range	Default
Operation Setting at CPU Built-in Memory Boot	Sets whether or not to clear the CPU built-in memory (program memory and data memory) upon file transfer from the SD memory card.	<ul style="list-style-type: none"> • Do Not Clear • Clear 	Do Not Clear
Boot File Setting	Sets the file used for boot operation from the SD memory card.	—	—

14.5 Writing Boot Settings and Boot Files

Use the following functions of the engineering tool.

Function	Description
Write to PLC	Use this function to write the data to the SD memory card inserted into the CPU module. Click [Online] ⇒ [Write to PLC] on the menu bar.
Write to Memory Card*1	Use this function to write the data to the SD memory card inserted into the computer. Click [Tool] ⇒ [Memory Card] ⇒ [Write to Memory Card] on the menu bar.

*1 The engineering tool with version 1.070Y supports this function.

The boot settings and boot files cannot be written with a user-data-write operation of the engineering tool.

For details, refer to the following.

GX Works3 Operating Manual

14.6 Operation When Security Functions Are Enabled

This section describes the operation when security functions are enabled.

When a security key is set

When a security key is set to the boot target program file and the security key of the program file does not match with that of the CPU module, a boot error occurs. Also, when no security key is written to the CPU module, a boot error occurs as well.

Security key of boot target program file	Security key of CPU module	Security key match/mismatch	Boot program execution
Set	Written	Match	Execute
	Written	Not match	Not execute (boot error)
	Not written	—	Not execute (boot error)

When a file password is set

If a file password is set on both the source boot file and destination file, the file can be transferred only when the passwords match. Furthermore, the file transfer does not work if a file password is set only on either one.

Transferring boot file		Transferred boot file		Password match/mismatch	Transfer
File	File password setting	File	File password setting		
Existing	Set	Existing	Set	Match	Yes
			Mismatch	No	
		Not set	—	No	
	Not set	Existing	Set	—	No
			Not set	—	Yes
		Not existing	—	—	Yes

14.7 Precautions

This section describes the precautions when using the boot operation.

- When a parameter file is set as boot file, it overwrites the parameter file inside the transfer destination CPU module. In addition, if a parameter file is not set as boot file even when stored on the SD memory card, the CPU module operates in accordance with the settings in the parameter file inside it.
- If a program in the program memory is changed online during boot operation, the change is also reflected in the transfer source program on the SD memory card.
- Note the model of the program written on the SD memory card (program specified in the boot file settings) and the model of the CPU module must be the same.
- For the boot file setting, check that the setting is consistent with the program/label setting. When the file is read from the programmable controller after the boot operation without consistency, conversion may not function properly due to lack of consistency in project data.

15 MONITOR FUNCTION

This chapter describes the functions for checking the CPU module operation.

Item	Description	Reference
Circuit monitor	Checks the status of the running program on the program editor.	GX Works3 Operating Manual
Device/buffer memory batch monitor	Checks the current values of the device and buffer memory in a batch.	
Watch	Registers a device and label and checks the current values.	
Program monitor list	Checks the processing time of the running program.	
Interrupt program monitor list	Checks the number of executions of the interrupt program used in the program.	
Real-time monitor	Monitors the contents of a specified device/label of the CPU module in real time at a specified interval or a desired timing.	GX LogViewer Version 1 Operating Manual
Scan time measurement	Measures the processing time of the set program section and displays it on the engineering tool.	<ul style="list-style-type: none"> • Page 197 Scan Time Measurement • GX Works3 Operating Manual
Scan time clear	Clears values of the scan time at a desired timing without stopping the CPU module.	<ul style="list-style-type: none"> • Page 590 Fixed scan function information • GX Works3 Operating Manual
Specified program monitor	Checks (monitors) device/label values in the program specified by the engineering tool on the program editor and changes current values.	<ul style="list-style-type: none"> • Page 202 Specified Program Monitor • GX Works3 Operating Manual

15.1 Real-Time Monitor Function

This function monitors the contents of a specified device/label of the CPU module in real time at a specified interval or a desired timing. The function can be set with GX LogViewer, where the value changes of a specified device/label can be shown graphically. Saving the set data and displayed graphs makes it possible to simplify the settings and check the graphs at a later time.

Restriction

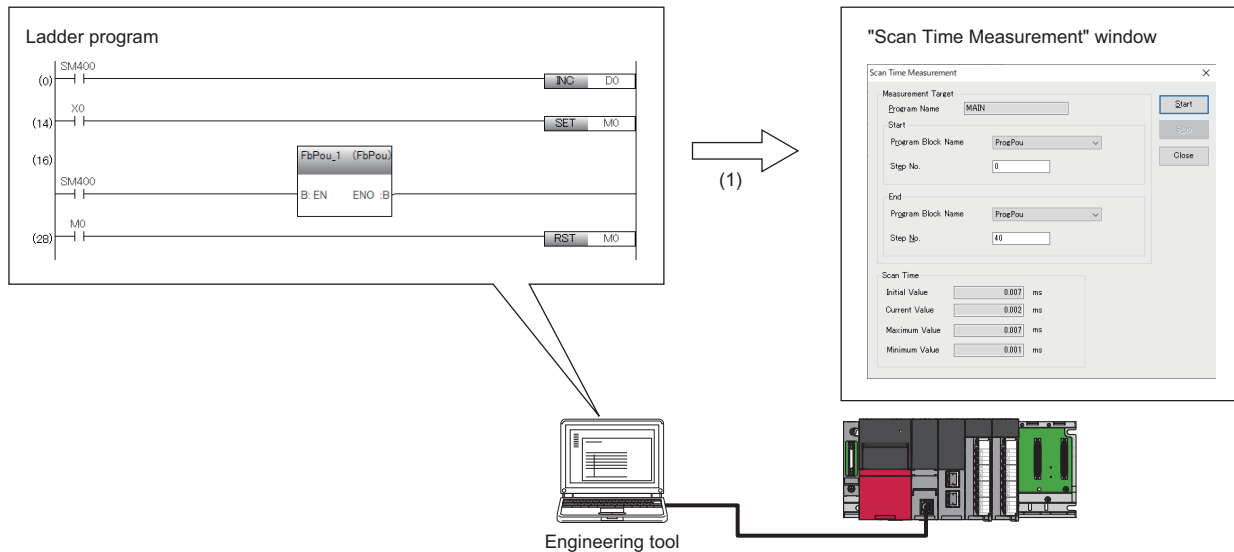

- Before executing the function, check the versions of the CPU module and GX LogViewer used. (Page 705 Added and Enhanced Functions)

For details on the function, refer to the following.

GX LogViewer Version 1 Operating Manual

15.2 Scan Time Measurement

This function measures the processing time of the set program section and displays it on the engineering tool. The time required for the subroutine and interrupt programs can be measured.

(1) Displays the scan time of the specified range.

Restriction

Before using scan time measurement, check the versions of the CPU module and engineering tool used.

(👉 Page 705 Added and Enhanced Functions)

Target programs

The target programs include ladder programs and SFC programs.

For details on operation when each program is measured, refer to the following.

📖 GX Works3 Operating Manual

Execution procedure

While the target program is displayed, execute this function from the "Scan Time Measurement" window.

For details on the menu operation, refer to the following.

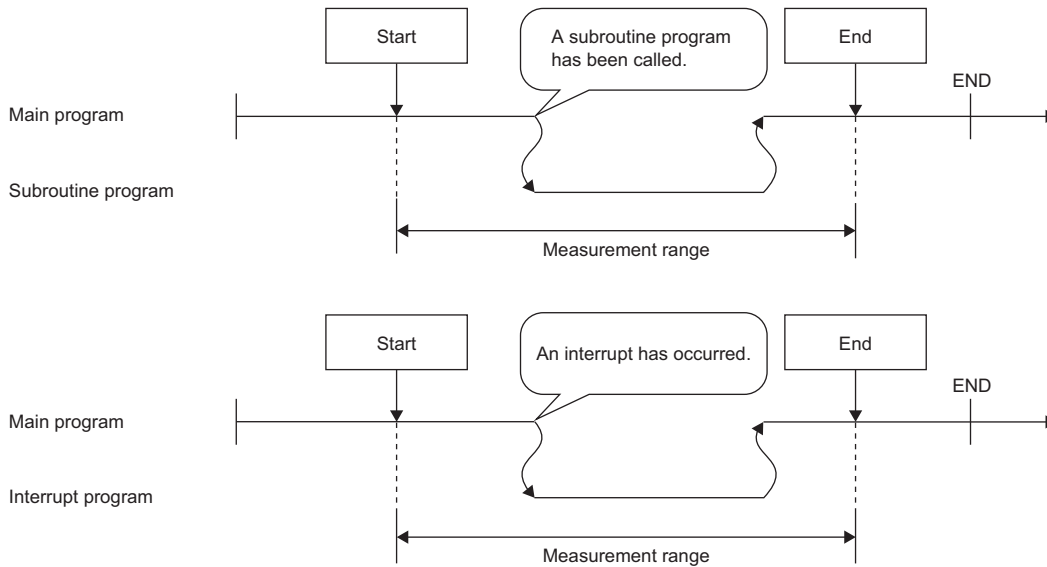

📖 GX Works3 Operating Manual

Minimum unit of measurement time

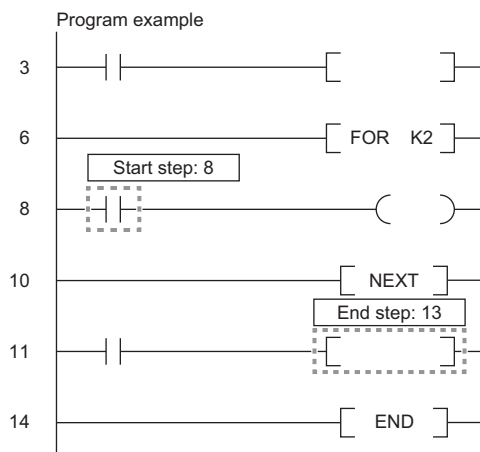

The minimum unit of measurement time is 1 μ s (0.001ms).

Operating specifications

- The scan time is measured while the operating status of the CPU module is the RUN state. When the CPU module is in the STOP state, the current value is 0ms and other values are the ones immediately before the CPU module enters the STOP state. (The values are not updated while the CPU module is in the STOP state.)
- The measurement starts from the start step of the scan subsequent to the scan where the start request receives.
- When a subroutine program is executed in the measurement range specified by the main program, the execution time of the subroutine program is also included in the measurement range. Also, when an interrupt program, fixed scan execution type program, or event execution type program triggered by occurrence of an interrupt is executed in the measurement range specified by the main program, the execution time of an interrupt program, fixed scan execution type program, or event execution type program triggered by occurrence of an interrupt is added accordingly to the scan time of the measurement range.

- When the start step is specified between the FOR and NEXT instructions, scan time measurement is performed with the measurement range from the execution of the first start step instruction to the execution of the end step instruction.
- When the start step is 8 and the end step is 13

Precautions

- Use the program written to the CPU module. If the program on the engineering tool and the program written to the CPU module do not match, an error occurs. However, if the program is changed using the engineering tool and restored again, the program is judged to be different from the program in the CPU module. In that case, the program must be read from the CPU module before being executed.
- The scan time measurement cannot be executed from multiple external devices simultaneously. Any scan time measurement executed after the first one will result in an error. The scan time measurement executed first will continue to measure normally.
- Measurement may not be executed depending on the program configuration. In that case, the CPU module returns a response without updating the value, and the displayed value is not updated. Therefore, specify the start and end steps in a program configuration in which measurement start and stop can be executed within one scan. The following shows an example of when measurement cannot be executed.

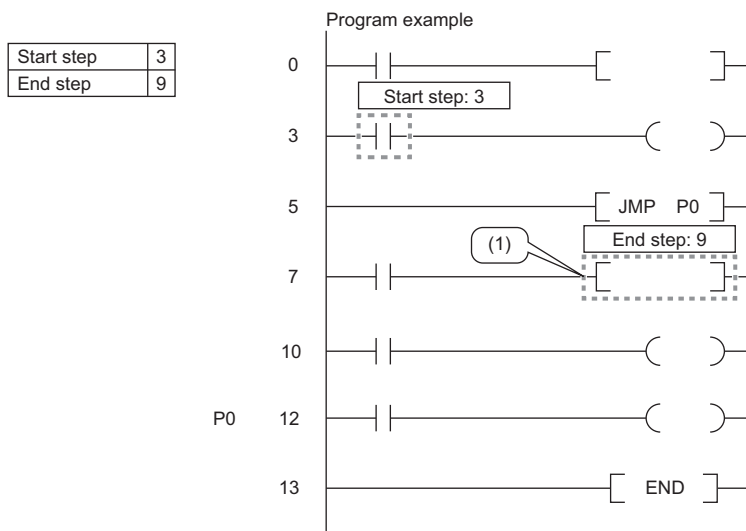

■When the branch instruction such as the JMP instruction is specified for the end step

- When the start step is 3 and the end step is 6

■When the END instruction is executed without executing the end stop after the execution of the start step

- When the start step is 3 and the end step is 9

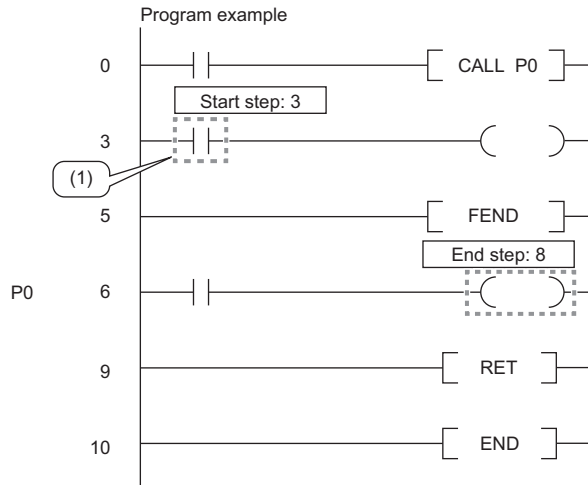

(1) The end stop is not executed due to the JMP instruction.

(2) Measurement cannot be performed because only the start step is executed.

- When the end step is executed before the start step
 - When the start step is 3 and the end step is 8

Start step	3
End step	8

- (1) The start step is executed after the execution of the end step by the CALL instruction.
 (2) Because the end step is not executed after the execution of the start step, measurement cannot be performed.

- When the END instruction is executed by executing the end step without executing the start step
- When the start step is consecutively executed (except for when any start step exists between the FOR and NEXT instructions (Page 198 Operating specifications))

- (1) Measurement cannot be performed when the start step is executed repeatedly.
- When the IRET instruction, FEND instruction, BREAK instruction, or RET instruction is specified for the end step
 - When the start step is 4 and the end step is 12

Start step	4
End step	12

- (1) When the scan time in an interrupt program is measured, do not specify the IRET instruction for the end step.

- When the start step is not the head step of the ladder block containing the specified step, or when the end stop is not the last step of the ladder block containing the specified step, correct the start/end step with the engineering tool.

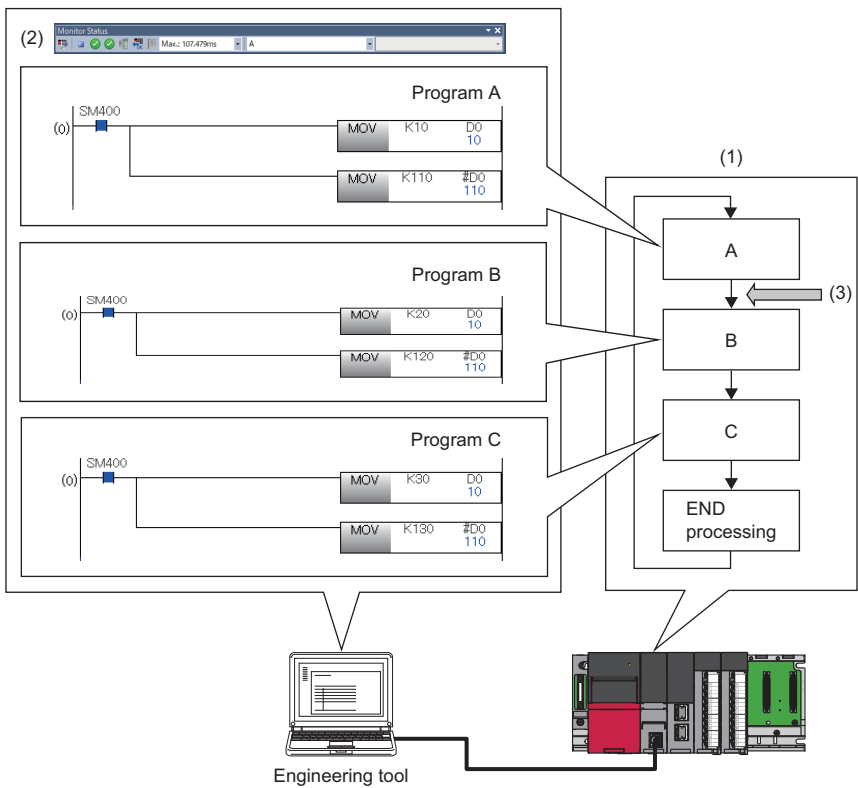

Program example

- If the program change is executed by the online program change or the file batch online change while scan time measurement is being executed, scan time measurement is interrupted. The program change by the online program change or the file batch online change is completed normally.
- If scan time measurement is executed while the program change is being executed by the online program change or the file batch online change, scan time measurement cannot be performed. The program change by the online program change or the file batch online change is completed normally.

15.3 Specified Program Monitor

This function checks (monitors) device/label values in the program specified by the engineering tool on the program editor and changes current values. Device/label values after the specified program is executed can be checked with this function, enabling debugging on a program basis.

- (1) The CPU module is executing three programs whose program names are "A", "B", and "C". (The order of program execution is A → B → C → END processing → A → B → ...)
- (2) Specify program A using the monitor status bar.
- (3) Global device and global label values, and file register values of each program for program A can be checked. For current value change, values after program A is executed will be changed.

Restriction

To use the specified program monitor, check the versions of the CPU module and engineering tool used. (☞
Page 705 Added and Enhanced Functions)

Setting the engineering tool

When using the specified program monitor, in the option settings of the engineering tool, set "After the execution of specified program" under "Timing to Execute Monitor Function and Modify Value Function" to "Yes".

 [Tool] ⇒ [Options] ⇒ [Monitor] ⇒ [Common Item] ⇒ [Timing to Execute Monitor Function and Modify Value Function]

For details, refer to the following.

 GX Works3 Operating Manual

When a program for calling a subroutine exists

When a program for calling a subroutine exists, to monitor or perform current value change on a local device on the subroutine side, a program to be specified varies depending on whether SM776 (Local device setting at CALL) is turned on or off.

SM776 setting	Program to be specified
OFF	Specify the call source program.
ON	Specify the call destination program.

Precautions

The precautions for the specified program monitor are mentioned below.

- Monitoring cannot be performed if a program not stored in the CPU module is specified.
- Only one instance of the specified program monitor can be executed with one engineering tool. The specified program monitor cannot be executed on multiple programs.
- When simultaneously executing the specified program monitor on separate personal computers with multiple engineering tools, the specified program monitor can be executed from up to eight engineering tools. When not executing the specified program monitor, there is no limit to the number of simultaneous executions of monitoring and current value change.
- When simultaneously executing the specified program monitor on the same personal computer with multiple engineering tools, whether to execute the monitor function of the engineering tool that was operated later can be selected. If selected, an error occurs for the engineering tool being executed.
- When the initial execution type program, standby type program, fixed scan execution type program, or event execution type program (interrupt occurrence) is specified with the specified program monitor, it is executed in the same timing as the timing when no program is specified.
- When the communication whose target is the device/label access service processing is performed while the specified program monitor is running, the scan time is extended because the processing is performed twice in one scan: after the specified program is performed and at a normal timing such as during the END processing.

Point

The scan time extension can be reduced by preventing other communication while the specified program monitor is running.

- To specify a program whose trigger type for the event execution type program is set to "ON of bit data (TRUE)" or "Passing time" using the specified program monitor, specify in a state in which the trigger is established. If the program is specified in a state in which the trigger is not established, the specified program monitor cannot be executed.
- While the specified program monitor is running, if the CPU module is set to STOP and the execution order of the target program is changed or the target program is deleted by using the program setting of the CPU parameter, do not write to the CPU module and execute RUN. Otherwise, the specified program monitor may not operate for the specified program.

16 TEST FUNCTION

16.1 External Input/Output Forced On/Off Function

External inputs/outputs can be forcibly turned on or off from the engineering tool. This function enables input devices to be turned on or off regardless of the on/off state of the external inputs and enables the external outputs to be turned on and off regardless of the operation result of a program.

(External input)

(External output)

- (1) Turn off X0 forcibly.
- (2) The input device is turned off regardless of the on/off state of the external input.
- (3) Turn on Y0 forcibly.
- (4) The external output is turned on regardless of the operation result of the program.

Point

The external input/output forced on/off function is available for MELSEC iQ-R series modules and Q series modules mounted on an extension base unit.

Restriction

Before executing the external input/output forced on/off function, check the versions of the CPU module and engineering tool used. (☞ Page 705 Added and Enhanced Functions)

Devices that allow forced on/off registration

The following lists the devices that allow forced on/off registration.

Device	Range
Input	<ul style="list-style-type: none">• R00CPU, R01CPU, and R02CPU: X0 to X1FFF (8192 points)• Other CPU modules: X0 to X2FFF (12288 points)
Output	<ul style="list-style-type: none">• R00CPU, R01CPU, and R02CPU: Y0 to Y1FFF (8192 points)• Other CPU modules: Y0 to Y2FFF (12288 points)

Number of device points that allows forced on/off registration

A maximum of 32 points can be registered for input devices and output devices in total.

Inputs/outputs for which forced on/off can be set

The following describes the inputs/outputs for which forced on/off can be set.

■Input

After the refreshed data from the module is reflected, the input devices for which forced on/off registration is set are forcibly turned on or off.

■Output

The following external outputs are turned on or off by refreshing output devices that have been forcibly turned on or off.^{* 1}

- Refresh target output of modules mounted on the base unit
- Link refresh target output of network modules
- Link refresh target output of CC-Link IE Field Network Basic

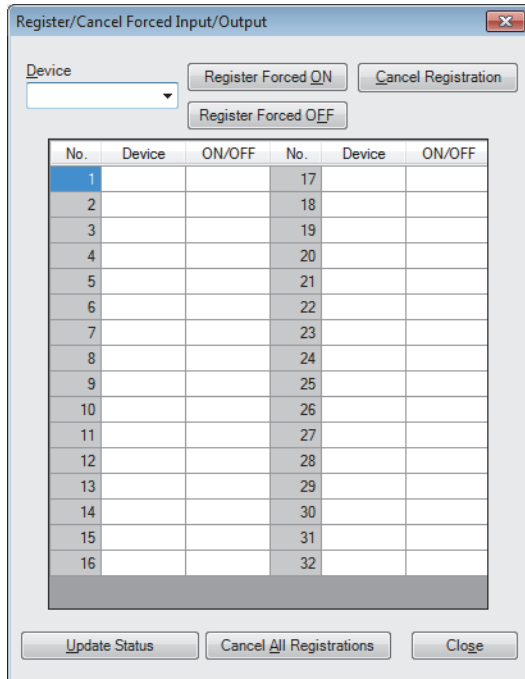

*1 When no modules are mounted on the base unit (no refresh targets), no data is output to the external outputs.

Operation method of forced on/off

Use the engineering tool for the forced on/off operation.

[Debug] ⇨ [Register/Cancel Forced Input/Output]

Window

Displayed items

Item	Description
Device	Enter target devices (X, Y).
[Register Forced ON] button	Registers forced on for the entered devices (X, Y).
[Register Forced OFF] button	Registers forced off for the entered devices (X, Y).
[Cancel Registration] button	Cancels forced on/off for the registered devices (X, Y).
[Update Status] button	Displays the latest on/off states.
[Cancel All Registrations] button	Batch-cancels forced on/off for the registered devices (X, Y).

Behavior in forced on/off registration

The following describes the behavior in forced on/off registration.

■Behavior of an input device

Registering forced on/off turns on or off the input device regardless of the status of the external input. When an input device for which the forced on/off has been registered is changed in the program, the input device is turned on or off in accordance with the operation result of the program.

Operation	Change in the input device in the program	Behavior of an input device
Forced on registration	Changed	<ul style="list-style-type: none"> The input device is on when the program operation at every scan starts. The input device is turned on or off in accordance with the operation result of the program after the program operation at every scan started.*1
	Not changed	The on state is held.
Forced off registration	Changed	<ul style="list-style-type: none"> The input device is off when the program operation at every scan starts. The input device is turned on or off in accordance with the operation result of the program after the program operation at every scan started.*1
	Not changed	The off state is held.

*1 If the forced on/off is registered for a device set to perform link refresh, the device value may be updated at the timing of refresh. Thus, a different value from the operation result may be displayed when the device value is monitored (performed in END processing).

■Behavior of an output device

Registering forced on/off turns on or off the external output regardless of the operation result of the program. When an output device has been changed in the program, the output device is turned on or off in accordance with the operation result of the program. Therefore, the on/off states between the output device and external output may differ.

Operation	Change in the output device in the program	Behavior of outputs	
		Behavior of an output device	Behavior of an external output
Forced on registration	Changed	<ul style="list-style-type: none"> The output device is on when the program operation at every scan starts. The output device is turned on or off in accordance with the operation result of the program after the program operation at every scan started.*1 	The external output is turned on regardless of the operation result of the program.
	Not changed	The on state is held.	
Forced off registration	Changed	<ul style="list-style-type: none"> The output device is off when the program operation at every scan starts. The output device is turned on or off in accordance with the operation result of the program after the program operation at every scan started.*1 	The external output is turned off regardless of the operation result of the program.
	Not changed	The off state is held.	

*1 If the forced on/off is registered for a device set to perform link refresh, the device value may be updated at the timing of refresh. Thus, a different value from the operation result may be displayed when the device value is monitored (performed in END processing).

CPU module operating status

Forced on/off registration is allowed regardless of the CPU module operating status. However, when a stop error has occurred, the external outputs are turned off regardless of the forced on/off registration setting. While the operating status of the CPU module is STOP due to a stop error, forced on/off is enabled only for the input devices. If the CPU module is powered off and on or is reset, all the forced on/off registration information will be canceled.

Forced on/off timing

The following table lists the timing to reflect the registered data in the forced on/off registration settings to the input/output devices or external outputs.

Inputs/outputs for which forced on/off can be set	Reflection timing for the input devices	Reflection timing for the output devices or external outputs
Input/output of the modules mounted on the base unit	<ul style="list-style-type: none"> • END processing (at input refresh) • At COM instruction execution (at input refresh) • At instruction execution using the direct access input (DX) (LD, LDI, AND, ANI, OR, ORI, LDP, LDF, ANDP, ANDF, ORP, ORF, LDPI, LDFI, ANDPI, ANDFI, ORPI, ORFI)^{*1} • At execution of the RFS instruction and MTR instruction • At execution of instructions used in the interrupt by the system (UDCNT1, UDCNT2, SPD) • At program execution^{*2} • At execution of the inter-module synchronization cycle program (I44) • At execution of the multiple CPU synchronization program (I45) and non-execution of the multiple CPU synchronization program (I45) (at END processing)^{*3} 	<ul style="list-style-type: none"> • END processing (at output refresh) • At COM instruction execution (at output refresh) • At instruction execution using the direct access output (DY) (OUT, SET, DELTA(P), RST, PLS, PLF, FF, MC, SFT(P))^{*1} • At execution of the RFS instruction and MTR instruction • At execution of instructions used in the interrupt by the system (PLSY, PWM) • At program execution^{*2} • At execution of the inter-module synchronization cycle program (I44)
Input/output of the CPU module assigned to RX and RY of the CC-Link IE TSN master/local module	<ul style="list-style-type: none"> • END processing (at link refresh) • At ZCOM instruction execution (at link refresh) 	
Input/output of the CPU module assigned to LX and LY of the CC-Link IE Controller Network module or MELSECNET/H network module	<ul style="list-style-type: none"> • END processing (at link refresh of the CC-Link IE Controller Network module or MELSECNET/H network module) • At COM instruction execution (at link refresh of the CC-Link IE Controller Network module or MELSECNET/H network module) • At ZCOM instruction execution (at link refresh of the CC-Link IE Controller Network module or MELSECNET/H network module) 	
Input/output of the CPU module assigned to RX and RY of the CC-Link module	<ul style="list-style-type: none"> • END processing (at link refresh) • At COM instruction execution (at link refresh) • At ZCOM instruction execution (at link refresh) 	
Input/output of the CPU module assigned to RX and RY of the CC-Link IE Field Network module	<ul style="list-style-type: none"> • END processing (at link refresh) • At COM instruction execution (at link refresh) • At ZCOM instruction execution (at link refresh) • At execution of the inter-module synchronization cycle program (I44) 	
Input/output of the CPU module assigned to RX and RY of the CC-Link IE Field Network Basic	<ul style="list-style-type: none"> • END processing (at link refresh) • At COM instruction execution (at link refresh) 	

*1 For the precautions for using the direct access device, refer to the following.

 Page 211 Precautions

*2 At input/output refresh execution where input/output refresh is registered for each program, and for interrupt programs.

*3 When an output device or external output is specified as a refresh device in multiple CPU refresh and the forced on/off function is executed, the device is not forcibly turned on or off.

Checking the forced on/off execution status

The execution status of the forced on/off can be checked in the following ways.

■Engineering tool

The execution status can be checked with the [Update Status] button of the engineering tool. ( Page 206 Operation method of forced on/off)

■FUNCTION LED

The FUNCTION LED of the CPU module flashes by registering forced on/off (every 200ms).

Point

The LED indicator follows the status of the external input/output forced on/off function even when the LED Display Setting has been set and other functions that use the FUNCTION LED are being executed. ( Page 172 LED display setting)

The display status of the FUNCTION LED can be checked with "Module Information List" in the module diagnostics. ( GX Works3 Operating Manual)

■Special register

SD1488 (Debug function usage status) can be used to check whether the external input/output forced on/off function is used. ( Page 604 List of Special Register Areas)

Behavior in cancellation of forced on/off

Forced on/off registration can be canceled for each input/output device individually.

■Behavior of the device

Inputs/outputs for which forced on/off can be set		Change in input/output devices in the program	
		Changed	Not changed
Input	Input from the modules mounted on the base unit	The input device is turned on or off in accordance with the on/off state of the modules.	
	Input from RX of CC-Link IE TSN	The input device is turned on or off in accordance with the on/off state refreshed from CC-Link IE TSN.	
	Input from LX of CC-Link IE Controller Network or MELSECNET/H	The input device is turned on or off in accordance with the on/off state refreshed from CC-Link IE Controller Network and MELSECNET/H.	
	Input from RX of CC-Link	The input device is turned on or off in accordance with the on/off state refreshed from CC-Link.	
	Input from RX of CC-Link IE Field Network	The input device is turned on or off in accordance with the on/off state refreshed from CC-Link IE Field Network.	
	Input from RX of CC-Link IE Field Network Basic	The input device is turned on or off in accordance with the on/off state refreshed from CC-Link IE Field Network Basic.	
	Input other than above (input without modules actually mounted)	The input device is turned on or off in accordance with operation result of the program.	The input device is turned on or off in accordance with the registered on/off state.
Output	Output to the modules mounted on the base unit	The operation result of the program is output.	Data is output in accordance with the registered on/off state.
	Output to RY of CC-Link IE TSN		
	Output to LY of CC-Link IE Controller Network or MELSECNET/H		
	Output to RY of CC-Link		
	Output to RY of CC-Link IE Field Network		
	Output to RY of CC-Link IE Field Network Basic		
	Output other than above (output without modules actually mounted)	The output device is turned on or off in accordance with operation result of the program. (Refresh to external output is not executed.)	The output device is turned on or off in accordance with the registered on/off state. (Refresh to external output is not executed.)

■CPU module operating status

Forced on/off registration can be canceled regardless of the CPU module operating status.

■LED status

The following describes the LED status after forced on/off registration is canceled.

Forced on/off registration status of when the registration is canceled	FUNCTION LED status
Registered on/off information is remaining.	Flashing (every 200ms)
No registered on/off information is remaining.	Off ^{*1}

*1 When other functions that use the FUNCTION LED are being executed, the LED indicator changes its status in accordance with the status of the functions.

Behavior in batch-cancellation of forced on/off registrations

All the forced on/off registrations can be canceled in a batch.

■Behavior of the device

The behavior of the device is the same as that of cancellation of forced on/off (for each device). (☞ Page 210 Behavior of the device)

■CPU module operating status

The behavior of the device is the same as that of cancellation of forced on/off (for each device). (☞ Page 210 CPU module operating status)

■LED status

The following describes the LED status after forced on/off registration is canceled in a batch.

Forced on/off registration status of when the registration is canceled	FUNCTION LED status
No registered on/off information is remaining.	Off*1

*1 When other functions that use the FUNCTION LED are being executed, the LED indicator changes its status in accordance with the status of the functions.

Precautions

The following describes precautions for using the external input/output forced on/off function.

- Multiple engineering tools connected to the network can be used to register forced on/off for the same CPU module. In this case, note the following.
 - The forced on/off state registered last is handled as the on/off state of input/output devices.
 - Since the on/off state displayed in engineering tools may differ from that of the CPU module, update the on/off state displayed in engineering tools.
- If a direct device is used in a program, forced on/off registration is reflected when an instruction is executed.

Ex.

When X0 is forcibly turned off

When the input device (X0) is used	When the direct input device (DX0) is used
<p>① Set X0 by using the SET instruction. ② Turn on X0 because the SET instruction is being executed.</p>	<p>① Set X0 by using the SET instruction. ② Reflect the registered off information. ③ Turn off X0 although the SET instruction is being executed.</p>

- When the external input/output forced on/off function is executed while the program of high-speed internal timer interrupt (I48, I49) is executed, the interval of programs of high-speed internal timer interrupt is short, and a large number of forced on/off is registered, the scan time will increase and a WDT error may occur.
- Execution of interrupt programs which are executed at a fixed scan may delay depending on the number of forced on/off registrations and the number of refresh points of each refresh processing.
- When forced on/off is registered in the multiple CPU system configuration, registration is allowed for input/output devices*2 and external outputs regardless of the out-of-group I/O fetch setting*1. Note, however, that the devices of other CPU modules and the external outputs controlled by other CPU modules are not turned on or off even if forced on/off is registered from the host CPU for the external outputs controlled by other CPU modules. Only the devices of the host CPU module are turned on or off.

*1 For the out-of-group I/O fetch setting, refer to the following.

☞ Page 372 Out-of-group I/O fetch setting

*2 Except when the on/off state of the input/output devices is changed by using the output instruction

16.2 Device Test with Execution Conditions

Using the engineering tool, device/label values can be set for each execution of specified steps of programs. This function enables to debug a specific ladder block without modifying the program even when the program is configured as shown in the example below.

(1) The device is operated in accordance with the registered settings. (M0 of the step number 10 is on.)

Restriction

Before using the device test with execution conditions, check the version of the CPU module and the engineering tool used. (☞ Page 705 Added and Enhanced Functions)

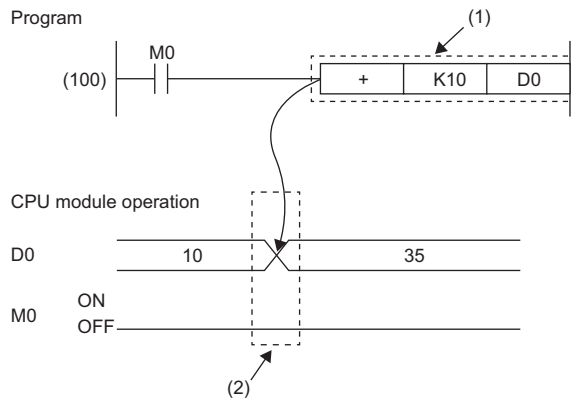

Operation when device test with execution conditions is registered

The device test with execution conditions can forcibly change device/label values (status) of specified locations.

Specify a location of a device/label value (status) to be changed with a program name and a step number. In addition, specify a device/label and its value (status) to be changed with a device/label name and a setting value.

Changes made to the device/label value (status) take effect in the specified step and later. However, when the device/label value (status) is changed due to operations of the program or other factors in the specified step and later, the device/label value (status) is changed accordingly.

In the device test with execution conditions, a device/label value is changed in a specified step regardless of whether or not the instruction execution conditions are satisfied in the specified step. In the following example, the D0 value is changed to 35 regardless of the status (on/off) of M0.

(1) The device test with execution conditions that sets D0 to 35 and is executed before execution of the instruction is registered to the step (100).

(2) The device value in the specified step is changed regardless of the value (on/off) of M0.

Operation when device test with execution conditions is disabled

The device/label value (status) when the registration is disabled is held. (It is not returned to the value (status) before execution of the device test with execution conditions.)

Data that can be set

The following tables list the data that can be set for the device test with execution conditions.

■Devices that can be set

Type	Device ^{*3}
Bit device ^{*1}	X, DX, Y, DY, M, L, F, SM, V, B, SB, T (contact), ST (contact), C (contact), LT (contact), LST (contact), LC (contact), FX, FY, Jn\X, Jn\Y, Jn\SB, Jn\B
Word device ^{*2}	T (current value), ST (current value), C (current value), D, SD, W, SW, RD, R, ZR, Z, FD, Un\G, Jn\W, Jn\SW, U3En\G ^{*4} , U3En\HG ^{*4}
Double-word device	LT (current value), LST (current value), LC (current value), LZ

*1 For bit devices, digit specification is allowed for K1 to K8 only.

*2 For word devices, bit specification is allowed.

*3 A local device, indirectly-specified device, or index-modified device can also be specified.

*4 The word devices of the other CPU modules, U3En\G and U3En\HG, can be specified in the engineering tool, however, the setting value is not reflected in the CPU module. If U3En\G□ is specified, an error will occur.

■Labels that can be set

Type ^{*1*2}	Class	Data type
Global label	<ul style="list-style-type: none"> • VAR_GLOBAL • VAR_GLOBAL_RETAIN 	<ul style="list-style-type: none"> ■Primitive data type <ul style="list-style-type: none"> • Bit^{*3} • Word (signed)^{*4} • Double word (signed) • Word (unsigned)^{*4} • Double word (unsigned) • Single-precision real number • Double-precision real number • Timer type <ul style="list-style-type: none"> • Retentive timer type • Counter type <ul style="list-style-type: none"> • Long timer type • Long retentive timer type • Long counter type ■Array^{*5} ■Structure^{*6}
Local label	<ul style="list-style-type: none"> • VAR • VAR_RETAIN 	

*1 Only labels that exist in the read project can be specified.

*2 Labels of a program block can be specified.

*3 Digit-specified labels cannot be specified.

*4 Bit specification is allowed.

*5 Specify the array element.

*6 Specify the structure member.

Programs that can be set

Only ladder programs can be set for the device test with execution conditions.

Maximum number of devices/labels that can be set

A total of 32 devices/labels can be set for the device test with execution conditions.

Checking execution status of device test with execution conditions

The execution status can be checked in the following ways.

■Engineering tool

The execution status can be checked by displaying the list of registered settings with the engineering tool.

■FUNCTION LED

The FUNCTION LED of the CPU module flashes (every 200ms) by registering the device test with execution conditions.

Point

When the device test with execution conditions is registered, the FUNCTION LED flashes regardless of the LED Display Setting in the RAS Setting. Even when the LED Display Setting has been set and other functions that use the FUNCTION LED are being executed, the LED indication at the registration of the device test with execution conditions takes priority. The LED indication is reset to the original state when the registration is disabled. (The LED indication follows the status of other functions that use the FUNCTION LED.) (👉 Page 172 LED display setting)

The display status of the FUNCTION LED can be checked with "Module Information List" in the module diagnostics. (📖 GX Works3 Operating Manual)

■Special register

SD1488 (Debug function usage status) can be used to check the usage status of the device test with execution conditions. (👉 Page 635 Debug function)

Registration of device test with execution conditions

This section describes how to register the device test with execution conditions.

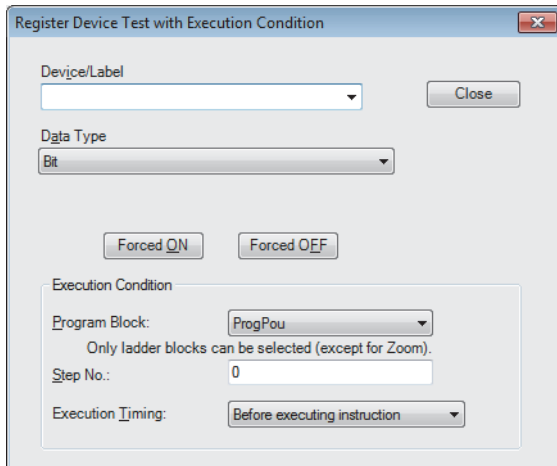

Registration method

Specify each field in the "Register Device Test with Execution Condition" window.

 [Debug] ⇒ [Device Test with Execution Condition] ⇒ [Register]

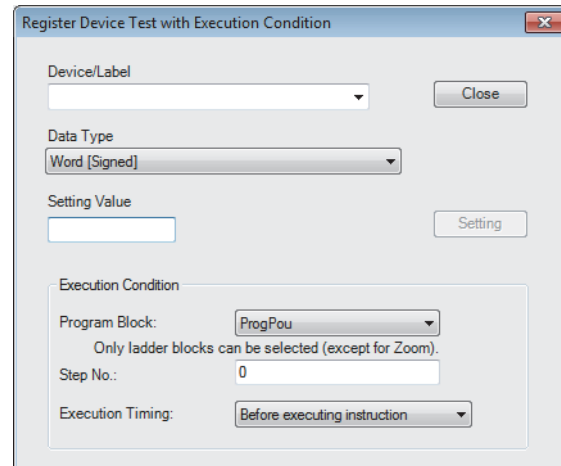

Window

• When bit device/bit type label is specified

The screenshot shows the 'Register Device Test with Execution Condition' dialog box. The 'Device/Label' field is empty. The 'Data Type' is set to 'Bit'. There are two buttons: 'Forced ON' and 'Forced OFF'. The 'Execution Condition' section includes a 'Program Block' dropdown set to 'ProgPou', a 'Step No.' text box with '0', and an 'Execution Timing' dropdown set to 'Before executing instruction'. A note states: 'Only ladder blocks can be selected (except for Zoom)'. A 'Close' button is in the top right.

• When word device/word type label is specified

The screenshot shows the 'Register Device Test with Execution Condition' dialog box. The 'Device/Label' field is empty. The 'Data Type' is set to 'Word [Signed]'. There is a 'Setting Value' text box and a 'Setting' button. The 'Execution Condition' section includes a 'Program Block' dropdown set to 'ProgPou', a 'Step No.' text box with '0', and an 'Execution Timing' dropdown set to 'Before executing instruction'. A note states: 'Only ladder blocks can be selected (except for Zoom)'. A 'Close' button is in the top right.

Setting data

Item	Description	
Device/Label	Set a device or a label to be registered. (☞ Page 214 Data that can be set)	
Data Type	Specify a data type. (☞ Page 214 Data that can be set)	
[Forced ON] button	These buttons appears when the data type is set to bit data. Click either button to register the forced on/off.	
[Forced OFF] button		
Setting Value	This field appears when the data type is set to word data. Enter a setting value in decimal or hexadecimal format. When setting a hexadecimal value, prefix the numerical value with "H". (Example: "H16", "H1F") Click the [Setting] button to register the value.	
[Setting] button		
Execution Condition	Program Block	Specify a program block.
	Step No.	Specify a step number for each program. To specify the step number, specify the start step of the instruction.
	Execution Timing	Specify whether to change the device/label value before or after the execution of the instruction of the specified step. (☞ Page 220 Execution timing)

Registration of multiple device tests with execution conditions to the same step

Multiple device tests with execution conditions can be registered to one step. However, device tests with execution conditions that have the same device/label name and the same execution timing cannot be registered to one step. When such device tests with execution conditions are registered, the existing registration is overwritten with new registration.

Point

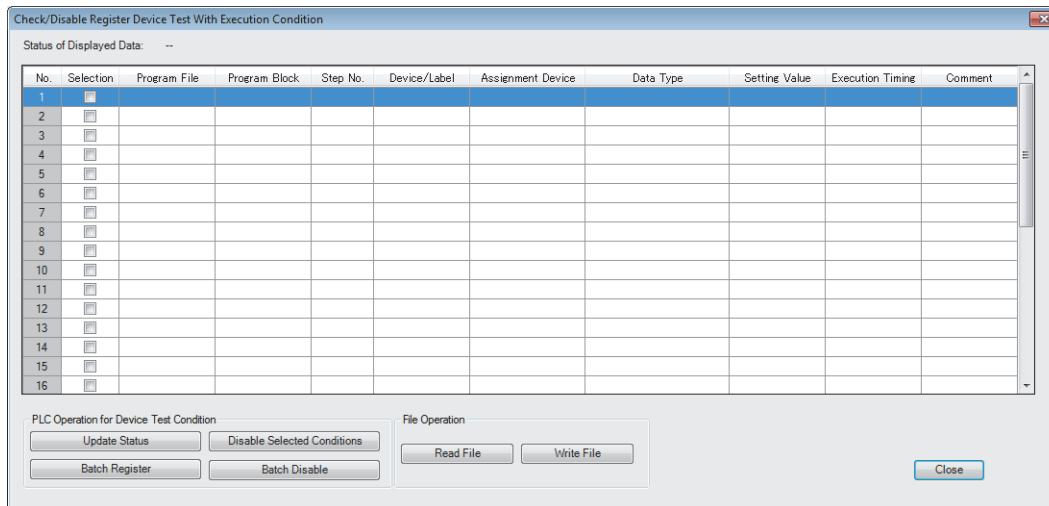

- Two device tests with execution conditions having different execution timing can be registered to one step even when they have the same device/label name.
- Different device modification (bit specification of word device, digit specification of bit device, or index modification) is handled as different device name. Therefore, two device tests with execution conditions having different device modification can be registered to one step.

Checking and disabling settings from list window

From the "Check/Disable Register Device Test with Execution Condition" window, the following operations can be performed: checking the registered settings, disabling selected settings, registering/disabling settings in batch, and reading/writing registered settings from/to a file.

 [Debug] ⇒ [Device Test with Execution Condition] ⇒ [Check/Disable Register]

Window

Displayed items

Item		Description
PLC Operation for Device Test Condition	[Update Status] button	Click this button to read the registered settings of the device test with execution conditions in the CPU module. No data is read when this operation is performed with no settings registered.
	[Disable Selected Conditions] buttons	Click this button to disable the selected registration of the device test with execution conditions that has been read from the CPU module by using the [Update Status] button.
	[Batch Register] button	All the existing registered settings of the device test with execution conditions in the CPU module are disabled by clicking this button, and the settings that have been read by using the [Update Status] button or [Read File] button are registered to the CPU module.
	[Batch Disable] button	Click this button to collectively disable the registered settings of the device test with execution conditions in the CPU module.
File Operation	[Read File] button	Click this button to read the registered settings of the device test with execution conditions, which have been saved by using the [Write File] button, and list them on the window.
	[Write File] button	Click this button to save the registered settings of the device test with execution conditions listed on the window into a file in the personal computer.

Point

The registered settings of the device test with execution conditions can be collectively disabled by the following operation in the engineering tool: [Debug] ⇒ [Device Test with Execution Condition] ⇒ [Batch Disable]

■ Disabling device test with execution conditions

In addition to the operations from the engineering tool, the following operations can be used to disable the device test with execution conditions.

- Powering off and on
- Resetting the CPU module
- Writing a program to the CPU built-in memory by writing data to the programmable controller while the CPU module is in the STOP state^{*1*4}
- Deleting a program in the CPU built-in memory by deleting data in the programmable controller while the CPU module is in the STOP state^{*1}
- Initializing the CPU built-in memory while the CPU module is in the STOP state^{*1}
- Changing a program in the CPU built-in memory using the following SLMP commands while the CPU module is in the STOP state^{*1}
 - Deleting a file (Delete File) (1822)
 - Copying a file (Copy File) (1824)
- Changing a program in the CPU built-in memory using the following FTP commands while the CPU module is in the STOP state^{*1}
 - Deleting a file (delete, mdelete)
 - Changing a file name (rename)
- Restoring a program using the CPU module data backup/restoration function^{*1*4}
- Changing a program online (the online change (ladder block)^{*6} or the file batch online change) ( Page 221 Operation during online change)
- Writing a global label to the CPU built-in memory by writing data to the programmable controller while the CPU module is in the STOP state^{*2*4}
- Deleting a global label in the CPU built-in memory by deleting data in the programmable controller while the CPU module is in the STOP state^{*2}
- Changing a global label in the CPU built-in memory using the following SLMP commands while the CPU module is in the STOP state^{*2*4}
 - Deleting a file (Delete File) (1822)
 - Copying a file (Copy File) (1824)
- Changing a global label in the CPU built-in memory using the following FTP commands while the CPU module is in the STOP state^{*2}
 - Deleting a file (delete, mdelete)
 - Changing a file name (rename)
- Restoring a global label using the CPU module data backup/restoration function^{*2*4}
- Writing CPU parameters to the CPU built-in memory by writing data to the programmable controller while the CPU module is in the STOP state^{*3*4}
- Deleting CPU parameters in the CPU built-in memory by deleting data in the programmable controller while the CPU module is in the STOP state^{*5}
- Changing the CPU parameter in the CPU built-in memory using the following SLMP commands while the CPU module is in the STOP state
 - Deleting a file (Delete File) (1822)^{*5}
 - Copying a file (Copy File) (1824)^{*3}
- Changing the CPU parameter in the CPU built-in memory using the following FTP commands while the CPU module is in the STOP state^{*5}
 - Deleting a file (delete, mdelete)
- Restoring a CPU parameter using the CPU module data backup/restoration function^{*3*4}

- *1 The registered settings of device test with execution conditions for the program to be changed are disabled when the operating status of the CPU module is changed from STOP to RUN after the operation. (They are not disabled at the completion of the operation.)
- *2 All the registered settings that specify global labels are disabled when the operating status of the CPU module is changed from STOP to RUN after the operation. (They are not disabled at the completion of the operation.)
- *3 When the CPU parameters are changed, all the registered settings that specify local devices or local labels are disabled when the operating status of the CPU module is changed from STOP to RUN after the operation. (They are not disabled at the completion of the operation.)
- *4 When the same programs, global labels, or CPU parameters are written, the registered settings are not disabled.
- *5 All the registered settings of device test with execution conditions are disabled when the operating status of the CPU module is changed from STOP to RUN after the operation. (They are not disabled at the completion of the operation.)
- *6 When the online change (ladder block) is performed while the CPU module is in the STOP state, the device test with execution conditions registered for the program to be changed is disabled when the operating status of the CPU module is changed from STOP to RUN after the operation. (They are not disabled at the completion of the operation.)

Execution timing

Select whether to change the device/label value before or after the execution of the instruction of the specified step when registering the device test with execution conditions.

Program

(1) The device test with execution conditions that sets 20 in D0 in step (100) is registered.

Setting of execution timing	Operation of CPU module	
Before execution of the instruction in step (101)		(2) A value in D0 is changed to 20.
After execution of the instruction in step (101)		(3) A value in D0 is changed to 20.

When the device test with execution conditions is registered with the step of the specific instruction specified, depending on the setting of the execution timing, the device/label may not be changed even if the specified step is executed.

When the step of the following instructions is specified and the execution timing is set to "Before executing instruction", the device/label value is not changed by the device test with execution conditions even when execution conditions of the instruction are satisfied and the specified step is passed.

Classification	Instruction name
Stop	STOP*1
Jump	CJ*1, SCJ*1, GOEND*1, JMP
Loop	BREAK(P)*1
Ending a program	FEND
Calling a subroutine program	CALL(P)*1, FCALL(P)*1, ECALL(P)*1, EFCALL(P)*1, XCALL*1
Return	RET, IRET

*1 When the execution timing is set to "After executing instruction", the device/label is changed when the execution condition of the instruction is not satisfied.

■FOR instruction, NEXT instruction, FOR to NEXT instruction loop

When the device test with execution conditions is registered with the step for the FOR instruction, the NEXT instruction, or the FOR to NEXT instruction loop specified, the timing to change the device/label differs from that when other instructions are specified.

Instruction for specified step	Specification detail of execution timing	
	Set to "Before executing instruction"	Set to "After executing instruction"
FOR	Executed only once before starting the loop processing	Executed only once after starting the loop processing (Specified devices are changed before the execution of the program that is between the FOR and NEXT instructions.)
NEXT	Executed only once after starting the loop processing (Specified devices are changed after the execution of the program that is between the FOR and NEXT instructions.)	Executed only once after ending the loop processing
FOR to NEXT instruction loop	Executed only once before execution of the instruction at specified step in the FOR to NEXT instruction loop	Executed only once after execution of the instruction at specified step in the FOR to NEXT instruction loop

■END instruction

When the step for the END instruction is specified, the execution timing cannot be set to "After executing instruction".

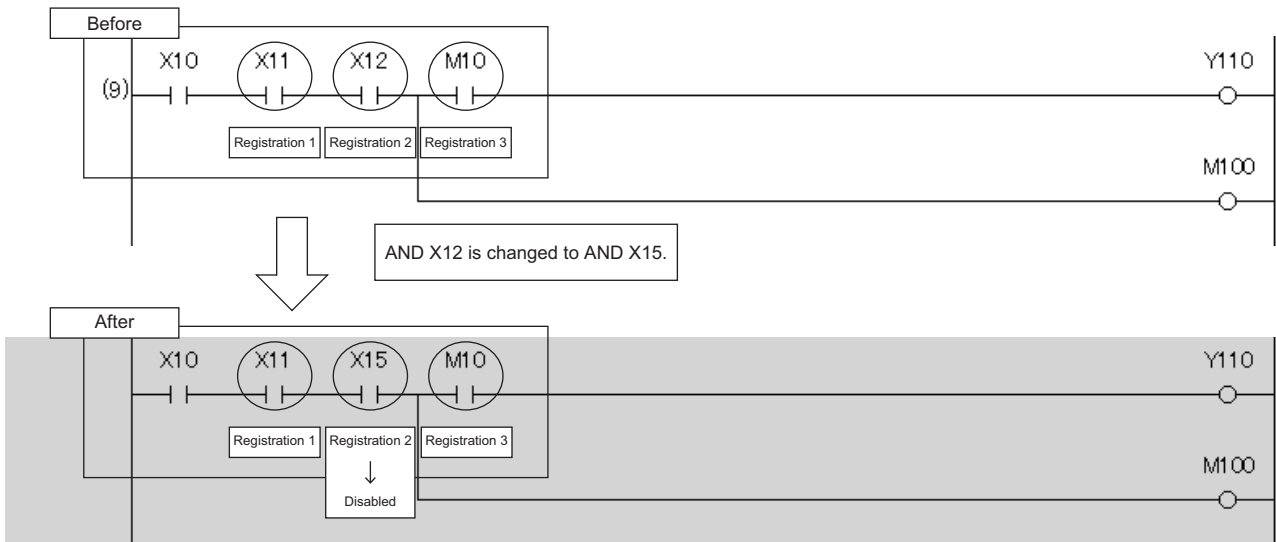

Operation during online change

This section describes the operation performed during the online change of the CPU module to which the device test with execution conditions is registered.

■Online change (ladder block) (without adding or deleting instruction)

If a part to be changed by the online change (ladder block) includes registrations of the device test with execution conditions, such registrations are disabled.

When the Registrations 1 to 3 of the device test with execution conditions are registered for the steps as shown below, the Registration 2 is disabled upon the execution of the online change (ladder block). The Registrations 1 and 3 are not disabled because the steps to which they are registered are not included in the part to be changed.

■Online change (ladder block) (with adding instruction)

When an instruction is added by the online change (ladder block), the registration of the device test with execution conditions of the instruction immediately after the instruction to be added is disabled.

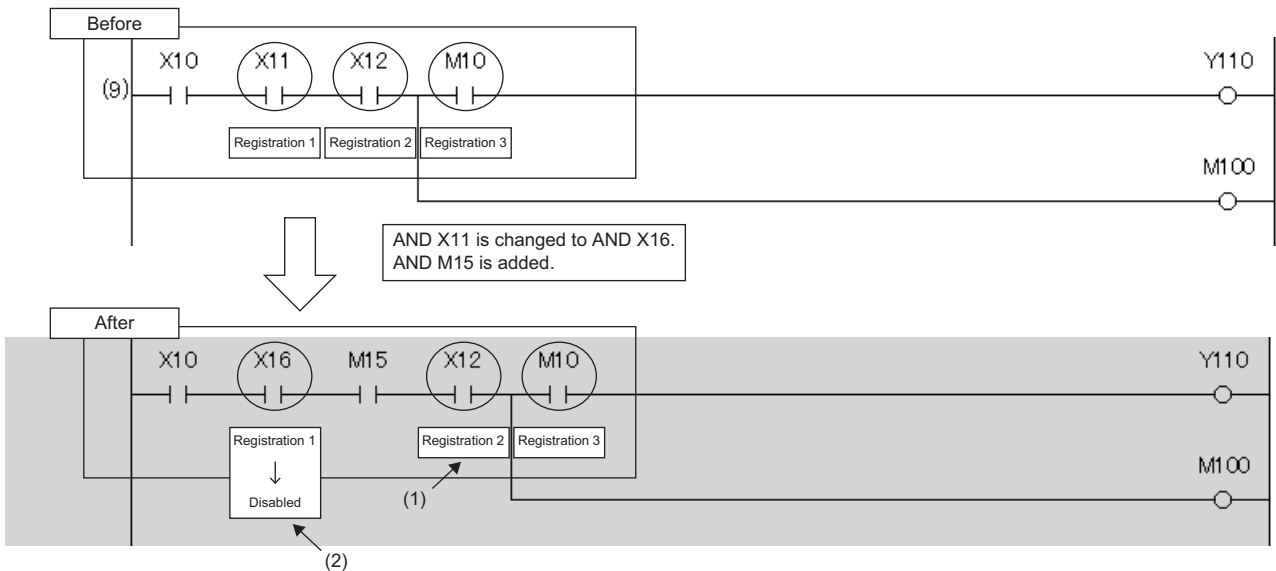

In the following example, an instruction is added by the online change (ladder block). In this case, when the device test with execution conditions is registered to the instruction immediately after the added instruction, the relevant registrations are disabled upon the execution of the online change (ladder block).

(1) The registration of the device test with execution conditions of the instruction immediately after the instruction to be added is disabled.

However, when an instruction to be added is adjacent to an instruction to be changed, the registration of the device test with execution conditions of the instruction immediately after the instruction to be added is not disabled.

In the following example, an instruction to be added is adjacent to an instruction to be changed. Therefore, even when the device test with execution conditions is registered to the instruction immediately after the instruction to be added, the relevant registration is not disabled by the execution of the online change (ladder block).

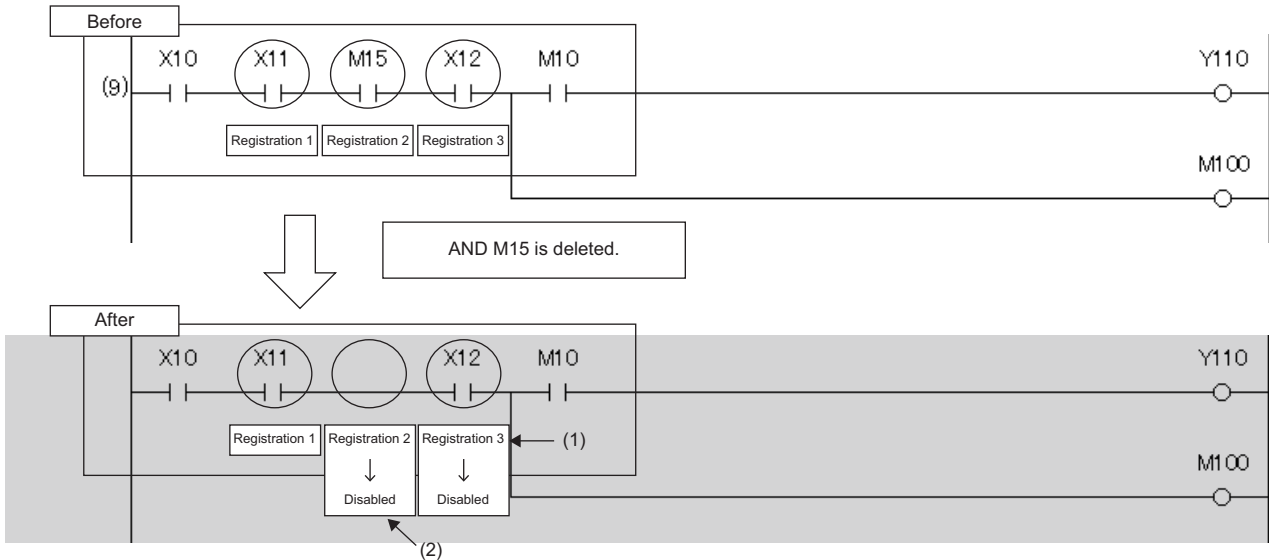

(1) Although this instruction is located immediately after the added instruction, the registration of the device test with execution conditions is not disabled because the added instruction is adjacent to the changed instruction.

(2) The registration of the device test with execution conditions is disabled because the instruction is changed.

■Online change (ladder block) (with deleting instruction)

When an instruction is deleted by the online change (ladder block), registrations of the device test with execution conditions for the deleted instruction and for the instruction immediately after the deleted instruction are disabled.

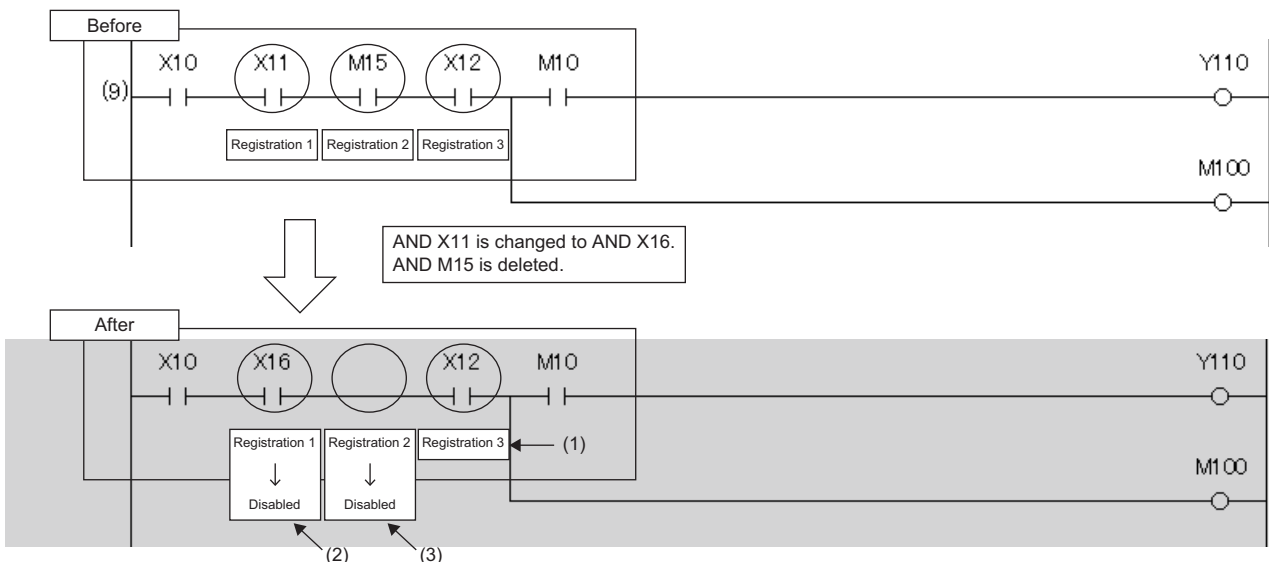

In the following example, an instruction is deleted by the online change (ladder block). In this case, when the device test with execution conditions is registered to the instruction immediately after the deleted instruction, the relevant registrations are disabled upon the execution of the online change (ladder block).

- (1) The registration of the device test with execution conditions is disabled because the instruction is located immediately after the deleted instruction.
- (2) The registration of the device test with execution conditions is disabled because the instruction where it is registered is deleted.

However, when an instruction to be deleted is adjacent to an instruction to be changed, registration of the device test with execution conditions of the instruction immediately after the instruction to be deleted is not disabled.

In the following example, an instruction to be deleted is adjacent to an instruction to be changed. Therefore, even when the device test with execution conditions is registered to the instruction immediately after the instruction to be deleted, the relevant registration is not disabled by the execution of the online change (ladder block).

- (1) Although this instruction is located immediately after the deleted instruction, the registration of the device test with execution conditions is not disabled because the deleted instruction is adjacent to the changed instruction.
- (2) The registration of the device test with execution conditions is disabled because the instruction where it is registered is changed.
- (3) The registration of the device test with execution conditions is disabled because the instruction where it is registered is deleted.

■ Addition/deletion/change of labels by the online change (ladder block)

- When SM940 (Operation setting of the device test with execution conditions) is off, if local labels or program files are added, deleted, or changed and the online change (ladder block) is performed, all the registrations that specify local labels of the relevant program file are disabled. When SM940 is on, the registrations are not disabled.*¹
- When SM940 is off, if global labels are added, deleted, or changed and the online change (ladder block) is performed, all the registrations that specify global labels are disabled. When SM940 is on, the registrations are not disabled.*¹

*1 If reassignment of local labels/global labels which are used in the program is performed when SM940 is on, registrations including reassigned labels are disabled. When SM940 is on, do not delete or change local labels or global labels registered to device tests with execution conditions. If deleted or changed, registered settings may not be read correctly.

■ File batch online change

All the device tests with execution conditions registered to the target program for the file batch online change are disabled. When global labels are added, deleted, or changed and the file batch online change is performed, all the registrations that specify global labels are disabled.

Precautions

This section describes the precautions on the use of the device test with execution conditions.

■Operation when devices/labels cannot be registered

When multiple devices/labels are registered to the device test with execution conditions, none of the devices/labels are registered if there is even one device/label or execution condition (program block, step number, or execution timing) that cannot be registered.

■Operation from multiple engineering tools

Multiple engineering tools connected to the network can be used to register the device test with execution conditions for the same CPU module. However, registration may fail if done simultaneously. If registration fails, register again. When the device tests with execution conditions are registered to the same device/label in the same location, the status (value) that is registered later takes effect. Before registering the device test with execution conditions from multiple engineering tools, update the data using "Update Status".

■Mutual exclusion

This section describes the mutual exclusion between the device test with execution conditions and other functions.

Other functions	Operation
Online change	When the device test with execution conditions is registered or disabled during execution of the online change, an error occurs and registering or disabling the device test with execution conditions fails.
Real-time monitor	When execution of these functions is set for the same step as that specified by the device test with execution conditions, the device test with execution conditions is executed first.
Data logging	

■Device range check

The following table lists the details of the device range check for each specification.

Item	Description
Specification of device name by index modification	When an index-modified device is registered to the device test with execution conditions, the device range check is not performed. Therefore, the device value is not changed under the following conditions. <ul style="list-style-type: none">• The index-modified device is across the boundary of the device area.• The index-modified device is out of the device range.
Specification of device name by indirect specification	When an indirectly-specified device is registered to the device test with execution conditions, the device range check is not performed. Therefore, the device value is not changed under the following conditions. <ul style="list-style-type: none">• The indirectly-specified device is across the boundary of accessible areas.• The indirectly-specified device is out of the range accessible.
Specification of file register	When file registers are registered to the device test with execution conditions, whether or not the register files are assigned and the range of the file registers are not checked. Therefore, file register values are not changed under the following conditions. <ul style="list-style-type: none">• File register files are not assigned.• Specified device numbers of file register is out of the file register range.

■Specification of local device

When local devices are registered to the device test with execution conditions, the write destination of the device values vary depending on the value of SM776 (Local device setting at CALL) and SM777 (Local device setting in interrupt programs).

( Page 593 Instruction related)

■Using together with interrupt programs

When a step number in an interrupt program is specified as an execution condition of a device test with execution conditions, the processing time of the interrupt program increases by the processing time of the device test with execution conditions.

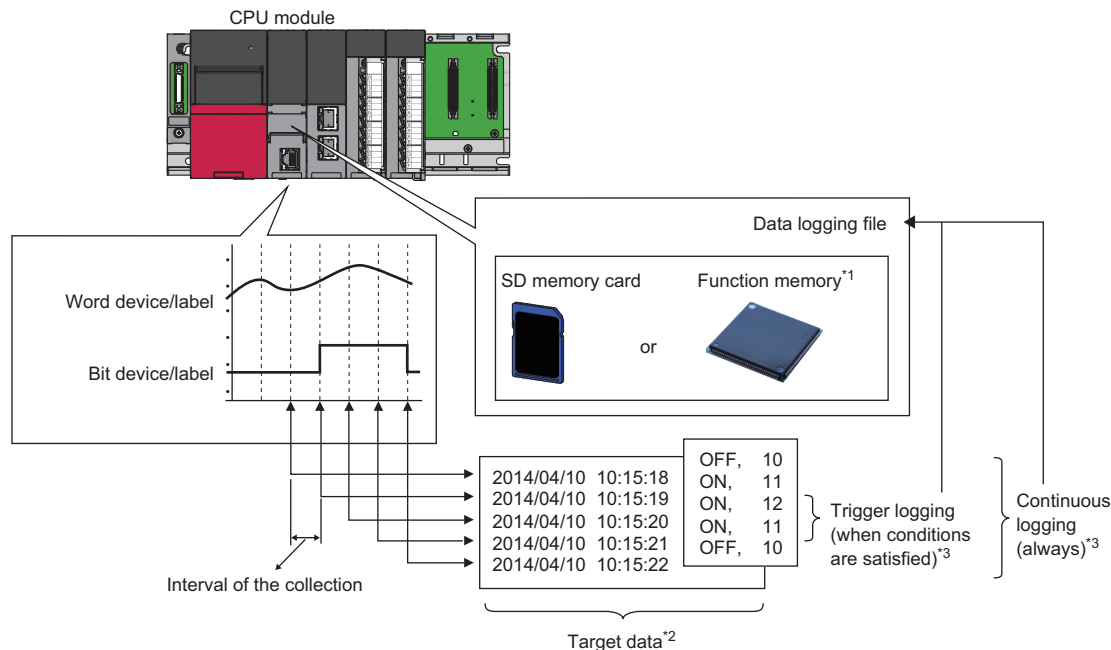

For example, when the interrupt interval of I49 set in the parameter of "Interrupt Setting from Internal Timer" under "Fixed Scan Interval Setting" is as short as 0.05ms and a step number in I49 is specified as an execution condition of a device test with execution conditions, the processing time of the interrupt program may exceed the time set in "Fixed Scan Interval Setting". Therefore, a WDT error may occur due to continuous execution of the interrupt program. For how to reduce processing time of interrupt programs, refer to descriptions of interrupt programs. ( Page 99 Interrupt Program)

17 DATA LOGGING FUNCTION

This function collects specified data at a specified interval or timing, and stores them in a file.

The SD memory card or CPU built-in memory (function memory^{*1}) can be specified as the storage location of the collected data.

The entire data logging function allows the entry of up to 10 data logging settings.

*1 For the CPU modules that can use the function memory, refer to the availability of storage location. (Page 260 Availability)

*2 For details on the data to be collected, refer to the following. (Page 230 Data to Be Collected)

*3 For details on continuous logging and trigger logging, refer to the following. (Page 237 Logging Type)

Point

- Data logging without using an SD memory card is enabled by specifying the CPU built-in memory as the storage location while using the data logging file transfer function. Data logging without using an SD card is also enabled by transferring the data logging result file stored in the CPU built-in memory to the data memory after the completion (stop) of the data logging. The data logging file transfer function is not required at this time. (Page 265 When the data storage destination memory is the function memory)
- For the procedures for operating and configuring this function in CPU Module Logging Configuration Tool, refer to the following.

📖 CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series)

Restriction

This function cannot be used in the R00CPU.

The data logging function can be configured with CPU Module Logging Configuration Tool of the supported version (listed in the table below) or any later version.

CPU module	Supported version of CPU Module Logging Configuration Tool
R04CPU, R08CPU, R16CPU, R32CPU, R120CPU	"1.35M" or later
R01CPU, R02CPU	"1.76E" or later

17.1 Data Logging Procedure

This section describes the data logging procedure.

- 1.** Install CPU Module Logging Configuration Tool. ( CPU Module Logging Configuration Tool/GX LogViewer Installation Instructions (BCN-P5999-0506))
- 2.** Launch CPU Module Logging Configuration Tool.
- 3.** When specifying a label as the target data, import the project of the engineering tool to CPU Module Logging Configuration Tool.
- 4.** Configure the data logging setting.
( CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))
- 5.** If auto logging is used, configure the common settings (auto logging common settings). ( Page 287 Auto logging common setting)
- 6.** When the storage destination of the data logging files is the SD memory card, insert an SD memory card into the CPU module, and power up the module.
- 7.** Connect the CPU module to a personal computer.
- 8.** Write the data logging setting to the SD memory card or data memory.
- 9.** Switch the CPU module to RUN state to start the data logging.
- 10.** Stop the data logging and read the data logging file.
- 11.** Check the file into which data has been read.

Point

- To start data logging, always click the [Start] button in the "Logging Status and Operation" window of CPU Module Logging Configuration Tool. The data logging cannot be started even when the setting is written and power is turned off and on or the CPU module is reset (except for the auto logging).
- For the operation procedures for CPU Module Logging Configuration Tool, refer to the following.
 CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series)

17.2 Specifications

This section describes the data logging specifications.

Item		Specifications	Reference	
Number of data logging settings		10 ^{*1}	—	
Data collection	Collection interval	<ul style="list-style-type: none"> • Every scan operation • Time specification • Interrupt occurrence • Condition specification (device/label specification, step No. specification) 	Page 232 Data Collection Conditions	
	Number of points for collection	Maximum of 1280 (128 per setting)		
	AND conjunction	AND conjunction of the device/label specification and step No. specification is enabled.		
Logging type		<ul style="list-style-type: none"> • Continuous logging • Trigger logging 	Page 237 Logging Type	
Data processing	Trigger logging	Trigger condition	<ul style="list-style-type: none"> • Condition specification (device/label change specification, step No. specification) • When trigger instruction executed 	Page 238 Operating procedure for trigger logging
		AND conjunction	AND conjunction of the device/label change specification and step No. specification is enabled.	
		Trigger logging range	Number of records specified before and after the trigger establishment	
		Number of trigger establishments (number of events that can be handled as trigger)	One time	
		Number of records	<ul style="list-style-type: none"> ■SD memory card Maximum of 1000000 ■CPU built-in memory (function memory) Maximum of 50000 	
File output	File name		Additional information plus file number	Page 242 Data Logging File
	File storage format		<ul style="list-style-type: none"> • Unicode text file • CSV file^{*3} • Binary file 	
	Data type		<ul style="list-style-type: none"> • Bit • Word (signed) • Double word (signed) • Word (unsigned) • Double word (unsigned) • Single-precision real number • Double-precision real number • String • Numeric string • Time 	
	Data output format	Unicode text file	<ul style="list-style-type: none"> • Decimal format • Hexadecimal format • Decimal fraction format • Exponential format 	
		CSV file	<ul style="list-style-type: none"> • Decimal format • Hexadecimal format • Decimal fraction format • Exponential format 	
		Binary file	<ul style="list-style-type: none"> • Word (signed) • Double word (signed) • Word (unsigned) • Double word (unsigned) • Single-precision real number • Double-precision real number 	
	Storage location of data logging files		<ul style="list-style-type: none"> • SD memory card • CPU built-in memory (function memory)^{*2} 	

Item			Specifications	Reference
Output file handling	Storage file switching	File switching timing	<ul style="list-style-type: none"> • Number of records • File size • Condition specification *3 	Page 268 Switching to a storage file
		Maximum number of storage files	1 to 65535	
Data logging file transfer function			This function automatically transfers data logging files to the FTP server.	Page 275 Data Logging File Transfer (Auto Transfer to FTP Server)
Operation settings when entering into RUN mode			This function sets data logging operations when entering into RUN mode after the data logging setting is registered.	Page 285 Setting Behavior at the Time of Transition to RUN
Auto logging			When inserting an SD memory card, which holds data logging setting, into the CPU module, the data logging automatically starts based on the data logging setting information on the SD memory card.	Page 286 Auto Logging
SD memory card replacement			SD memory cards can be replaced using the SD memory card forced disable function even when the data logging is in progress.	Page 290 SD Memory Card Replacement

- *1 When the storage destination of the data logging files is the function memory, up to two data loggings can be executed simultaneously even though 10 data loggings can be set. However, up to 10 data loggings can simultaneously be executed depending on the firmware version and production information of the CPU module. (☞ Page 705 Added and Enhanced Functions)
- *2 When using the CPU built-in memory (function memory) as the storage location, check the firmware version of the CPU module and the version of the CPU Module Logging Configuration Tool. (☞ Page 705 Added and Enhanced Functions)
 The data logging file stored in the CPU built-in memory can be transferred to the FTP server by using the data logging file transfer function. (☞ Page 275 Data Logging File Transfer (Auto Transfer to FTP Server))
 If the data logging file transfer function is not set, the files are transferred to the data memory. (☞ Page 284 Data Logging File Transfer to Data Memory)
- *3 Check the firmware version of the CPU module and the version of CPU Module Logging Configuration Tool. (☞ Page 705 Added and Enhanced Functions)

17.3 Data to Be Collected

This section describes the data to be collected by data logging.

Number of data points

The data logging function can collect up to 1280 data records. (10 settings × 128 records)^{*1*2}

*1 Duplicate data records are counted as distinct.

*2 The number of data records depends on the data type.

Data type

The following table shows the number of data records for each data type.

Data type	Number of data points
Bit	1
Word (signed)	1
Double word (signed)	2
Word (unsigned)	1
Double word (unsigned)	2
Single-precision real number	2
Double-precision real number	4
Time	2
String ^{*1}	Specified size/2 ^{*2}
Numeric string	Specified size/2 ^{*2}

*1 The entered character code are output.

*2 The specified size can be 1 to 256. If the specified size is an odd number, the number of data records is rounded to the next higher integer. Example: The number of data records is 3 if the specified size is 5.

Data to be collected

The following table lists the data to be collected.

Data	Description
Global device	Sets the start number of the global device to be collected.
Local device ^{*1}	Sets the start number of the local device to be collected. For the settings of the local device, use "program name + #device".
Global label ^{*1}	Sets the label name of the global label to be collected. To set the global label, the project of the engineering tool is required to be read.
Local label ^{*1}	Sets the label name of the local label to be collected. To set the local label, the project of the engineering tool is required to be read. Use "program block name/label name" for the local label.

*1 When specifying the local device, global label, or local label, check the versions of the CPU module, engineering tool, and CPU Module Logging Configuration Tool. (📖 Page 705 Added and Enhanced Functions)

Point

- When specifying a label, save the project of the engineering tool that contains the label in advance because the project is imported into CPU Module Logging Configuration Tool.
- Devices or labels in a single setting can be specified simultaneously. For such specification, check the versions of the CPU module, engineering tool, and CPU Module Logging Configuration Tool. (📖 Page 705 Added and Enhanced Functions)
- For the local devices and local labels, the local device or local label of a single program can be specified in a single data logging setting. To specify local devices or local labels of multiple programs, specify them in different data logging settings.

Devices to be collected

The following table lists the devices that can be specified as the collected data.

Type	Device ^{*1}
Bit device ^{*2}	X, DX, Y, DY, M ^{*4} , L, F, SM, V ^{*4} , B, SB, T (contact) ^{*4*5} , T (coil) ^{*4*5} , ST (contact) ^{*4*5} , ST (coil) ^{*4*5} , C (contact) ^{*4*5} , C (coil) ^{*4*5} , LT (contact) ^{*4*5} , LT (coil) ^{*4*5} , LST (contact) ^{*4*5} , LST (coil) ^{*4*5} , LC (contact) ^{*4*5} , LC (coil) ^{*4*5} , FX, FY, Jn\X, Jn\Y, Jn\SB, Jn\B, BLnS ^{*6}
Word device ^{*3}	T (current value) ^{*4} , ST (current value) ^{*4} , C (current value) ^{*4} , D ^{*4} , SD, W, SW, RD, R, ZR, Z, FD, Un\G, Jn\W, Jn\SW, U3En\G, U3En\HG
Double-word device	LT (current value) ^{*4} , LST (current value) ^{*4} , LC (current value) ^{*4} , LZ

- *1 An index modified device and indirectly specified device cannot be specified.
- *2 For bit devices, digit specification is allowed for K1 to K8 only.
- *3 For word devices, bit specification is allowed.
- *4 To specify the local device, use "Program name/#Device name". (Example: "MAIN/#M1")
- *5 To specify these devices with CPU Module Logging Configuration Tool, use T (contact): TS, T (coil): TC, ST (contact): STS, ST (coil): STC, C (contact): CS, C (coil): CC, LT (contact): LTS, LT (coil): LTC, LST (contact): LSTS, LST (coil): LSTC, LC (contact): LCS, and LC (coil): LCC.
- *6 The device can be collected by using the CPU module where the SFC function can be used. (📖 Page 705 Added and Enhanced Functions)

Labels to be collected

The following table lists the labels that can be specified to be collected.^{*1*2}

Type	Class	Data type
Global label	<ul style="list-style-type: none"> • VAR_GLOBAL • VAR_GLOBAL_RETAIN 	<ul style="list-style-type: none"> ■ Primitive data type/array^{*7} <ul style="list-style-type: none"> • Bit^{*4} • Word (signed)^{*5} • Double word (signed) • Word (unsigned)^{*5} • Double word (unsigned) • Single-precision real number • Double-precision real number • Time • String • String [Unicode]^{*9} • Timer type^{*6} • Retentive timer type^{*6} • Counter type^{*6} • Long timer type^{*6} • Long retentive timer type^{*6} • Long counter type^{*6} ■ Structure^{*8}
Local label ^{*3}	<ul style="list-style-type: none"> • VAR • VAR_RETAIN 	

- *1 A label with a name of 256 characters or less can be specified. When the local label is specified (program block name/label name), the "program block name/" part is counted as the number of characters.
- *2 Only labels in the read project of the engineering tool can be specified.
- *3 Specify the label with "Program block name/Label name". (Example: "ProgPou/label_w1")
- *4 Digit-specified labels cannot be specified.
- *5 Bit specification is allowed.
- *6 For the label of timer type and counter type, specify the element name. (S: contact, C: coil, N: current value)
Global label example: "label_w1.S"
Local label example: "ProgPou/label_w1.S"
- *7 Specify the array element. If the array element is not specified, it is handled as the start of the array ([0]). (📖 CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))
- *8 Specify the structure member. (📖 CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))
- *9 Up to 128 characters can only be specified.

Point

When specifying a label, save the project of the engineering tool that contains the label in advance because the project is imported into CPU Module Logging Configuration Tool.

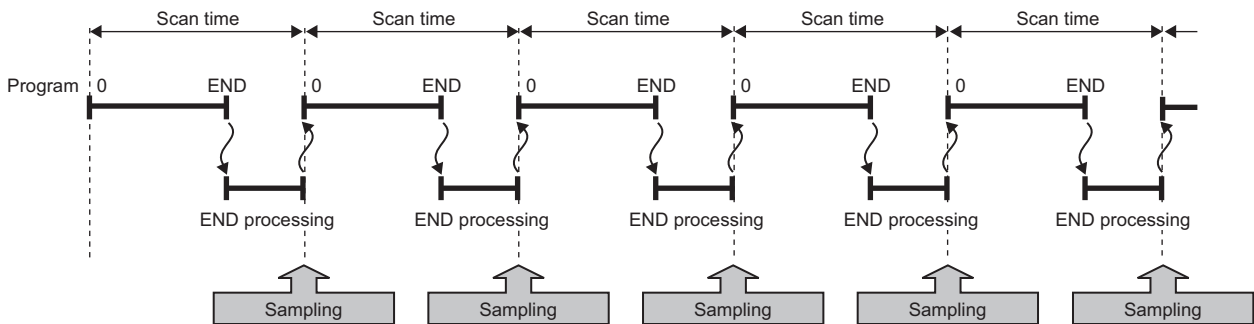

17.4 Data Collection Conditions

This section describes the timing when data is collected and the conditions under which data is collected.

Data collection conditions		Description
Each scan		Collects data during the END processing of each scan.
Time specification	Data collection at specified time interval	Collects data at specified time interval.
	Data collection during the END processing after specified time interval	Collects data during the END processing after specified time interval.
Interrupt occurrence		Collects data at specified time interval after the execution of an interrupt program.
Condition specification	Device/label specification	Collects data when the monitored data meets the specified condition during the END processing.
	Step No. specification	Collects data when the specified condition is met immediately before the execution of the specified step.

Each scan

Data are collected during the END processing of each scan.

Time specification

Specify the collection time interval. Specify the timing of data collection using advanced settings as well.

Data collection at specified time interval

Data are collected at specified time interval.

Ex.

10 milliseconds (10ms)

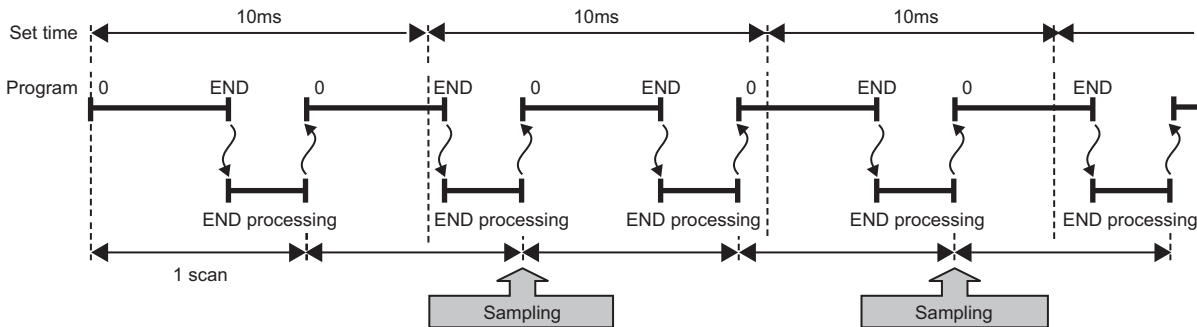

Data collection during the END processing after specified time interval

This option causes data collection to be performed at the timing of the END processing rather than during the course of program execution. Ensure that the "Scan time" is less than "Time specification". If the scan time is longer than the specified time and the collection interval or the collection timing occurs more than once during the same scan, data is collected only once during the END processing. Data collection is performed on a scan by scan basis, which is the same behavior as when "Each scan" is used.

Ex.

10 milliseconds (10ms)

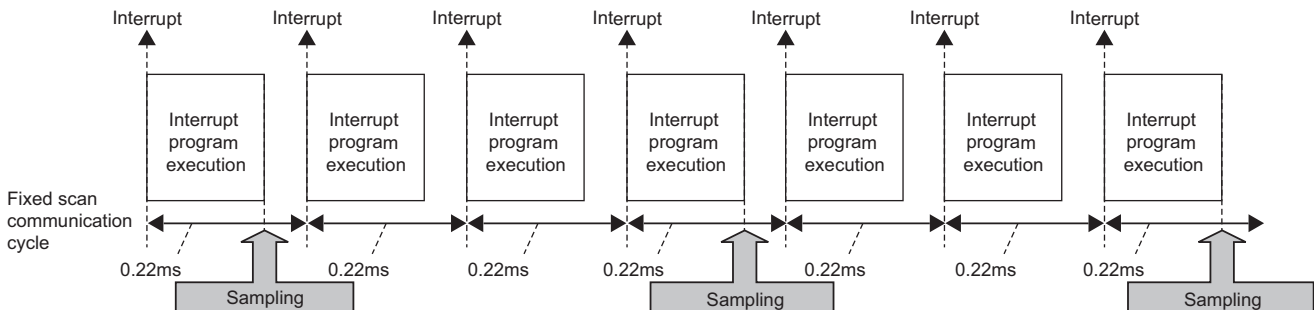

Interrupt occurrence

Data are collected at specified time interval after the execution of an interrupt program. The time interval is specified by "Interrupt cycle specified sampling intervals" × "Interval". Interrupt pointers which can be specified are I28 to I31, I44, I45, I48, and I49.

Ex.

When multiple CPU synchronous interrupt (I45) is used (multiple CPU synchronous interrupt is set to 0.22 milliseconds (0.22ms) and interval to 3):

Point

Since data collection is performed at the timing of the execution of the interrupt program, data is collected only when all of the following conditions are met:

- The specified interrupt meets the operating condition.
- The specified interrupt pointer exists in the program.
- The current state is an EI state and the interrupt mask of the interrupt pointer has been reset.

Condition specification

Specify the data collection timing according to the device/label data conditions and step number. The AND condition using a combination of "Device specification", "Label specification", and "Step No. specification" results in the collection of data at the time when both conditions are established.

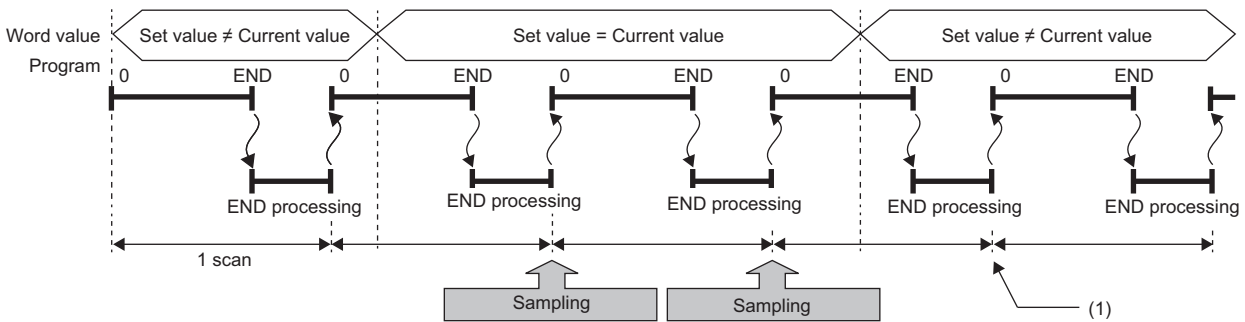

Device/label specification

Data are collected when the monitored data meets the specified condition during the END processing.

■To collect data continuously while the conditions are met

The following conditional formula causes the data logging function to collect data continuously while the conditions are met:

- =: When the current value of the monitored data is equal to the comparison value
- ≠: When the current value of the monitored data is not equal to the comparison value
- ≥: When the current value of the monitored data is equal to or larger than the comparison value
- >: When the current value of the monitored data is larger than the comparison value
- ≤: When the current value of the monitored data is equal to or smaller than the comparison value
- <: When the current value of the monitored data is smaller than the comparison value

(1) During the END processing, the data logging function does not collect data because the conditions are not met.

■To collect data only when the state changes

The following conditional formula causes the data logging function to collect data only during the END processing for the scans where the conditional formula is met. It does not collect data for any single scan where the conditional formula is not met during the END processing (even if the conditional formula is met before the END processing is initiated).

- ↑: When the specified data turns on
- ↓: When the specified data turns off
- At change: When the current value of the specified data changes

(1) The data logging function does not collect data because there has been no change in state since the last scan.

■Specifying the monitored data

For monitored data, the following devices and labels can be specified.*1

*1 When specifying the local device, global label, or local label, check the versions of the CPU module, engineering tool, and CPU Module Logging Configuration Tool. (📖 Page 705 Added and Enhanced Functions)

The data types that can be selected include bit/word (unsigned), word (signed), double word (unsigned), and double word (signed).

Type		Device*2
Device	Bit device*3	X, Y, M*5, L, F, SM, V*5, B, SB, T (contact)*5*6, ST (contact)*5*6, C (contact)*5*6, LT (contact)*5*6, LST (contact)*5*6, LC (contact)*5*6, FX, FY, JnX, JnY, JnSB, JnB, BLnS*7
	Word device*4	T (current value)*5, ST (current value)*5, C (current value)*5, D*5, SD, W, SW, RD, R, ZR, Z, FD, UnG, JnW, JnSW, U3EnG, U3EnHG
	Double-word device	LT (current value)*5, LST (current value)*5, LC (current value)*5, LZ

*2 An index modified device and indirectly specified device cannot be specified.

*3 For bit devices, digit specification is not supported.

*4 For word devices, bit specification is allowed.

*5 To specify the local device, use "Program name/#Device name". (Example: "MAIN/#M1")

*6 To specify these devices with CPU Module Logging Configuration Tool, use T (contact): TS, ST (contact): STS, C (contact): CS, LT (contact): LTS, LST (contact): LSTS, and LC (contact): LCS.

*7 The device can be collected by using the CPU module where the SFC function can be used. (📖 Page 705 Added and Enhanced Functions)

Type	Class	Data type
Label*8*9	Global label	<ul style="list-style-type: none"> ■Primitive data type/array*15 • Bit*11 • Word (signed)*12 • Double word (signed) • Word (unsigned)*12 • Double word (unsigned) • Timer type*13*14 • Retentive timer type*13*14 • Counter type*13*14 • Long timer type*13*14 • Long retentive timer type*13*14 • Long counter type*13*14 ■Structure*16
	Local label*10	

*8 A label with a name of 256 characters or less can be specified. When the local label is specified (program block name/label name), the "program block name/" part is counted as the number of characters.

*9 Only labels in the read project of the engineering tool can be specified.

*10 Specify the label with "Program block name/Label name". (Example: "ProgPou/label_w1")

*11 Digit-specified labels cannot be specified.

*12 Bit specification is allowed.

*13 Only the contacts and current values can be specified.

*14 For the label of timer type and counter type, specify the element name. (S: contact, N: current value)

Global label example: "label_w1.S"

Local label example: "ProgPou/label_w1.S"

*15 Specify the array element. If the array element is not specified, it is handled as the start of the array ([0]). (📖 CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

*16 Specify the structure member. (📖 CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

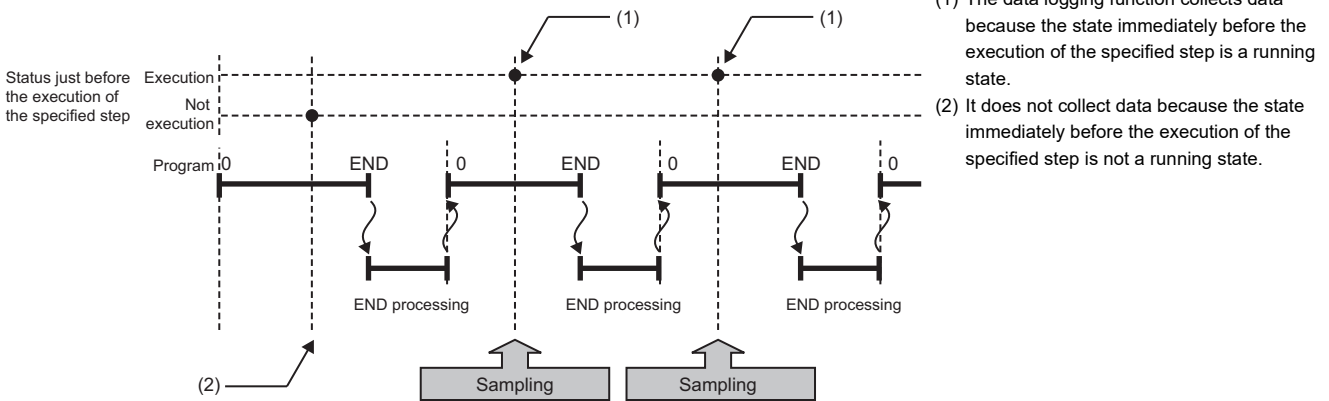

Step No. specification

Data are collected when the specified condition is met immediately before the execution of the specified step.

■To collect data continuously while the execution conditions are met

The following execution conditions cause the data logging function to collect data continuously while the execution condition are met:

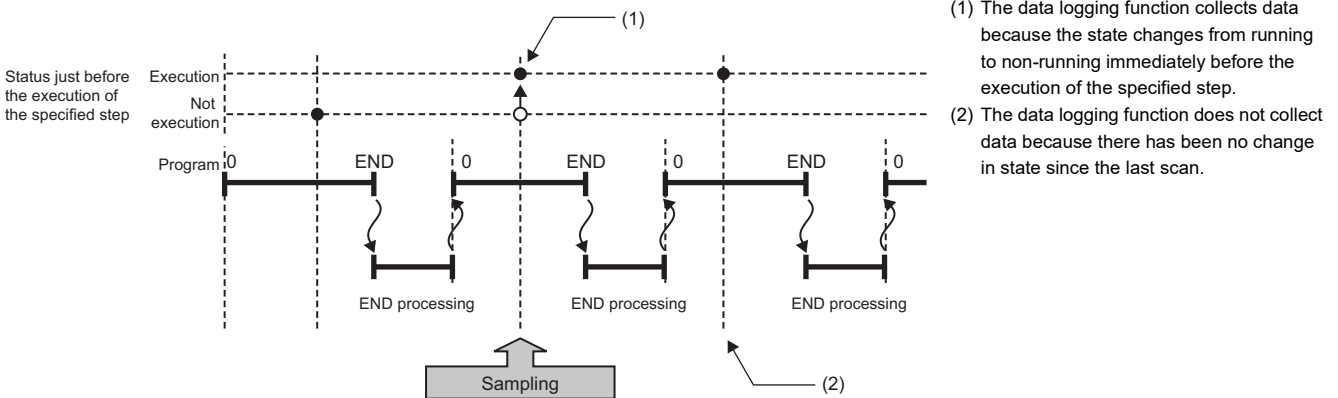

- Always: The specified step is executed regardless of the state immediately before the execution of it.
- In the specified condition satisfied: The specified step is executed if the state immediately before the execution is a running state.
- In the specified condition not satisfied: The specified step is executed if the state immediately before the execution is not a running state.

■To collect data only when the execution conditions are met

The following execution conditions cause the data logging function to collect data only when the execution conditions are met:

- On the rising edge of the specified condition: The specified step is executed if the state changes from non-running to running immediately before the execution of it.
- On the falling edge of the specified condition: The specified step is executed if the state changes from running to non-running immediately before the execution of it.

Point

If the specified step is contained between FOR and NEXT loop of instructions, the data logging function collects the data for only the first iteration of the loop where the specified conditions are met.

Restriction

Since the step number cannot be checked in the following programs, the step number cannot be specified.

- Program having multiple parts
- ST program
- FB program
- SFC program

17.5 Logging Type

The following table describes available methods of data collection:

Logging type	Data collection method	Application
Continuous logging	Continuously collects specified data at specified interval or timing.	Allows the user to continuously monitor the content of specified data.
Trigger logging	Collects specified data at specified interval or timing and extracts a specified number of data records before and after the satisfaction of a trigger condition.	Allows the user to monitor the content of specified data before and after the satisfaction of a trigger condition.

Operating procedure for continuous logging

In continuous logging, the CPU module stores specified data in its internal buffer at a specified collection interval or timing and, at the time of a file save operation, it saves the data in a data logging file residing in the storage memory.

1. Write the settings into data memory or SD memory card using CPU Module Logging Configuration Tool.
2. Operate CPU Module Logging Configuration Tool to start data logging. The data logging settings are registered and continuous logging begins. (The special relay (data logging start) turns on.)
3. Data collection finishes upon reaching "Number of files to be saved" specified as part of the "Stop" setting configured in "Operation when exceeds the number of files".
4. Specify the desired file in the storage memory to read the results of data logging.

Point

In continuous logging, data logging files are continuously created, thus allowing the user to read the results of data logging any time without having to wait for the completion of collection.

To stop continuous logging

The user can completely stop data logging by instructing CPU Module Logging Configuration Tool to stop data logging and unregister the data logging settings stored in the CPU module. (The special relay (data logging start) turns off.)

To suspend/resume continuous logging

The user can suspend data logging with the data logging settings remaining intact by doing either of the following:

- Instruct CPU Module Logging Configuration Tool to suspend data logging (the special relay (data logging start) turns off).
- Turn on the special relay (Data logging suspend/resume flag).

To resume continuous logging from suspension, do either of the following:

- Instruct CPU Module Logging Configuration Tool to resume data logging (the special relay (data logging start) turns on).
- Turn off the special relay (Data logging suspend/resume flag).

Operating procedure for trigger logging

In trigger logging, the CPU module stores specified data in its internal buffer at a specified collection interval or timing; it extracts a specified number of data records before and after the satisfaction of a trigger condition and saves the extracted data in a data logging file residing in the storage memory. Note that data collection is performed not only at the specified collection interval or timing but also when a trigger condition is met. In addition, once a trigger condition is met, any subsequent trigger conditions are ignored.

1. Write the settings into data memory or SD memory card using CPU Module Logging Configuration Tool.
2. Instruct CPU Module Logging Configuration Tool to start data logging. The data logging settings are registered and trigger logging begins. (The special relay (data logging start) turns on.)
3. Wait until the trigger condition is met. (Trigger standby)
4. The data specified in CPU Module Logging Configuration Tool is collected. (Trigger condition met)
5. Data collection is completed by collecting as much data as the number of records specified in CPU Module Logging Configuration Tool and writing the collected data into the storage memory.
6. Specify the desired file in the storage memory to read the results of data logging.

Trigger condition

The following table lists the conditions to be used as a trigger.

Trigger condition		Description
Condition specification	Device/label change specification	A trigger occurs when the monitored data meets the specified condition.
	Step No. specification	A trigger occurs when the specified condition is met immediately before the execution of the specified step.
When trigger instruction executed		A trigger occurs when the LOGTRG instruction is executed.

Point

The AND condition using a combination of "Device/Label change specification" and "Step No. specification" results in the collection of data at the time when both conditions are established.

■ Device/label change specification

A trigger occurs when the monitored data meets the specified condition.

Conditional formula	Description
↑	When the specified data turns on
↓	When the specified data turns off
=	When the monitored data is equal to the comparison value, regardless of whether or not its current value is equal.
≠	When the monitored data is not equal to the comparison value, regardless of whether or not its current value is equal.
≥	When the monitored data is greater than or equal to the comparison value, regardless of whether or not its current value is equal.
>	When the monitored data is greater than the comparison value, regardless of whether or not its current value is equal.
≤	When the monitored data is less than or equal to the comparison value, regardless of whether or not its current value is equal.
<	When the monitored data is less than the comparison value, regardless of whether or not its current value is equal.
At change	When the current value of the specified data changes

- Specifying the monitored data

For the monitored data used for the device/label change specification, the devices and labels listed in the following tables can be specified.*1

*1 When specifying the local device, global label, or local label, check the versions of the CPU module, engineering tool, and CPU Module Logging Configuration Tool. (Page 705 Added and Enhanced Functions)

The data types that can be selected include bit/word (unsigned), word (signed), double word (unsigned), and double word (signed). If double word (unsigned) or double word (signed) is specified, a trigger occurs only when as much data as one double word is written. No trigger occurs when only the upper or lower word of a double word is written.

Type		Device*2
Device	Bit device*3	X, Y, M*5, L, F, SM, V*5, B, SB, T (contact)*5*6, ST (contact)*5*6, C (contact)*5*6, LT (contact)*5*6, LST (contact)*5*6, LC (contact)*5*6, FX, FY
	Word device*4	T (current value)*5, ST (current value)*5, C (current value)*5, D*5, SD, W, SW, RD, R, ZR, Z, FD
	Double-word device	LT (current value)*5, LST (current value)*5, LC (current value)*5

*2 An index modified device and indirectly specified device cannot be specified.

*3 For bit devices, digit specification is not supported.

*4 For word devices, bit specification is allowed.

*5 To specify the local device, use "Program name/#Device name". (Example: "MAIN/#M1")

*6 To specify these devices with CPU Module Logging Configuration Tool, use T (contact): TS, ST (contact): STS, C (contact): CS, LT (contact): LTS, LST (contact): LSTS, and LC (contact): LCS.

Type		Class	Data type
Label*7*8	Global label	<ul style="list-style-type: none"> • VAR_GLOBAL • VAR_GLOBAL_RETAIN 	<ul style="list-style-type: none"> ■ Primitive data type/array*14 • Bit*10 • Word (signed)*11 • Double word (signed) • Word (unsigned)*11 • Double word (unsigned) • Timer type*12*13 • Retentive timer type*12*13 • Counter type*12*13 • Long timer type*12*13 • Long retentive timer type*12*13 • Long counter type*12*13 ■ Structure*15
	Local label*9	<ul style="list-style-type: none"> • VAR • VAR_RETAIN 	

*7 A label with a name of 256 characters or less can be specified. When the local label is specified (program block name/label name), the "program block name/" part is counted as the number of characters.

*8 Only labels in the read project of the engineering tool can be specified.

*9 Specify the label with "Program block name/Label name". (Example: "ProgPou/label_w1")

*10 Digit-specified labels cannot be specified.

*11 Bit specification is allowed.

*12 Only the contacts and current values can be specified.

*13 For the label of timer type and counter type, specify the element name. (S: contact, N: current value)

Global label example: "label_w1.S"

Local label example: "ProgPou/label_w1.S"

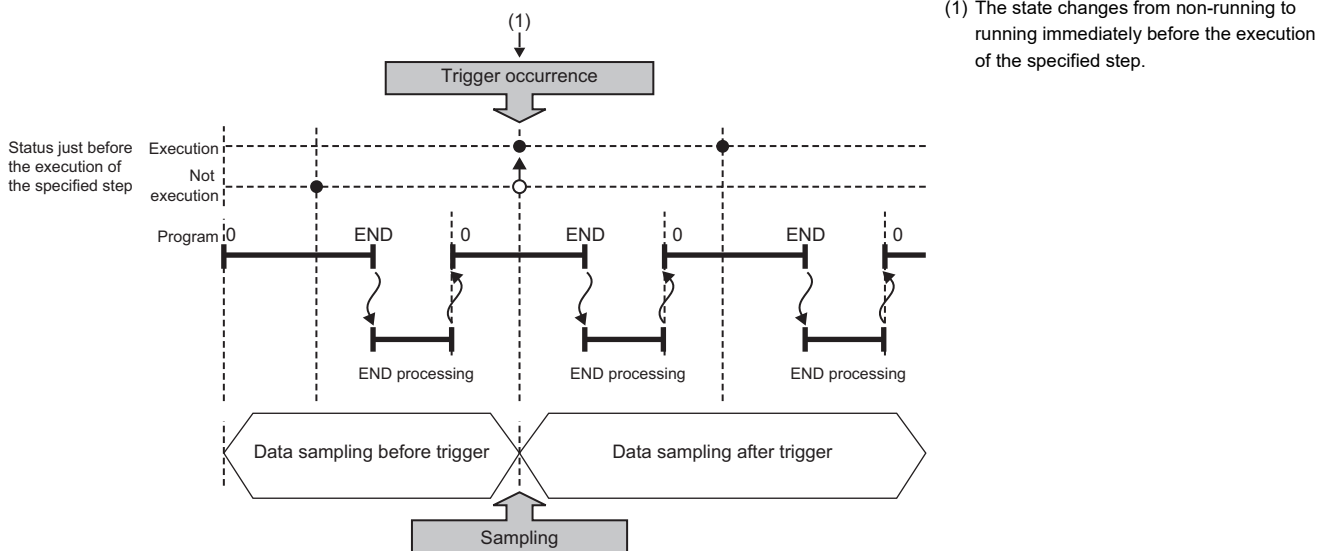

*14 Specify the array element. If the array element is not specified, it is handled as the start of the array ([0]). (CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

*15 Specify the structure member. (CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

■Step No. specification

A trigger occurs when the specified condition is met immediately before the execution of the specified step.

Execution condition	Description
Always	Executes the specified step regardless of the state immediately before the execution of it.
In the specified condition satisfied	Executes the specified step if the state immediately before the execution is a running state.
In the specified condition not satisfied	Executes the specified step if the state immediately before the execution is not a running state.
On the rising edge of the specified condition	Executes the specified step if the state changes from non-running to running immediately before the execution of it.
On the falling edge of the specified condition	Executes the specified step if the state changes from running to non-running immediately before the execution of it.

Point

If the specified step is contained between FOR and NEXT loop of instructions, only the first iteration of the loop where the specified conditions are met is handled as a trigger.

Restriction

Since the step number cannot be checked in the following programs, the step number cannot be specified.

- Program having multiple parts
- ST program
- FB program
- SFC program

Restriction

When a step number in an interrupt program is specified, the trigger condition may not be met.

■When trigger instruction executed

A trigger occurs when the LOGTRG instruction is executed. (MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks))

Restriction

When the LOGTRG instruction is used in an interrupt program, the trigger condition may not be met.

To stop trigger logging

The user can completely stop data logging by instructing CPU Module Logging Configuration Tool to stop data logging and unregister the data logging settings stored in the CPU module. (The special relay (data logging start) turns off.)

To suspend/resume trigger logging

The user can suspend data logging with the data logging settings remaining intact by doing either of the following:

- Instruct CPU Module Logging Configuration Tool to suspend data logging (the special relay (data logging start) turns off).
- Turn on the special relay (Data logging suspend/resume flag).

To resume trigger logging from suspension, do either of the following:

- Instruct CPU Module Logging Configuration Tool to resume data logging (the special relay (data logging start) turns on).
- Turn off the special relay (Data logging suspend/resume flag).

Number of records

Specify the number of records to be collected before and after the satisfaction of a trigger condition. (CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

*1 This number includes the record exactly at the time when the trigger condition is met.

Point

After starting data logging, if the trigger condition is met before data collection of the specified number of records (before trigger) is completed, the number of sampled records will be less than the specified.

17.6 Data Logging File

This section describes data logging files.

Storage format of data logging files

The following storage formats are available for data logging files.

File format	Application	Reference
Unicode text file format	This is a file format which can be opened in generic-purpose application programs such as Excel and Notepad. GX LogViewer is also available for displaying data.	☞ Page 243 Unicode text file output type
CSV file format* ¹ * ²	This is a file format which can be opened in generic-purpose application programs such as Excel and Notepad. GX LogViewer is also available for displaying data. Select this format when saving data together with the output data of MELSEC-Q series.	☞ Page 249 CSV file output format
Binary file format	Comparing the Unicode text file format, the size of files is small and therefore quicker access to files is provided. GX LogViewer is also available for displaying data.	☞ Page 255 Binary file output format

*1 When setting the data logging file storage format to the CSV file format, check the firmware version of the CPU module and the version of the CPU Module Logging Configuration Tool. (☞ Page 705 Added and Enhanced Functions)

*2 If any character that cannot be converted to ASCII or Shift-JIS is used in the data name (device/label name), device comment, or program name, the corresponding data is output as "." (single-byte period).

Data output format

This section describes each of file output types.

Unicode text file output type

This section describes the format specifications of the Unicode text file output type and output content of each data.

- Format specifications

Item	Description
Delimiter	Tab
Return code	CRLF (0x0D, 0x0A)
Character code	Unicode
Character encoding schema	UTF-16 (Little-Endian)
Field data	Not enclosed by double quotation marks (" ") Double quotation marks (" ") and commas (,) cannot be used in each data.*1

- *1 When double quotation marks (" ") and/or commas (,) are included in the output data, the following processing occurs:
- When the data includes commas (,), whole data is enclosed by double quotation marks (" ").
 - When the data includes double quotation marks (" "), another set of double quotation marks will be appended to each of them.

- File format example

Output items can be specified. (CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

File information row	[LOGGING]	RCPU_2	3	4	5	7	2	6		
Comment row	LOG01									
Data type information row	DATE[TIME[YYYY/MM/DD hh:mm:ss.sss]]	INTERVAL	STEP NO.	PROGRAM NO.	PROGRAM NAME	INDEX	SHORT[DEC.0]	BIT[1:0]	BIT[1:0]	TRIGGER[*]
Data name row	TIME(UTC+09:00)	INTERVAL[μs]	STEP NO.	PROGRAM NO.	PROGRAM NAME	INDEX	D1	M0	M1	Trigger
Device comment row										Start contact
Program name row*2										
Data rows	2014/10/01 12:00:00,000	100	4	1	MAIN	1	1234	1	1	
	2014/10/01 12:01:00,000	100	4	1		2	1234	0	0	
	2014/10/01 12:02:00,000	100	4	1		3	1234	0	0	
	2014/10/01 12:03:00,000	100	4	1		4	0	0	0	
	2014/10/01 12:04:00,000	100	4	1		5	0	0	0	
	2014/10/01 12:05:00,000	100	4	1		6	0	0	0	*
	2014/10/01 12:06:00,000	100	4	1		7	0	0	0	
	2014/10/01 12:07:00,000	100	4	1		8	0	0	0	

Labels for rows: File type, Model information file version, No. for data name row, No. for data start row, No. for program name row*2.

Labels for columns: Date column, Data collection interval column, Execution step No. column, Execution program No. column, Execution program name column, Index column, Data columns, Trigger occurrence information column.

- *2 Information on the program name row appears when the version of CPU Module Logging Configuration Tool is "1.82L" or later and local devices or labels are specified. When the version is "1.76E" or earlier, or the version is "1.82L" or later and only global devices are specified, the information on the program name row does not appear.

- Output content for each data

<File information row>

File-related information is displayed.

Item	Description	Size
File type	[LOGGING] is output.	14 bytes
Model information_file version	When the version of CPU Module Logging Configuration Tool is "1.82L" or later and local devices or labels are specified, "RCPU_2" is displayed in the file version, which shows the model information. When the version of CPU Module Logging Configuration Tool is "1.76E" or earlier, or the version is "1.82L" or later and only global devices are specified, "RCPU_1" is displayed in the file version, which shows the model information.	12 bytes
No. for data type information row	Numerical value indicating the position of the data type information row from the top of the file is placed.	2 bytes
No. for data name row	Numerical value indicating the position of the data name row from the top of the file is placed.	2 bytes
No. for device comment row	Numerical value indicating the position of the device comment row from the top of the file is placed.	2 bytes
No. for data start row	Numerical value indicating the starting position of the data row from the top of the file is placed.	2 bytes
No. for comment row	Numerical value indicating the position of the comment row from the top of the file is placed. When the comment row is not output, this field is blank.	0 to 2 bytes
No. for program name row	Numerical value indicating the position of the program name row from the top of the file is placed.	2 bytes

Ex.

The total size of the file information row can be obtained by the following equation: (when comment is output)

$$14(\text{file type}) + 12(\text{model information_file version}) + 2(\text{data type information row number}) + 2(\text{data name row number}) + 2(\text{device comment row number}) + 2(\text{data start row number}) + 2(\text{comment row number}) + 10(\text{the number of tabs}) + 4(\text{CR} + \text{LF}) = 50 \text{ bytes}$$

<Comment row>

Comments are displayed.

Item	Description	Size
Comment	Comment specified in CPU Module Logging Configuration Tool is output (the comment can contain up to 256 characters.*3 When no comment is set, a blank row is output).	0 to 512 bytes

*3 Double quotation marks (" "), commas (,), and semicolons (;) cannot be used.

Ex.

The total size of the comment row can be obtained by the following equation:

$$\text{Character size of the specified comment (depending on the specified character string)} + 4(\text{CR} + \text{LF})$$

<Data type information row>

The data type for each column is displayed. This information is output in the following format: (Data type)[(Additional information)].

Item	"Data type" output content	Size	"Additional information" output content	Size
Date column	DATETIME	16 bytes	Format is output. [YYYY/MM/DD hh:mm:ss.sss]	6 to 68 bytes
Data collection interval column	INTERVAL	16 bytes	No additional information	0 bytes
Execution step No. column	STEP NO.	16 bytes		
Execution program number column	PROGRAM NO.	22 bytes		
Execution program name column	PROGRAM NAME	24 bytes		
Index column	INDEX	10 bytes		

Item	"Data type" output content	Size	"Additional information" output content	Size
Data column	Bit type: BIT	6 bytes	Bit type: [1;0]	10 bytes
	16-bit integer (unsigned): USHORT	12 bytes	For decimal format: [DEC.0]	14 bytes
	16-bit integer (signed): SHORT	10 bytes		
	32-bit integer (unsigned): ULONG	10 bytes	For hexadecimal format: [HEX]	10 bytes
	32-bit integer (signed): LONG	8 bytes		
	Single-precision floating point (32-bit): FLOAT	10 bytes	For exponent expression: [EXP. (number of digits of decimal part)]	14 to 16 bytes
	Double-precision floating point (64-bit): DOUBLE	12 bytes		
	Character string type: STRING	12 bytes	Character string type, numeric string type: the specified data length value (unit: bytes) is output.	6 to 10 bytes
	Numeric string type: RAW	6 bytes		
	Time: TIME	8 bytes	No additional information	0 bytes
Trigger occurrence information column	TRIGGER	14 bytes	[(string occurred)] is output (semicolons (;), double quotation marks (" "), and commas (,) cannot be used).	6 to 516 bytes

Ex.

The size of the data type information row is determined by the following equation when data logging of 128 points of data (signed 16-bit integer, decimal format) is performed (The following sections in the "Output" window are set to be output: "Date" (the output format is YYYY/MM/DD hh:mm:ss.sss), "Data sampling interval", "Execution step No.", "Execution program name or execution program No.", and "Index").

$$(16 + 50)(\text{date column}) + 16(\text{data collection interval column}) + 16(\text{execution step No. column}) + 22(\text{execution program number column}) + 24(\text{execution program name column}) + 10(\text{index column}) + (10 + 14) \times 128(\text{data column}) + 264(\text{the number of tabs}) + 4(\text{CR} + \text{LF})$$

= 3494 bytes

<Data name row>
The data name for each column is displayed.

Item	Description	Size
Date column	TIME (time zone) is output.	28 bytes
Data collection interval column	INTERVAL[us] is output.	24 bytes
Execution step No. column	STEP NO. is output.	16 bytes
Execution program number column	PROGRAM NO. is output.	22 bytes
Execution program name column	PROGRAM NAME is output.	24 bytes
Index column	INDEX is output.	10 bytes
Data column	The specified data name is output.	1 to 512 bytes*4
Trigger occurrence information column	Trigger is output.	14 bytes

*4 When the data column is specified and the multidimensional array label is specified, if the index of the array includes comma (,), the data size will increase than the data name string size.

Ex.

The size of the data name row is determined by the following equation when data logging of 128 data points from D100 to D227 is performed (The following sections in the "Output" window are set to be output: "Date", "Data sampling interval", "Execution step No.", "Execution program name or execution program No.", and "Index").

$$28(\text{date column}) + 24(\text{data collection interval column}) + 16(\text{execution step No. column}) + 22(\text{execution program number column}) + 24(\text{execution program name column}) + 10(\text{index column}) + (6 \times 128)(\text{data column}) + 264(\text{the number of tabs}) + 4(\text{CR} + \text{LF})$$

= 1138 bytes

<Program name row>

The program name row for each column is displayed. (This row appears when the version of CPU Module Logging Configuration Tool is "1.82L" or later and local devices or labels are specified. If the version is "1.76E" or earlier, or the version is "1.82L" or later and only global devices are specified, this row does not appear.)

Item	Description	Size
Date column	No output (blank).	0 bytes
Data collection interval column		
Execution step No. column		
Execution program number column		
Execution program name column		
Index column		
Data column	When the collected data is a local device or local label, the specified program name (no extension) is displayed. When the collected data is a global device or global label, this field is blank.	0 to 120 bytes
Trigger occurrence information column	No output (blank).	0 bytes

Ex.

The size of the program name row is determined by the following equation when data logging of 128 data points from D100 to D227 is performed (The following sections in the "Output" window are set to be output: "Date", "Data sampling interval", "Execution step No.", "Execution program name or execution program No.", and "Index". Also, devices from D200 to D227 are specified as the local device of the program No.1 of "MAIN").

$$\begin{aligned}
 &0(\text{date column}) + 0(\text{data collection interval column}) + 0(\text{execution step No. column}) + 0(\text{execution program number column}) + \\
 &0(\text{execution program name column}) + 0(\text{index column}) + (0 \times 100 + 8 \times 28)(\text{data column}) + 264(\text{the number of tabs}) + 4(\text{CR} + \\
 &\text{LF}) \\
 &= 492 \text{ bytes}
 \end{aligned}$$

<Device comment row>

The device comment row for each column is displayed.

Item	Description	Size
Date column	No output (blank).	0 bytes
Data collection interval column		
Execution step No. column		
Execution program number column		
Execution program name column		
Index column		
Data column	<p>When "Output device comment" is selected in the output settings, the comment with the specified comment number is displayed.</p> <p>When "Output each program device comment" is selected, the comment with the specified comment number in the device comment file for each program is output only for the local device.</p> <p>When the device comment file for each program or the comment of the corresponding program does not exist, the comment of the device comment file is output.</p> <p>When comments are not output or a device comment to be displayed does not exist, this field is blank.</p>	0 to 2048 bytes*5
Trigger occurrence information column	No output (blank).	0 bytes

*5 When "Output device comment" is selected in "Device comment output" of the output settings and double quotation marks (" ") and/or commas (,) are included in a device comment, the size of data in use becomes larger than the size of the character string of the device comments.

Ex.

The size of the device comment row is determined by the following equation when data logging of 128 data points from D100 to D227 is performed (The following sections in the "Output" window are set to be output: "Date" (the output format is YYYY/MM/DD hh:mm:ss.sss), "Data sampling interval", "Execution step No.", "Execution program name or execution program No.", "Index", and "Device comment output" (only for devices from D200 to D227)).

$$0(\text{date column}) + 0(\text{data collection interval column}) + 0(\text{execution step No. column}) + 0(\text{execution program number column}) + 0(\text{execution program name column}) + 0(\text{index column}) + (0 \times 100 + 14 \times 28)(\text{data column}) + 264(\text{the number of tabs}) + 2(\text{CR} + \text{LF})$$

= 660 bytes

<Data row>

The collected data value is displayed. All the data items collected during a single collection is displayed in a single row.

Item	Description	Size
Date column	Information is output according to the data row output character string specified in the format.	2 to 64 bytes
Data collection interval column	The time interval from the previous collection time to the current collection time is output. If the maximum display range is exceeded, the count returns to 1 and starts again to output a new time interval (unit: μ s, display range: 1 to 10000000000).	2 to 24 bytes
Execution step No. column	The step No. executed on the engineering tool at the time interval and timing in which data was collected is output. With the collection condition "Each scanning cycle" specified, the resulting output is the step No. at the time of execution of END instruction in the last executed program in the scan. With the collection condition "Interrupt occurrence" specified, the resulting output is the step No. at the time of execution of IRET instruction in the interrupt program. If the system operation (such as system interrupt) is running during collection interval and collection timing or the FB program is in running, "0" is output.	2 to 12 bytes
Execution program number column	The program No. executed on the engineering tool at the time interval and timing in which data was collected is output. With the collection condition "Each scanning cycle" specified, the resulting output is the program number of the last executed program in the scan. If two or more system operations, such as collection timing and system interrupt, occur simultaneously, "—" is output.	2 to 6 bytes
Execution program name column	The program name (no extension) executed on the engineering tool at the time interval and timing in which data was collected is output. With the collection condition "Each scanning cycle" specified, the resulting output is the program name of the last executed program in the scan. If a program name with the same program number has already been in the file, a null value is output. If two or more system operations, such as collection timing and system interrupt, occur simultaneously, "** SYSTEM" is output.	0 to 200 bytes
Index column	A value which increments in ascending order from 1 is output. When it exceeds the upper limit, it returns to 1 and increments again (range: 1 to 4294967295).	2 to 20 bytes
Data column	When bits are specified: bit On = 1 and bit Off = 0 are output.	2 bytes
	When unsigned/signed word type is specified: data value is output according to the specified output type.	<ul style="list-style-type: none"> • Decimal format: 2 to 22 bytes • Hexadecimal format: 2 to 16 bytes • Decimal fraction format: 2 to 42 bytes • Exponential format: 10 to 42 bytes
	When unsigned/signed double word type, single-precision real number, or double-precision real number is specified: data value is output according to the specified output type.	<ul style="list-style-type: none"> • Decimal format: 2 to 22 bytes^{*6} • Hexadecimal format: 2 to 16 bytes • Decimal fraction format: 2 to 52 bytes • Exponential format: 10 to 44 bytes
	When character string is specified: the specified character string is output.	2 to 256 bytes
	When numeric string is specified: the character string which represented by the hexadecimal in increments of a byte is output without clearance.	4 to 1024 bytes
	When time is specified: T#-24d20h31m23s648ms to T#24d20h31m23s647ms is displayed.	26 to 40 bytes
Trigger occurrence information column	The specified character string is output when the trigger occurs. In other cases, no character string is output.	0 to 512 bytes

*6 When single-precision real number or double-precision real number is specified, if the numerical value to be output does not fall into the range -2147483648.0 to 4294967295.0, it is displayed in an equivalent format to "exponential format and the number of decimal part digits is nine".

Ex.

The size of the data type information row is determined by the following equation when data logging of 128 points of data from D100 to D227 (unsigned word type, decimal format) is performed (The following sections in the "Output" window are set to be output: "Date" (the output format is YYYY/MM/DD hh:mm:ss.sss), "Data sampling interval", "Execution step No.", "Execution program name or execution program No.", and "Index").

$$46(\text{date column}) + 24(\text{data collection interval column}) + 12(\text{execution step No. column}) + 6(\text{execution program number column}) + 200(\text{execution program name column}) + 20(\text{index column}) + (12 \times 128)(\text{data column}) + 264(\text{the number of tabs}) + 4(\text{CR} + \text{LF}) = 2112 \text{ bytes}$$

■CSV file output format

The following table lists the format specifications of the CSV file output format and output content of each data.

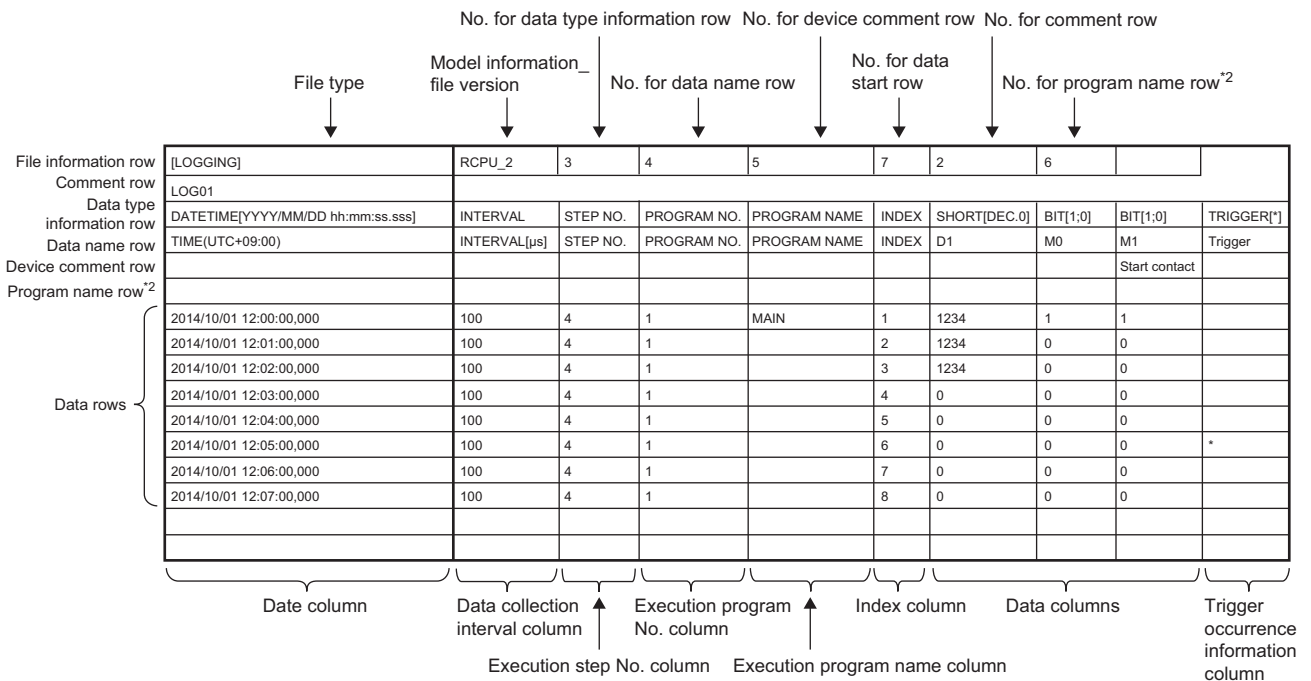

• Format specifications

Item	Description
Delimiter	Comma (,)
Return code	CRLF (0x0D, 0x0A)
Character code	ASCII
Character encoding schema	Shift-JIS
Field data	Not enclosed by double quotation marks (" ") Double quotation marks (" ") and commas (,) cannot be used in each data.*1

- *1 When double quotation marks (" ") and/or commas (,) are included in the output data, the following processing occurs:
- When the data includes commas (,), whole data is enclosed by double quotation marks (" ").
 - When the data includes double quotation marks (" "), another set of double quotation marks will be appended to each of them.

• File format example

Output items can be specified. (CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

*2 Information on the program name row appears when the version of CPU Module Logging Configuration Tool is "1.82L" or later and local devices or labels are specified. When the version is "1.76E" or earlier, or the version is "1.82L" or later and only global devices are specified, the information on the program name row does not appear.

- Output content for each data

<File information row>

File-related information is displayed.

Item	Description	Size
File type	[LOGGING] is output.	9 bytes
Model information_file version	When the version of CPU Module Logging Configuration Tool is "1.82L" or later and local devices or labels are specified, "RCPU_2" is displayed in the file version, which shows the model information. When the version of CPU Module Logging Configuration Tool is "1.76E" or earlier, or the version is "1.82L" or later and only global devices are specified, "RCPU_1" is displayed in the file version, which shows the model information.	6 bytes
No. for data type information row	Numerical value indicating the position of the data type information row from the top of the file is placed.	1 byte
No. for data name row	Numerical value indicating the position of the data name row from the top of the file is placed.	1 byte
No. for device comment row	Numerical value indicating the position of the device comment row from the top of the file is placed.	1 byte
No. for data start row	Numerical value indicating the starting position of the data row from the top of the file is placed.	1 byte
No. for comment row	Numerical value indicating the position of the comment row from the top of the file is placed. When the comment row is not output, this field is blank.	0 to 1 bytes
No. for program name row	Numerical value indicating the position of the program name row from the top of the file is placed.	1 byte

Ex.

The total size of the file information row can be obtained by the following equation: (when comment is output)

$$9(\text{file type}) + 6(\text{model information_file version}) + 1(\text{data type information row number}) + 1(\text{data name row number}) + 1(\text{device comment row number}) + 1(\text{data start row number}) + 1(\text{comment row number}) + 6(\text{the number of commas}) + 2(\text{CR} + \text{LF}) = 29 \text{ bytes}$$

<Comment row>

Comments are displayed.

Item	Description	Size
Comment	Comment specified in CPU Module Logging Configuration Tool is output (the comment can contain up to 256 characters.* ³ When no comment is set, a blank row is output). Since the comment is stored in Unicode, the data is converted to ASCII and Shift-JIS. If any characters that cannot be converted to ASCII or Shift-JIS are specified, the conversion fails and those characters will be output as periods (.).	0 to 512 bytes

*³ Double quotation marks (" "), commas (,), and semicolons (;) cannot be used.

Ex.

The total size of the comment row can be obtained by the following equation:

$$\text{Character size of the specified comment (depending on the specified character string)} + 2(\text{CR} + \text{LF})$$

<Data type information row>

The data type for each column is displayed. This information is output in the following format: (Data type)[(Additional information)].

Item	"Data type" output content	Size	"Additional information" output content	Size
Date column	DATETIME	8 bytes	Format is output. [YYYY/MM/DD hh:mm:ss.sss]	3 to 34 bytes
Data collection interval column	INTERVAL	8 bytes	No additional information	0 bytes
Execution step No. column	STEP NO.	8 bytes		
Execution program number column	PROGRAM NO.	11 bytes		
Execution program name column	PROGRAM NAME	12 bytes		
Index column	INDEX	5 bytes		
Data column	Bit type: BIT	3 bytes	Bit type: [1;0]	5 bytes
	16-bit integer (unsigned): USHORT	6 bytes	For decimal format: [DEC.0]	7 bytes
	16-bit integer (signed): SHORT	5 bytes		
	32-bit integer (unsigned): ULONG	5 bytes	For hexadecimal format: [HEX]	5 bytes
	32-bit integer (signed): LONG	4 bytes		
	Single-precision floating point (32-bit): FLOAT	5 bytes	For exponent expression: [EXP. (number of digits of decimal part)]	7 to 8 bytes
	Double-precision floating point (64-bit): DOUBLE	6 bytes		
	Character string type: STRING	6 bytes	Character string type, numeric string type: the specified data length value (unit: bytes) is output.	3 to 5 bytes
	Numeric string type: RAW	3 bytes		
Time: TIME	4 bytes	No additional information	0 bytes	
Trigger occurrence information column	TRIGGER	7 bytes	<p>[(string occurred)] is output (semicolons (;), double quotation marks (" "), and commas (,)) cannot be used).</p> <p>Since the string occurred is stored in Unicode, the data is converted to ASCII and Shift-JIS. If any characters that cannot be converted to ASCII or Shift-JIS are specified, the conversion fails and those characters will be output as asterisks (*).</p>	3 to 514 bytes

Ex.

The size of the data type information row is determined by the following equation when data logging of 128 points of data (signed 16-bit integer, decimal format) is performed (The following sections in the "Output" window are set to be output: "Date" (the output format is YYYY/MM/DD hh:mm:ss.sss), "Data sampling interval", "Execution step No.", "Execution program name or execution program No.", and "Index").

$$(8 + 25)(\text{date column}) + 8(\text{data collection interval column}) + 8(\text{execution step No. column}) + 11(\text{execution program number column}) + 12(\text{execution program name column}) + 5(\text{index column}) + (5 + 7) \times 128(\text{data column}) + 132(\text{the number of commas}) + 2(\text{CR} + \text{LF})$$

$$= 1745 \text{ bytes}$$

<Data name row>

The data name for each column is displayed.

Item	Description	Size
Date column	TIME (time zone) is output.	14 bytes
Data collection interval column	INTERVAL[us] is output.	12 bytes
Execution step No. column	STEP NO. is output.	8 bytes
Execution program number column	PROGRAM NO. is output.	8 bytes
Execution program name column	PROGRAM NAME is output.	12 bytes
Index column	INDEX is output.	5 bytes
Data column	The specified data name is output. Since the data name is stored in Unicode, the data is converted to ASCII and Shift-JIS. If any characters that cannot be converted to ASCII or Shift-JIS are specified, the conversion fails and those characters will be output as periods (.).	1 to 512 bytes*4
Trigger occurrence information column	Trigger is output.	7 bytes

*4 When the data column is specified and the multidimensional array label is specified, if the index of the array includes comma (,), the data size will increase than the data name string size.

Ex.

The size of the data name row is determined by the following equation when data logging of 128 data points from D100 to D227 is performed (The following sections in the "Output" window are set to be output: "Date", "Data sampling interval", "Execution step No.", "Execution program name or execution program No.", and "Index").

$$14(\text{date column}) + 12(\text{data collection interval column}) + 8(\text{execution step No. column}) + 8(\text{execution program number column}) + 12(\text{execution program name column}) + 5(\text{index column}) + (4 \times 128)(\text{data column}) + 132(\text{the number of commas}) + 2(\text{CR} + \text{LF})$$

= 705 bytes

<Program name row>

The program name row for each column is displayed. (This row appears when the version of CPU Module Logging Configuration Tool is "1.82L" or later and local devices or labels are specified. If the version is "1.76E" or earlier, or the version is "1.82L" or later and only global devices are specified, this row does not appear.)

Item	Description	Size
Date column	No output (blank).	0 bytes
Data collection interval column		
Execution step No. column		
Execution program number column		
Execution program name column		
Index column		
Data column	When the collected data is a local device or local label, the specified program name (no extension) is displayed. When the collected data is a global device or global label, this field is blank. Since the program name is stored in Unicode, the data is converted to ASCII and Shift-JIS. If any characters that cannot be converted to ASCII or Shift-JIS are specified, the conversion fails and those characters will be output as periods (.).	0 to 120 bytes
Trigger occurrence information column	No output (blank).	0 bytes

Ex.

The size of the program name row is determined by the following equation when data logging of 128 data points from D100 to D227 is performed (The following sections in the "Output" window are set to be output: "Date", "Data sampling interval", "Execution step No.", "Execution program name or execution program No.", and "Index". Also, devices from D200 to D227 are specified as the local device of the program No.1 of "MAIN").

$$0(\text{date column}) + 0(\text{data collection interval column}) + 0(\text{execution step No. column}) + 0(\text{execution program number column}) + 0(\text{execution program name column}) + 0(\text{index column}) + (0 \times 100 + 4 \times 15)(\text{data column}) + 132(\text{the number of commas}) + 2(\text{CR} + \text{LF})$$

= 194 bytes

<Device comment row>

The device comment row for each column is displayed.

Item	Description	Size
Date column	No output (blank).	0 bytes
Data collection interval column		
Execution step No. column		
Execution program number column		
Execution program name column		
Index column		
Data column	<p>When "Output device comment" is selected in the output settings, the comment with the specified comment number is displayed.</p> <p>When "Output each program device comment" is selected, the comment with the specified comment number in the device comment file for each program is output only for the local device.</p> <p>When the device comment file for each program or the comment of the corresponding program does not exist, the comment of the device comment file is output.</p> <p>When comments are not output or a device comment to be displayed does not exist, this field is blank.</p> <p>Since the device comment is stored in Unicode, the data is converted to ASCII and Shift-JIS. If any characters that cannot be converted to ASCII or Shift-JIS are specified, the conversion fails and those characters will be output as periods (.).</p>	0 to 2048 bytes*5
Trigger occurrence information column	No output (blank).	0 bytes

*5 When "Output device comment" is selected in "Device comment output" of the output settings and double quotation marks (") and/or commas (,) are included in a device comment, the size of data in use becomes larger than the size of the character string of the device comments.

Ex.

The size of the device comment row is determined by the following equation when data logging of 128 data points from D100 to D227 is performed (The following sections in the "Output" window are set to be output: "Date" (the output format is YYYY/MM/DD hh:mm:ss.sss), "Data sampling interval", "Execution step No.", "Execution program name or execution program No.", "Index", and "Device comment output" (only for devices from D200 to D227)).

$$\begin{aligned}
 &0(\text{date column}) + 0(\text{data collection interval column}) + 0(\text{execution step No. column}) + 0(\text{execution program number column}) + \\
 &0(\text{execution program name column}) + 0(\text{index column}) + (0 \times 100 + 7 \times 15)(\text{data column}) + 132(\text{the number of commas}) + \\
 &2(\text{CR} + \text{LF}) \\
 &= 239 \text{ bytes}
 \end{aligned}$$

<Data row>

The collected data value is displayed. All the data items collected during a single collection is displayed in a single row.

Item	Description	Size
Date column	Information is output according to the data row output character string specified in the format.	2 to 64 bytes
Data collection interval column	The time interval from the previous collection time to the current collection time is output. If the maximum display range is exceeded, the count returns to 1 and starts again to output a new time interval (unit: μ s, display range: 1 to 100000000000).	1 to 12 bytes
Execution step No. column	The step No. executed on the engineering tool at the time interval and timing in which data was collected is output. With the collection condition "Each scanning cycle" specified, the resulting output is the step No. at the time of execution of END instruction in the last executed program in the scan. With the collection condition "Interrupt occurrence" specified, the resulting output is the step No. at the time of execution of IRET instruction in the interrupt program. If the system operation (such as system interrupt) is running during collection interval and collection timing or the FB program is in running, "0" is output.	1 to 6 bytes
Execution program number column	The program No. executed on the engineering tool at the time interval and timing in which data was collected is output. With the collection condition "Each scanning cycle" specified, the resulting output is the program number of the last executed program in the scan. If two or more system operations, such as collection timing and system interrupt, occur simultaneously, — is output.	1 to 3 bytes
Execution program name column	The program name (no extension) executed on the engineering tool at the time interval and timing in which data was collected is output. With the collection condition "Each scanning cycle" specified, the resulting output is the program name of the last executed program in the scan. If a program name with the same program number has already been in the file, a null value is output. If two or more system operations, such as collection timing and system interrupt, occur simultaneously, "*" SYSTEM" is output. Since the program name is stored in Unicode, the data is converted to ASCII and Shift-JIS. If any characters that cannot be converted to ASCII or Shift-JIS are specified, the conversion fails and those characters will be output as periods (.).	0 to 120 bytes
Index column	A value which increments in ascending order from 1 is output. When it exceeds the upper limit, it returns to 1 and increments again (range: 1 to 4294967295).	1 to 10 bytes
Data column	When bits are specified: bit On = 1 and bit Off = 0 are output.	1 byte
	When unsigned/signed word type is specified: data value is output according to the specified output type.	<ul style="list-style-type: none"> • Decimal format: 1 to 6 bytes • Hexadecimal format: 1 to 4 bytes • Decimal fraction format: 1 to 21 bytes • Exponential format: 3 to 21 bytes
	When unsigned/signed double word type, single-precision real number, or double-precision real number is specified: data value is output according to the specified output type.	<ul style="list-style-type: none"> • Decimal format: 1 to 11 bytes^{*6} • Hexadecimal format: 1 to 8 bytes • Decimal fraction format: 1 to 26 bytes • Exponential format: 3 to 22 bytes
	When character string is specified: the specified character string is output.	1 to 256 bytes
	When numeric string is specified: the character string which represented by the hexadecimal in increments of a byte is output without clearance.	1 to 256 bytes
	When time is specified: T#-24d20h31m23s648ms to T#24d20h31m23s647ms is displayed.	13 to 20 bytes
Trigger occurrence information column	The specified character string is output when the trigger occurs. In other cases, no character string is output. Since the trigger occurrence information is stored in Unicode, the data is converted to ASCII and Shift-JIS. If any characters that cannot be converted to ASCII or Shift-JIS are specified, the conversion fails and those characters will be output as asterisks (*).	0 to 512 bytes

*6 When single-precision real number or double-precision real number is specified, if the numerical value to be output does not fall into the range -2147483648.0 to 4294967295.0, it is displayed in an equivalent format to "exponential format and the number of decimal part digits is nine".

Ex.

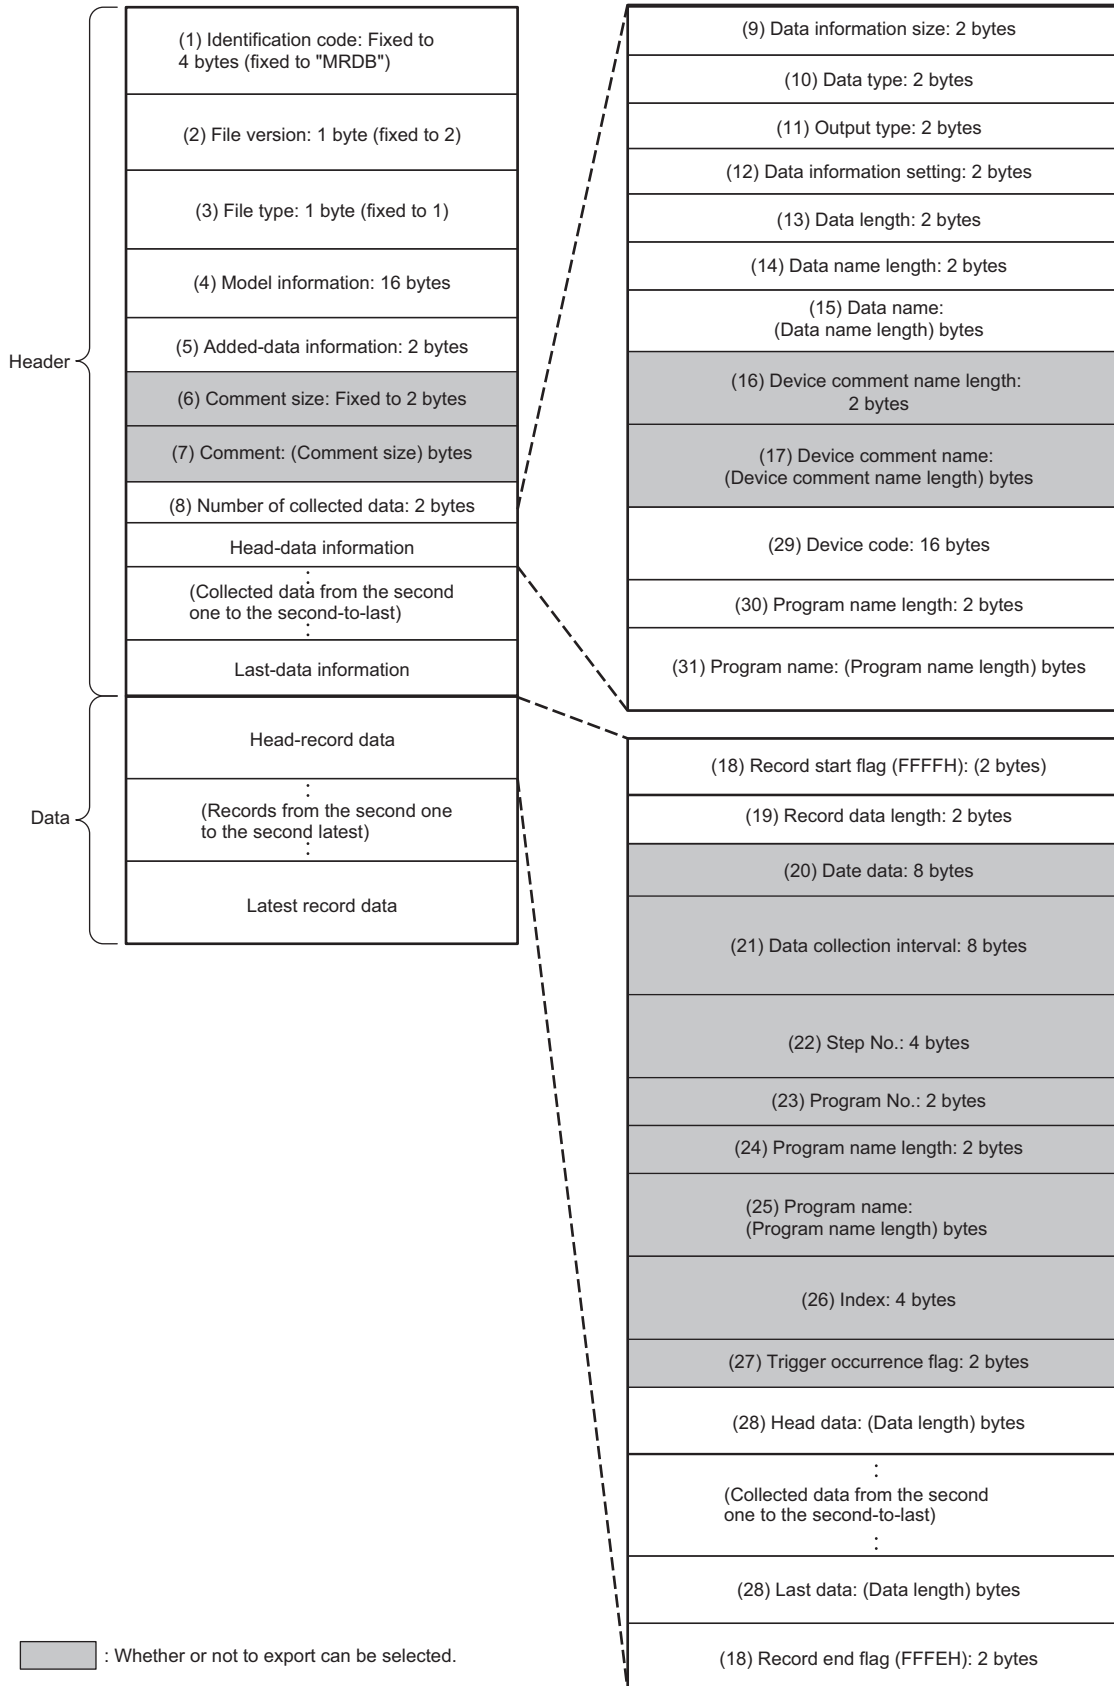

The size of the data type information row is determined by the following equation when data logging of 128 points of data from D100 to D227 (unsigned word type, decimal format) is performed (The following sections in the "Output" window are set to be output: "Date" (the output format is YYYY/MM/DD hh:mm:ss.sss), "Data sampling interval", "Execution step No.", "Execution program name or execution program No.", and "Index").

$$23(\text{date column}) + 12(\text{data collection interval column}) + 6(\text{execution step No. column}) + 3(\text{execution program number column}) + 100(\text{execution program name column}) + 10(\text{index column}) + (6 \times 128)(\text{data column}) + 132(\text{the number of commas}) + 2(\text{CR} + \text{LF}) = 1056 \text{ bytes}$$

Binary file output format

The following figure shows the configuration of the binary format and details of each data.

- Configuration figure of binary format (when the version of CPU Module Logging Configuration Tool is "1.82L" or later and local devices or labels are specified)

- Configuration figure of binary format (when the version of CPU Module Logging Configuration Tool is "1.76E" or earlier, or the version is "1.82L" or later and only global devices are specified)

• Details of each data

No.	Item	Description	Size (byte)
(1)	Identification code	When the version of CPU Module Logging Configuration Tool is "1.82L" or later and local devices or labels are specified, "MRDB" is always output to identify the file. When the version of CPU Module Logging Configuration Tool is "1.76E" or earlier, or the version is "1.82L" or later and only global devices are specified, "MRCB" is always output to identify the file.	4
(2)	File version	When the version of CPU Module Logging Configuration Tool is "1.82L" or later and local devices or labels are specified, file version 2 is displayed. When the version of CPU Module Logging Configuration Tool is "1.76E" or earlier, or the version is "1.82L" or later and only global devices are specified, file version 1 is displayed.	1
(3)	File type	The file type is output. (fixed to 1: Continuous/trigger logging)	1
(4)	Model information	The module model name that outputted binary file is output. R□CPU is output to the first eight bytes and 00H is output to the last eight bytes.*1	16
(5)	Added-data information	The output selection setting for the data that can be output is output.  <p>b0 1: Output date and time data. 0: Do not output date and time data.</p> <p>b1 1: Output a data collection interval. 0: Do not output a data collection interval.</p> <p>b2 1: Output an execution step No. 0: Do not output an execution step No.</p> <p>b3 1: Output an execution program name and No. 0: Do not output an execution program name or No.</p> <p>b4 1: Output a trigger flag. 0: Do not output a trigger flag.</p> <p>b5 1: Output index. 0: Do not output index.</p> <p>b6 1: Output device comments. 0: Do not output device comments.</p> <p>b7 1: Output comments. 0: Do not output comments.</p> <p>b9 1: Output device comments for each program. 0: Do not output device comments for each program.</p>	2
(6)	Comment size	The comment length of (7) Comment is output.	2
(7)	Comment	The comment specified in the setting is output in Unicode.	2 to 512
(8)	Number of collected data	The number of data points of the data information ((9) to (17) and (29) to (31)) for data logging is output.	2
(9)	Data information size	The total size of the data information ((9) to (17) and (29) to (31)) for data logging is output.	2
(10)	Data type	The numeric value shown below is output depending on the data type. 0000H: Bit 0001H: Word (signed) 0002H: Double word (unsigned) 0003H: Word (signed) 0004H: Double word (unsigned) 0005H: Single-precision real number 0006H: Double-precision real number 0007H: String 0008H: Numeric string 0009H: Time	2
(11)	Output format	The same numerical value as the value in (10) Data type is output. However, when the data type is bit, character string, numeric string, or time, FFFFH is output because the output type cannot be specified.	2
(12)	Data information setting	The data-related information is output.  <p>b2 1: Device comment specified 0: Device comment not specified</p> <p>b3 1: Device code specified 0: Device code not specified</p> <p>b4 1: Program name length/program name specified 0: Program name length/program name not specified</p>	2
(13)	Data length	The data length of data is output. When the data type is the bit type, it will be output as two bytes.	2
(14)	Data name length	The length of the data name specified in the setting is output.	2
(15)	Data name	The data name specified in the setting is output in Unicode.	2 to 512

No.	Item	Description	Size (byte)															
(16)	Device comment name length	The length of the device comment name specified in the setting is output. When "Output device comment" is selected and the corresponding device comment exist, the device comment is output. When the corresponding device comment does not exist, "0" is output.	2															
(17)	Device comment name	The device comment name specified in the setting is output in Unicode. When "Output each program device comment" is selected and the corresponding device comment exists, each program device comment of a specified comment number is output to the local device. When the corresponding device comment does not exist, no data is output. When a "device comment for each program" of the corresponding program does not exist or a comment for the target device is not set, and if a device comment is set for the target device, the device comment is output. When the label is specified as the data to be logged, data is not output.	0 to 2048															
(18)	Record start flag, record end flag	The flags for identifying the start and end of the record are output. The FFFFH is output for record start while the FFEH is output for record end as the fixed flag.	2															
(19)	Record data length	The total size of (20) Day and time data to (28) Last data is output.	2															
(20)	Date data	The Day and time data is output. <table border="1" style="margin-left: 20px;"> <tr> <td style="text-align: center;">b15</td> <td style="text-align: center;">to</td> <td style="text-align: center;">b0</td> </tr> <tr> <td style="text-align: center;">Year</td> <td></td> <td style="text-align: center;">Month</td> </tr> <tr> <td style="text-align: center;">Day</td> <td></td> <td style="text-align: center;">Time</td> </tr> <tr> <td style="text-align: center;">Minute</td> <td></td> <td style="text-align: center;">Second</td> </tr> <tr> <td colspan="3" style="text-align: center;">Millisecond</td> </tr> </table> Year: Last 2 digits of the year, Month: 1 to 12 Day: 1 to 31, Time: 0 to 23 Minute: 0 to 59, Second: 0 to 59 Millisecond: 0 to 999	b15	to	b0	Year		Month	Day		Time	Minute		Second	Millisecond			8
b15	to	b0																
Year		Month																
Day		Time																
Minute		Second																
Millisecond																		
(21)	Data collection interval	The time interval from the previous collection time to the current collection time is output. (Unit: μ s, Display range: 1 to 10000000000 (When it exceeds the max value, it returns to "1" and incrementing runs again.)) After logging collection is started, 0 is stored at the first collection.	8															
(22)	Step No.	The step No. executed on the engineering tool at the timing in which data was collected is output. With the collection condition "Each scanning cycle" specified, the resulting output is the step No. at the time of execution of END instruction in the last executed program in the scan. With the collection condition "Interrupt occurrence" specified, the resulting output is the step No. at the time of execution of IRET instruction in the interrupt program. If the system operation (such as system interrupt) is running during collection interval and collection timing or the FB program is in running, "0" is output.	4															
(23)	Program No.	The program No. (FB File No.) executed on the engineering tool at the timing in which data was collected is output. With the collection condition "Each scanning cycle" specified, the resulting output is the program number of the last executed program in the scan. If system operation (such as system interrupt) is running at collection interval and collection timing, "0" is output.	2															
(24)	Program name length	The name length of a program that is executed at the time interval and timing in which data was collected is output. If the same program number or program name has already been in the file, "0" is output.	2															
(25)	Program name	The program name (no extension) that is executed at the time interval and timing in which data was collected is output in Unicode. With the collection condition "Each scanning cycle" specified, the resulting output is the program name of the last executed program in the scan. If system operation (such as system interrupt) is running at collection interval and collection timing, "" SYSTEM" is output.	0 to 200															
(26)	Index	The index number ranging from 1 to 4294967295 of data, which was collected by the data logging function, is output. When it exceeds the max value, it returns to "1" and incrementing runs again. If missing occurs in processing data, index will be reassigned from 1 again.	4															
(27)	Trigger occurrence flag	The trigger occurrence information is output. <table border="1" style="margin-left: 20px;"> <tr> <td style="width: 100px; height: 15px;"></td> <td style="text-align: right;">b0</td> </tr> </table> b0 1: A trigger has occurred. 0: No trigger has occurred.		b0	2													
	b0																	
(28)	Data	Data collected by the data logging function is output corresponding to (13) Data length and (10) Data type. <ul style="list-style-type: none"> • When bits are specified: bit On = 1 and bit Off = 0 are output. • When word type (signed/unsigned) or double-word type (signed/unsigned) is specified: the data values are output in the specified unit. • When single-precision real number or double-precision real number is specified: data value is output in the specified unit. (Page 259 Numerical value range for each output type) • When character string type is specified: the character string with the specified size is output. If the character string terminator "0" exists in the middle of data, NULL is generated on from said point onward until the terminator of the specified size. • When numeric string type is specified: the data value with the specified size is output. • When time is specified: T#24d20h31m23s648ms to T#24d20h31m23s647ms is output. 	<ul style="list-style-type: none"> • Bit: 2 • Word (signed/unsigned): 2 • Double word (signed/unsigned): 4 • Single-precision real number: 4 • Double-precision real number: 8 • String/numeric string: 1 to 256 • Time: 4 															
(29)	Device code	The device code of the device/label specified in the setting is output.	16															
(30)	Program name length	The length of the program name specified in the setting is output. (When a global device or global label is specified, "0" is output.)	2															
(31)	Program name	The specified program name (no extension) is output in Unicode. (When a global device or global label is specified, the program name is not output.)	0 to 120															

*1 The following capacity values are output to □ based on the model.
 Example: R08CPU, R08ENCPU: □ = 08

Numerical value range for each output type

This section describes the numerical value ranges that can be output for each output type.

Integer type

The following table lists the numerical value ranges that can be expressed for each integer type.

Output format	Lower limit	Upper limit
Word (unsigned)	0	65535
Word (signed)	-32768	32767
Double word (unsigned)	0	4294967295
Double word (signed)	-2147483648	2147483647

Real number type

The following table lists the numerical value ranges that can be expressed for each real number type.

Output format	Negative value		Positive value	
	Lower limit	Upper limit	Lower limit	Upper limit
Single-precision real number	-3.4028235E+38	-1.401298E-45	1.401298E-45	3.4028235E+38
Double-precision real number	-1.79769313486231570E+308	-4.94065645841246544E-324	4.94065645841246544E-324	1.79769313486231570E+308

When the value of the data exceeds the numerical value range, the following rule is applied to the output.

- When the value exceeds the upper limit of the positive value, +Inf is output.
- When the value falls below the lower limit of the negative value, -Inf is output.
- When the value is between the upper limit of the negative value and the lower limit of the positive value, 0 is output.

Output format	-Inf	0	+Inf
Single-precision real number	0xff800000	0x00000000	0x7f800000
Double-precision real number	0xfff0000000000000	0x0000000000000000	0x7ff0000000000000

Storage location of data logging files

Select an SD memory card or the function memory for the storage location. (CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

The number of data logging settings and the number of records vary, depending on the storage location. For details, refer to the functional specifications. (Page 228 Specifications)

Availability

The following table lists available CPU module models by each storage location.

○: Applicable, ×: Not applicable

CPU module	Storage location	
	SD memory card	Function memory
R01CPU, R02CPU	○	×
R04CPU, R08CPU, R16CPU, R32CPU, R120CPU R04ENCPU, R08ENCPU, R16ENCPU, R32ENCPU, R120ENCPU	○	○*1

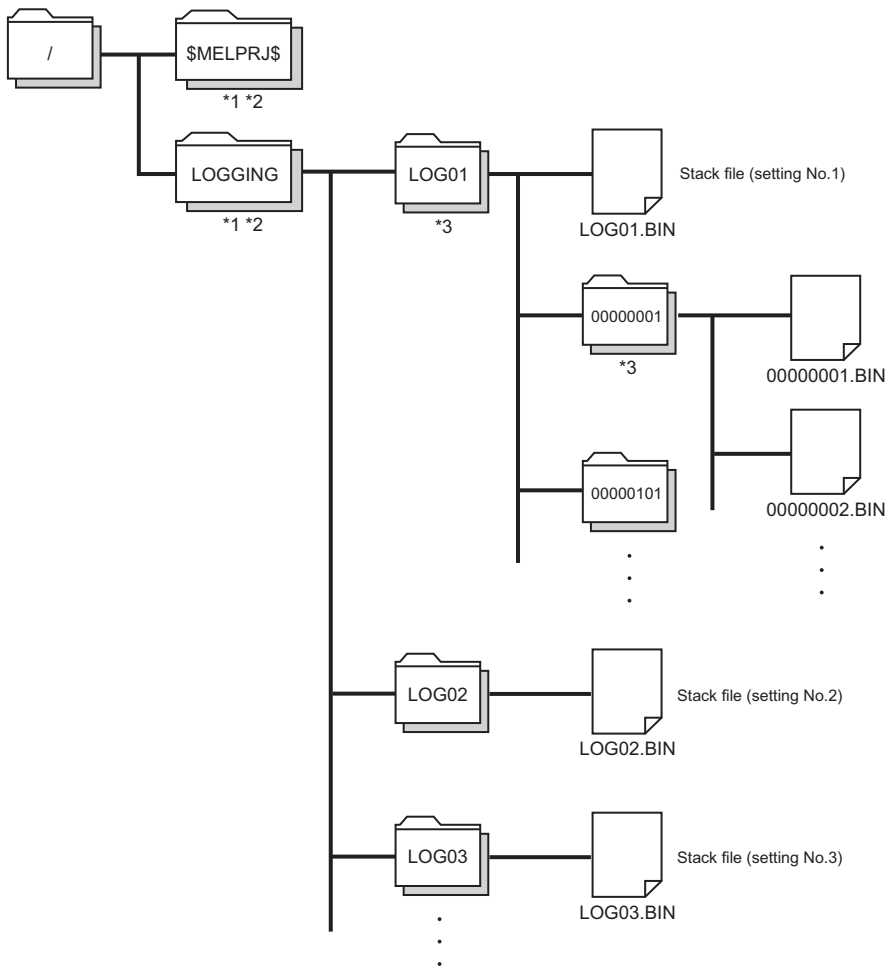

- *1 When using the function memory as the storage location, check the firmware version of the CPU module and the version of the CPU Module Logging Configuration Tool. (Page 705 Added and Enhanced Functions)
The data logging file stored in the function memory can be transferred to the FTP server by using the data logging file transfer function. (Page 275 Data Logging File Transfer (Auto Transfer to FTP Server))
If the data logging file transfer function is not set, the files are transferred to the data memory. (Page 284 Data Logging File Transfer to Data Memory)

Restriction

- Data logging into different storage locations (SD memory card and function memory) cannot be executed simultaneously.
- When the storage location is the function memory, up to two data loggings can be executed simultaneously. (Up to 10 data loggings can be set.) The maximum number of data loggings that can be executed simultaneously is ten, depending on the firmware version and production information of the CPU module. (Page 705 Added and Enhanced Functions)

Folder configuration of SD memory cards

The following figure shows the folder configuration of the SD memory card attaching to a CPU module.

- *1 Folder names cannot be modified.
- *2 Do not create folders/files under the \$MELPRJ\$ and LOGGING folders using a personal computer and other devices.
- *3 To remove unnecessary folders, use the following methods:
 - Use a personal computer.
 - Logging File Operation (CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R series))

17.7 States of the Data Logging Function

The data logging function has the data logging state. The data logging state can be checked by CPU Module Logging Configuration Tool. (CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

Data logging states

The following table lists all the possible data logging states.

Data logging states	Description
Stop* ¹	Data logging settings are unregistered and data collection is inactive.
Stop (after collection)	Transition from "Collection completed" to "Stop" has occurred due to the execution of another function* ² .
Stop (after error)	Transition from "Error" to "Stop" has occurred due to the execution of another function* ² .
RUN waiting (no collection)	Data collection has not yet begun because the operating status of the CPU module is not in the RUN state.
Start waiting (no collection)	Data collection is inactive, waiting for the start command.
Pause* ¹	Data logging is suspended and data collection has not yet been started. (The data logging settings remain intact.)
Condition waiting (no collection)	Data logging settings are registered and waiting for the first collection timing.
Collecting	Continuous logging is active and collecting data.
Trigger waiting (Collecting before trigger)	Data logging settings are registered, data collection is being performed, and waiting until the trigger condition is met.
Collecting after trigger	Trigger logging is active and collecting data after the trigger condition is met.
Collection completed* ¹	<ul style="list-style-type: none">• Continuous logging: Data collection has finished upon reaching "Number of files to be saved" specified as part of the "Stop" setting configured in "Operation when exceeds the number of files". (The data logging settings remain intact.)• Trigger logging: Trigger logging has finished collecting data as much as the specified number of records. (The data logging settings remain intact.)
Error	Data logging has failed due to the occurrence of an error.

*1 CPU Module Logging Configuration Tool displays "Saving the logging data" as the data logging state until saving of collected data completes. After the completion, the state changes to each of three states.

*2 The execution of another function includes:

- Execution of data logging with the same trigger conditions (trigger conditions = the specified conditions)
- Auto logging
- Online program change

LED status

Whether the data logging function is active or not can be checked by the LED of the CPU module.

States of the Data Logging Function	LED status		
	FUNCTION LED	CARD READY LED ^{*1}	CARD ACCESS LED ^{*1}
<ul style="list-style-type: none"> Data logging settings have been registered by the start operation from CPU Module Logging Configuration Tool. After registering the auto logging common setting, an SD memory card that stores the setting for which the auto logging function is enabled has been inserted. 	On	On	Off
All of the registered data logging sessions are in the state "RUN waiting (no collection)", "Start waiting (no collection)", "Pause", "Condition waiting (no collection)", or "Trigger waiting (Collecting before trigger)".			
One or more of the registered data logging sessions are in the state "Collecting" (including the data being saved) or "Collecting after trigger" (including the data being saved).	Flashes slowly (every one second)	On	On (when the SD memory card is accessed)
All of the registered data logging sessions have finished (or failed due to an error).	Flashes at normal rate (every 200ms)	On	Off

*1 The LED status when the data storage destination memory is the SD memory card.

Point

For the FUNCTION LED indication, the following cases have priority over the function above.

- When the external input/output forced on/off function is executed (in registration) ( Page 209 FUNCTION LED)
- When program restoration information is not written ( Page 691 Checking the program restoration information write status)

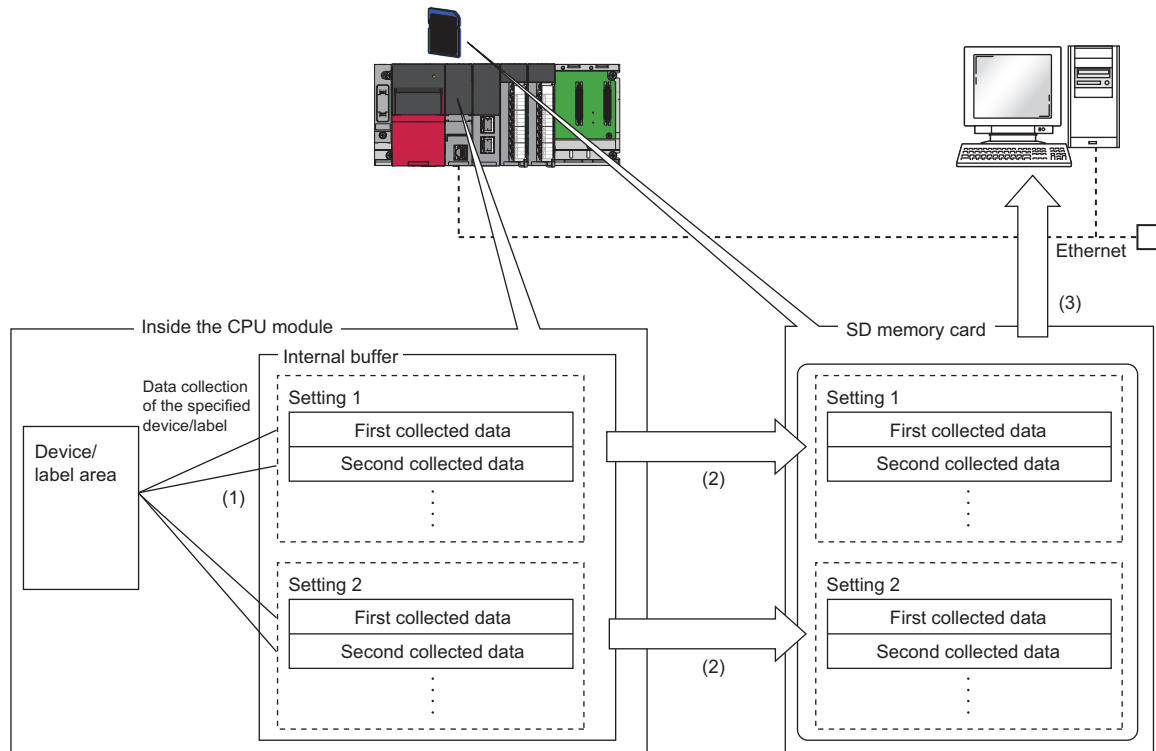

After the external input/output forced on/off function has been executed (after the registration is canceled) and program restoration information has been written, the LED indicator follows the status of the data logging function. ( Page 172 LED display setting)

17.8 Steps Until the Collected Data Is Saved

This section describes the steps until the collected data is saved.

When the data storage destination memory is the SD memory card

The following figure shows the flow of data when the data storage destination memory is the SD memory card.

- (1) The collected data is temporarily stored in the specified internal buffer. (☞ Page 266 Internal buffer)
- (2) The data stored in the internal buffer is stored into the SD memory card at the timing of a file save operation.
- (3) With the file transfer setting, data logging files can be transferred from the SD memory card to the FTP server. (☞ Page 275 Data Logging File Transfer (Auto Transfer to FTP Server))

When the data storage destination memory is the function memory

The following figure shows the flow of data when the data storage destination memory is the function memory.

- (1) The collected data is temporarily stored in the specified internal buffer. (☞ Page 266 Internal buffer)
- (2) The data stored in the internal buffer is stored into the function memory at the timing of a file save operation.
- (3) With the file transfer setting, data logging files can be transferred from the function memory to the FTP server. (☞ Page 275 Data Logging File Transfer (Auto Transfer to FTP Server))
- (4) Without the file transfer setting, data logging files are transferred to the data memory upon completion or stopping of the data logging (including when an error occurs). (☞ Page 284 Data Logging File Transfer to Data Memory)

Internal buffer

The internal buffer is a system area used to temporarily store collected data.

The collected data is temporarily stored in the internal buffer and stored in the specified data storage destination memory at the time of a file save operation.

Internal buffer capacity setting

Set the capacity of the area (internal buffer) used by the system to temporarily store the results of data logging and memory dump processing. The capacity can be set individually for each data logging setting number (1 to 10).

 [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Internal Buffer Capacity Setting]

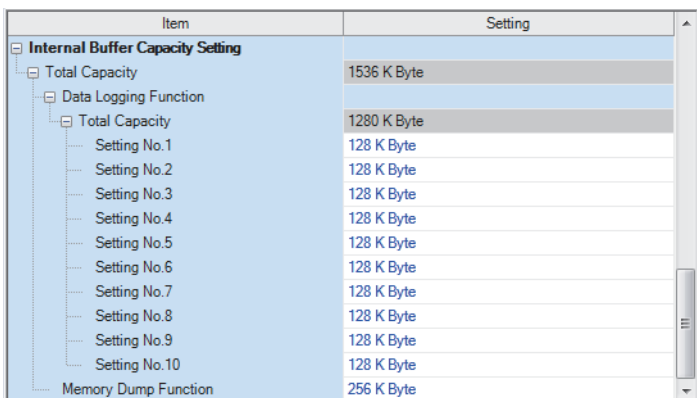

Restriction

This function cannot be used in the R00CPU.

For trigger logging, increasing the internal buffer capacity allows an increase in the number of collected data before trigger and also helps to prevent processing overflow. If the free space in the internal buffer is still insufficient after increasing the internal buffer capacity, use the following workarounds:

- Increase the data collection interval or timing.
- Reduce the number of data records to be collected.
- Lower the frequency of file switching.

Window

Item	Setting
Internal Buffer Capacity Setting	
Total Capacity	1536 K Byte
Data Logging Function	
Total Capacity	1280 K Byte
Setting No.1	128 K Byte
Setting No.2	128 K Byte
Setting No.3	128 K Byte
Setting No.4	128 K Byte
Setting No.5	128 K Byte
Setting No.6	128 K Byte
Setting No.7	128 K Byte
Setting No.8	128 K Byte
Setting No.9	128 K Byte
Setting No.10	128 K Byte
Memory Dump Function	256 K Byte

Displayed items

Item	Description	Setting range	Default
Total Capacity	Shows the total of the internal buffer capacity set in the data logging function and the memory dump function.	64 to 3072K bytes	1536K bytes
Data Logging Function	Total Capacity	—	1280K bytes
	Setting No.1 to 10	<ul style="list-style-type: none"> • Each setting range: 32 to 3040K bytes (in increments of 1K bytes)^{*1} • Total setting range: 32 to 3040K bytes 	128K bytes
Memory Dump Function	Set the internal buffer capacity used for the memory dump function.	32 to 3040K bytes (in increments of 1K bytes) ^{*2}	256K bytes

*1 Leaving this field blank allows the setting to be unused (0K bytes).

*2 A reduced capacity of the internal buffer decreases the extension of scan time, but it takes time to complete.

Point

The internal buffer is also consumed in the real-time monitor function. Set the total of the internal buffer to no more than 3072K bytes including the internal buffer to be consumed in the real-time monitor function as well. The internal buffer for the real-time monitor function can be set with GX LogViewer. ( GX LogViewer Version 1 Operating Manual)

Amount of internal buffer consumed

This value can be calculated by multiplying "Number of data points" by 2 bytes. Note, however, that additional space is consumed by columns configured for output, as indicated below:

- Date/time column: 10 bytes
- Data collection interval column: 8 bytes
- Execution step No. column: 10 bytes
- Execution program No. column: 2 bytes
- Index column: 4 bytes

Ex.

When data logging is configured to collect as much data as one setting × 128 records and output all of the columns (i.e., maximum allowable configuration):

$$128 \times 2 + (10 + 8 + 10 + 2 + 4) = 290 \text{ bytes}$$

Switching to a storage file

The data collected by data logging is temporarily stored in a stack file. The stack file can be switched to a storage file to free the space in the SD memory card.

How file switching works

File switching works as follows:

1. The CPU module writes collected data into a stack file (such as LOG01.BIN).
2. It changes the file name when the storage file switching condition is met. ^{*1*2}
3. It creates a new stack file.
4. It continues to write collected data into the newly created stack file.

*1 The file name format can be customized. (CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

*2 The file number of the most recent storage file is stored in the special register (Latest storage file number).

File switching condition

The following table shows the file switching conditions.

File switching condition	Description
Number of records	The file is switched when the number of records exceeds the specified value. Specify the number of records within the following range. <ul style="list-style-type: none"> • When the data storage destination memory is the SD memory card: 1 to 65500 • When the data storage destination memory is the function memory: 1 to 12000
File size* ¹	The file is switched when the file size exceeds the specified value. Specify the file size within the following range. <ul style="list-style-type: none"> • When the data storage destination memory is the SD memory card: 10 to 16384K bytes • When the data storage destination memory is the function memory: 10 to 1024K bytes
Condition* ²	The file is switched when the monitored data meets the specified conditions. Specify the following data. (☞ Page 269 Condition specification) <ul style="list-style-type: none"> • Monitored data • Conditional formula: ↑, ↓, =, ≠, ≥, >, ≤, <, At value change • Condition values (comparison values)

*1 File switching occurs before the file grows beyond the specified size.

*2 When setting specified conditions, check the firmware version of the CPU module and the version of the CPU Module Logging Configuration Tool. (☞ Page 705 Added and Enhanced Functions)

However, file switching occurs regardless of the setting when:

- the number of records has reached the maximum number;
- the file size has reached the maximum size;
- the CPU module is stopped or suspended/resumed; or
- data logging is started and there is an existing stack file.

Point

Trigger logging does not require the configuration of these settings because the stack file is automatically switched to a storage file after as much data as the specified number of records is written into the stack file. SM1218 (logging data storage file switching in progress) can be used to check if storage file switching is in progress.

Condition specification

The stack file is switched to the storage file at the END processing of when the specified conditions are met. Therefore, the storage file is not switched if the conditions are met within one scan.

Even when the file switching conditions are met, the storage file is not switched if the data does not exist in the internal buffer or the stack file does not exist because the data collection conditions are not met or for the other reasons. In this case, the data is recorded in the internal buffer, and the file is switched when data is written to the stack file.

- Specifying a conditional formula

The following symbols can be specified for the conditional formula.

Conditional formula	Description
↑	When the specified data turns on
↓	When the specified data turns off
=	When the current value of the monitored data is equal to the comparison value
≠	When the current value of the monitored data is not equal to the comparison value
≥	When the current value of the monitored data is equal to or larger than the comparison value
>	When the current value of the monitored data is larger than the comparison value
≤	When the current value of the monitored data is equal to or smaller than the comparison value
<	When the current value of the monitored data is smaller than the comparison value
At change	When the current value of the specified data changes

- Specifying the monitored data

For monitoring data, the following can be set.

The data types that can be selected include bit/word (unsigned), word (signed), double word (unsigned), and double word (signed).

Type		Device ^{*1}
Device	Bit device ^{*2}	X, Y, M ^{*4} , L, F, SM, V ^{*4} , B, SB, T (contact) ^{*4*5} , ST (contact) ^{*4*5} , C (contact) ^{*4*5} , LT (contact) ^{*4*5} , LST (contact) ^{*4*5} , LC (contact) ^{*4*5} , FX, FY
	Word device ^{*3}	T (current value) ^{*4*5} , ST (current value) ^{*4*5} , C (current value) ^{*4*5} , D ^{*4} , SD, W, SW, RD, R, ZR, FD
	Double-word device	LT (current value) ^{*4*5} , LST (current value) ^{*4*5} , LC (current value) ^{*4*5}

*1 An index modified device and indirectly specified device cannot be specified.

*2 For bit devices, digit specification is not supported.

*3 For word devices, bit specification is allowed.

*4 To specify the local device, use "Program name/#Device name". (Example: "MAIN/#M1")

*5 To specify these devices with CPU Module Logging Configuration Tool, use T (contact): TS, ST (contact): STS, C (contact): CS, LT (contact): LTS, LST (contact): LSTS, and LC (contact): LCS.

Storage file

The CPU module creates a subfolder ("storage file container folder") under the file storage folder and writes storage files to that storage file container folder. One storage file container folder can contain up to 256 storage files. When the files contained in the current storage file container folder reach the maximum number, the CPU module creates a new storage file container folder at the time of next storage file switching and begins writing storage files to that new folder. The number of files that can be contained in one file storage folder is configurable within the range of 1 to 65535.

Point

The base folder name of a storage file container folder is an eight-digit (hexadecimal) number. This number matches the lowest of the serial numbers of the files contained in the directory. Date and time stamps can be appended to the folder name.

Storage file name

The following describes the storage file name. The base file name is an eight-digit (hexadecimal) serial number.^{*1}

^{*1} The same number is not used in the same file storage folder. If storage files have already existed when a new storage file is created by switching a stack file to a storage file, the number added one to the largest serial number among existing storage files becomes the name of the new storage file.

The following extra information can be added to the base file name. Up to 64 characters (including an extension and the period) can be a file name, combining any of the following.

Extra information	Details on extra information	Remarks
Simple setting	Storage folder name	Name of a folder where storage files are stored
	Date	Date information in YYYYMMDD format <ul style="list-style-type: none"> • YYYY: Year (four digits) • MM: Month (two digits) • DD: Day (two digits)
	Time	Time information in hhmmss format <ul style="list-style-type: none"> • hh: Hour (two digits) • mm: Minute (two digits) • ss: Second (two digits)
Optional setting	String	Any string ^{*2}
	Date	Date information added by specifying the following strings <ul style="list-style-type: none"> • YYYY: Year (four digits) • YY: Year (two digits) • MM: Month (two digits) • DD: Day (two digits)
	Day of week	Day of the week information added by specifying the following strings <ul style="list-style-type: none"> • ddd: Day of week (three digits) (Sunday: Sun, Monday: Mon, Tuesday: Tue, Wednesday: Wed, Thursday: Thu, Friday: Fri, Saturday: Sat)
	Time	Time information added by specifying the following strings <ul style="list-style-type: none"> • hh: Hour (two digits) • mm: Minute (two digits) • ss: Second (two digits)
	Device value ^{*3}	The data value of the specified device can be added to the beginning of the file name by the number of digits specified (in the range of 1 to 5).

^{*2} When using an above formatted string as it is, enclose a character string with double-quotation marks (" ") to add it.
 Example: When adding the character string "address" to the file name, "address" → address_00000001.bin can be used.
 However, when a character string that contains double quotation marks (" ") is specified, the maximum number reduces by the number of the double quotation marks.

^{*3} When adding a device value, check the firmware version of the CPU module and the version of the CPU Module Logging Configuration Tool. (📖 Page 705 Added and Enhanced Functions)

- Date type

A date type can be selected from the following.

Add date type	Description
Date to establish file switching condition	Date and time information when the storage file switching condition is met is added.
File creation date	Date and time information when the file is created as a stack file (when the previous file switching is executed) is added.

- Processing of file switching may take time depending on the setting. In this case, a date and time, which is closer to present than the timestamp of the first record in the data logging file, is added even though "File creation date" is selected for "Add date type".
- When "File creation date" is selected for "Add date type", a second information (two digits) added to a file name is always even number.
- After a data logging stops (completes) and restarts, the serial number (eight digits) of the base file name starts from 1 again in the following two cases: where the setting to delete data logging files after transfer is completed by using the data logging file transfer function or where the CPU built-in memory is specified as the file storage destination for transferring the files to the data memory (without using the data logging file transfer function). If the storage file name consists of the serial number only, the existing files in the transfer destination may be overwritten. It is recommended to add a date and time to the file name.

• Device value

The data value of the specified device can be added to the beginning of the file name by the number of digits specified (in the range of 1 to 5).

The timing to obtain the device value varies depending on the add date type. (☞ Page 271 Storage file name)

The date and time when the file switching condition is met is added when "Date to establish file switching condition" is selected, and the date and time when the stack file is created is added when "File creation date" is selected.

If the device value cannot be obtained upon file switching or stack file creation, no data is added to the storage file name.

The following table describes the types of the data that can be selected for adding to the file name.

Data type	Effective data	Remarks
Word (unsigned)	Fixed decimal format (0 to 65535) ^{*1}	—
String	Single-byte alphabetical characters ^{*2}	Characters in the file format that was specified in the storage format for data logging files.

*1 If the number of digits in the device data value exceeds the specified number of digits, only the specified number of digits are displayed from the small end. If the number of digits is insufficient, the remainder is supplemented with 0.

Example 1: When the device value is K123 and five digits are specified, "00123" is displayed.

Example 2: When the device value is K12345 and three digits are specified, "345" is displayed.

*2 If the number of characters in the device data value exceeds the specified number of characters, only the specified number of characters are displayed from the beginning. If the number of characters is insufficient, the remainder is not supplemented. If invalid data is included in the specified number of characters, valid characters are displayed.

Example: When the device value is "ABC" and five characters are specified, "ABC" is displayed.

Example: When the device value is "ABCDE" and three characters are specified, "ABC" is displayed.

The following describes the devices that can be specified for a device value.

Type	Device ^{*3}
Word device	T (current value), ST (current value), C (current value), D, SD, W, SW, RD, R, ZR, Z

*3 An index modified device, indirectly specified device, and local device cannot be specified.

When the maximum number of storage files to be saved is exceeded

Either "Overwrite" or "Stop"^{*1} can be selected as the action to take when the maximum number of storage files is exceeded.

*1 This settings is not configurable for trigger logging.

■When "Overwrite" is selected

When the storage file switching condition is met after the specified maximum number of storage files is exceeded, the CPU module deletes the file with the lowest serial number and creates a new file that has a serial number incremented by one from the highest serial number, allowing data logging to continue. In addition, if deleting the file with the lowest serial number results in an empty folder, the CPU module deletes that folder as well.

■When "Stop" is selected

As described in the following table, the action differs depending on when the specified maximum number of storage files is exceeded.

Occurrence timing	Occurrence condition	Behavior
When data logging is started	There exist more storage files than the specified maximum number when data logging is started.	<ul style="list-style-type: none"> • If an attempt is made to register the data logging settings by the start operation from CPU Module Logging Configuration Tool, an error occurs, resulting in failure to run data logging. • If an attempt is made to register^{*1} the data logging settings from outside CPU Module Logging Configuration Tool, a special relay area (data logging error) turns on and a special register area (data logging error cause) stores its error cause, resulting in failure to run data logging.
While data logging is running	The specified maximum number of storage files is reached due to file switching upon the satisfaction of the storage file switching condition.	Data logging stops and enters into the completion state with the data logging settings remaining intact. A special relay area (Data logging end) turns on to indicate that data logging is completed.

*1 When an attempt is made to register the data logging settings again, the CPU module enters into the data logging completed state. A special relay area (Data logging end) turns on to indicate that data logging is completed.

Point

The files deleted by "Delete files completed transfer" in the data logging file transfer setting are counted as the number of storage files. (Temporary stored files are counted as the number of storage files although they are not stored in the SD memory card or function memory.)

When "Overwrite" is selected, the file being transferred may be deleted with the data logging file transfer setting. It is recommended to set "Stop"

17.9 Missing Data

The term "missing data" means that some of the collected data is missing, resulting in data discontinuity.

Conditions under which missing data occurs

Missing data occurs under the following conditions:

Item	Description
Processing overflow	Processing overflow has occurred due to failure to keep up with the specified collection interval/timing. ^{*1}
Operations for the CPU module	The CPU module has been stopped and run with "Operation at transition to RUN" set to "Auto Start".
	The CPU module has been turned off and on with "Operation at transition to RUN" set to "Auto Start".
	The CPU module has been reset and run with "Operation at transition to RUN" set to "Auto Start".
Operation from engineering tools, CPU Module Logging Configuration Tool, and external devices via protocols such as FTP, SLMP, and MC	<ul style="list-style-type: none">• When the CPU module is suspended and restarted, and operation for displaying the logging state is performed from CPU Module Logging Configuration Tool• File read^{*2}, write, delete, or verification

*1 Failure to collect data at the specified collection interval/timing due to the execution of a long-running instruction (such as FMOV) does not cause processing overflow or missing data.

*2 The following operation also is included:

- Online operation which displays data by operation such as read from the programmable controller performed from an engineering tool (retrieval and display of a list of files on the CPU module)
- View of the event history (retrieval of the event history from the CPU module)

Processing overflow

In normal cases when the usage of the internal buffer reaches the specified maximum capacity, the CPU module overwrites the data stored in the storage memory on a first-in first-out basis. If the internal buffer becomes full before all of the data stored in it is saved to the storage memory, however, the CPU module does not overwrite the existing data and stops storing data in the internal buffer, thus resulting in missing data. This situation is referred to as processing overflow. Upon the occurrence of overflow, the special register (Number of processing overflow occurrences) stores the number of times when processing overflow occurred.

17.10 Data Logging File Transfer (Auto Transfer to FTP Server)

This function automatically transfers data logging files to the FTP server.

An SD memory card as the temporary storage destination is not required by setting the CPU built-in memory (function memory*1) as the data storage destination while using this function.

*1 For the CPU modules that can use the function memory, refer to the availability of storage location. (Page 260 Availability)

Restriction

- This function cannot be used in the R00CPU.
- Before executing the function, check the versions of the CPU module and CPU Module Logging Configuration Tool used. (Page 705 Added and Enhanced Functions)

Point

An FTP server is required for the data logging file transfer function. For details on the server, refer to the manual for the server used.

The operation of this function is checked with the following FTP server.

Item	Supported operating system
FTP server whose operation is checked by Mitsubishi	Microsoft® Internet Information Services(IIS) The supported operating systems are as follows: <ul style="list-style-type: none"> • Microsoft® Windows® 10 • Microsoft® Windows® 8.1 • Microsoft® Windows® 8 • Microsoft® Windows® 7

Transfer specifications and start timing of the data logging file

Data logging files are transferred at the file switching timing in the data logging function.

Transfer specifications of the data logging file

- Data logging files are transferred one by one from each setting number (folder).
- If multiple files exist in multiple setting numbers, a file which has the smallest serial number in the lowest setting number is transferred.
- Only one file per setting number can be the standby file.

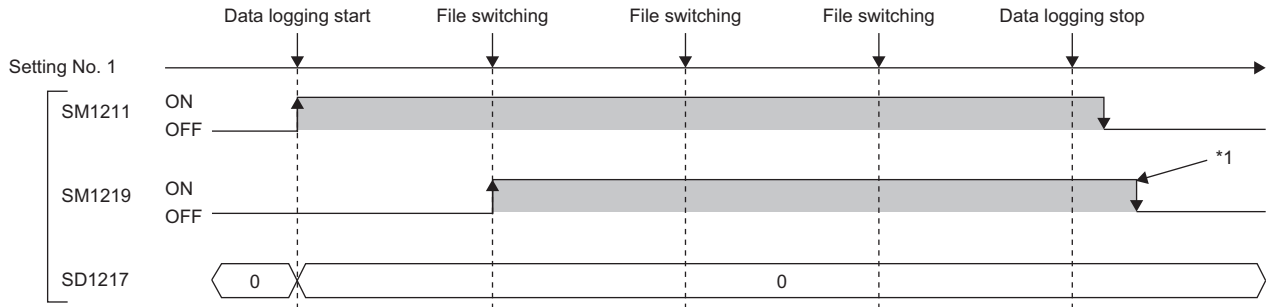

For example, in the following data structure, files are transferred from the file ①. (Files are transferred in order from ① → ② → ... → ⑦ → ⑧.)

- If an error occurs during a file transfer, the data logging file caused the error is omitted from the standby files. A following file in the same setting number becomes a new standby file.
- If the file switching timing occurs during a file transfer, the file that has been being transferred becomes a standby file.
- If the data logging operation is completed or the user has operated CPU Module Logging Configuration Tool to stop data logging, the data logging file transfer is stopped at the completion of the transfer of the stored data logging files.

Start timing of file transfer

After data logging is started, the transfer of the files created at the file switching timing in the data logging function starts. When the transfer is started, special relay areas SM1219 to SM1309 (Data logging file transfer execution status flag) for each setting number turn on. They turn off after all the files are transferred.

- SM1211: Data logging setting No.1 Data logging start
- SM1219: Data logging setting No.1 Data logging file transfer execution status flag
- SD1217: Data logging setting No.1 Data logging file transfer error cause

*1 SM1219 does not turn off until all the files are transferred.

Procedure for file transfer

FTP server setting

Set the login name, password, and home directory to the FTP server. Authorize the user of the data logging file transfer function to read/write files. (Manual for the server used)

Engineering tool setting

1. Set the IP address of the CPU module. Set the subnet mask and default gateway as necessary.

[Navigation window] ⇒ [Parameter] ⇒ CPU module ⇒ [Module Parameter] ⇒ [Basic Settings] ⇒ [Own Node Settings] ⇒ [IP Address]

2. To specify an FTP server with the server name, set "To Use or Not to Use DNS Server Settings" to "Use" by using the engineering tool.

[Navigation window] ⇒ [Parameter] ⇒ CPU module ⇒ [Module Parameter] ⇒ [Application Settings] ⇒ [DNS Settings]

3. Set an address of the DNS server.

Window

Displayed items

Setting item	Description	Setting range	Default
DNS server 1 IP address	Set the IP address of the DNS server 1 in the decimal format.	0.0.0.1 to 223.255.255.254	Blank
DNS server 2 IP address	Set the IP address of the DNS server 2 in the decimal format.	0.0.0.1 to 223.255.255.254	Blank

■ Setting of CPU Module Logging Configuration Tool

Data logging files can be transferred to the specified FTP server at the file switching timing.

Transferring files to the FTP server
If the auto logging function is enabled, this function cannot be used.
 Auto transfer to data memory after logging is completed when users specify the function memory in data stored destination memory beforehand and do not use the function.

Server Setting

No.	FTP Server	Login User Name	Password	Directory Path	Data Transfer Mode
01					
02					
03					
04					
05					
06					
07					
08					
09					
10					

*If the same directory path in the same transfer destination server is set to another CPU module, the transferred file may be overwritten.
 Set the FTP server and directory path correctly.

FTP server connection request timeout time [s] (1-30)

File transfer retry time [m] (1-1440)
Files are repeatedly resent during the file transfer retry time.

Adjust directory configuration of FTP server by CPU
Specify a configuration stored in the directory path of transfer destination FTP server.
 When users do not specify it, save logging files in the directory of transfer destination FTP server.

Delete files completed transfer
Delete transferred files in SD memory card or function memory.

FTP Setting

FTP Server Name IP Address
 Server Name

Application Settings is necessary when specify FTP server by a server name.
 DNS Settings can be set in "Parameter->Control CPU->Module Parameter->Application Settings->DNS Settings" of GX Works3.

Port No.

Login User Name

Login Password

Confirm Login Password

Directory Path

Data Transfer Mode PORT Mode (Normal) PASV Mode

1. Select the "Transferring files to the FTP server" check box in "File transfer" of CPU Module Logging Configuration Tool.

(CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

2. Click the [Server Setting] button.

3. Configure the server setting. To specify the FTP server with the server name, the DNS setting is required. (Page 277 Engineering tool setting)

4. Click the [File Transfer Test] button to execute the file transfer test to the FTP server. Before operating the system, execute the file transfer test and ensure the connection with the FTP server. (Page 279 File transfer test)

5. Set the timeout time and other items on the "File transfer" window. (Page 280 Setting on the "File transfer" window)

6. Write the setting from CPU Module Logging Configuration Tool.

(CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

7. The transfer is started at the logging file switching timing. (Page 277 Start timing of file transfer)

File transfer test

Check the communication status and settings by transferring a test file from the CPU module to the FTP server. The file transfer to the FTP server can be checked before system operation.

■Procedure for the file transfer test

The following describes the procedure for the file transfer test.

1. Configure the transfer destination server setting in CPU Module Logging Configuration Tool. (📖 CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))
2. Click the [File Transfer Test] button in the "FTP Setting" window to execute the file transfer test.
3. Check the execution result.
4. Check that the test file is transferred to the FTP server. (👉 Page 279 Structure of a test file)

■Structure of a test file

The following table lists structures of a test file to be transferred to the FTP server.

Item	Description	Example
Test file name	MELSEC_CPU_FTP_TEST_**.txt ** indicates the data logging setting number (two digits, with zero-padding).	For setting No.1 MELSEC_CPU_FTP_TEST_01.txt
Contents of the test file	The IP address of the CPU module, test execution date, and test execution time are described. For the date and time, the clock data in the CPU module is used.	For IP address: 192.168.3.39, date: October 01, 2017, time: 11:22:33 192.168.3.39_20171001_112233

■File transfer test specification

- The FTP server connection request timeout time is fixed to 10 seconds.
- Even if the file transfer test fails due to a communication error, the retry is not executed.
- Even if the file transfer test fails, the error is not stored in the file transfer error history. (📖 CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

■Precautions

- File transfer tests cannot be executed simultaneously with another configuration tool. Execute the file transfer test after the file transfer test from another configuration tool is completed.
- If the engineering tool is operated or monitored from the same connection destination of the same computer during the file transfer test, the operation or monitoring will be executed after the file transfer test completion.

Setting on the "File transfer" window

■FTP server connection request timeout time

Set the waiting time from when the connection request from the CPU module to the FTP server is sent to when the response is received. If no response is received from the FTP server within the connection request timeout time, an error occurs.

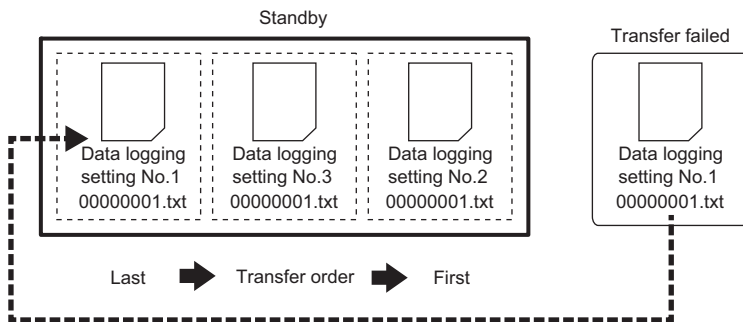

■File transfer retry time

Set the time to retry the file transfer when the file transfer fails due to an error caused by communication failure such as the network error between the CPU module and the FTP server.

The data logging file failed to be transferred is in the standby state and the retry starts. The file is resent until the file transfer retry time elapses. Even when the file transfer fails again due to a communication error, the file will be on standby for the reverse transfer again without an error of the data logging file transfer function.

Ex.

When a data logging file of the data logging setting No.1 has not been transferred due to a network failure

The retry ends when the network is recovered and retry of the file transfer succeeds.

■ Matching the folder structure of the transfer destination FTP server with the CPU module

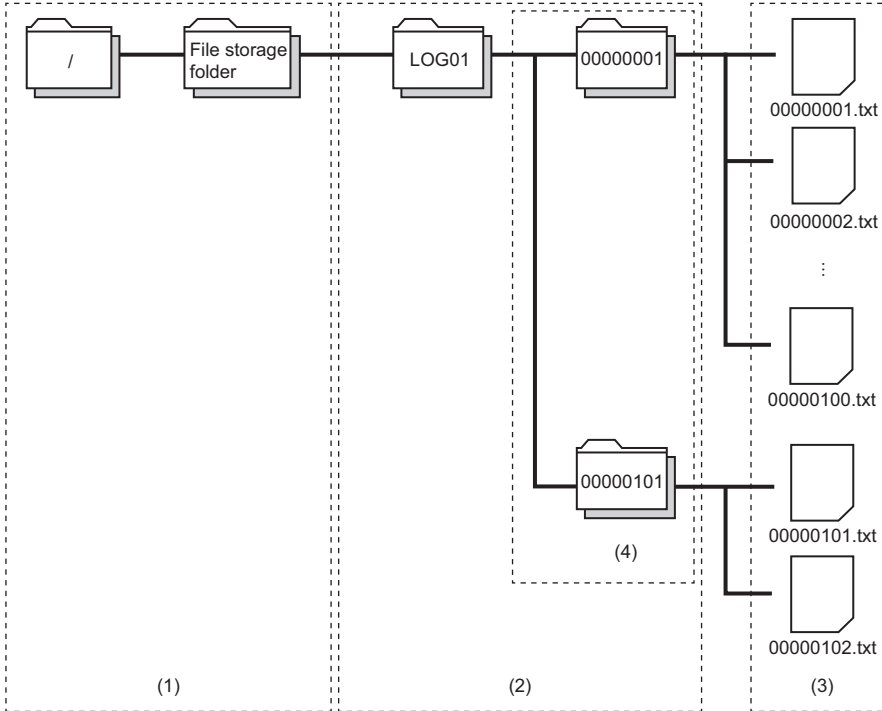

When the data logging file is transferred, the directory is automatically created in the specified folder path of the FTP server so that the structure is the same as the storage destination ( Page 261 Folder configuration of SD memory cards).

If the same file exists, the file will be overwritten.

- When the folder structure is matched with the CPU module

The folder path (1) specified in the server setting, folder structure (2), logging files transferred (3).

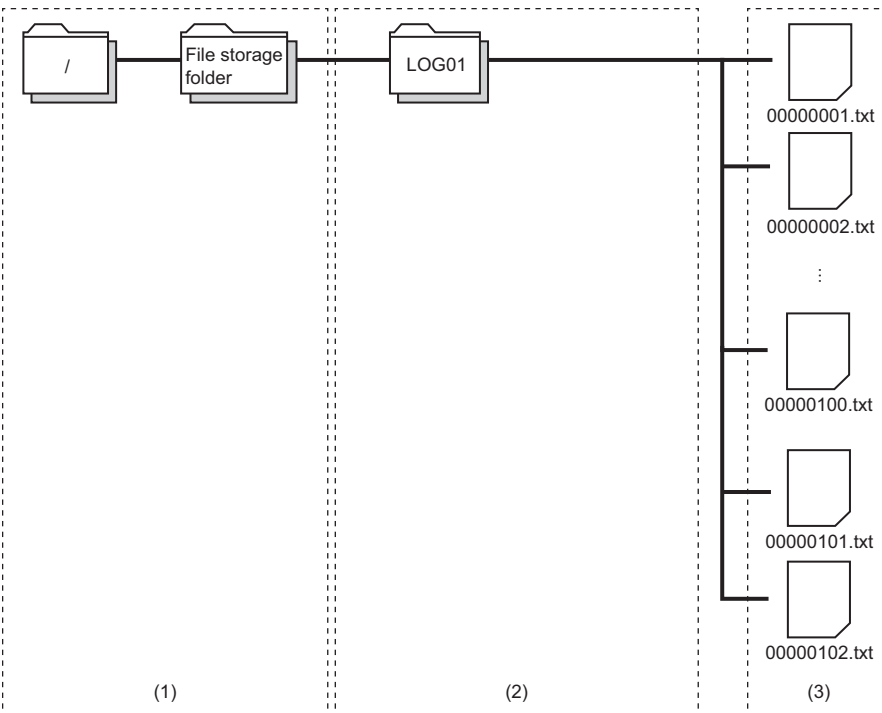

In the folder structure (2), subdirectories (4) are created.

- When the folder structure is not matched with the CPU module

The folder structure of the FTP server consists of the storage destination structures of the data logging file excluding the subdirectory.

The folder path (1) specified in the server setting, folder structure (2), logging files transferred (3).

■Deleting files completed transfer

At the completion of data logging file transfer, transferred files are automatically deleted. If there is no file in the saved file storage folder (subdirectory) as a result of the file deletion, the saved file storage folder (subdirectory) is deleted while data logging is stopped.

Point

- If the function memory is specified as the data storage destination, files are deleted after the transfer regardless of the setting.
- Even if "Delete files completed transfer" is specified, data logging stops when the number of files stored by the data logging function exceeds the maximum value of the number of files to be saved. To consecutively execute data logging, set a large number of files to be saved.

Data logging file transfer status

The file transfer status, the data logging name, and the IP address of the file transfer destination FTP server can be checked. They can be checked on the data logging file transfer status window of CPU Module Logging Configuration Tool. (CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

File transfer error log

Error history including the date and time of error occurrence, data logging No., and the error codes can be checked. They can be checked on the file transfer error log window of CPU Module Logging Configuration Tool. (CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

Stopping the data logging file transfer

After data logging is stopped, the data logging file transfer stops when no standby file for the data logging file transfer is left. However, after data logging is stopped, if the data logging file transfer is being retried and does not stop, the file transfer in progress can be stopped by following the procedure below.

1. Set the data logging setting number for SD1203 (Data logging file transfer stop information). Multiple data logging setting numbers can be set for SD1203.
2. Turn on SM1203 (Data logging file transfer stop request). When multiple data logging setting numbers are specified for SD1203 and SM1203 is turned off and on, SM1203 turns off after the data logging file transfer of all the data logging setting numbers stops.
3. At the completion of the file transfer stop processing, an error is stored in each data logging file transfer error cause of the files being transferred and in the standby (retry) state.

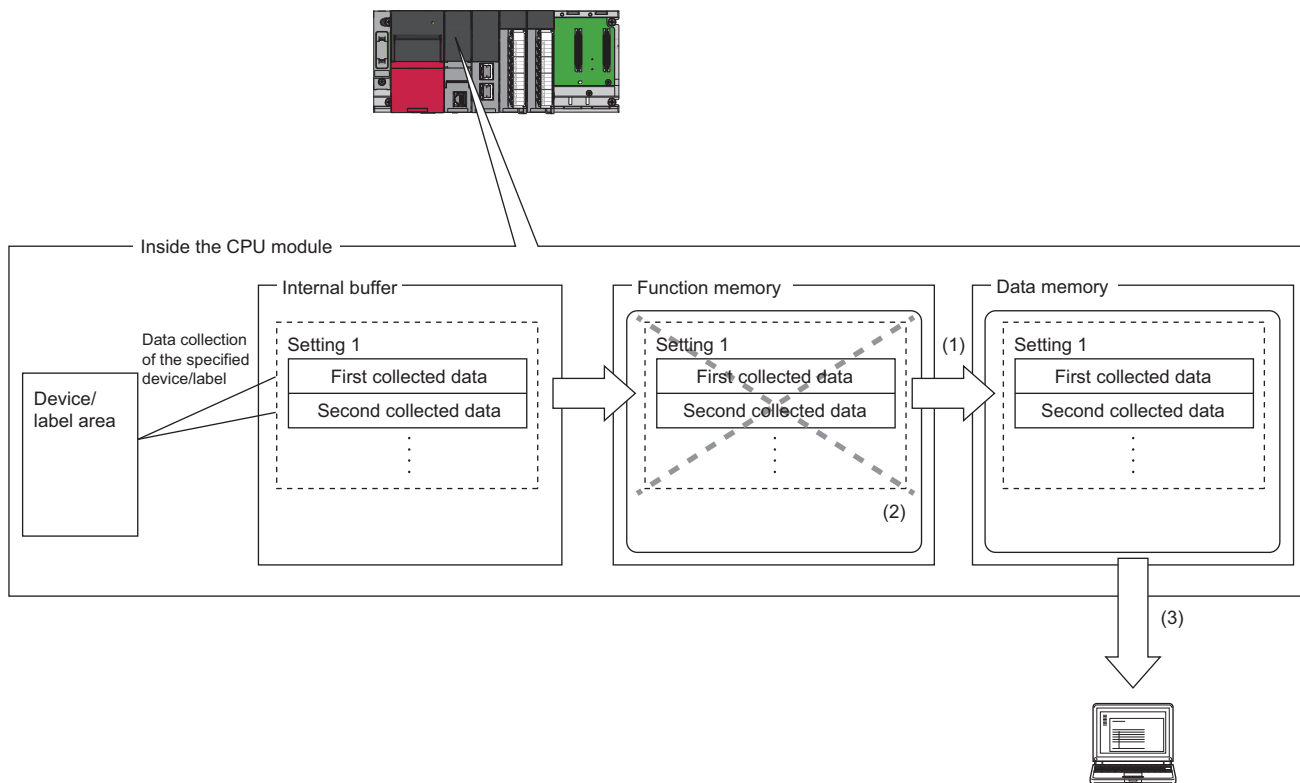

For the file transfer stopped by the stop request, files which have not been transferred cannot be transferred even if the data logging of the same setting number is restarted and the file transfer is executed. To transfer files which have not been transferred, the procedure differs depending on the data storage destination. When the data storage destination is the SD memory card, transfer the files to the server by using the FTP server function. When the data storage destination is the function memory, transfer the files to the data memory by using SM653 (File transfer to data memory request) and transfer the files to the server by using the FTP server function.

Point

- When the data logging status of the data logging setting No. which has been set by SD1203 (Data logging file transfer stop information) is other than stop, or the data logging file transfer is not enabled in the data logging setting, turning off and on SM1203 (Data logging file transfer stop request) does not execute the stop processing and SM1203 turns off.
- When the data logging is in the collection completed state or when an error occurs, file transfer cannot be stopped by SM1203 (Data logging file transfer stop request). To stop file transfer, stop the data logging function.

17.11 Data Logging File Transfer to Data Memory

When the function memory*1 is specified for the data storage destination memory without setting of the file transfer, the data is transferred from the function memory to the data memory at the logging completion or stop (including when an error occurs) as shown below.

(1) At the logging completion or stop (including when an error occurs), the data is transferred from the function memory to the data memory.

When data logging is suspended or waiting for RUN without collection, the data is not transferred to the data memory.

(2) Data in the function memory is automatically deleted after completion of the transfer.

(3) The data logging files transferred to the data memory can be read by engineering tool or displayed by GX LogViewer.

*1 For the CPU modules that can use the function memory, refer to the availability of storage location. (Page 260 Availability)

Behavior when the free space in the data memory is full

When multiple data logging files exist in the function memory and the free space in the data memory is full by only transferring some of the files, an error occurs and the files remaining are not transferred. In this case, files that have not been transferred are not deleted from the function memory.

Starting data logging during the data transfer to the data memory

The data logging cannot be started during the data transfer to the data memory. An error occurs when starting the data logging. (Page 304 Starting data logging during the data transfer to the data memory)

An error during the data transfer to the data memory is stored in SD1217 (Data logging file transfer error cause). (Page 628 Data logging function)

17.12 Setting Behavior at the Time of Transition to RUN

After the data logging settings are registered by the start operation of data logging, set the behavior of data logging when the following user operations to switch the operating status of the CPU module to RUN are performed (transition to RUN). (📖 CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

- Powering off and on and switching the operating status to RUN
- Resetting and switching the operating status to RUN
- Switching the operating status from STOP to RUN

Point

The logging operation can be set individually for each setting number (1 to 10).

Behavior at the time of a transition to RUN

The behavior can be selected from the following.

■Auto start

The data logging automatically starts after the user operation of starting data logging in CPU Module Logging Configuration Tool and switching the operating status of the CPU module to RUN.

 [Online] ⇨ [Logging Status and Operation]

■Start by user operation

The data logging status becomes "Start waiting (no collection)" after the user operation of starting data logging in CPU Module Logging Configuration Tool and switching the operating status of the CPU module to RUN. To start data logging, operate CPU Module Logging Configuration Tool to start data logging again.

 [Online] ⇨ [Logging Status and Operation]

Point

When the auto logging is used, the behavior of the data logging is always "Auto Start", even if the behavior at transition to RUN is set to "Start by User Operation". (📖 Page 286 Auto Logging)

Data logging behavior that occurs after operating status of CPU module has changed

Data logging does not continue when the operating state of the CPU module changes from RUN to STOP or PAUSE after it has been started. The data logging status changes to "RUN waiting (no collection)" and data collection is stopped.

17.13 Auto Logging

When inserting an SD memory card, which holds data logging setting, into the CPU module, the data logging automatically starts based on the data logging setting information on the SD memory card.

How to use auto logging

This section describes how to use auto logging.

1. Prepare an SD memory card that contains data logging settings as well as common settings (auto logging common settings) in which auto logging is enabled.
2. Insert the SD memory card prepared in step 1 into the CPU module while it is running.
3. When the SD memory card is inserted, data logging starts automatically. (CARD READY LED and CARD ACCESS LED turn on.)
4. Check that auto logging is completed on the engineering tool or using the LED^{*1} on the CPU module.
5. Remove the SD memory card.

*1 When "Data Logging Function" is set in the LED indicator setting, the FUNCTION LED flashes every 200ms. If the executed function has higher priority of the FUNCTION LED than the function set in the LED indicator setting, the data logging function status is not displayed. (🔍 Page 172 LED display setting)

Point

- Even when the data logging stop operation is performed after auto logging starts, auto logging does not end until when the SD memory card is removed.
- To use auto logging, the auto logging common setting file and data logging setting file for operation are required in the SD memory card.
- Write the auto logging common setting file to the SD memory card only when using auto logging. When auto logging is not used, delete the auto logging common setting file. (📖 CPU Module Logging Configuration Tool Version 1 Operating Manual (MELSEC iQ-R Series))

Auto logging common setting

The following window configures the required settings for using the auto logging function.

17

Window

Set for auto logging function.

Enable the auto logging function
 Inserting an SD memory card into the CPU in RUN status starts operation.
 Save the target data logging setting in the SD memory card before inserting the card.

The auto logging function does not operate according to the logging setting in the data memory.
 Logging being operated when the SD memory card is inserted,
 the auto logging function does not start operating.

Auto logging terminate condition
 Specify conditions for terminating auto logging.
 If two or more conditions are selected, logging will terminate when any of the conditions is met.

Data logging stop
 Select when to terminate auto logging operation.

When all data loggings stop
 When any of the data loggings stops

Timer

Complete with timer
 Terminates logging after a specified period of time has elapsed after logging starts.

Elapsed time [s] (1-86400)

Displayed items

Item	Description	Setting range	Default
Enable the auto logging function	Select this item to use auto logging.	—	Not checked
Auto logging terminate condition	Data logging stop	Select the condition to complete the auto logging operation. (☞ Page 288 Conditions for auto logging completion)	• When all data loggings stop • When any of the data loggings stops
	Timer	Complete with timer	Select this checkbox to stop the auto logging operation by a timer.
	Elapsed time	Specify the time interval from the start of the data logging until stopping it.	1 to 86400 seconds

Auto logging start conditions

Auto logging starts in the following cases.

■Inserting the SD memory card with the auto logging setting while the CPU module is running

Auto logging starts when the SD memory card with the auto logging setting is inserted while the CPU module is running.

(When the CPU module is in the STOP state, auto logging starts by changing the state from STOP to RUN.)

If data logging is in progress before the SD memory card with the auto logging setting is inserted, auto logging does not start.

■Inserting the SD memory card with the auto logging setting while the CPU module is off or being reset, and powering on or resetting the CPU module

Auto logging starts when the CPU module is powered on or reset after the SD memory card with the auto logging setting is inserted while it is off or being reset. If data logging is in progress, powering on or resetting the CPU module executes auto logging instead of the data logging.

Conditions for auto logging completion

Auto logging completes when a completion condition is met as described in the following table. These completion conditions can also be configured in combination with each other. When they are configured in combination, auto logging completes as soon as one of the conditions is met.

Completion condition	Description
Data logging stop	Choose one of the following: <ul style="list-style-type: none">• When all data loggings stop• When any of the data loggings stops
Complete with timer	Auto logging is stopped when the specified time has elapsed after the start of data logging. Elapsed time setting range: 1 second to 86400 seconds (unit: second)

■When "Data logging stop" is selected

Auto logging is assumed to be completed if all the settings or any of auto logging stops*1.

*1 Here the term "stop" means one of the following:

- Continuous logging: When the "Number of files to be saved" setting configured in the save setting has been exceeded and data logging has been completed.
- Trigger logging: When as much data as the number of records specified in "Number of records" has been collected, the collected data has been written to the SD memory card, and data logging has been completed.
- When the user has operated CPU Module Logging Configuration Tool to stop data logging.

Point

- If "When any of the data loggings stops" is selected, the behavior of any other data logging sessions than stopped is the same as the behavior that occurs upon the elapse of the time configured using "Complete with timer".
- When completing auto logging for continuous logging, do not select "Overwrite" for the operation at the time when the number of files exceeds the save setting because doing so results in failure to stop data logging; instead, select "Stop".

■When "Complete with timer" is selected

When the operating time since the start of data logging reaches the specified time, the CPU module completes auto logging by moving all the data collected so far from the internal buffer to the SD memory card. If trigger logging has not yet collected as much data as the number of records specified "Number of logging lines", however, the CPU module does not store any data including the collected data.

Point

The timer is cleared to zero when auto logging is suspended and resumed by stopping and running the CPU module or turning off and on the CPU module or resetting it before the completion of auto logging. If auto logging is suspended by the turning on of the special relay (Data logging suspend/resume flag), the timer continues to run even while data logging is suspended.

Conditions under which auto logging does not start

Doing any of the following operations once auto logging is completed does not start auto logging:

- Turn off and on the power
- Reset
- STOP to RUN state

If data logging is in progress before the SD memory card with the auto logging setting is inserted, auto logging does not start as well.

Behavior of auto logging at the time of a transition to RUN

If some, not all, of data logging sessions configured using auto logging have been completed when entering into the RUN mode, only the uncompleted data logging sessions are started.

Behavior of auto logging that occurs when an error is generated

When an error is generated, auto logging behaves as follows:

■When an error is generated at the start of auto logging (Registration of the data logging settings has failed.)

If auto logging cannot be started (registration has failed), it behaves in the same way as when it is completed.

■When an error has occurred during the execution of auto logging

An error that occurs during the execution of auto logging does not constitute the auto logging completion condition since it does not prevent data logging from being resumed. If such an error is resulting from an online change during the execution of auto logging, however, it constitutes the auto logging completion condition because it prevents data logging from being resumed.*1

*1 Applies only when "When all data loggings stop" is selected as part of the auto logging completion condition.

17.14 SD Memory Card Replacement

SD memory cards can be replaced using the SD memory card forced disable function even while data logging is in progress.

 Page 132 How to forcibly disable the SD memory card with a special relay

Only the data saving to an SD memory card is stopped while this function is being executed. The data collection keeps working. (Data collection continues in accordance with the settings registered when data logging is started.)

With the setting for the file transfer, an error occurs when the SD memory card is replaced during the file transfer. ( Page 539 Codes of errors detected by other than the self-diagnostic function (4000H to 4FFFH))

Point

If SD memory card replacement causes processing overflow, make adjustments by changing the collection interval, internal buffer capacity, or other settings.

Behavior during SD memory card replacement

If the internal buffer becomes full during the time between SD memory card replacement and the resumption of data writes to the SD memory card, processing overflow occurs resulting in missing data.

Storage file numbers after SD memory card replacement

The numbering of the first storage file created after SD memory card replacement differs depending on the storage file switching condition, as described in the following table.

Storage file switching condition	Storage file numbers after SD memory card replacement
Overwrite	Numbering continues from the number of the last storage file contained in the replaced SD memory card.
Stop	Numbering begins at 00000001.*1

*1 While the data logging file transfer function is used, numbering begins at 00000001 only when the "Delete files completed transfer" is disabled in the "File transfer" setting of CPU Module Logging Configuration Tool.

Point

If the new SD memory card contains a "LOGGING" folder and its subfolders, folder deletion takes time, possibly resulting in missing data. Ensure that the new SD memory card does not contain a "LOGGING" folder.

Logging state during SD memory card replacement

SD memory cards can be replaced without depending on the current data logging state. SD memory card replacement results in the deletion of the LOGGING folder if the data logging state is other than below:

- Stop
- Stop (after collection)
- Stop (after error)

Operations during SD memory card replacement

If one of the following operations is performed during the time between the removal and installation of SD memory cards, any data collected during that time will not be stored in the new SD memory card.

- STOP to RUN state*1
- Turn off and on the power*1
- Reset*1
- Suspend data logging
- Stop data logging

*1 An error is generated if data logging was previously running based on the setting file contained in the replaced SD memory card.

Operations after SD memory card replacement

If the SD memory card was replaced while data logging was running based on the data logging setting file contained in the SD memory card, the data logging setting file contained in the new SD memory card is used when data logging is started by one of the following operations. If the new SD memory card does not contain the data logging setting file, data logging is not started.

- STOP to RUN state
- Power-on to RUN state
- RESET to RUN state
- Data logging start

Stack file remaining in the replaced SD memory card

Replacing an SD memory card that contains a stack file may result in the storage file remaining in the replaced SD memory card along with storage files. If the stack file is remaining in the replaced SD memory card, recover the latest data contained in the stack file by doing the following:

- Retrieve the data from the stack file and combine the data with a storage file.
- Save the stack file as a storage file.

17.15 SD Memory Card Life When the Data Logging Function Is Used

An SD memory card has a life (restriction on writing data). The following shows the calculation method of an SD memory card life when the data logging function is used. Note that the actual life of the card varies depending on the use conditions and environment. Therefore, use the calculated life as a rough standard for the replacement of the card.

Calculation formula of SD memory card life

SD memory card life (year) = Total size of data that can be written (G bytes) ÷ Size of data to be written per year (G bytes/year)

Total size of data that can be written

Capacity × Number of writes^{*1}

^{*1} For the capacity of applicable SD memory cards and the number of writes, refer to the following.

 MELSEC iQ-R Module Configuration Manual

Size of data to be written per year

The size of data to be written per year is obtained by the following formula.

Size of data to be written per year (G bytes/year) = $((DS1^{*1} + 6144) \times DN1 + \dots + (DSn^{*1} + 6144) \times DNn + (DCS1^{*1} + 6144) \times DCN1 + \dots + (DCSn^{*1} + 6144) \times DCNn) \div 1073741824$

^{*1} Round up DS_n and DCS_n to a multiple of 512.

DS_n, DN_n, DCS_n, and DCN_n are obtained as follows.

■Data logging data size per record (DS_n)

Binary file output format: Refer to the data. ( Page 255 Binary file output format)

Unicode text file format: Refer to the data row. ( Page 243 Unicode text file output type)

■Number of records for data logging per year (DN_n)

Continuous logging: $DNn = 60 \times 60 \times 24 \times 365 \div \text{Collection interval and timing (seconds)}^{*1} \times \text{Operating rate}^{*2}$

Trigger logging: $DNn = \text{Total number of records}^{*3}$

^{*1} The value that is determined depending on the condition set in "Sampling" when "Continuous logging" is selected for the logging type. (When the value is determined in milliseconds, convert the value into seconds.)

^{*2} Calculate the ratio using the operating time per year of the CPU module. For example, if the operating time per year is 5000 hours, the operating rate is calculated as follows: $5000 \div (24 \times 365) = 0.57$.

^{*3} The value set in "Number of logging lines" when "Trigger logging" is selected for the logging type.

■Header size of data logging (DCS_n)

Binary file output format: Refer to the header. ( Page 255 Binary file output format)

Unicode text file format: Refer to the file information row to device comment row. ( Page 243 Unicode text file output type)

■Number of file switching times for the data logging per year (DCN_n)

Calculate this number with an estimated number according to the save setting of the data logging and system operations. For example, when 1000 records are set in "Number of records" of "File switching timing" in the save setting and "Each scanning cycle" is specified for "Sampling interval" in the sampling setting, the time interval of the file switching is obtained by multiplying the scan time by 1000. Therefore, the number of file switching times for the data logging per year is obtained by the following formula: $60 \times 60 \times 24 \times 365 \div (\text{Scan time (second)} \times 1000)$

17.16 Errors Generated During Data Logging

No diagnostic error occurs if an error occurs during data logging, the SM applicable to the special relay (data logging error) setting No. turns on, and the error cause is stored in the SD applicable to the special register (data logging error cause) setting No.

17.17 Special Relay and Special Register Used by the Data Logging Function

For details on the special relay and special register areas used by the data logging function, refer to the following:

- Special relay: Special relay areas relating to the data logging function ( Page 597 Data logging function)
- Special register: Special register areas relating to the data logging function ( Page 628 Data logging function)

17.18 Precautions to Take When Using the Data Logging Function

This section describes precautions to take when using the data logging function.

Mutual exclusion of the data logging function

This section describes the mutual exclusion of the data logging function.

■When another function is executed during the execution of the data logging function

The following table lists the cases where another function is executed during the execution of the data logging function.*1

Function that has been already executed	Function to be executed later	Behavior
Data logging function	Data logging function	When the data logging is started using CPU Module Logging Configuration Tool to the same data logging setting number via another route, the data logging to be executed later cannot be executed. However, the data logging to be executed later can be executed to a data logging setting number different from the data logging setting number currently being executed.
		The data conditions cannot be specified as the trigger conditions for multiple trigger conditions at the same time.
		For the execution of multiple data loggings, the data logging settings stored in different target memory areas cannot be executed at the same time.
	Auto logging	The auto logging cannot be executed during the execution of the data logging. (Even though an SD memory card where the auto logging setting is written is inserted, the auto logging does not start.)
	Online change (ladder block)	<ul style="list-style-type: none"> ■When a step number is specified as the collection start condition or trigger condition <ul style="list-style-type: none"> • A data logging error occurs. • The online change (ladder block) is completed. ■When a label is specified as the collection start condition, data collection target, or trigger condition <ul style="list-style-type: none"> • When the bit of the corresponding setting No. of SD940 (Stop direction at file change on label specification) is on, changing the global label setting file (when the global label is specified) or the program file (when the local label is specified) to files different from the ones at the start operation of data logging causes a data logging error. • The online change (ladder block) is completed.
	File batch online change	<ul style="list-style-type: none"> ■When a step number is specified as the collection start condition or trigger condition <ul style="list-style-type: none"> • A data logging error occurs. • File batch online change is completed. ■When a label is specified as the collection start condition, data collection target, or trigger condition <ul style="list-style-type: none"> • When the bit of the corresponding setting No. of SD940 (Stop direction at file change on label specification) is on, changing the global label setting file (when the global label is specified) or the program file (when the local label is specified) to files different from the ones at the start operation of data logging causes a data logging error. • File batch online change is completed.
	CPU module data backup function	The CPU module data backup function cannot be executed while a logging setting file is being written/deleted or a logging setting is being registered/cleared.
	CPU module data restoration function	The CPU module data restoration function cannot be executed while a logging setting file is being written/read/deleted or a logging setting is being registered/cleared.
	iQ Sensor Solution data backup/restoration function	The iQ Sensor Solution data backup/restoration function cannot be executed while a logging setting file is being written/deleted or a logging setting is being registered/cleared.
	Function specified in the internal buffer capacity setting*2	If the internal buffer capacity setting is changed to execute the subsequent function, attempting to start the subsequent function results in an error. The data logging continues to function normally.
	Function not specified in the internal buffer capacity setting	<p>If the condition "Total capacity that is set in the internal buffer capacity setting + Internal buffer capacity that is set in other than the internal buffer capacity setting > 3072K bytes" is satisfied, attempting to start the subsequent function results in an error. The data logging continues to function normally.</p> <p>If the internal buffer capacity setting is changed to execute the subsequent function, attempting to start the subsequent function results in an error. The data logging continues to function normally.</p>
Auto logging	Data logging function	<ul style="list-style-type: none"> • Another data logging cannot be executed during the execution of the auto logging. • Even if data logging is started by using CPU Module Logging Configuration Tool, another data logging cannot be executed until the SD memory card with the auto logging setting is removed.
Data logging function (when the storage location is the function memory)	File batch online change	The file batch online change cannot be executed during data logging (when the storage location is the function memory).

Function that has been already executed	Function to be executed later	Behavior
Data logging file transfer (when the storage location is the function memory)	File batch online change	The file batch online change cannot be executed during data logging file transfer (when the storage location is the function memory).
Data logging function (Transfer to the data memory)	CPU module data backup function	The CPU module data backup function cannot be executed during data logging file transfer to the data memory.
	CPU module data restoration function	The CPU module data restoration function cannot be executed during the data logging file transfer to the data memory.

*1 The data logging function is being executed in the following states where the data logging status remains intact or when the save status is "Saving".

- RUN waiting (no collection)
- Condition waiting (no collection)
- Start waiting (no collection)
- Pause
- Collecting
- Trigger waiting (Collecting before trigger)
- Collecting after trigger

In the states other than the above, although the functions can be executed, the registration of the data logging setting executed first is canceled when the data logging function or another function is executed.

*2 The data logging function is not included here.

■When the data logging function is executed during the execution of another function

The following table lists the cases when the data logging function is executed during the execution of another function.

Function that has been already executed	Function to be executed later	Behavior
Online change (ladder block)	Data logging function	<p>■When a step number is specified as the collection start condition or trigger condition or when a label is specified as the collection start condition, data collection target, or trigger condition</p> <ul style="list-style-type: none"> • The online change (ladder block) is completed. • The data logging cannot be executed. (An error occurs when the start operation of the data logging is performed during the online change (ladder block).)
File batch online change		<p>■When a step number is specified as the collection start condition or trigger condition or when a label is specified as the collection start condition, data collection target, or trigger condition</p> <ul style="list-style-type: none"> • File batch online change is completed. • The data logging cannot be executed. (An error occurs when the start operation of the data logging is performed during the file batch online change.)
CPU module data backup function		While the CPU module data backup function is being executed, a logging setting file cannot be written/deleted or a logging setting cannot be registered/cleared.
CPU module data restoration function		While the CPU module data restoration function is being executed, a logging setting file cannot be written/read/deleted or a logging setting cannot be registered/cleared.
iQ Sensor Solution data backup/restoration function		While the iQ Sensor Solution data backup/restoration function is being executed, a logging setting file cannot be written/deleted or a logging setting cannot be registered/cleared.
Function specified in the internal buffer capacity setting ^{*1}		If the internal buffer capacity setting is changed to execute data logging, attempting to start data logging results in an error. The function already in execution continues to function normally.
Function not specified in the internal buffer capacity setting		If the internal buffer capacity setting is changed to execute data logging, attempting to start data logging results in an error. The function already in execution continues to function normally.
CPU module data backup function ^{*2}	Data logging function (Transfer to the data memory) ^{*3}	While the CPU module data backup function is being executed, a data logging file cannot be transferred to the data memory.
CPU module data restoration function ^{*2}		While the CPU module data restoration function is being executed, a data logging file cannot be transferred to the data memory.

*1 The data logging function is not included here.

*2 The CPU module data backup/restoration function executed during data logging

*3 It is executed when the trigger logging data collection is completed or data collection for the specified number of storage files is completed.

■When a file operation related to the data logging is performed during the execution of the data logging function

The following table lists the cases when a file operation related to the data logging is performed during the execution of the data logging function.

Target file	File operation	Behavior
Data logging setting file/common setting file	Write/delete	During execution of the data logging function, data cannot be written/deleted to/in the data logging setting file/common setting file being used.
	Folder delete	Folders cannot be deleted from the \$MELPRJ\$ folder in which the data logging setting files and the common setting file are stored.
	Initialize	During execution of the data logging function, the memory storing the data logging setting files and the common setting file being used cannot be initialized.
Data logging file	Write/delete/folder delete	During execution of the data logging function, data cannot be written/deleted to/in or folders cannot be deleted from the data logging file being used.
	Initialize	During execution of the data logging function, the memory storing the data logging file being used cannot be initialized.

■When an attempt is made to write the data logging setting file during the execution of another function

The following table lists the cases when an attempt is made to write the data logging setting file during the execution of another function.

Function that has been already executed	Behavior
Online change (ladder block)	<p>■When a label is specified as the collection start condition, data collection target, or trigger condition</p> <ul style="list-style-type: none"> • The online change (ladder block) is completed. • The data logging setting file cannot be written.
File batch online change	<p>■When a label is specified as the collection start condition, data collection target, or trigger condition</p> <ul style="list-style-type: none"> • File batch online change is completed. • The data logging setting file cannot be written.

Locations from which data logging can be performed

Data logging cannot be performed from multiple locations to the same setting number. The CPU module supports data logging performed concurrently at a maximum of 10 locations assigned to setting numbers 1 to 10.

Retention and clearance of data logging settings

After the data logging is started, the registered data logging settings are latched. Thus, if the data logging is started (registered) before powering off and on or resetting the CPU module, register the settings again when performing the following operations to the CPU module; Powering off and on and switching the operating status to RUN; Resetting and switching the operating status to RUN; Switching the operating status from STOP to RUN.

As a result, data logging can be executed again with the registered data logging setting.

However, the registration of the data logging settings is canceled in the following cases. (The corresponding SM number to the data logging setting number among relevant special relay areas (data logging preparation) turns off.)

- The CPU module is turned off and on or is reset without an SD memory card that contains the data logging setting file.
- The replaced SD memory card does not contain the data logging setting file and the CPU module is turned off and on or is reset.*1

*1 If the data logging setting file contained in the replacement (new) SD memory card is different from that contained in the replaced (old) SD memory card, register the data logging setting file contained in the replacement SD memory card.

It is necessary to register the data logging settings again by the user operation of starting data logging in CPU Module Logging Configuration Tool.

Behavior that occurs when trigger logging is resumed

If data logging is stopped or collection is suspended before the completion of trigger logging and subsequently data logging is run again, data collection begins from the initial state before trigger logging, rather than continuing from the last time.

Stopping/suspending data logging using CPU Module Logging Configuration Tool

After data logging is stopped or suspended from CPU Module Logging Configuration Tool, all the data in the internal buffer are saved into the target memory. If a small number of records or a small file size is specified as part of the storage file switching condition, saving data to the target memory may take longer.

Error that occurs when the data logging is started

Behavior when an error occurs at the start of the multiple data logging settings at the same time is as follows:

- If the start operation is performed by using CPU Module Logging Configuration Tool, the CPU module runs data logging for the setting files that have been successfully registered.
- If the auto logging is started, the CPU module does not run any data logging session.

Behavior upon change of the internal buffer capacity

When the internal buffer capacity is changed during execution of the data logging function, note that:

- If the internal buffer capacity for the setting number of the running data logging is left empty to disable the capacity, an error occurs when the data logging is stopped and restarted (write to the programmable controller does not cause an error).
- If the internal buffer capacity of the setting number of the running data logging is changed to a smaller value, data may be lost when the data logging is stopped and restarted.

Trigger condition at the start operation of data logging

Ensure that the trigger condition is not met during the registration of the data logging settings by the start operation of data logging. If the trigger condition is met, the data logging settings cannot be registered.

When file register is specified as device/label in condition specification

After registration of data logging, do not change the file name and block number of the file register file in the following cases; the file register is specified as the device or the global label where the file register is assigned as the label for the condition specification in the "Sampling" and "Trigger" settings. Doing so may possibly result in failure to successfully collect data logging results.

When the data collection condition is set to "Time specification"

If "Time specification" is selected for the data collection condition, data collection is performed as an interrupt processing operation and therefore special care should be taken when configuring the data collection interval, the data collection timing, and the data logging processing time per scan. In the following cases, scans may take a longer time, possibly resulting in a WDT error:

- The collection interval and the collection timing are so short that data logging is frequently performed during a single scan.
- The data to be collected is so much that the data logging processing time per scan is long.

Numbering of the storage files used during data logging

■If one or more numbered storage files already exist in the file storage folder

The new file is given a file name that uses a number incremented by one from the highest number among the existing files. When the setting for files that has been completed to transfer is specified to delete in the file transfer setting, numbering to new storage files starts from 1 because no files exist in the folder at the time of restarting data logging.

■If one or more storage file folders exist but no storage files in them

A new file is stored into a folder with the lowest number and given the same number as the folder.

However, if there are 258 or more folders, a new folder is created and the file in it is given the same number as the new folder. When the file that has been completed to transfer is specified to delete in the file transfer setting, the existing folders are deleted if no files exist in the folders when the data logging stops. (The existing folders are not deleted while the data logging is in progress.)

Behavior that occurs while collected data is stored in the target memory

If one of the following operations is performed while collected data is stored in the target memory, any unsaved data is cleared and not reflected to the results:

- Powering off and on the CPU module
- Reset

If one of the following operations is performed, unsaved data continues to be stored in the target memory:

- Changing the operating status of the CPU module from RUN to STOP
- Suspending the data logging by turning on of the special relay areas SM1312 to SM1321 (Data logging setting No.1 to 10 Data logging suspend/resume flag)
- Stopping/suspending data logging from within CPU Module Logging Configuration Tool
- Issuing the LOGTRGR instruction

Creating files and folders

Under the "LOGGING" folder that contains data logging setting files and data logging files, do not attempt to create files or folders using a personal computer or other device. Doing so may result in deletion of files and folders.

When collection is performed at the specified time

When "Time specification" is selected for the data collection condition and the collection at the specified time is selected rather than data collection during the END processing, check the collection interval by referring to the information reported in the collection interval column. Do not rely on the information reported in the date/time column because it may be incorrect due to clock accuracy error.

Changing the clock data

Whatever changes, such as advancing or reverting the clock, are made to the clock data of the CPU module during data logging, the CPU module performs data collection at the specified collection interval/timing, but the date/time column in the output file reports the changed clock data.

Events that are not recognized as a trigger condition

For trigger logging, the following events are not recognized as a trigger condition:

- A second trigger condition is met after the first trigger condition is met.
- The data condition specified as part of the trigger condition is met within the I49 interrupt program.

Point

If a data condition is specified as part of the trigger condition, any trigger condition met during the execution of the I49 interrupt program will not be recognized as a trigger condition. In this case, using I48 instead of I49 allows for avoiding the timing when the condition is not met.

Access to an SD memory card or the function memory

If data logging is performed with a setting that the data collection interval is short or the number of records to be collected is large, access (read/write) to an SD memory card or the function memory occurs so frequently that a delay occurs in completing the access. To avoid such a delay, use the following workarounds:

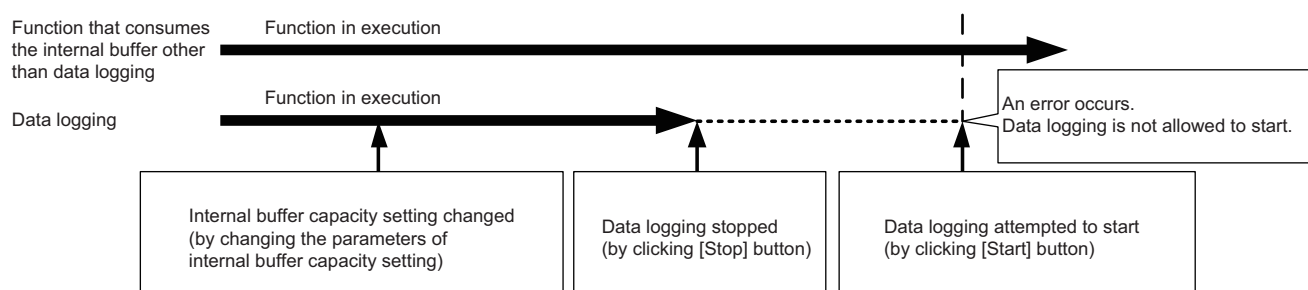

- Increase the data collection interval/timing.
- Reduce the number of data records to be collected.
- Lower the frequency of file switching.

Access to the CPU module during data logging

When the multiple data logging settings are started at the same time (when the multiple data logging settings are registered again at the same time), a time-out error may occur in communications or a dedicated instruction issued from a peripheral to the CPU module. Take measures such as increasing the time-out time period of the peripheral, reducing some data logging settings, and stopping the other functions.

Behavior at parameter change when functions consuming the internal buffer are active

If the internal buffer capacity setting is changed during the execution of the functions that consume the internal buffer, attempting to start data logging results in an error, where the data logging fails to start.

CPU module operation when registering the data logging

Note that the operating status of the CPU module is not changed until the following data logging registration or data save processing is completed. (The operating status may not be switched to STOP immediately.)

- While saving the data in the internal buffer by changing the operating status of the CPU module from RUN to STOP or operation to stop/pause data logging from CPU Module Logging Configuration Tool
- When the multiple data logging settings are started at the same time (when the multiple data loggings are registered again at the same time)
- When the data logging is started with any unused folders remaining in the storage memory

The waiting time for the operation status change of the CPU module is shortened by reducing the number of data logging settings and deleting unused folders.

Unicode text file

To view the data, use a software application with Unicode support. The data may be displayed incorrectly in a software application with no Unicode support. To open a Unicode text file with multiple lines of comments in Microsoft® Excel, be sure to drag and drop the file on the Microsoft® Excel window; otherwise, the content of the file may be displayed incorrectly in Microsoft® Excel.

Registration of the available devices

■User device, system device, file register, and index register

The data logging settings can be registered when devices of the CPU module exist. When a device number outside the range is specified, an error occurs at the registration.

■Module access device (buffer memory) and link direct device

The data logging settings can be registered when the buffer memory and devices of the target module exist. When the target module is not mounted or a device number outside the range is specified even with the target module mounted, an error occurs at the registration.

■Local device

The data logging settings can be registered when the target program name and devices in the target program exist. When a device number outside the range of the target program is specified, an error occurs at the registration.

■Local index register, local long index register, and file register in which "Use File Register of Each Program" is set

The program name cannot be specified for the following devices.

- Local index register
- Local long index register
- File register in which "Use File Register of Each Program" is set

To perform data logging of the above devices, transfer the data of the above devices to the global device on the program using the engineering tool beforehand.

For the data logging device, specify the global device where the data is transferred. The data to be logged is the data specified in the data collection condition.

File operation during execution of data logging

This section describes file operation during execution of data logging.

Target file	File operation	Behavior
Data logging setting file	Write	During execution of data logging, it is not possible to write/delete data to/in the data logging setting file being used.
	Delete	
	Initialize	During execution of data logging, it is not possible to initialize the memory storing the data logging setting file being executed.
	Folder delete	Folders cannot be deleted from the \$MELPRJ\$ folder in which the data logging setting file is stored.
Data Logging File	Write	During execution of data logging, it is not possible to write/delete data to/in and delete folders from the data logging setting file being used.
	Delete	
	Folder delete	
	Initialize	During execution of data logging, it is not possible to initialize the memory storing the data logging setting file being executed.

About remote operation

When remote RUN is performed while the data logging function is in the following execution status, the remote RUN may fail. In that case, wait for a while and retry remote RUN. If remote RUN still cannot be executed, check whether remote RUN is acceptable and retry remote RUN.

Execution state of data logging function	The situation to accept remote RUN
Saving data in the internal buffer into a storage location in progress	No special relay (Data logging data saving in progress) is on.
After the start operation of data logging by CPU Module Logging Configuration Tool (Registration of the data logging setting in progress)	The special relay (data logging preparation) and the special relay (data logging start) corresponding to the setting number of the data logging setting, which is being registered in the way shown in the left column, are on.
After data logging is started by auto logging (Registration of the auto logging setting in progress)	SM1200 (Auto logging setting file and registration status) is on.

RUN operation through switching operation or the RUN contact

During execution of data logging, when the status of the CPU module is switched from STOP to RUN with the RUN/STOP/RESET switch, or when the RUN contact that is specified in the RUN-PAUSE contact setting turns off, it may take time to return to the RUN state.

Using together with interrupt programs

When occurrence of an interrupt is specified as the data collection condition of data logging, the processing time of the interrupt program increases because the processing time of the data logging function is added.

When the sampling method of the recording function is set to use the trigger instruction in an interrupt program, the processing time of the interrupt program also increases because the sampling processing time for the recording function is added.

For this reason, a WDT error may occur if an interrupt interval of I49 set in the parameter of "Interrupt Setting from Internal Timer" under "Fixed Scan Interval Setting" is too short (such as 0.05ms) and occurrence of I49 is specified as the data collection condition, since the processing time of the interrupt program becomes longer than the set interrupt period and the END instruction cannot be executed due to the continuous execution of the interrupt program. For how to reduce processing time of interrupt programs, refer to Saving/restoring of the file register (R) block number. (📖 Page 111 Saving/restoring of the file register (R) block number)

Data logging using the function memory as the data storage destination

■Power-off or reset during data logging

During data logging using the function memory as the data storage destination, do not power off or reset the CPU module. During data logging, if the CPU module is powered off or reset before completion of the data transfer to the data memory (before data logging is completed or stopped), all the data logging data (data logging files) in the function memory are deleted. When the data logging file transfer function is used, all data logging data in the standby state are deleted as well. When data logging is restarted after power-off or reset, a new data logging file is given a file name that uses a number incremented by one from the end number of data logging file in the function memory before power-off or reset.

■Starting data logging during the file batch online change

Do not start the data logging using the function memory as the data storage destination during the file batch online change. Otherwise, an error occurs at the start operation of data logging.

Data logging file transfer (FTP server auto transfer)

■Operations and functions that cannot be performed

While the following operation or function is being executed, the data logging file transfer function cannot be executed.

- Auto logging

■Data collection performance

The performance of the data collection is decreased compared to when the data logging file transfer function is not used. As a result, missing may occur in the data logging setting in which no missing has occurred. When a missing has occurred, the frequency of missing may be increased. ( Page 274 Switching to a storage file)

■SD memory card during data logging file transfer

If the SD memory card is specified as the data storage destination of data logging files, an SD memory card cannot be replaced during data logging file transfer. ( Page 290 Conditions under which missing data occurs)

If the SD memory card forced disable function is executed or the SD memory card is removed during data logging file transfer, a file transfer error occurs.

■Powering off and on or a reset operation during file transfer

If the CPU module is powered off and on or is reset during data logging file transfer, data logging files being transferred may remain in the FTP server. The files being transferred and in the standby (retry) status are not transferred again.

■File transfer at power-off or reset

The files being transferred and in the standby (retry) status when the CPU module is powered off or reset are not transferred again after the power-on or reset.

■Error at "Overwrite" operation of the data logging file

When "Overwrite" is selected for the operation at the time when the number of files exceeds the maximum number of files to be saved, the file being transferred may be overwritten and a file transfer error may occur if the Ethernet line is busy.

To ensure the file transfer, configure the following settings.

1. Set a large value for "Number of files to be saved".
2. Set "Stop" for "Operation when exceeds the number of files".
3. Configure the setting to delete files that complete data logging file transfer. ( Page 282 Deleting files completed transfer)

■Port number when using the socket communications function

For the data logging file transfer function, the own station port numbers F230H to FFFEH are used. Thus, do not specify the own station port numbers F230H to FFFEH for the connection establishment instruction (SP.SOCOPEN) of the socket communications function while the data logging file transfer function is executed. Otherwise, the instruction may be completed with an error.

■SLMP communications

For the SLMP communications, port numbers set with the parameters take a priority. Thus, the SLMP communications are not affected by this function even if F230H to FFFEH are specified for the own station port number with the parameters.

■File transfer processing time

The file transfer processing time differs depending on the Ethernet line load ratio (network congestion), the operating status and system configuration of other communication functions.

■Communications during the data logging file transfer

Since the Ethernet communication load is high during the data logging file transfer, the behavior is as follows.

- When other communication functions such as MELSOFT connection and SLMP communications are executed using UDP, data may be lost at UDP reception and timeout and other errors may occur. Use TCP for communications while this function is executed.
- When other communication functions such as MELSOFT connection and SLMP communications are executed, their completion are delayed.

■A data logging file with a file transfer error

If a communication error, a file access error, or a file transfer stop error occurs during the file transfer, the data logging files being transferred may remain in the FTP server. Do not refer to those data logging files since the data is not guaranteed. (Data logging files in which a file transfer error has occurred can be checked in the file transfer error history.)

■Data logging stop operation at logging out from the FTP server

Even when the data logging file is transferred successfully, a data logging file transfer error occurs if the operation to stop data logging file transfer function is performed before logging out from the FTP server or logout fails.

■Timing for DNS setting

To enable the DNS setting, the CPU module needs to be powered off and on or reset. Therefore, when DNS is set during logging, data in the function memory is deleted if the function memory is specified as the data logging file storage destination. Configure the DNS setting before the logging starts.

■When the function memory is specified for the data storage destination

When the function memory is specified for the data storage destination, do not power off or reset the CPU module until the file transfer is completed. Doing so deletes all the data logging files which have not been transferred (standby) in the function memory.

■File access during the data logging file transfer

- Do not read files in the SD memory card during the file transfer. The transferred files can be read from the server. If a data logging file in the CPU module is read by using GX LogViewer during the data logging file transfer, the file being read may be deleted by the setting to delete the transferred files and a file read error may occur.
- When a file is accessed (read/write) during the data logging file transfer, the completion for the file access may be delayed depending on the number of files.

■Starting data logging during the file transfer

Since the data logging of the same setting number cannot be started during the file transfer to the FTP server, start data logging after completion of the file transfer. Otherwise, an error occurs at the start operation of data logging.

Data transfer to the data memory

■Free space in the data memory

When the transfer to the data memory is set, delete data by user data operation in the engineering tool to free up space in the data memory for storing the transferred data logging files.

When a file transfer error occurs due to out of data memory space during transfer to the data memory, free up the required space and turn on SM653 (File transfer to data memory request) to transfer the data to the data memory again.

Check the required free space for transfer to the data memory as follows.

Required free space for transfer to the data memory = Function memory capacity^{*1} - Function memory free area capacity^{*2}.

*1 The size can be checked in SD648/SD649 (Function memory capacity).

*2 The size can be checked in SD650/SD651 (Function memory free space capacity).

The data logging file in the function memory are not deleted by transferring data to the data memory by using SM653. Thus, after transferring data to the data memory by using SM653, it is recommended to turn on SM652 (Function memory clear request) and delete unnecessary files in the function memory for the next data logging.

■When the CPU module is in the STOP state and data logging is in the pause state

When the CPU module is in the STOP state, and the data logging is in the pause state, data is not transferred to the data memory. Turn on SM653 (File transfer to data memory request) as necessary and transfer data to the data memory again.

■Power-off or reset during the data transfer to the data memory

- When an error occurs during the data transfer to the data memory, all data logging files in the function memory are deleted when the CPU module is powered off or reset. Turn on SM653 (File transfer to data memory request) as necessary and transfer data to the data memory again.
- During the data transfer to the data memory, a temporary file "LOGGING_T.TMP" is created and file name is changed after completion of the file transfer. Therefore, if the CPU module is powered off or reset during the transfer, the temporary file may remain. In that case, delete the file by user data operation in the engineering tool.

■Starting data logging during the data transfer to the data memory

Since the data logging of the same setting number cannot be started during the data transfer to the data memory, start data logging after completion of the file transfer. Otherwise, an error occurs at the start operation of data logging.

Data in the CPU module when a device/label is specified

Before starting the data logging, write the following data to the CPU module from the engineering tool.

Device/label specification	Data required to be written
When a local device is specified	The CPU parameter including the program name specified with CPU Module Logging Configuration Tool
When a global label is specified	Project data that is read using CPU Module Logging Configuration Tool (global label setting file)
When a local label is specified	<ul style="list-style-type: none"> Project data that is read using CPU Module Logging Configuration Tool (the program file with the corresponding program name) The CPU parameter including the program name specified with CPU Module Logging Configuration Tool

In the following cases, data cannot be written with CPU Module Logging Configuration Tool.

Device/label specification	Description
When a local device is specified	<ul style="list-style-type: none"> The CPU parameters do not exist in the CPU module. The program name specified is not set in the program setting in the CPU parameters.
When a global label is specified	<ul style="list-style-type: none"> The global label setting file does not exist in the CPU module. The global label setting file in the CPU module and the project that is read using CPU Module Logging Configuration Tool (global label setting file) do not match.
When a local label is specified	<ul style="list-style-type: none"> The CPU parameters and the program file which has the corresponding program name do not exist in the CPU module. The program name is not set in the program setting in the CPU parameters. The program file which has the corresponding program name in the CPU module and the project that is read using CPU Module Logging Configuration Tool (the program file which has the corresponding program name) do not match.

CPU parameter at the start operation of data logging

When performing data logging in which the local device or local label specifying the program name (execution order) in the program setting of the CPU parameter is specified, do not change and write the CPU parameter to the CPU module after writing the data logging setting file. An error occurs during data logging registration after the CPU parameter is written. Change the internal buffer capacity in the CPU parameter used for data logging before writing the data logging setting file.

Change of the file when a label is specified

Do not perform the following operations after the registration of the data logging setting by starting the data logging or between the completion of writing the data logging setting file and the registration of the data logging setting.

Label specification	Description
When a global label is specified	Writing the global label setting file where a global label is added, changed, or deleted.
When a local label is specified	Writing a program file where a program is changed (including addition, change, and deletion of a local label).

These operations change assignment of labels, and thus the data logging may not be performed to the specified label. If a file is changed, perform either of the following operations.

- Import the project of the engineering tool to CPU Module Logging Configuration Tool again, and then write the data logging setting again.
- Read the file from the CPU module with "Online Data Operation" of the engineering tool. Save the project with the engineering tool and import the project to CPU Module Logging Configuration Tool again, and then write the data logging setting again.

Point

Using SD940 (Stop direction at file change on label specification) can prevent the data logging to a different file.

Turning on the bit of SD940 corresponding to the data logging setting No. being executed generates an error at the following timings.

- When the data logging is being executed: At writing a program file or global label setting file
- When the data logging is stopped or paused: At the registration of the data logging after a program file or global label setting file is written

For details on SD940, refer to the following.

 Page 626 Latch area

18 DEBUG FUNCTION

This chapter describes the functions used for debugging.

Item	Description	Reference
Online change (ladder block)	Changes and writes a part of the program and data online.	☞ Page 155 Online change (ladder block)
Memory dump function	Stores device values of the CPU module at any given timing.	☞ Page 306 Memory Dump Function

18.1 Memory Dump Function

This function stores device values of the CPU module at any given timing. Checking data at the desired timing through the function facilitates the analysis of troubles, the occurrence of which depends on a particular condition.

- (1) Perform memory dump settings.
- (2) Enters a wait state for the trigger after the memory dump setting file has been written.
- (3) Establishment of the trigger condition
- (4) Start of data collection
- (5) The LED on the front of the CPU module allows memory dump status to be checked. (☞ Page 312 LED status)
- (6) The memory dump file is stored in the SD memory card. (☞ Page 311 Memory dump file)

Restriction

- This function cannot be used in the R00CPU.
- Before executing the function, check the versions of the CPU module and engineering tool used. (☞ Page 705 Added and Enhanced Functions)

Object data

This section describes the data to be collected by memory dump.

Data to be collected

Of the devices listed below, all devices that are within the range specified in the device settings are subject to the collection.

Type	Device ^{*1}
Bit device	X, Y, M, L, B, F, SB, V, T (contact), T (coil), LT (contact), LT (coil), ST (contact), ST (coil), LST (contact), LST (coil), C (contact), C (coil), LC (contact), LC (coil), FX, FY, SM, BLn\S ^{*3}
Word device	T (current value), ST (current value), C (current value), D, W, SW, FD, SD, R ^{*2} , ZR ^{*2} , Z, RD
Double-word device	LT (current value), LST (current value), LC (current value), LZ

*1 Includes local devices as well. Note that to the memory dump file, the program names of collected local devices are output.

*2 All file registers that exist in the device/label memory are collected.

*3 The CPU module where the SFC function can be used supports this device. (📖 Page 705 Added and Enhanced Functions)

Trigger condition

The following table lists the conditions to be used as a trigger. Set the trigger condition in the memory dump settings. (📖 GX Works3 Operating Manual)

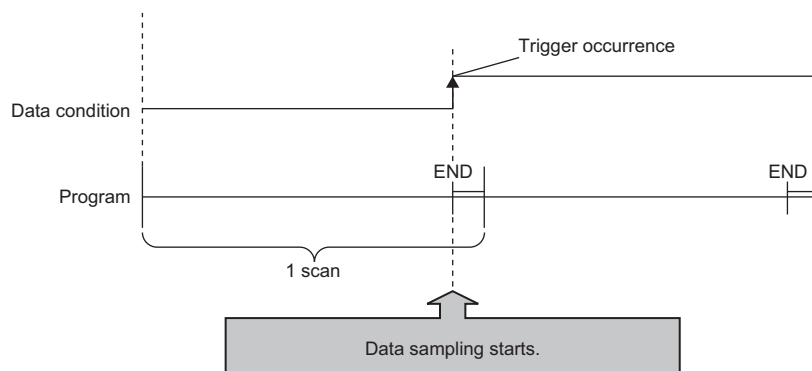

Trigger condition	Description
Device specification	Data are collected when the specified monitoring target data (bit data) turns on during the END processing.
Error code specification	Data are collected when an error occurs in the specified CPU module.

Point

- On the occurrence of consecutive triggers, if data collection due to the previous occurrence of trigger is completed and the status is "Trigger-wait not collected", the next trigger is recognized as a trigger again. Note that events other than the above are not recognized as a trigger condition.
- A trigger can be generated with trigger conditions combined. (📖 Page 309 Combining trigger conditions)

Device specification

Data are collected when the specified monitoring target data (bit data) turns on during the END processing. Even though the value of the monitoring target data changes during a single scan, if the value during the END processing is same as that during the last END processing, it is not recognized as a trigger. Completion bits (including error completion bits) used in dedicated instructions cannot be used as a trigger.

For monitoring data, the following devices can be specified.

Type	Device ^{*1}
Bit device	X, Y, M, L, F, SM, V, B, SB, T (contact) ^{*3} , ST (contact) ^{*3} , C (contact) ^{*3} , LT (contact) ^{*3} , LST (contact) ^{*3} , LC (contact) ^{*3} , FX, FY
Word device ^{*2}	D, SD, W, SW, R, ZR, FD, RD

*1 A local device, index modified device, and indirectly specified device cannot be specified.

*2 Word devices allow bit specification only.

*3 In the engineering tool, specify TS as T (contact), STS as ST (contact), CS as C (contact), LTS as LT (contact), LSTS as LST (contact), and LCS as LC (contact).

Error code specification

With a specified error code of the CPU module as a trigger, data is to be collected. The occurrence timing of trigger varies depending on the error type: continuation error or stop error.

■At the occurrence of a continuation error

The occurrence timing of trigger is at the time of END processing of the scan where an error has occurred.

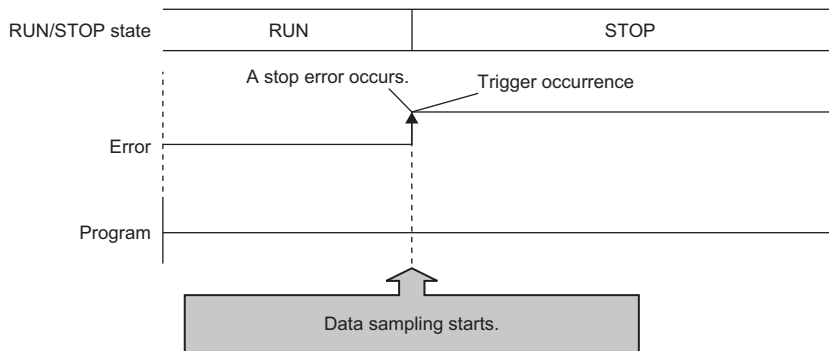

In the following situations, the occurrence of a continuation error that is specified as a trigger condition is not recognized as a trigger, with no data collection:

- After the occurrence of a continuation error that is specified as a trigger condition, the same error, or a continuation error, has occurred again.
- In the situation that a continuation error of 15 or more has occurred, a continuation error that is specified as a trigger condition has occurred.

Being recognized as a trigger requires the error to be cleared.

■At the occurrence of a stop error

The occurrence timing of trigger is at the time of occurrence of an error.

Point

To specify an annunciator number as a trigger condition, employ device specification to specify any desired annunciator number.

Combining trigger conditions

A trigger can be generated with trigger conditions combined. This combination is based on an OR condition. The establishment of a condition, either device specification or error code specification, results in data collection.

Procedure for memory dump

This section describes the procedure for memory dump. Note that each operation of the memory dump function is performed with the engineering tool.

[Debug] ⇒ [Memory Dump]

For how to view and operate the window, refer to the following.

GX Works3 Operating Manual

1. Configure the memory dump settings by the menu operation in the engineering tool.
 2. Writing the memory dump setting file results in a wait state for the trigger. Whether the CPU module is in a RUN state, STOP state (a stop error also included*1), or PAUSE state, a wait state for the trigger results.
- *1 Limited to where the trigger condition is device specification.

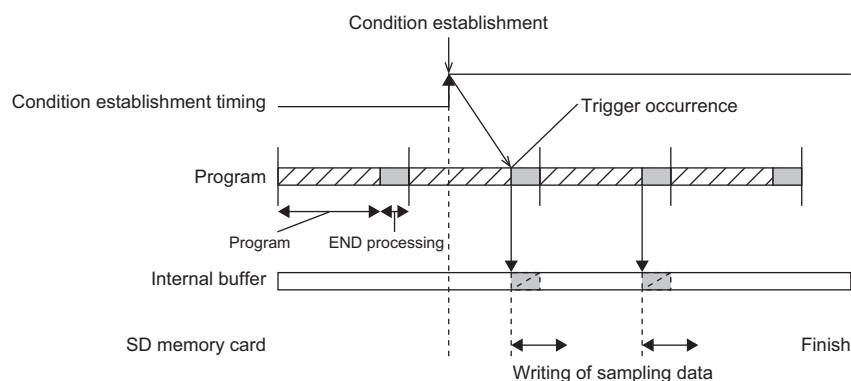

Point

- If the memory dump setting file is stored, putting the CPU module back into operation (powering off and on, or resetting) results in a wait state for the trigger.
- The engineering tool allows the memory dump status to be checked. The event history also allows checking whether or not in a wait state for the trigger.

3. Establishment of the trigger condition initiates data collection, saving the memory dump file to the SD memory card.
4. The contents of the memory dump file (collected device data) can be checked with the engineering tool.

Flow of data collection

Collected data is stored in the internal buffer, where the data is partitioned at END processing and saved in the SD memory card.

The size of data to be collected per END processing is determined according to the capacity setting of the internal buffer ( Page 266 Internal buffer capacity setting) and the individual area size of devices from which data is to be collected. Data is collected and partitioned into the groups per END processing, as in the table below. If the capacity of an individual area exceeds the internal buffer capacity, collected data in the individual area is further partitioned. The first 1K byte in the internal buffer is used as the system area, and thus the collection size per END processing is determined to a value of the internal buffer capacity minus 1K byte.

Partition area	Remarks
Device area	If the total value of devices exceeds the internal buffer capacity, the amount by which the internal buffer capacity is exceeded is collected at the next END processing in order from the top device, not collected at the current END processing.
Local device (at each program)	If the total value of local devices of programs concerned exceeds the internal buffer capacity, the amount by which the internal buffer capacity is exceeded is collected at the next END processing in order from the top device, not collected at the current END processing.
File register (at each file)	—
Refresh memory Refresh memory area	—

Effect on the scan time

The greater the number of collected points, the longer the scan time. For the increase in scan time due to the collected points, refer to the processing time. ( Page 661 Memory dump function)

Memory dump file

This file stores data that is collected through memory dump (collection result by memory dump). Data collected by one execution is saved in one file. The memory dump file is saved in a binary format and stored under the "MEMDUMP" folder.

Save file name

The file name can be arbitrarily set within a range of 64 characters (extension and period included) together with an auto-assigned number (00 to 99). Specify the save file name in the memory dump settings. (📖 GX Works3 Operating Manual)

Ex.

MEMDUMP_00*¹

*¹ Between a specified file name (MEMDUMP) and an auto-assigned number (00), the single-byte underscore (_) is added. When the memory dump function is registered, the debug folder (DEBUG (fixed)) and the memory dump folder (MEMDUMP (fixed)) are created in the SD memory card. The memory dump file (result file) is stored in the memory dump folder. One folder can contain a maximum of 100 files. If any file does not exist in creating a save file, the file with the number 00 is created. If any file already exists in creating a save file, the behavior is as follows:

Number of files	Behavior
For less than 100	Creates a file* ² assigning the number obtained by adding 1 to the number of the file where the creation date and time is the latest.
For 100 (maximum)	Deletes the file where the creation date and time is the oldest and creates a new file using the deleted number as it is.

*² If the corresponding file number is 99, a file with file number 00 is created.

States of the memory dump function

The state of the memory dump function is reflected in the memory dump status. The engineering tool allows the memory dump status to be checked. (📖 GX Works3 Operating Manual)

Memory dump status

The following table lists the memory dump status.

Memory dump status	Description
Trigger-wait not collected	A state that data is not yet collected and establishment of the trigger condition is being waited
Collecting after trigger	A state that collection of the data after trigger is in progress (includes a state that collected data is being saved in the target memory)
Collection completed	A state that collection of a specified data is completed
Error	A state that a memory dump error occurs and memory dump fails

LED status

Whether the memory dump function is active or not can be checked by the LED of the CPU module.

State of the memory dump function	LED status		
	FUNCTION LED	CARD READY LED	CARD ACCESS LED
Trigger-wait not collected	On	On	Off
Collecting after trigger	Flashes slowly (every one second)	On	Turns on when the SD memory card is accessed
Collection completed	Flashes at normal rate (every 200ms)	On	Off

Point

To let the FUNCTION LED indicate the status while the memory dump function is used, setting "LED Display Setting" in "RAS Setting" of the CPU parameter is required. (📖 Page 172 LED display setting)

For the FUNCTION LED indication, the following cases have priority over the function above.

- When the external input/output forced on/off function is executed (in registration) (📖 Page 209 FUNCTION LED)
- When program restoration information is not written (📖 Page 691 Checking the program restoration information write status)

After the external input/output forced on/off function has been executed (after the registration is canceled) and the program restoration information has been written, the LED display follows the status of the memory dump function.

Sizes of files used for the memory dump function

This section shows the sizes of files used for the memory dump function.

Capacity of the memory dump setting file

The capacity of the memory dump setting file varies depending on the length of the save file name. The following formula is used for the calculation:

$$\text{Capacity of memory dump setting file} = (((\text{Number of characters of save file name}^{*1} \times 2 \text{ bytes} + 1201 \text{ bytes (fixed)}) + 3) \div 4)^{*2} \times 4$$

*1 Except for the period and extension.

*2 The remainder is discarded.

Capacity of the memory dump file

The capacity of the memory dump file is given by the total of the following items:

$$\text{Capacity of memory dump file} = \text{Volume of header} + \text{Volume of data of program file name} + \text{Volume of device data} + \text{Volume of local device data} + \text{Volume of data of file register file name} + \text{Volume of file register data}$$

■Volume of header

The volume of header is given by:

$$\text{Volume of header} = 1088 \text{ bytes (fixed)}$$

■Volume of data of program file name

The volume of data of program file name is given by the total of the following items. Note that this data is always created in the memory dump file regardless of the settings of CPU parameters.

$$\text{Volume of data of program file name} = 16 \text{ bytes (fixed)} + (\text{Number of programs} \times (2 \text{ bytes (length of program file name)} + 130 \text{ bytes (program file name)}))$$

■Volume of device data

The volume of device data is given by the total of the following items. Note that this data is always created in the memory dump file regardless of the settings of CPU parameters.

$$\text{Volume of device data} = 682 \text{ bytes (fixed)} + \text{Volume of collected device data}$$

The volume of collected device data is given by the following:

$$\text{Volume of collected device data} = (\text{Total number of points of bit devices} \div 8) + (\text{Total number of points of word devices} \times 2) + (\text{Total number of points of word devices} \times 4)$$

■Volume of local device data

The volume of local device data is given by the total of the following items. Note that this data is not created in the memory dump file unless local devices are set in the CPU parameters.

$$\text{Volume of local device data} = 16 \text{ bytes (fixed)} + (\text{Number of programs} \times 4 \text{ bytes}) + (\text{Number of programs} \times \text{Volume of local device contents})$$

Item	Calculation method
Volume of local device contents	418 bytes (fixed) + Volume of collected local device data
Volume of collected local device data	(Total number of points of bit devices \div 8) + (Total number of points of word devices \times 2) + (Total number of points of word devices \times 4)

■Volume of data of file register file name

The volume of data of file register file name is given by the total of the following items. Note that this data is not created in the memory dump file unless a file register file exists in the device/label memory.

$$\text{Volume of data of file register file name} = 16 \text{ bytes (fixed)} + (\text{Number of file register files} \times (2 \text{ bytes (length of file register file name)} + 130 \text{ bytes (file register file name)}))$$

■Volume of file register data

The volume of file register data is given by the total of the following items. Note that this data is not created in the memory dump file unless a file register file exists in the device/label memory.

$$\text{Volume of file register data} = \text{Number of file register files} \times (148 \text{ bytes (fixed)} + (\text{Number of file registers} \times 2))$$

Special relay and special register used in the memory dump function

For details, refer to the following.

- Special relay: Special relay relating to the memory dump function (☞ Page 600 Memory dump function)
- Special register: Special register relating to the memory dump function (☞ Page 635 Memory dump function)

Precautions for the memory dump function

This section describes precautions to take when using the memory dump function.

Mutual exclusion of the memory dump function

The mutual exclusion of the memory dump function is as follows.

The following table lists the cases when another function is executed during the execution of the memory dump function^{*1}.

Function that has been already executed	Function to be executed later	Behavior
Memory dump function	CPU module data backup function	The CPU module data backup function cannot be executed while memory dump is being registered/cleared.
	CPU module data restoration function	The CPU module data restoration function cannot be executed while a memory dump file or memory dump setting file is being read or memory dump is being registered/cleared.
	iQ Sensor Solution data backup/restoration function	The iQ Sensor Solution data backup/restoration function cannot be executed while memory dump is being registered/cleared.
	Function specified in the internal buffer capacity setting ^{*2}	If the internal buffer capacity setting is changed to execute the subsequent function, attempting to start the subsequent function results in an error. The memory dump continues to function normally.
	Function not specified in the internal buffer capacity setting	If the condition "Total capacity that is set in the internal buffer capacity setting + Internal buffer capacity that is set in other than the internal buffer capacity setting > 3072K bytes" is satisfied, attempting to start the subsequent function results in an error. The memory dump continues to function normally. If the internal buffer capacity setting is changed to execute the subsequent function, attempting to start the subsequent function results in an error. The memory dump continues to function normally.

*1 The state where the memory dump function is in execution includes the memory dump status of "Collecting after trigger" or the save status of "Saving in progress".

*2 The memory dump function is not included.

The following table lists the cases when the memory dump function is executed during the execution of another function.

Function that has been already executed	Function to be executed later	Behavior
CPU module data backup function	Memory dump function	While the CPU module data backup function is being executed, memory dump cannot be registered/cleared.
CPU module data restoration function		While the CPU module data restoration function is being executed, a memory dump file or memory dump setting file cannot be read or memory dump cannot be registered/cleared.
iQ Sensor Solution data backup/restoration function		While the iQ Sensor Solution data backup/restoration function is being executed, memory dump cannot be registered/cleared.
Function specified in the internal buffer capacity setting ^{*3}		If the internal buffer capacity setting is changed to execute memory dump, attempting to start memory dump results in an error. The function already in execution continues to function normally.
Function not specified in the internal buffer capacity setting		If the internal buffer capacity setting is changed to execute memory dump, attempting to start memory dump results in an error. The function already in execution continues to function normally.

*3 The memory dump function is not included.

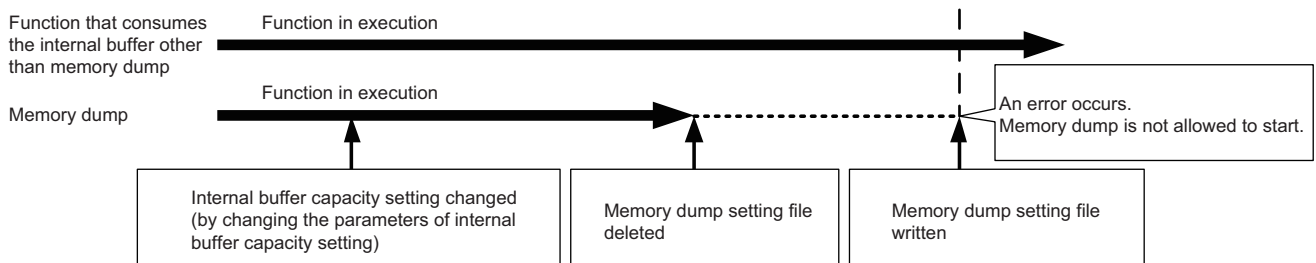

The following table shows the cases where the file operation related to the memory dump function is executed while the memory dump function is in execution.^{*4}

Target file	File operation	Behavior
Memory dump setting file	Write	Settings that are subsequently written during the execution of the memory dump function are reflected after the completion of save, not reflected immediately.
	Delete	If the memory dump setting file is subsequently deleted during the execution of the memory dump function, the memory dump settings are cleared after the completion of save.
	Initialize	Initialization fails on the memory dump setting file during the execution of the memory dump function.
	Folder delete	Folder delete fails on the folder in which the memory dump setting file is stored.
Memory dump file	Write, read, delete, initialize, and folder delete	Write, read, delete, initialize, and folder delete fails on the memory dump file during the execution of the memory dump function.

*4 The state where the memory dump function is in execution includes the memory dump status of "Collecting after trigger" or the save status of "Saving in progress".

Behavior at parameter change when functions consuming the internal buffer are active

If the internal buffer capacity setting is changed during the execution of functions that consume the internal buffer, attempting to start memory dump results in an error, where the memory dump fails to start.

Operation on each individual file

Write, read, and delete are possible on each file. In addition, folder/file all delete and folder delete are possible on the memory or folder in which files are stored. The following table shows whether each operation is possible or not depending on the execution status of memory dump.

○: Operation possible, ×: Operation not possible

File type	Operation to be performed							
	Read		Write/delete		Folder/file all delete		Folder delete	
	Not during execution ^{*1}	During execution ^{*1}	Not during execution ^{*1}	During execution ^{*1}	Not during execution ^{*1}	During execution ^{*1}	Not during execution ^{*1}	During execution ^{*1}
Memory dump setting file	○	○	○	○	○	×	×	×
Memory dump file	○	×	○	×	○	×	○	×

*1 The state where the memory dump function is in execution includes the memory dump status of "Collecting after trigger".

Where to carry out memory dump

Concurrent execution from multiple sources is not allowed. In the CPU module, execution at a time from only one source is possible.

Trigger condition during the registration of memory dump

If a trigger condition is established during the registration of memory dump, the memory dump settings can be registered. A second establishment of the trigger condition is recognized as a trigger condition there.

When file register is specified as specification device in the condition specification

After registering memory dump, do not change the file name of the file registers and the block number of the file registers. Doing so may result in a failure to successfully collect the memory dump results.

Creating files and folders

Under the "MEMDUMP" folder containing memory dump files, do not create any files or folders using a personal computer or other device. Doing so may result in deletion of files and folders.

Access to the SD memory card

The SD memory card is so frequently accessed that a delay occurs in completing the access to the SD memory card (read/write).

19 DATABASE FUNCTION

This function manages the data such as product information or production information as a database in an SD memory card of the CPU module.

This function cannot be used in the R00CPU, R01CPU, and R02CPU.

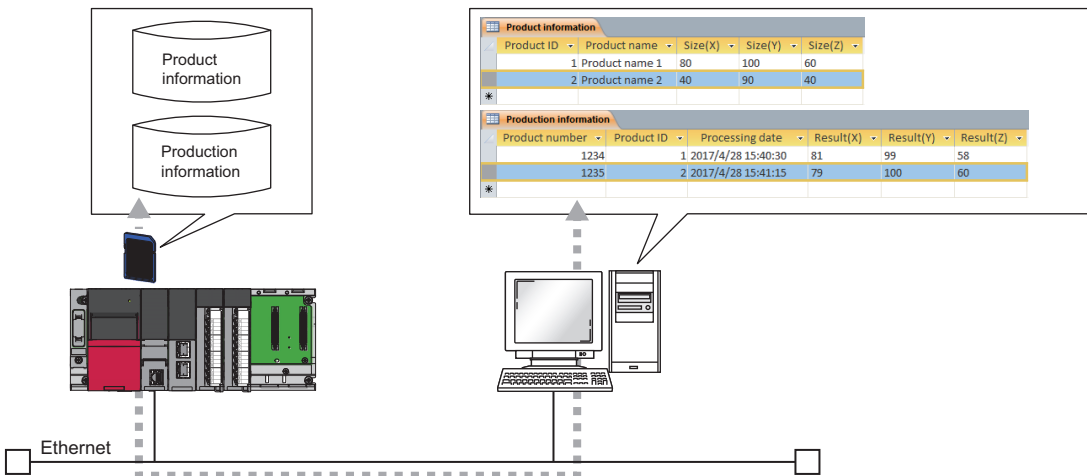

Database access instruction

The database access instructions allow the databases of product information and production information to be created, input, updated, edited, searched, transacted, and rolled back.

CPU module database access (from external device) function

The CPU module database access function enables operations such as table creation and record operation/search of the database built in an SD memory card inserted into the CPU module.

19.1 Specifications

Database specifications

The following table lists specifications of databases which the user can create.

Item	Description
The maximum number of fields	128 fields per table ^{*1}
The maximum number of records	No limitation (they can be created up to the capacity of the SD memory card) ^{*2*}
The maximum number of tables	32 tables per database ^{*3}
The maximum number of databases	No limitation (they can be created up to the capacity of the SD memory card)
The maximum number of concurrently connectable databases (number of connections)	4
The maximum number of characters of a field name	32 single-byte alphabetical characters
The maximum number of characters of a table name	32 single-byte alphabetical characters
Corresponding data type	 Page 318 Data type

*1 For the programmable controller CPU with firmware version earlier than "28", up to 16 fields can be created per table.

*2 For the programmable controller CPU with firmware version earlier than "28", up to 100000 records can be created per table.

*3 For the programmable controller CPU with firmware version earlier than "28", up to 16 tables can be created per database.

*4 For rough standards of the access time depending on the database size, refer to the following.

 Page 674 Database function processing time

■Data type

The following table lists the data types that can be used in the table created by using the database access instructions and the corresponding data types for the CPU module database access function.

Data type that can be used in the table created by using the database access instruction	Range	Corresponding data type for the CPU module database access function
BOOL: Bit	0, 1	BOOLEAN: Bit
WORD: Unsigned 16-bit numerical value	0 to 65535	INT: Unsigned 16-bit numerical value
DWORD: Unsigned 32-bit numerical value	0 to 4294967295	BIGINT: Unsigned 32-bit numerical value
INT: Signed 16-bit numerical value	-32768 to 32767	INT: Signed 16-bit numerical value
DINT: Signed 32-bit numerical value	-2147483648 to 2147483647	BIGINT: Signed 32-bit numerical value
REAL: Single-precision real number	E±1.175495-38 to E±3.402823+38	REAL: Single-precision real number
LREAL: Double-precision real number	E±2.22507385850721-308 to E±1.79769313486231+308	DOUBLE PRECISION: Double-precision real number
STRING: String (Shift-JIS code)	Number of supported characters: 1 to 124	NLSCHAR: String (Unicode)
WSTRING: String (Unicode)	Number of supported characters: 1 to 124	NLSCHAR: String (Unicode)

The following table lists the data types that can be used in the table created by the CPU module database access function and the corresponding data types for the database access instructions.

Data type that can be used in the table created by the CPU module database access function	Range	Corresponding data type for the database access instruction
BOOLEAN: Bit	0, 1	BOOL: Bit
INT: Signed 16-bit numerical value	-32768 to 32767	INT: Signed 16-bit numerical value
BIGINT: Signed 32-bit numerical value	-2147483648 to 2147483647	DINT: Signed 32-bit numerical value
REAL: Single-precision real number	E±1.175495-38 to E±3.402823+38	REAL: Single-precision real number
DOUBLE PRECISION: Double-precision real number	E±2.22507385850721-308 to E±1.79769313486231+308	LREAL: Double-precision real number
NLSCHAR: String (Unicode)	Number of supported characters: 1 to 124	WSTRING: String (Unicode)

- To input the data to the field of STRING using the CPU module database access function, use the data type of NLSCHAR. (Although the data is managed as Unicode in the database of the CPU module, it is converted to Shift-JIS code on the device of the CPU module.)
- To input the data in the data type of WORD or DWORD to the field using the CPU module database access function, the data must be within the range of WORD: 0 to 65535 or DWORD: 0 to 4294967295.

Available operations

The following table lists the operations that can be performed with the database functions.

○: Can be performed, ×: Cannot be performed

Operation		Description	Database access instruction		CPU module database access function	
			Availability and instruction symbol		Availability and application	
Database	Connection	Connects to the specified database.	○	DBOPEN(P)	○	Microsoft Access®, Excel®, user-created application
	Disconnection	Disconnects from the specified database.	○	DBCLOSE(P)	○	
	Import	Imports the specified data from the specified Unicode text file to create a database.	○	DBIMPORT(P)	×	—
	Export	Exports the specified data in the specified database into a Unicode text file.	○	DBEXPORT(P)	×	—
Table	Add	Adds a table to the database.	×	—	○	Microsoft Access®
Record	Access	Accesses the specified table in the database.	×	—	○	Microsoft Access®
	Add	Adds a record to the specified table of the database.	○	DBINSERT(P)	○	Microsoft Access®
	Update	Updates the value of the specified record on the specified table in the database.	○	DBUPDATE(P)	○	Microsoft Access®
	Acquire (Search)	Acquires the value of the specified record on the specified table in the database.	○	DBSELECT(P)	○	Excel®
	Delete	Deletes the specified record on the specified table in the database.	○	DBDELETE(P)	○	Microsoft Access®
Transaction	Start	Starts a transaction for the specified database.	○	DBTRANS(P)	○	Microsoft Access® (The transaction range depends on the application.)
	Commit	Commits a transaction for the specified database.	○	DBCOMMIT(P)	○	Microsoft Access® (The transaction range depends on the application.)
Rollback		Performs rollback on the specified database.	○	DBROLBAK(P)	○	Microsoft Access® (The transaction range depends on the application.)
Database operation by a desired SQL			×	—	○	User-created application

- For details on the database access instructions, refer to the following.
 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)
- For the available SQL commands for the CPU module database access function, refer to the following.
 Page 694 List of Available SQL Commands for CPU Module Database Access Function

- The user cannot execute multiple database access instructions simultaneously. If they are executed simultaneously, instructions other than the first one will be completed with an error.
- Even though the operation can be performed for the database of the CPU module by the SQL command, an error occurs on the application side when it cannot be performed in the application. In this case, check the details of the error and perform the operation within the range of the specifications of the application again.

19.2 Database Access Instruction

Usage procedure

This section describes the procedure to use the database function.

Creating databases

To construct a database on an SD memory card, create a Unicode text file which defines the configuration of the database and its tables, store the file on the SD memory card, and execute the DBIMPORT(P) instruction, specifying the created Unicode text file.

1. Create a Unicode text file which defines the configuration of a database and its tables. (☞ Page 321 Creating Unicode text files)
2. Write the created Unicode text file to the SD memory card. For details on how to write Unicode text files (write of user data), refer to the following.
📖 GX Works3 Operating Manual
3. By executing the DBIMPORT(P) instruction with the created Unicode text file specified, the database folder is created on the same layer as the Unicode text file and the database is constructed. (☞ Page 324 Folder configuration of databases)

Point

The DBEXPORT(P) instruction enables the user to check the contents of a database by exporting it to a Unicode text file. Also, when the user wants to add more than one record or field to a database, the user can change the configuration of the database by exporting it to a Unicode text file, editing the file, and executing the DBIMPORT(P) instruction to get the database back to the system.

Operating databases

First, the user must execute the DBOPEN(P) instruction to connect to the database which the user wants to work on. Also, after finishing database operation, the user must execute the DBCLOSE(P) instruction to disconnect from the database.

1. Execute the DBOPEN(P) instruction to connect to the database which the user wants to work on (connect to the database by specifying the folder which was created in Step 3 of the database creation procedure). When the execution is finished, a value including the "database ID number" is returned.

Point

Since the database ID number must be specified for performing database operation, use the database ID number to be returned when the DBOPEN(P) instruction is executed.

2. Once the connection to the database is established, perform operation (addition, update, search, or deletion) of the database. To perform database operation, the user must specify the "database ID number" of the target database in each instruction.
3. When database operation is finished, execute the DBCLOSE(P) instruction to disconnect from the database.

Point

The user can use a transaction when the user wants to perform multiple operations for a database as a set and update the database at once. (☞ Page 324 Transactions for databases)

Creating Unicode text files

When the DBIMPORT(P) instruction is executed, a database is created on an SD memory card, according to setting details in the tab-delimited format of Unicode text file. The user must create Unicode text files on an SD memory card.

Setting details of Unicode text file

The following table lists items which must be specified in a Unicode text file to create a database.

Item	Description
Database name	Specify a database name, using single-byte alpha-numeric characters. <ul style="list-style-type: none"> • Within 32 characters • Not case-sensitive • The following characters cannot be used: " # % * + , / : ; < = > ? [\] ' { } & ~ \$ @ ^
Table definition start tag	Specify the tag, <table>, using a single-byte lower-case characters. When defining more than one table, enclose each table with <table> and </table>.
Table name	Specify a table name, using single-byte alpha-numeric characters. <ul style="list-style-type: none"> • Within 32 characters • Not case-sensitive • The following characters cannot be used: " # % * + , / : ; < = > ? [\] ' { } & ~ \$ @ ^ • The maximum number of tables is 32.*³
Field name	Specify the name of each field of each record, using single-byte alpha-numeric characters, and in the tab-delimited format. <ul style="list-style-type: none"> • The maximum number of characters which can be used for each field name is 32. • Case-sensitive • The following characters cannot be used: " and ' • The maximum number of fields is 128.*³
Data type	Specify the data type of each field in the tab-delimited format. The data types which can be specified are as follows. They must be specified using upper-case characters. <ul style="list-style-type: none"> • BOOL • WORD • DWORD • INT • DINT • REAL • LREAL • STRING: Specify the number of characters after a colon (:). (For example, when the number of characters is 16, the user can specify like that: "STRING: 16"). The range of the number of characters is 1 to 124.*^{1,2} • WSTRING: Specify the number of characters after the colon (:). The range of the number of characters is 1 to 124.*¹
Key constraint	Specify the key constraint on each field, using single-byte alphabetical characters. Between key constraints, a tab must be inserted as a delimiter. One of the following can be specified: <p>0: None</p> <p>1: Primary key (used to uniquely identify each record) (When a primary key is specified, its key name also must be specified after a colon (:). (e.g. "1: pk1"). Key names must be up to 16 single-byte alphabetical characters and are case sensitive.)</p> <p>2: NOT NULL constraint (When this setting is selected, setting values cannot be left unspecified by skipping specification of primary keys or foreign keys. This value is used to set a restriction.)</p> <p>3: Foreign key (used to refer to the field of another table) (When a foreign key is specified, a table name, which is to be associated with the key name, also must be specified after a colon (:), like that: "3: Key Name: Table Name" (e.g. "3: fk1: tb2"). Key names must be up to 16 single-byte alphabetical characters and are case sensitive.)</p>
Index	Specify 0 (single-byte numeric character) when any indexes are not specified. When an index is specified, the name of the index and a field name must be specified using a colon (:) between them, like that: "Index Name: Field Name" (e.g. "id1: field1"). <ul style="list-style-type: none"> • Index names must be up to 16 single-byte alphabetical characters and are case sensitive. • The maximum number of indexes is 128.*³ • For fields with a primary or foreign key constraint, indexes are automatically set, and it is not necessary to specify indexes by this setting (if specified, the DBIMPORT(P) instruction is completed with an error).
Setting value	Specify the setting value of each field in the tab-delimited format. <ul style="list-style-type: none"> • Characters or numbers which will be set to each field must match with the specified data type ( Page 321 Creating Unicode text files,  Page 322 Format of setting values in Unicode text) • Individual records are set by row.
Table definition end tag	Specify the tag, </table>, using a single-byte lower-case characters.

*1 The termination character, NULL, is not counted in the number of characters.

*2 The length of characters is represented by single-byte characters. For double-byte character strings, one double-byte character should be counted as two single-byte characters.

*3 For the programmable controller CPU with firmware version earlier than "28", the maximum number is 16.

Specifications of the character code for Unicode text files are as follows:

- Character encoding schema: UTF-16 (Little-Endian)
- BOM: Yes

■Format of setting values in Unicode text

Item	Description
WORD, DWORD, INT, DINT	The value must be specified in the decimal format (e.g. 0, 1, 111, -111).
BOOL	The value must be 0 or 1.
REAL, LREAL	The value must be specified in the following exponential format (e.g. 1.0e-01, 1.0E+01): Mantissa + E ⁺¹ + Exponent part ²

*1 "E" can be specified in lower case.

*2 The exponent part must always have a sign.

Configuration of Unicode text files

```

Database name
<table>
Table name 1
Field name 1 [Tab] Field name 2 [Tab] ... [Tab] Field name n
Data type 1 [Tab] Data type 2 [Tab] ... [Tab] Data type n

<table>
Table name 2
(The subsequent setting is the same as the setting of Table name 1.)
</table>
    
```

[Tab] in the figure represents a tab character and it is entered using the  key on the keyboard in practice. Line breaks, comments, tabs, and spaces are processed as follows.

Item	Description
Line break	<ul style="list-style-type: none"> • The line break code is CR+LF. • Lines consisting of only line breaks are ignored.
Comment	<p>A row beginning with "/" is regarded as a comment.</p> <p>The maximum number of characters in a comment row is 2048 (including two characters for the line break code).</p>
Tab	Tabs cannot be used for database names, table names, field names, key constrains, and setting values. Tabs are recognized as delimiters.
Space	<ul style="list-style-type: none"> • Spaces between tabs and printable characters are not recognized as a part of settings. • Spaces between printable characters are recognized as spaces.

Ex.

Example of the Unicode text file format (Database name: database1, Table name: product-info1)

Data type: INT Key restriction: Main key		Data type: STRING, Number of characters: 124 Key restriction: None

</table>
```

Point

Unicode text files can be created using a text editor or spreadsheet software program. The method for saving Unicode text files in Notepad or Excel is as follows:

- In the text editor (Notepad, an accessory of Windows® 7 or later), select [Save As] from the [File] menu, and select "Unicode" as the character code to save the file.
- In the spreadsheet software program (Excel 2010), select [Save As] from the [File] menu, and select "Unicode" as the file type to save the file. When a Unicode text file is created using a spreadsheet software program, tabs are automatically inserted by saving the file. Therefore, it is not necessary to insert tabs into the file in the spreadsheet software program.

Transactions for databases

Use a transaction (the DBTRANS(P) instruction and the DBCOMMIT(P) instruction) to perform multiple operations for a database as a set and update the database at once. The DBTRANS(P) instruction starts a transaction, and the DBCOMMIT(P) instruction groups the results of the following instructions together to update the target database at once.

- The target of a transaction must be a single database. If a transaction is executed for more than one database, transaction instructions for the second and later databases are completed with errors.
- When the CPU module is powered off or is reset in the period from the start of a transaction (execution of the DBTRANS(P) instruction) to the commit of the transaction (execution of the DBCOMMIT(P) instruction), the database is automatically rolled back to the status before the start of the transaction. However, if a database access instruction is completed with an error, the database is not roll backed to the previous status.
- To cancel the running transaction processing and reset the database to the status before the start of the transaction, perform a rollback (the DBROLBAK(P) instruction). A rollback is an operation which resets the target database to the previous status by executing the DBROLBAK(P) instruction in the period from the start of the transaction to the commit of the transaction. When the DBCLOSE(P) instruction is executed without the DBCOMMIT(P) instruction or the DBROLBAK(P) instruction, the transaction is committed during execution of the DBCLOSE(P) instruction.

1. Execute the DBOPEN(P) instruction to connect to a database.
2. Execute the DBTRANS(P) instruction to start a transaction.
3. Operate the database.
4. To commit the transaction, execute the DBCOMMIT(P) instruction. When committing the transaction is not necessary, execute the DBROLBAK(P) instruction to restore to the state before the start of the transaction (rollback).
5. Execute the DBCLOSE(P) instruction to disconnect from the database.

Folder configuration of databases

The database folder for storing database files is generated at the same level in the folder hierarchy as the Unicode text file which is specified in the DBIMPORT(P) instruction. Also, the database folder is given the same names as the database. The length of a database folder path name must be up to 128 characters, including the drive name and a colon (:) prefixed to the path name.

Operation of files/folders in the database folder

Files and folders in the database folder are used for database access instructions. They should not be changed, deleted, and newly created. Otherwise, database access instructions may be completed with errors. In that case, delete the relevant database folder.

Timing of database update

Once execution of a database access instruction is completed, the target database is updated. However, during transaction, the database is not updated each time execution of an instruction is completed. Instead, all changes during the transaction are applied to the database at once when the DBCOMMIT(P) instruction is executed.

Precautions

This section describes precautions on using the database function.

Free space of SD memory card required for execution of database access instruction

To execute a database access instruction, the SD memory card must have at least 10MB of free space. When a database access instruction is performed and if the SD memory card does not have enough free space, the instruction is completed with an error.

When the SD memory card is write-protected

Before using database access instructions, check that the write protection of the SD memory card used is disabled. If a database access instruction is performed while the SD memory card is write protected, the instruction is completed with an error.

When the CPU module database access function is used

The database access instructions can be executed while SM1498 (CPU module database start-up flag) is on.

When the database is being operated by another function

Before creating a database by using the DBIMPORT(P) instruction, check that the same database is not being operated by another function.

If the DBIMPORT(P) instruction is executed specifying a name of a database in the SD memory card while the same database is operated by another function, the DBIMPORT(P) instruction may be completed with an error and the database operation in another function may fail. After the DBIMPORT(P) instruction is completed with an error, if the database operated by another function cannot be operated, the database may be broken. Power off and on or reset the CPU module, and build the database again by using the DBIMPORT(P) instruction.

Combination of the firmware version and database

For the combination of the firmware version of the programmable controller CPU that creates a database and that of the programmable controller CPU that can operate the database, refer to the following.

 Page 343 Combination of the firmware version and database

Removal of the SD memory card

Do not remove the SD memory card while connecting to a database by using the DBOPEN(P) instruction or executing a database access instruction. Otherwise, the database access instruction is completed with an error.

19.3 CPU Module Database Access (from External Device) Function

The CPU module database access function operates a database, that is built in an SD memory card inserted into the CPU module, from an application on a personal computer through the Ethernet port of the CPU module.

To use the CPU module database access function, install CPU Module Database Access Driver into a personal computer. (📖 CPU Module Database Access Driver Installation Instructions)

Point

In the CPU module database access function, the CPU module operates as the ODBC server and the personal computer operates as the ODBC client.
ODBC (Open Database Connectivity) is the standard API that allows applications to connect with the database management system (DBMS) to acquire and write the data.

Restriction

Before using the CPU module database access function, check the version of the CPU module and the engineering tool used. (👉 Page 705 Added and Enhanced Functions)

Usage procedure

This section describes the procedure for operating the database by using the CPU module database access function.

Procedure	Description
Construction of usage environment	Construct the environment to use the CPU module database access function.
Database access setting	Configure this setting to create or change a database of the CPU module.
Database operation	Operate a database of the CPU module from a personal computer.

Construction of usage environment

■Engineering tool

1. Module parameter setting of the CPU module

Set whether or not to use the CPU module database access function, login name, and password in the module parameter of the CPU module. (👉 Page 328 Built-in database access setting)

2. Update of the built-in database access setting in the CPU module

Write the module parameter to the CPU module, and then power off and on or reset the CPU module.

■CPU Module Database Access Driver

1. Obtaining CPU Module Database Access Driver

For CPU Module Database Access Driver, please consult your local Mitsubishi representative.

2. Installing CPU Module Database Access Driver

Install CPU Module Database Access Driver into the personal computer. (📖 CPU Module Database Access Driver Installation Instructions)

Point

The installer of CPU Module Database Access Driver has the 32-bit or the 64-bit version. Choose the installer depending on the supported bit of the application (Microsoft Access, Excel, user-created application) used for the CPU module database access function.

For example, when using Microsoft Access with 32-bit version, use the 32-bit installer of CPU Module Database Access Driver even though the 64-bit OS is used.

Database access setting

1. Creating a database

Create a database in an SD memory card of the CPU module. (☞ Page 329 Creating a database)

2. Adding a database to the ODBC data source

Add the created database of the CPU module to the ODBC data source of the personal computer. (☞ Page 330 Adding a database to the ODBC data source)

Database operation

1. Checking the start-up of the ODBC server

Check that SM1498 (CPU module database start-up flag) is on.

When SM1498 is on, the ODBC server of the CPU module is active. The ODBC server starts and SM1498 turns on when:

- An SD memory card storing the database folder is inserted to the CPU module, and the CPU module is powered off and on or is reset.
- An SD memory card storing the database folder is inserted to the CPU module powered-on when SD1498 (Start-up status of CPU module database) is 0H.

Whether or not the ODBC server has been started up can be checked in SD1498 (Start-up status of CPU module database).

Point

The active ODBC server stops when:

- The SD memory card is disabled (SD memory card forced disable) or the SD memory card is removed.
- The CPU module is powered off.
- The data memory is initialized.
- Free space of the SD memory card is less than 10MB.

2. Connecting to a database

Start an application (Microsoft Access, Excel, or the user-created application) on a personal computer and connect it to a database specified with the application. (☞ Page 332 Application example)

3. Operating a database

Operate an application on a personal computer to operate a database. (☞ Page 332 Application example)

Restriction

The SD memory card is accessed when the ODBC server is started up. This may lengthen the processing time of other functions that use the SD memory card.

Built-in database access setting

To use the CPU module database access function, set "To Use or Not to Use the Built-in Database Access" of the module parameter to "Use" with the engineering tool.

[Navigation window] ⇒ [Parameter] ⇒ CPU module ⇒ [Module Parameter] ⇒ [Application Settings] ⇒ [Built-in Database Access Setting]

Window

Displayed items

Item			Description	Setting range	Default
To Use or Not to Use the Built-in Database Access			Set whether to use the CPU module database access function.	<ul style="list-style-type: none"> Use Not Use 	Not Use
Login Name			A user name to be used for the authentication at the access to a database	1 to 31 characters ^{*1*}	RCPU
Advanced Settings	Password Setting	Current Password	A password to be used for the authentication at the access to a database	0 to 31 characters ^{*1}	RCPU
		New Password	A new password to be set	0 to 31 characters ^{*1}	—
		Confirm New Password	A password for confirmation. The password can be changed only when this password matches a new password.	0 to 31 characters ^{*1}	—
	Built-in Database Access Timer Setting	Message Monitoring Timer	A monitoring timer for until the first message is sent from the personal computer after the connection establishment	1 to 16383s	5
		Connection Monitoring Timer	A monitoring timer for until the CPU module disconnects the personal computer after the CPU module recognizes that the personal computer stops accessing to the CPU module	1 to 16383s	1800

*1 Single-byte alphabetical characters and special characters (excluding " # % * + , / : ; < = > ? [\] | ' { } & ~ \$ @ ^) can be input.

*2 A space cannot be used as the first character.

Creating a database

This section describes the procedure for creating a database to be used with the CPU module database access function. A database can be created with the following methods.

- Storing the database folder
- DBIMPORT(P) instruction (a database access instruction)

Storing the database folder

Store the database folder in an SD memory card.

1. For the database folder, please consult your local Mitsubishi representative.
2. Create the CPUDB folder directly under the root directory of the SD memory card from the personal computer. (1)
3. Store the database folder (default database name: my_db_vv^{*1}) in the CPUDB folder. (2)

*1 "vv" indicates the version of the database folder.

- The name of the database folder stored is recognized as the database name. The maximum number of characters in the folder path to the database folder is 128. The characters that can be used for a database name is the same as the Unicode text file specified by using the DBIMPORT(P) instruction. (Page 321 Setting details of Unicode text file)
- Only the CPUDB folder directly under the root directory can be used as the storage location of the database. In the CPUDB folder, store database folders only.
- Up to 32 folders can be stored in the CPUDB folder.
- If data other than the database folder or 33 database folders or more is stored in the CPUDB folder, starting up of the ODBC server is failed and an error code is stored in SD1498 (Start-up status of CPU module database).

■Precautions

Do not change, delete, or create a file and folder in the database folder from the personal computer. Otherwise, the CPU module database access function and database access instructions are completed with an error. If the above mentioned operations are performed from the personal computer, delete the database folder in the CPU module and create the new one.

DBIMPORT(P) instruction (a database access instruction)

Use the DBIMPORT(P) instruction and create a database in an SD memory card according to the setting of the Unicode text file.

- For details on the Unicode text file, refer to the following.

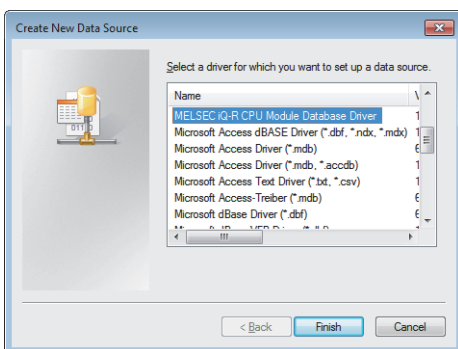

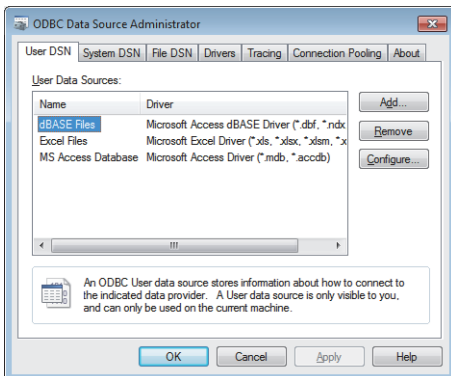

Page 321 Setting details of Unicode text file

- For details on the DBIMPORT(P) instruction, refer to the following.

MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

Adding a database to the ODBC data source

This section describes the procedure for adding a created database of the CPU module to the ODBC data source in the personal computer. (Examples of Windows[®] 7 are shown below. Names of windows and menus may differ depending on the version of the OS.)

1. Select [Start] ⇒ [Control Panel] ⇒ [System and Security] ⇒ [Administrative Tools] ⇒ [Data Sources (ODBC)] on the personal computer and start the ODBC Data Source Administrator.
2. Click [User DSN] ⇒ the [Add] button to display the "Create New Data Source" window.
3. Select "MELSEC iQ-R CPU Module Database Driver", and click the [Finish] button.
4. Set the database of the CPU module on the "Data Source Name Setup" window. (Page 331 Data Source Name Setup)

Point

When the 64-bit OS is used, the ODBC Data Source Administrator of a 32-bit or 64-bit version can be used. Choose the appropriate one depending on the supported bit of the application used with the CPU module database access function.

For the 64-bit OS, the ODBC Data Source Administrator can be started from the following. (When the start-up drive is C)

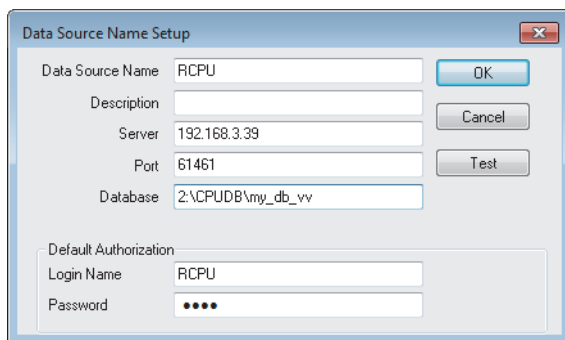

64-bit version: C:\WINDOWS\System32\odbcad32.exe

32-bit version: C:\WINDOWS\SysWOW64\odbcad32.exe

Data Source Name Setup

Set the database of the CPU module connected from the personal computer.

Window

19

Displayed items

Item	Description	
Data Source Name	Set the identification name (any character string) for specifying the connection target database from the application. Input 1 to 32 characters in single-byte or double-byte alphanumeric characters. Characters except for * ! () = \ ? , [] can be used.	
Description	Input the comment. Input none, up to 1023 single-byte alphanumeric characters, or up to 512 double-byte characters.	
Server	Set the IP address of the CPU module to be connected.	
Port	Set 61461. (Default setting is 61461. Do not change the value.)	
Database	Set the absolute path of the database to be connected. For example, input the following for the database folder, my_db_vv, stored in the CPUDB folder directly under the root directory of the SD memory card. 2:\CPUDB\my_db_vv ("2:\" indicates the root directory of the SD memory card. "vv" indicates the version of the database folder.)	
Default Authorization	Login Name* ¹	Set the login user to access the database which is set. Input the user name which is set in the module parameter. (Page 328 Built-in database access setting)
	Password* ¹	Input the password which is set in the module parameter. (Page 328 Built-in database access setting)

*1 If they are not set, input them at login to connect to the database.

Point

Click the [Test] button to perform a connection test of the database of the CPU module in accordance with the setting.

Application example

This section describes the examples of database operations of the CPU module from applications in the personal computer using the CPU module database access function. (Names of windows and menus may differ depending on the version of the OS and application.)

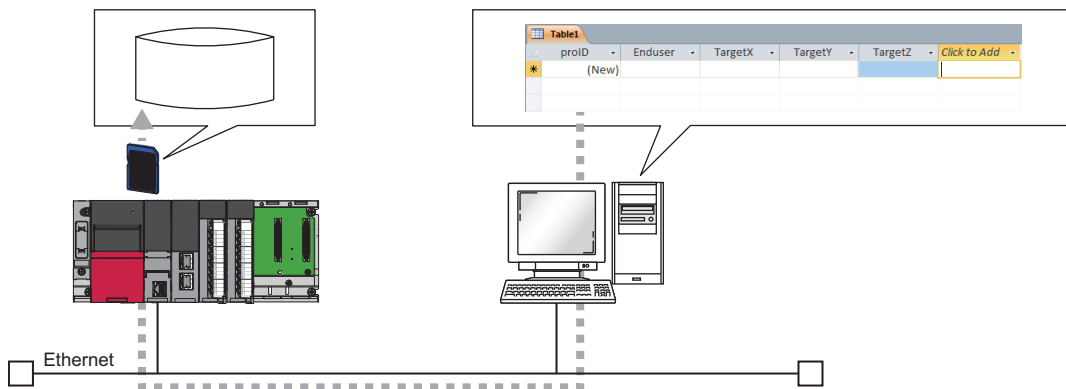

Item	Description	Application	Reference
Table creation	Create a table in a database of the CPU module from the personal computer.	Microsoft Access	Page 332 Creating a table by using an application
Record operation	Edit a database of the CPU module from the personal computer.	Microsoft Access	Page 335 Record operation from an application
Record search	Search a database of the CPU module from the personal computer.	Excel	Page 337 Record search from an application
Database operation with the user-created application	Create a database access application using the ODBC classes of Microsoft .NET Framework.	User-created application	Page 339 User-created application

The following table lists the applications whose connection to the database has been checked.

Application	Version
Microsoft Access	Microsoft Office 2010, 2013, 2016
Excel	
User-created application	Application created by using Microsoft .NET Framework 4.5

Creating a table by using an application

The following provides an example to create a recipe table in a database of the CPU module by using Microsoft Access.

1. Start Microsoft Access and select "Blank database".

2. Add the following fields.

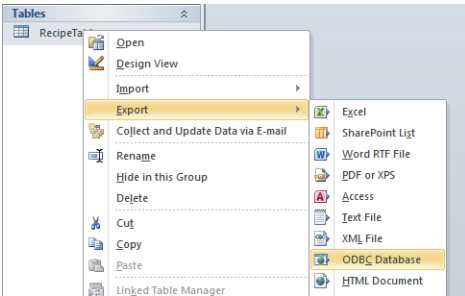

Field name	Data type	Data type for when the data is exported to the database of the CPU module
proID ^{*1}	AutoNumber type: Long integer	INT
Enduser	Numeric type: Long integer	INT
TargetX	Numeric type: Single-precision floating point type	REAL
TargetY	Numeric type: Single-precision floating point type	REAL
TargetZ	Numeric type: Single-precision floating point type	REAL

*1 Rename the ID field.

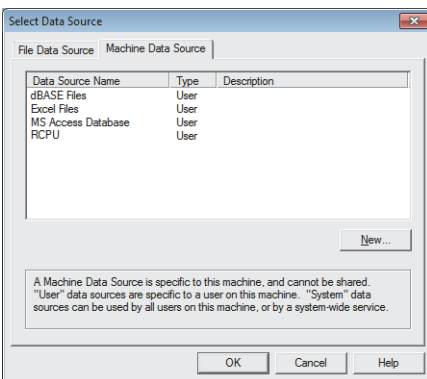

3. Name the table "RecipeTable" and save it. After saving, close the table.

4. Right-click on RecipeTable, and select [Export] ⇒ [ODBC Database].

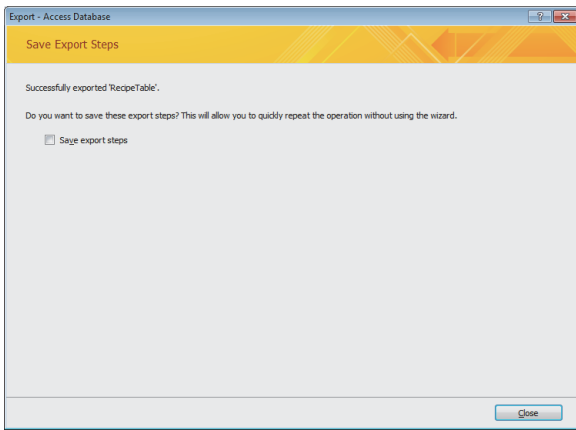

5. When the window to specify the export destination is displayed, click the [OK] button.

6. On the window for selecting the data source, click the [Machine Data Source] tab and select the data source of the CPU module.

- When the default user is not set to the ODBC data source, input the user name and password.
- When no data source of the CPU module is displayed in the window, add a database of the CPU module to the ODBC data source. (Page 330 Adding a database to the ODBC data source)

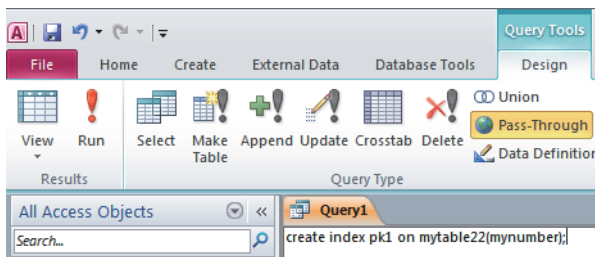

7. The result of export is displayed, and the table is added to the database of the CPU module.

To set the details that cannot be set with Microsoft Access, send desired SQL commands to the database of the CPU module.

Clicking the [Create] tab ⇒ [Query Design] of Microsoft Access displays the "Show Table" window, so click the [Close] button. The [Query Tools] tab becomes enabled. Select [Pass-Through].

Selecting [Pass-Through] enables the query tab and allows input of SQL commands to be sent to the database of the CPU module directly.

For available SQL commands for the CPU module database access function, refer to the following.

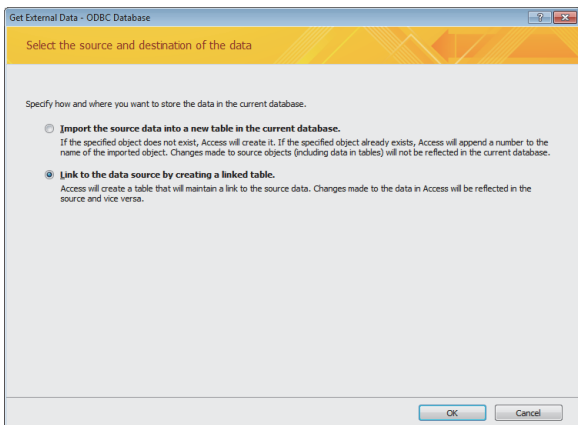

☞ Page 694 List of Available SQL Commands for CPU Module Database Access Function

Record operation from an application

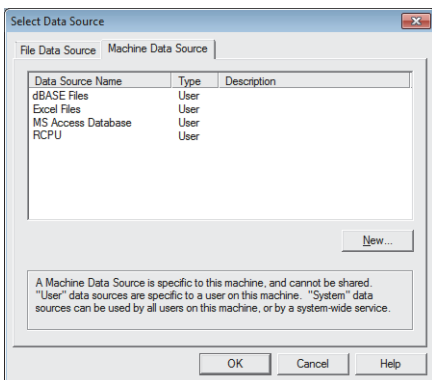

The following provides an example of record operation such as synchronizing, writing, and deleting of the data by connecting to the database of the CPU module by using Microsoft Access.

1. Start Microsoft Access and select the [External Data] tab
⇒ [ODBC Database].

2. When the window to select the method for storing the data in the database, select "Link to the data source by creating a linked table", and click the [OK] button.

3. On the window for selecting the data source, click the [Machine Data Source] tab and select the data source of the CPU module.

- When the default user is not set to the ODBC data source, input the user name and password.
- When no data source of the CPU module is displayed in the window, add a database of the CPU module to the ODBC data source. (Page 330 Adding a database to the ODBC data source)

4. On the window for selecting table, select a table to be operated and click the [OK] button to display the contents of the table.

SerialNo	Enduser	X	Y	Z	Judge

20170428024	H	535	474	526	0
20170428025	P	507	509	509	1

5. When the value is changed or the record is deleted, the database of the CPU module is changed according to the operation.

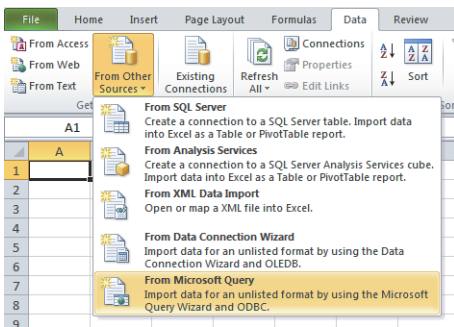

- (1) Select a cell to change the value.
- (2) Select a row to delete the record.
- (3) Add a new record.

Record search from an application

The following provides an example to search the record that matches the specified condition from the production data stored in the database by connecting to the database of the CPU module by using Excel.

19

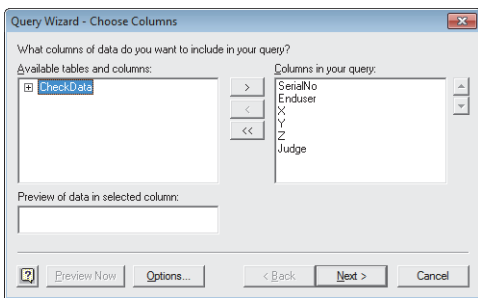

1. Start Excel, and select the [Data] tab ⇒ [From Other Sources] ⇒ [From Microsoft Query].

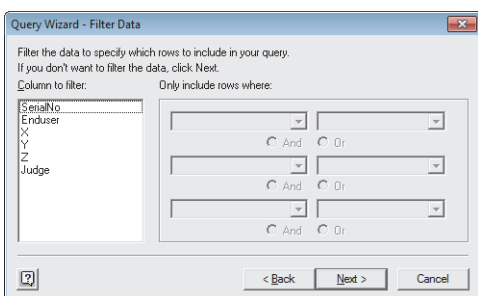

2. On the window for selecting the data source, select the data source of the CPU module.

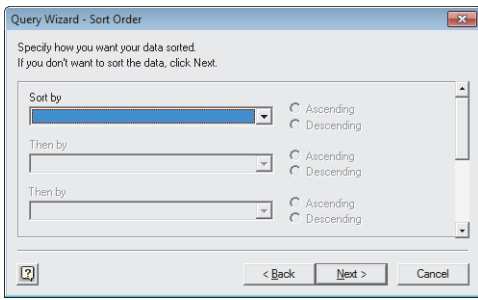

- When the default user is not set to the ODBC data source, input the user name and password.
- When no data source of the CPU module is displayed in the window, add a database of the CPU module to the ODBC data source. (Page 330 Adding a database to the ODBC data source)

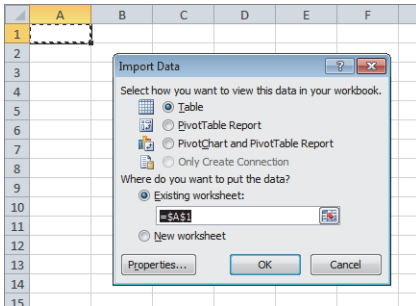

3. On the window for selecting columns of the query wizard, select the field to be output.

4. On the window for filtering data of the query wizard, set the search condition.

5. On the window for setting the sort order of the query wizard, set the condition to sort the output data.

6. Set the output destination. Then, the search result is output.

Point

When the file used in the above procedure is saved, the search condition is also saved.

Click the [Data] tab ⇒ [Refresh All] in Excel to acquire the data in the same condition from the database of the CPU module once more.

User-created application

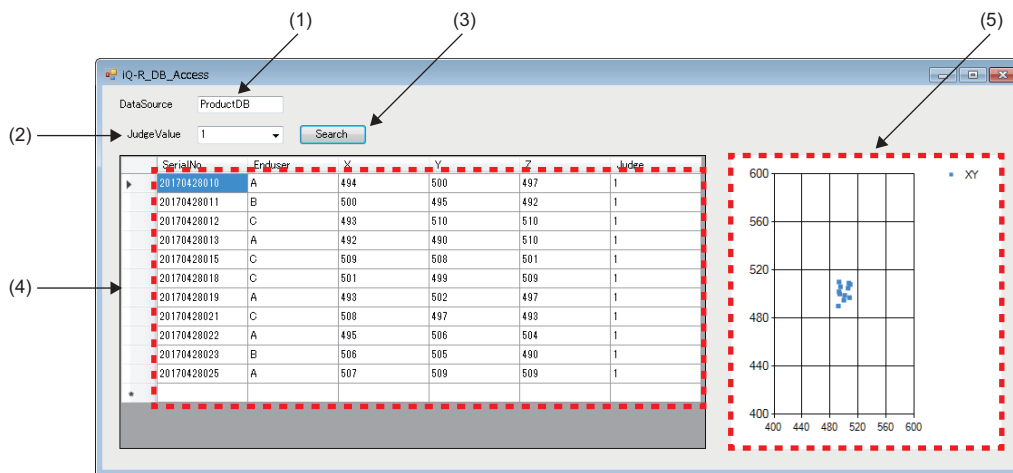

The following describes a sample program for accessing the database of the CPU module with the SQL command using the ODBC class of Microsoft .NET Framework.

19

■ Overview of the sample program

This sample program performs the condition search in the database of the CPU module using the value of the Judge field as its key, and displays the acquired search result in a list and graph (scatter plot).

- (1) Specify the database source name to be connected.
- (2) Specify the Judge field value to be searched.
- (3) Click the [Search] button to search the record with the same value as the one specified by "JudgeValue" in the database specified by "DataSource".
- (4) The acquired record is displayed in the list.
- (5) The X value and Y value of the acquired record are displayed in a graph (scatter plot).

■ Database configuration of the sample program

The following describes the database configuration to be searched by the sample program.

Item	Description
Server name (IP address of CPU module)	192.168.3.39
Database folder path	2:\Database\SampleDB
Database name	SampleDB
Table name to be searched	CheckData

The following table lists the records of CheckData table.

SerialNo	Enduser	X	Y	Z	Judge
20170428010	A	494	500	497	1
20170428011	B	500	495	492	1

20170428024	C	535	474	526	0
20170428025	A	507	509	509	1

■ Source code of the sample program

The following describes the source code of the sample program.

- Development environment: Visual Studio 2015
- Programming language: C#

```
namespace iQ_R_DB_Access
{
    public partial class FrmMain : Form
    {
        public FrmMain()
        {
            InitializeComponent();

            // Range setting of X-/Y-axis on a graph
            chart1.ChartAreas[0].AxisX.Minimum = 400;
            chart1.ChartAreas[0].AxisX.Maximum = 600;
            chart1.ChartAreas[0].AxisY.Minimum = 400;
            chart1.ChartAreas[0].AxisY.Maximum = 600;

            // Initial value (all) set to the judge value of search target
            cmbJudge.SelectedIndex = 2;
        }

        /// <summary>
        /// Operation when the Search button is clicked
        /// Records that match the judge value specified by the combo box are acquired and displayed in a list and a scatter plot of X and Y field values.
        /// </summary>
        /// <param name="sender"></param>
        /// <param name="e"></param>
        private void btnSearch_Click(object sender, EventArgs e)
        {
            // The number of fields (the number of fields on the CheckData table)
            int len = 6;

            // Acquiring the data source name
            string strConnect = txtDataSourceName.Text.ToString();
            // ODBC connection information management class
            OdbcConnectionStringBuilder o = new OdbcConnectionStringBuilder();
            o.Dsn = strConnect;
            // Creating the connection object
            OdbcConnection cn = new OdbcConnection(o.ConnectionString);

            // SQL statement
            string strQuery = GetSQL();
            // Creating the command object
            OdbcCommand cmd = new OdbcCommand(strQuery, cn);

            // Initializing the list
            dtRecord.Rows.Clear();
            // Initializing the graph
            chart1.Series[0].Points.Clear();

            try
            {
                // Connecting to DB
                cn.Open();

                // Creating the data reader object
                OdbcDataReader reader = cmd.ExecuteReader();
            }
        }
    }
}
```

```

// Processing the search results one record at a time

            break;
    }
    return strSQL;
}
}
}

```

Precautions

This section describes the precautions for using the CPU module database access function.

Database creation

When creating a database in the CPUDB folder, use characters that can be specified only. If the characters that cannot be specified are used to create the database, the table cannot be accessed by the database access instructions.

For the characters that can be specified, refer to the following.

 Page 321 Setting details of Unicode text file

Combination of the firmware version and database

The following table lists the combination of the firmware version of the programmable controller CPU that creates the database and that of the programmable controller CPU where the operation of the database is available.

○: Available, ×: Not available

Database	Availability	
	The programmable controller CPU with firmware version earlier than "28"	The programmable controller CPU with firmware version "28" or later
Database created with the programmable controller CPU with firmware version earlier than "28"	○	○*1
Database created with the programmable controller CPU with firmware version "28" or later	×	○

*1 If the database that has been operated with the programmable controller CPU with firmware version "28" or later is operated with the programmable controller CPU with firmware version earlier than "28", the operation is completed with an error.

Number of connections that can be operated simultaneously

Up to four connections can be operated with the CPU module database access function simultaneously.

However, if an application such as Microsoft Access uses several connections, four applications may not connect with the database of the CPU module simultaneously. If an attempt was made to connect with the database with all the connections used, an error occurs in the application and the database cannot be connected. In this case, end unused applications connected with the database and connect again.

Several simultaneous accesses

When several applications access the same database in the CPU module, the database processing becomes slow.

■Access to the same table

When the database access instructions or the CPU module database access function access the same table, the function executed first locks the table, and an error may occur in the function executed later. For the database access instruction, an error code is stored in the completion status.

■Definition change of the same database

When the database definition is changed with "CREATE TABLE" or "DROP TABLE" in a single database from several applications using the CPU module database access function, the application executed first locks the database and an error may occur in the function executed later.

Completion with an error during database access

Do not power off or reset the CPU module during the access to a database of the CPU module. Otherwise, the change is not reflected on the database that is being executed.

Files created with this function

Do not create, change, and delete the ODBC server setting file (netserver.cfg), database path file (dbmaintainpath.txt), and error database check file (ErrorDB.txt) created with the CPU module database access function. Otherwise, the CPU module database access function or database access instruction is completed with an error.

If the above mentioned operations are performed, delete the database folder in the CPU module and create the new one.

Removal of the SD memory card

To remove the SD memory card while the ODBC server is active, execute the SD memory card forced disable and check that CARD READY LED is off before removing the SD memory card. (Failure to do so may result in a failure of databases.)

Since databases stop after the execution of the SD memory card forced disable, databases of the CPU module cannot be accessed. (The error code is stored in SD1498.)

To access the databases of the CPU module again, insert the SD memory card and power off and on or reset the CPU module.

Free space of the SD memory card

To use the CPU module database access function, the SD memory card must have at least 20MB of free space.

When the free space of the SD memory card becomes 20MB or less while the CPU module database access function is used, SM1497 (Memory card free space flag for CPU module database) turns on. When the free space of the SD memory card becomes 10MB or less, the ODBC server of the CPU module stops and the error code is stored in SD1498 (Start-up status of CPU module database).

When the ODBC server stops because the SD memory card does not have enough free space, secure the free space of the SD memory card using the online operation and power off and on or reset the CPU module. Powering off and on or resetting the CPU module starts the ODBC server.

When the SD memory card is write-protected

To use the CPU module database access function, the user must ensure that write protection of the SD memory card is off.

When the SD memory card is write-protected, the CPU module database access function cannot update the database and the error code is stored in SD1498.

When the load of the CPU module is high

When the CPU module database access function is used with high circuit load to the Ethernet port of the CPU module by other functions or high access load to the SD memory card, a timeout error may occur in the application on the personal computer side. In this case, eliminate the cause of the error and execute this function.

Errors

■Errors detected by the CPU module

The CPU module starts the ODBC server based on the setting of the module parameter. When the CPU module fails to start the ODBC server, the error code is stored in SD1498 (Start-up status of CPU module database). For the error code to be stored, refer to the following.

 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

■Errors detected by the personal computer

When an error occurs during the access to the database of the CPU module, the CPU module returns the error message to the personal computer. In this case, check the error message displayed on the personal computer and eliminate the cause of the error. The error causes are as follows.

- The built-in database access setting of the module parameter is disabled.
- The ODBC server of the CPU module is not started. (SM1498 is not on.)
- The communication between the Ethernet port of the CPU module and the personal computer is not established.
- There is no database to be accessed.
- Multiple accesses are simultaneously performed to an access target database.
- A broken database is being accessed.
- The database is accessed when the circuit load of the Ethernet port of the CPU module or the access load to the SD memory card are high.

20 PID CONTROL FUNCTION

This chapter describes the PID control function.

PID control is applicable to process control in which factors such as flow rate, velocity, air flow volume, temperature, tension, and mixing ratio must be controlled. The control for maintaining the control object at the preset value is shown in the diagram below: PID control via the PID control instructions is implemented by combining the CPU module with the A/D converter module and D/A converter module.

- *1 SV: Set value
- *2 PV: Process value
- *3 MV: Manipulated value

In the PID control, the PID operation is executed to compare the value set beforehand (SV) with the digital value (process value (PV)) in which the analog value measured by a sensor is read from the A/D converter module.

PID operation utilizes proportional operation (P), integral operation (I), and derivative operation (D) in combination, thereby calculating the manipulated value (MV) quickly and accurately so that a process value (PV) is to be equivalent to a set value (SV). A larger difference between the process value (PV) and set value (SV) results in a faster speed to reach the set value (SV) quickly by increasing the manipulated value (MV) and a smaller difference between the process value (PV) and set value (SV) results in a slower speed to reach the set value (SV) accurately by decreasing the manipulated value (MV). The calculated manipulated value (MV) is written to the D/A converter module and output to the external device.

Point

For the PID control, use the PID operation instruction. To execute the same PID control as that of the MELSEC-Q series and MELSEC-L series, use the PID control instructions.

For details on the comparison between the PID operation instruction and PID control instructions, instruction specifications, PID control, and programming, refer to the following.

📖 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

21 CPU MODULE DATA BACKUP/RESTORATION FUNCTION

This function backs up data such as program files, a parameter file, and device/label data*¹ of a CPU module to an SD memory card. The data backed up in the SD memory card can be restored as required.

*¹ Module access devices and buffer memory are excluded.

The following table lists the backup and restoration methods of the CPU module data backup/restoration function.

Function		Reference
Backup function	Backup processing triggered by turning on SM1351	Page 355 Backup processing triggered by turning on SM1351
	Automatic backup using SD944	Page 356 Automatic backup using SD944
Restoration function	Restoration processing triggered by turning on SM1354	Page 363 Restoration processing triggered by turning on SM1354
	Automatic restoration using SD955	Page 364 Automatic restoration using SD955

Point

The restoration function modifies programs, parameters, or device/label data of the CPU module. After restoration, check the restored data carefully before an actual operation. (Check the data with an engineering tool.)

Restriction

- This function cannot be used in the R00CPU, R01CPU, and R02CPU.
- When using the CPU module data backup/restoration function, check the versions of the CPU module and engineering tool used. (☞ Page 705 Added and Enhanced Functions)

Backup data

Backup data is saved in an SD memory card. The following shows the folder structure of backup data.

No.	Folder type	Folder name	Number of storable folders	Description
(1)	Backup data folder	Backup (Fixed)	1	A folder for storing all backup data
(2)	CPU data folder	CPU (Fixed)	1	A folder for storing backup data of the CPU module
(3)	Date folder	Automatically determined* ¹ Folder name format: YYYYMMDD • YYYY: Year when the data was backed up (four digits) • MM: Month when the data was backed up (two digits) • DD: Day when the data was backed up (two digits)	Depends on the capacity of the SD memory card used* ² or 1 to 100 folders	Folders for storing backup data by date For the setting of the upper limit value for the number of CPU module backup data, the number of backup data indicates the number of date folders. (☞ Page 353 Setting the upper limit value for the number of CPU module backup data)
(4)	Number folder	Automatically determined* ¹ Folder name: Sequentially numbered from 00001 to 32767 (five digits)	Depends on the capacity of the SD memory card used* ²	Folders for storing information per backup data. Each backup data created on a date is stored in sequentially numbered folders.
(5)	Drive folder	Drive0 (Fixed), Drive3 (Fixed), and Drive4 (Fixed)	One set of the folders in a number folder	Folders for storing folders/files stored in each drive of the backup target CPU module by each drive
(6)	System file for backing up CPU module data	\$BKUP_CPU_INF.BSC	One folder in a number folder	Files for storing the information required at restoration of data, such as a list of backup data and identification information of the CPU module
(7)	Backup data file for backing up CPU module data	BKUP_CPU.BKD	One folder in a number folder	The following data is stored. • Data on operations of the data logging setting • Data for restarting the SFC program from the block and step where the processing was stopped
(8)	Device/label data file for backing up CPU module data	BKUP_CPU_DEVLAB.BKD	One folder in a number folder	Device/label data is stored.

- *1 Date folders and number folders are automatically named by the CPU module.
- *2 The maximum number of storable folders is 32767.
- *3 When bit 2 of SD955 (Restoration function setting) is set to on at the backup processing, the file is generated if it is not in the CPU folder, and the setting information stored is updated if it is. (When bit 2 of SD955 is set to off at the backup processing, the file is not generated.)

Backup/restoration target data

Backup target data is all target data in the CPU module. (☞ Page 350 Backup/restoration target files)

Restoration target data is set with SD954 (Restoration target data setting). (☞ Page 361 Restoration target data)

■Backup/restoration target drives

Target drives are Drive0 (Program memory), Drive3 (Device/label memory), and Drive4 (Data memory).

Drive2 (SD memory card) is not a target drive.

■Backup/restoration target files

The following table lists backup/restoration target files.

○: Available, ×: Not available

File type	Backup/restoration	
Program	○	
FB file	○	
CPU parameter	○	
System parameter	○	
Module parameter	○	
Memory card parameter	×	
Device comment	○	
Device initial value	○	
Global label setting file	○	
Initial label value file	Initial global label value file	○
	Initial local label value file	○
File register	○	
Event history	○	
Device data storage file	○	
General-purpose data	○	
Data logging setting file	Common setting file	×
	Individual setting file	○
Memory dump setting file	○	
Remote password	○	
System file for the iQ Sensor Solution data backup/restoration function	×	
Backup data file for the iQ Sensor Solution data backup/restoration function	×	
Slave station parameter file	○	
ODBC server setting file	○	
Recording setting file	○	

All folders/files in the CPU built-in memory are backup/restoration targets.

■The number of CPU module backup data that can be stored in an SD memory card

The number of CPU module backup data that can be stored in an SD memory card is 32767. This number is equal to the maximum number of storable folders.

The number of files that can be backed up and restored (the number of backup source data files) depends on the maximum number of files of each model or drive.

■ Backup/restoration target device data

○: Available, ×: Not available

Classification	Device name	Symbol	Backup*5	Restoration*5
User device	Input	X	○	○
	Output	Y	○	○
	Internal relay	M	○*3	○*3
	Link relay	B	○	○
	Annunciator	F	○	○
	Link special relay	SB	○	○
	Edge relay	V	○*3	○*3
	Step relay	S	○	○
	Timer	T	○*3	○*3
	Retentive timer	ST	○*3	○*3
	Long timer	LT	○*3	○*3
	Long retentive timer	LST	○*3	○*3
	Counter	C	○*3	○*3
	Long counter	LC	○*3	○*3
	Data register	D	○*3	○*3
	Link register	W	○	○
	Link special register	SW	○	○
Latch relay	L	○	○	
System device	Function input	FX	○	×
	Function output	FY	○	×
	Function register	FD	○	×
	Special relay	SM	○	○*1*2
	Special register	SD	○	○*1*2
Link direct device	Link input	Jn\X	×	×
	Link output	Jn\Y	×	×
	Link relay	Jn\B	×	×
	Link special relay	Jn\SB	×	×
	Link register	Jn\W	×	×
	Link special register	Jn\SW	×	×
Module access device	Module access device	Un\G	×	×
CPU buffer memory access device	CPU buffer memory access device	U3En\G	○	○*2
		U3En\HG	○	○*2
Index register	Index register	Z	○*4	○*4
	Long index register	LZ	○*4	○*4
File register	File register	R/ZR	○	○
Refresh data register	Refresh data register	RD	○	○
Nesting	Nesting	N	×	×
Pointer	Pointer	P	×	×
	Interrupt pointer	I	×	×
Other devices	Network No. specification device	J	×	×
	I/O No. specification device	U	×	×
	SFC block device	BL	○	×
	SFC transition device	TR	×	×

*1 Whether to restore these areas can be set to the bit 14 of SD955 (Restoration function setting).

*2 Areas used by the system may be overwritten after restoration.

*3 Includes local devices.

*4 Includes the local index register.

*5 Device data may be overwritten depending on the mounting status (I/O refresh) of each module or the refresh settings.

■ Backup/restoration target label data

○: Available, ×: Not available

Classification	Backup ^{*2}	Restoration ^{*2}
Global label (including module labels)	○	○ ^{*1}
Global label with latch specified	○	○
Local label	○	○
Local label with latch specified	○	○

*1 For module labels, data may be overwritten to the write areas from a module to the CPU module when the refresh settings have been made.

*2 Device data may be overwritten depending on the mounting status (I/O refresh) of each module or the refresh settings.

Progress of the backup/restoration processing

The progress of the backup/restoration processing can be checked in SD1350 (Number of uncompleted folders/files of CPU module data backup/restoration) or SD1351 (Progression status of CPU module data backup/restoration). However, the progress of the automatic restoration cannot be checked with the special register.

Special register	Description
SD1350	Displays the number of remaining backup/restoration target folders and files. <ul style="list-style-type: none"> • When the backup/restoration processing is started, the total number of backup/restoration folders and files is stored. • When the backup/restoration processing is completed, 0 is stored.
SD1351	Displays the progress of the backup/restoration processing in percentage (0 to 100%). ^{*1}

*1 When program files are restored, the progress in SD1351 stops while data is being written to the program memory in the restoration processing because the data is transferred from the program cache memory to the program memory. The progress of data transfer to the program memory can be checked in SD629 (Program memory write (transfer) status).

21.1 Backup Function

This function backs up data of a specified CPU module in an SD memory card.

Point

The backup function operates even when the CPU module is in the RUN state.

When executing the backup function with the CPU module in the RUN state, do not change device/label data during execution of the function. Doing so may cause data inconsistency of the device/label data and the contents of the backup data may unintentionally change.

Setting the upper limit value for the number of CPU module backup data

When the backup processing has not been executed (when no backup data folder (CPU data folder) exists in the SD memory card), the upper limit value for the number of CPU module backup data can be set.

The number of CPU module backup data in the upper limit value setting is the number of date folders.

The upper limit value for the number of CPU module backup data is enabled by turning on the bit 5 of SD944 (Enable the upper limit value for the number of CPU module backup data). The set value can be checked in SD960 (Upper limit status for the number of CPU module backup data).

When the bit 5 of SD944 is turned off, no upper limit value setting is applied.

Special relay/Special register	Description
SM960	This relay specifies an operation of backup when the number of CPU module backup data reaches the upper limit value. (This relay is valid only when the bit 5 of SD944 is on.) <ul style="list-style-type: none">• Off: The oldest date folder is deleted, and the backup operation continues.• On: The backup operation does not continue if the upper limit value for the number of CPU module backup data is exceeded. (In this case, the backup is completed with an error.)
Bit 5 of SD944	Set to enable or disable the upper limit value for the number of CPU module backup data. <ul style="list-style-type: none">• Off: Disable (No limit (Date folders are created within the maximum capacity of the SD memory card.))• On: Enable
SD960	This register displays the value (1 to 100) set in SD1353. If the bit 5 of SD944 is off, 0 is stored in this special register (SD).
SD1353	Set the upper limit value (1 to 100) for the number of CPU module backup data.

Restriction

If data folders are created more than the capacity of the SD memory card before the number of them reaches the upper limit value for the number of CPU module backup data, the backup processing is completed with an error and the data cannot be backed up to reach the upper limit value.

■ Operation of the special relay and special register

The following figure shows the operations of the special relay and special register of when the upper limit value for the number of CPU module backup data has been set.

Check the following at the timing on when the bit 5 of SD944 (Enable the upper limit value for the number of CPU module backup data) is turned on, and enable the upper limit value for the number of CPU module backup data.

- The backup processing has not been executed (when no backup data folder (CPU data folder) exists in the SD memory card).
- The value set in SD1353 (Upper limit value setting for the number of CPU module backup data) is within the range (1 to 100).

(1) The upper limit value for the number of CPU module backup data is set. (0 → 10)

Backup processing triggered by turning on SM1351

Data in the CPU module is backed up at a desired timing.

Operating procedure

Data in the CPU module is backed up by turning on SM1351.

1. To set the upper limit value for the number of CPU module backup data, follow the steps below.

- Set SD1353 (Upper limit value for the number of CPU module backup data).
- Set SM960 (Upper limit operation setting flag for the number of CPU module backup data).
- Turn on the bit 5 of SD944 (Backup function setting).

For the upper limit value for the number of CPU module backup data, refer to the following.

 Page 353 Setting the upper limit value for the number of CPU module backup data

2. Turn on SM1351 (CPU module data backup execution request).

- (1) A backup execution request is sent.
- (2) The system turns on SM1350 (CPU module data backup status flag).
- (3) The system turns off SM1351 after the backup processing is completed.
- (4) The system turns off SM1350.

If the backup processing is completed with an error and SM953 (CPU module data backup error check flag) turns on, check SD953 (Backup error cause), take actions, and then back up the data again as required.

Point

The execution status of the backup processing can be checked in SD1350 (Number of uncompleted folders/files of CPU module data backup/restoration) and SD1351 (Progression status of CPU module data backup/restoration). ( Page 352 Progress of the backup/restoration processing)

Automatic backup using SD944

Data in the CPU module can be automatically backed up at a preset execution timing. Set the execution timing of the automatic backup with SD944 (Backup function setting). Multiple execution timing settings can be set.

Bit pattern of SD944	Execution timing
Bit 0: On	On the time set in SD948 and SD949 on the day set in SD947
Bit 1: On	On the time set in SD950 and SD951 on the day of the week set to SD952
Bit 15: On	When a stop error has occurred in the CPU module

Since the special register set for the automatic backup is a latch area, setting data is held.

Retrying the automatic backup

Set whether to retry the automatic backup when the automatic backup is executed during execution of an operation or function that cannot be executed (Page 359 Operations and functions that cannot be performed).

The retry interval is three minutes and the number of retries is 10.

Special relay/Special register	Description
SM961	This relay turns on when the retry of the automatic backup is completed with an error after the retry of the automatic backup for the number of retries was attempted. This relay turns off at the start of the automatic backup. (This relay does not turn off when SM1351 (CPU module data backup execution request) is on.) <ul style="list-style-type: none"> • Off: Retry not executed/Retry being executed • On: Retry failed
SM1356	This relay turns on during execution of the retry of the automatic backup. This relay turns on at the start of the retry of the automatic backup and turns off when the retry of the automatic backup is started or the retry of the automatic backup for the number of retries is attempted without execution of an operation or function that cannot be executed. <ul style="list-style-type: none"> • Off: Retry is not being executed. • On: Retry is being executed.
Bit 10 of SD944	Set whether to retry the automatic backup. <ul style="list-style-type: none"> • Off: Retry is not executed. • On: Retry is executed.

The setting of the bit 10 of SD944 (Backup function setting) cannot be changed during execution of the automatic backup. The retry setting of the automatic backup is enabled at the following timing.

- When the bit 0, bit 1, or bit 15 of SD944 turns on

Operating procedure (when date and time are specified)

Data is automatically backed up on the specified date and time.

1. Set the upper limit value for the number of CPU module backup data. (The setting method and operating procedure for the upper limit value are the same as those for the upper limit value for the backup processing triggered by turning on SM1351.) (Page 355 Operating procedure)
2. Set the date and time with SD947 to SD949.

Special register	Description
SD947	Set the date when the data is to be automatically backed up.
SD948	Set the time (hour) when the data is to be automatically backed up.
SD949	Set the time (minute) when the data is to be automatically backed up.

3. To retry the automatic backup, turn on the bit 10 of SD944 (Backup function setting). For the retry of the automatic backup, refer to the following.

Page 356 Retrying the automatic backup

4. Turn on the bit 0 of SD944.

If the backup processing is completed with an error and SM953 (CPU module data backup error check flag) turns on, check SD953 (Backup error cause), take actions, and then back up the data again as required.

Restriction

- In months that does not have the specified date, the automatic backup is not executed. For example, when SD947 has been set to "31", the months when the automatic backup is executed are January, March, May, July, August, October, and December.
- If the time less than 1 hour from the start time of daylight saving time has been set with the daylight saving time function, the automatic backup is not executed.

Operating procedure (when time and day of the week are specified)

Data is automatically backed up on the specified time on the specified day of the week.

1. Set the upper limit value for the number of CPU module backup data. (The setting method and operating procedure for the upper limit value are the same as those for the upper limit value for the backup processing triggered by turning on SM1351. (Page 355 Operating procedure))
2. Set the time and day of the week with SD950 to SD952.

Special register	Description
SD950	Set the time (hour) when the data is to be automatically backed up.
SD951	Set the time (minute) when the data is to be automatically backed up.
SD952	Set the day of the week when the data is to be automatically backed up. b0: Sunday, b1: Monday, b2: Tuesday, b3: Wednesday, b4: Thursday, b5: Friday, b6: Saturday

3. To retry the automatic backup, turn on the bit 10 of SD944 (Backup function setting). For the retry of the automatic backup, refer to the following.

Page 356 Retrying the automatic backup

4. Turn on the bit 1 of SD944.

If the backup processing is completed with an error and SM953 turns on, check SD953, take actions, and then back up the data again as required.

Restriction

If the time less than 1 hour from the start time of daylight saving time has been set with the daylight saving time function, the automatic backup is not executed.

Operating procedure (when a stop error has occurred in the CPU module)

Data is automatically backed up when a stop error occurs in the CPU module.

1. Set the upper limit value for the number of CPU module backup data. (The setting method and operating procedure for the upper limit value are the same as those for the upper limit value for the backup processing triggered by turning on SM1351. (Page 355 Operating procedure))
2. To retry the automatic backup, turn on the bit 10 of SD944 (Backup function setting). For the retry of the automatic backup, refer to the following.

Page 356 Retrying the automatic backup

3. Turn on the bit 15 of SD944.

If the backup processing is completed with an error and SM953 turns on, check SD953, take actions, and then back up the data again as required.

Restriction

If a major error has occurred, the automatic backup may not be performed.

Checking backup errors

When an error has occurred, a diagnostic error is not detected and an error code is stored in SD953 (Backup error cause).

Page 504 List of Error Codes)

Precautions

The following describes the precautions for the backup function.

Prohibited operation during execution of the backup processing

Do not perform the following operations during execution of the backup processing.

- Removing and inserting the SD memory card
- Powering off or resetting the CPU module

The above mentioned operations leave the backup data in the SD memory card in an incomplete state which is middle of the backup processing. Do not use these data for a restoration. If these data are used, the restoration is completed with an error.

Suspending backup processing

The following operation can suspend a backup processing.

- Setting the SD memory card forced disable

Suspending a backup processing leaves the backup data in the SD memory card in an incomplete state which is middle of the backup processing. Do not use these data for a restoration. If these data are used, the restoration is completed with an error.

Device/label data

To execute the backup processing, do not change device/label data during execution of the processing. Since device/label data is divided into multiple scans and backed up, changes in the device/label data may cause data inconsistency.

When labels accessible from external devices have been set in the CPU module

For the CPU module with firmware version "24" or earlier, the backup cannot be executed if labels accessible from external devices have been set in the CPU module by access label settings from external devices.

Check that no such labels have been set in the CPU module and then execute the backup processing.

When parameter settings were changed before execution of the backup processing

When programs or parameter settings were changed, check that operations are performed with the new programs and parameter settings and then execute the backup function. If the backup processing is executed without the check of the operations with the new programs and parameter settings, the restoration processing may not be executed.

Changing backup target data

Do not change backup target data in the CPU module during execution of the backup processing. If the target data was changed during execution of the backup processing, the changes will not applied.

Special relay and special register that function as flags to execute other functions

Before executing the backup processing, turn off the special relay and special register that function as flags to execute other functions. If the backup processing is executed when they are on, the corresponding function request may turn on and the function may be executed at the restoration of data in the special relay and special register.

Data protected by security functions

■File password function

Unlock the file passwords of the files in the backup target CPU module. If any files to which file passwords have been set exist in the CPU module, the files are not backed up.

■Security key authentication function

Locked programs are backed up in the locked state regardless of whether security keys have been written or not.

Timing for setting the upper limit value for the number of CPU module backup data

Set the upper limit value for the number of CPU module backup data before execution of the backup processing.

When the backup processing has been executed (a CPU data folder exists in the SD memory card) and the bit 5 of SD944 (Enable the upper limit value for the number of CPU module backup data) is turned on, an error will occur.

Even though the backup processing has been executed, turning off the bit 5 of SD944 can disable the upper limit value for the number of CPU module backup data. To set the upper limit value for the number of CPU module backup data again, replace the SD memory card with another one where no CPU data folder exist, or turn off and on the bit 5 of SD944 after deleting the backup data folder.

SFC program status

Do not change the status of the SFC program, such as step active status and transition conditions during execution of the backup processing. If the status of the SFC program was changed, the backup processing is completed with an error.

Time required for completing the backup processing

The backup processing takes more time depending on the size of data or the number of folders/files stored in the CPU module.

Operations and functions that cannot be performed

While the following operations or functions are being executed, the backup processing cannot be executed.

The following operations and functions cannot be executed during execution of the backup processing.

Operation or function		
Operation from the engineering tool	Initializing the CPU built-in memory/SD memory card	
	Clearing values (Devices, labels, file registers, latches)	
	Writing data to the programmable controller (including online change of files)	
	Deleting data in the programmable controller	
	User data operation	Writing user data
		Deleting user data
		Creating a folder
		Deleting a folder
		Changing a folder name
	Online change (online change (ladder block))	
	Event history function (Clearing event history)	
	File password function	
	Security key authentication function (Writing/deleting a security key to/in the CPU module)	
	Predefined protocol support function (Writing protocol setting data)	
Memory dump function (Registering/clearing memory dump)		
Firmware update function (Firmware update using the engineering tool)		
Operation using the CPU module logging configuration tool	Data logging function (Writing/deleting a logging setting file, registering/clearing a logging setting, stopping a logging)	
	Deleting a logging file	

Operation or function		
Others	<ul style="list-style-type: none"> • SLMP • MC protocol 	Clearing the remote latch (Remote Latch Clear)
		Creating a new file (New File)
		Writing data to a file (Write File)
		Deleting a file (Delete File)
		Copying a file (Copy File)
		Changing a file attribute (Change File State)
		Changing file creation date (Change File Date)
		Opening a file (Open File) ^{*1}
	File transfer from an Ethernet-equipped module (FTP server)	Writing a file (put, mput, pm-write)
		Deleting a file (delete, mdelete)
		Changing a file name (rename)
		Changing a file attribute (change)
	File transfer function (FTP server) of the built-in Ethernet function	
	File transfer function (FTP client) of the built-in Ethernet function	
	Changing an IP address	
iQ Sensor Solution data backup/restoration function		
System operation setting with SD384		
Transfer to the data memory with special relay		
Data logging file transfer to data memory ^{*2}		

*1 The operation performed only for opening a file to write data

*2 It is executed when the trigger logging data collection is completed or data collection for the specified number of storage files is completed.

Backup during execution of the backup processing

The backup processing triggered by turning on SM1351 or automatic backup cannot be executed during execution of the backup processing. (The latter backup processing is ignored.)

Data logging function and backup

When the CPU built-in memory (function memory) is specified for the data storage destination memory in the data logging function, the function memory is cleared after the CPU module is powered off or the RESET state is cleared. Thus, data logging files are also cleared. To prevent data logging files from being lost, back up the files after the completion of file transfer by the data logging file transfer function.

21.2 Restoration Function

This function restores backup data in the SD memory card to the CPU module.

Restoration target folder

Set restoration target data among backup data in the SD memory card with SD956 (Restoration target date folder setting) to SD958 (Restoration target number folder setting). The latest backup data can be restored with the bit 13 of SD955 (Restoration function setting).

Special register	Description
Bit 13 of SD955	Set the restoration function setting with bit patterns. Off: Data specified with the restoration target folders is restored. On: The latest data is restored.*1
SD957, SD956	Specify a date folder of the restoration target data in BCD. SD957 (upper): Year, SD956 (lower): Month and date
SD958	Specify the folder number (00001 to 32767) of restoration target data.

*1 The latest data is the backup data with the largest number in the latest date folder.

Restoration target data

Restoration target data is set with SD954 (Restoration target data setting).

Value of SD954	Restoration target data setting
0	All target data
1	Only device/label data
2	All target data excluding device/label data

Restoration of the special relay and special register

Set whether to restore the special relay and special register with the bit 14 of SD955.

Bit 14 of SD955	Restoration target data setting
Off	The special relay and special register are not restored.
On	The special relay and special register are restored.

However, the special relay/special register areas listed below are not restored even when the bit 14 of SD955 is on.

CPU module	Special relay/Special register
Programmable controller CPU	Special relay/special register areas for the CPU module data backup/restoration function • SM953, SM959, SM961, SM1350, SM1351, SM1353, SM1354, SM1356, SD953, SD959, SD1350, SD1351, SD1353

Operation setting after restoration

As an operation after the restoration processing, set whether to operate the CPU module in the status at the backup processing or to operate the CPU module in the initial status with the bit 15 of SD955. The following table lists the operations of each item to be performed according to the operation setting after restoration.

Item	Operation setting after restoration	
	Operating the CPU module in the status at data backup (bit 15 of SD955 = On)	Operating the CPU module in the initial status (bit 15 of SD955 = Off)
Device initial value	The device initial value is not set after the restoration processing.	The device initial value is set after the restoration processing. (The device data at data backup will be overwritten with the device initial value.)
Initial values of global/local labels	The initial values of global/local labels are not set after the restoration processing.	The initial values of global/local labels are set after the restoration processing. (The label data at data backup will be overwritten with the initial value of the initial global/local value.)
SFC program* ¹	When "Resume Start" was selected before data backup, the SFC program is resumed after restoration processing.	The SFC program is not resumed after restoration processing even though "Resume Start" was selected before data restoration.
Event history	The event history at data backup is set.	The event history at data backup is not set, a new file is created and a restoration event is registered.

*1 When the firmware version of the CPU module at the backup processing is different from that of at the restoration processing, the SFC program will be started from the block 0 and step 0 regardless of the operation setting after the restoration.

Note that this setting is invalid since the device initial value file, initial global label value file, initial local label value file, event history file, and SFC program are not restored when the value in SD954 (Restoration target data setting) is 1 (restoration target data are only device/label data).

Point

For the operation setting after restoration, specify the operation at a completion of restoration.

When the CPU module is switched from STOP to RUN, values of devices are changed according to the operation of the device memory at an operating status change of the CPU module. ( Page 121 Operation Processing When Operating Status Is Changed)

Restoration processing triggered by turning on SM1354

Backup data is restored at a desired timing.

Point

Use the restoration function by turning on SM1354 to check the backup data and to test before actual operation.

To operate the system using the backup data, use the automatic restoration with SD955. (Page 364 Operating procedure)

Restriction

The restoration processing triggered by turning on SM1354 (CPU module data restoration execution request) can be executed only when the CPU module is the STOP state.

Operating procedure

1. Set restoration target data with SD954 (Restoration target data setting).
2. Set a restoration target folder in the areas from SD956 (Restoration target date folder setting) to SD958 (Restoration target number folder setting). (These settings are not required when the bit 13 of SD955 is on.)
3. Set each setting with the bit 13 to 15 of SD955.
4. Set the CPU module to the STOP state.
5. Turn on SM1354.

- (1) A restoration execution request is sent.
- (2) The system turns on SM1353 (CPU module data restoration status flag).
- (3) The system turns off SM1354 after the restoration processing is completed.
- (4) The system turns off SM1353.

If the restoration processing is completed with an error and SM959 (CPU module data restoration error check flag) turns on, check SD959 (Restoration error cause), take actions, and then restore the data again as required.

Point

The execution status of the restoration processing can be checked in SD1350 (Number of uncompleted folders/files of CPU module data backup/restoration) and SD1351 (Progression status of CPU module data backup/restoration). (Page 604 List of Special Register Areas)

Automatic restoration using SD955

Backup data is automatically restored when the CPU module is powered on or is reset.

Initialization at the automatic restoration

Set whether or not to initialize drives other than the SD memory card at execution of the automatic restoration with the bit 1 of SD955 (Restoration function setting).

This setting is enabled only when SD954 (Restoration target data setting) is set to 0 (All target data).

Bit 1 of SD955	Restoration target data setting
Off	Not initialized
On	Initialized

Operating procedure

1. Set the data to restore in SD954.
2. Set a restoration target folder in the areas from SD956 (Restoration target date folder setting) to SD958 (Restoration target number folder setting). (These settings are not required when the bit 13 of SD955 is on.)
3. Set values to the bit 1 and bits from 13 to 15 of SD955.
4. Turn on the bit 0 of SD955.
5. Power off and on or reset the CPU module.

If the restoration processing is completed with an error and SM959 (CPU module data restoration error check flag) turns on, check SD959 (Restoration error cause), take actions, and then restore the data again as required.

Point

- Since the special register set for the automatic restoration is a latch area, setting data is held.
- SD955 holds its setting even after the CPU module is powered off and on or is reset. Thus, if the CPU module is powered off and on or is reset while the bit 0 of SD955 is on, the automatic restoration is executed again. Not to perform the automatic restoration when the CPU module is powered off and on or is reset next time, turn off the bit 0 of SD955 after a restoration is completed and then power off and on or reset the CPU module.

Checking restoration errors

- When an error occurs in the restoration processing triggered by turning on SM1354, a diagnostic error is not detected and an error code is stored in SD959 (Restoration error cause). ( Page 504 List of Error Codes)
- When an error occurs at the automatic restoration using SD955, a diagnostic error is detected. The error code is also stored in SD959. ( Page 504 List of Error Codes)

Precautions

The following describes the precautions for the restoration function.

Prohibited operation during execution of the restoration processing

Do not perform the following operations during execution of the restoration processing.

- Removing and inserting the SD memory card
- Powering off or resetting the CPU module

The above mentioned operations leave the data in the CPU module in an incomplete state which is middle of the restoration processing. Do not run the CPU module with this incomplete state. Doing so may cause an unintended operation. Restore the data again or format each drive in the CPU module, and clear devices/labels before writing programs or parameters to the programmable controller.

Suspending the restoration processing

The following operation can suspend a restoration processing.

- Setting the SD memory card forced disable

Suspension during a restoration leaves the data in the CPU module in an incomplete state which is middle of the restoration processing. Do not run the CPU module with this incomplete state. Doing so may cause an unintended operation. Restore the data again or format each drive in the CPU module, and clear devices/labels before writing programs or parameters to the programmable controller.

Model name of the CPU module to which data is restored

Restore the data to the CPU module whose model name is the same as that of the CPU module where the backup data has been stored. If not, the data cannot be restored.

When labels accessible from external devices have been set in the CPU module

For the programmable controller CPU with firmware version "24" or earlier, the restoration cannot be executed if labels accessible from external devices have been set in the CPU module by access label settings from external devices.

Check that no such labels have been set in the CPU module and then execute the restoration processing.

For the programmable controller CPU with firmware version "25" or later, the restoration by turning on SM1354 cannot be executed if labels accessible from external devices have been set in the CPU module or in a backed up data from external devices. When the restoration is required, execute the automatic restoration using SD955.

Automatic restoration using SD955 and functions that cannot be executed

Do not set both of the automatic restoration using SD955 and the boot operation at a time.

If the CPU module is powered off and on or is reset with both of the automatic restoration using SD955 and the boot operation set, the automatic restoration using SD955 does not function.

Status of the restoration destination CPU module

If the status of the restoration destination CPU module differs from that of the CPU module at the backup processing (such as programs or parameters), the restoration may not be executed.

When the backup data to be restored is backed up in a different status from that of the restoration destination CPU module, store 0 (All the target data) to SD954 (Restoration target data setting) and execute the automatic restoration.

When the same name folder or file exists in the restoration target CPU module

If the name of a folder or file in the restoration target CPU module and the name of a folder or file in backup data are identical, the folder or file in the module will be overwritten by that in the backup data.

Changing the operating status during execution of restoration

During execution of the restoration processing, the CPU module remains in the STOP state even though the RUN/STOP/RESET switch is changed from the STOP to RUN position or the remote RUN or the remote PAUSE is executed. If the operating status of the CPU module is changed, the status will change to the set status after the restoration processing is completed.

Time required for completing the restoration processing

The restoration processing takes more time depending on the number of backup data sets (folders), file size, and the number of files in the SD memory card.

In a multiple CPU system, if the automatic restoration has taken time and an error has occurred in another CPU module, another error may occur in the CPU module to which the automatic restoration was executed after the completion of the restoration.

In that case, shorten the time for restoration. Change the setting of SD954 (Restoration target data setting) to only the device data that is to be cleared at a system start-up, and execute the automatic restoration again.

Monitoring stop at restoration

Stop monitoring before executing the restoration processing.

When the restoration processing is executed, programs, parameters, and device/label values may not be properly monitored because they are changing.

Reflecting restored data

Some of the parameters are reflected only when the CPU module is powered off and on or is reset. If the restoration processing is executed while the CPU module is in the STOP state and then is switched to the RUN state, the CPU module may not operate with the backup data. In that case, power off and on or reset the CPU module. For device/label data, since device/label data except for latch-specified devices/labels is initialized when the CPU module is powered off and on or is reset, restore the device/label data again as required.

Abnormal completion of restoration

Since the restoration processing will be completed with an error, do not execute the restoration processing in the following cases.

- The name of a file in the restoration destination CPU module and the name of a file in backup data are identical, and a file password has been set.
- Data in a backup folder has been deleted. (Do not delete the data in backup folders that are likely to be used for restoration.)
- Backup data has problems. (Backup data has been changed or the CPU module was powered on and off during execution of the backup processing.)

Instruction executed at the rising/falling edge when data is restored

When the program file is restored by turning on SM1354, the execution status of instructions is undefined and the instructions executed at the rising/falling edge may not work properly.

To operate the system by restoring the backup data, use the automatic restoration with SD955.

When the special relay and special register are restored

When a restoration is operated with the setting to restore the special relay and special register, the system will be operated with the values (time, day of the week, day, time, and the upper limit value of the number of backup data for the automatic backup set to the backup function setting) before restoration. (The backup function setting will not be re-set although the special register areas are overwritten by the restoration.)

To operate the system with the restored backup function setting, set the backup function setting again.

Data protected by security functions

■File password function

Unlock the file passwords of the files in the backup target CPU module. If any files to which file passwords have been set exist in the CPU module, the files are not restored.

■Security key authentication function

Locked programs can be restored regardless of whether security keys have been written or not. However, when the security key has not been written to the CPU module after the restoration processing, the program cannot be executed. Restore unlocked backup data or set the same security key.

When the SFC program is restarted from where the program was stopped

Specify the continue start. When the continue start has not been specified, the SFC program will be started from the block 0 and step 0 even though the bit 15 of SD955 is on (the continue start is executed).

When the IP address change function is used

If the backup processing is executed with the IP address stored in the IP address storage area (system memory), the IP address will be changed at the following timing in the restoration processing.

- Restoration processing triggered by turning on SM1354: When the CPU module is powered off and on or is reset after the restoration processing
- Automatic restoration using SD955: When the restoration processing is executed

Operations and functions that cannot be performed

While the following operations or functions are being executed, the restoration processing cannot be executed.

The following operations and functions cannot be executed during execution of the restoration processing.

Operation or function		
Operation from the engineering tool	Initializing the CPU built-in memory/SD memory card	
	Clearing values (Devices, labels, file registers, latches)	
	Reading data from the programmable controller	
	Writing data to the programmable controller (including online change of files)	
	Verifying data with the programmable controller	
	Deleting data in the programmable controller	
	User data operation	Reading user data
		Writing user data
		Deleting user data
		Creating a folder
		Deleting a folder
		Changing a folder name
		Online change (online change (ladder block))
		Event history function (Updating event history data, clearing event history)
		File password function
Operation using the CPU module logging configuration tool	Security key authentication function (Writing/deleting a security key to/in the CPU module)	
	Predefined protocol support function (writing/reading/verifying protocol setting data)	
	Memory dump function (Memory dump setting/reading results, registering/clearing memory dump)	
	Firmware update function (Firmware update using the engineering tool)	
	Data logging function (Writing/reading/deleting a logging setting file, registering/clearing a logging setting, stopping a logging)	
	Deleting a logging file	

Operation or function		
Others	<ul style="list-style-type: none"> • SLMP • MC protocol 	Remote latch clear (Remote Latch Clear)
		Creating a new file (New File)
Writing data to a file (Write File)		
Deleting a file (Delete File)		
Copying a file (Copy File)		
Changing a file attribute (Change File State)		
Changing file creation date (Change File Date)		
Opening a file (Open File)		
Reading a file (Read File)		
File transfer from an Ethernet-equipped module (FTP server)		Reading a file (get, mget)
	Writing a file (put, mput, pm-write)	
	Deleting a file (delete, mdelete)	
	Changing a file name (rename)	
	Changing a file attribute (change)	
File transfer function (FTP server) of the built-in Ethernet function		
File transfer function (FTP client) of the built-in Ethernet function		
Changing an IP address		
iQ Sensor Solution data backup/restoration function		
System operation setting with SD384		
Transfer to the data memory with special relay		
Data logging file transfer to data memory ^{*1}		

*1 It is executed when the trigger logging data collection is completed or data collection for the specified number of storage files is completed.

Operation of when the data logging function is used

If data is backed up during execution of the data logging function and the function has been set to be started automatically when the operating status of the CPU module is changed to RUN, the data logging function will be automatically executed when the status of the CPU module changes to RUN after the restoration processing. To restart the data logging function after the restoration processing without the above setting, use the CPU module logging configuration tool.

When the CPU built-in memory (function memory) is specified for the data storage destination memory, the function memory is not backed up. Therefore, when the data logging is restarted after the restoration processing, the logging files are deleted after the CPU module is powered off or the RESET state is cleared, and the logging file number starts from 1 at the storage file switching.

Restoration during execution of the restoration processing

The restoration processing triggered by turning on SM1354 cannot be executed during execution of the restoration processing. (The latter restoration processing is ignored.)

When the CPU module database access function is used

When the data is backed up with the CPU module data backup/restoration function and restored by turning on SM1354 while using the CPU module database access function, power off and on or reset the CPU module regardless of the completion status of the restoration. (For the automatic restoration by SD955, the CPU module is not required to be powered off and on or reset.)

Restoration of when the data allocation in the program file is different

The data allocation in the program file differs depending on the firmware version of the CPU module. (☞ Page 125 Data allocation and procedure of read/write operations)

When the data backed up using the CPU module with the conventional data allocation is restored to the CPU module with the new data allocation, the restoration processing is completed successfully. In this case, data allocation in the CPU module is different. Therefore, an error occurs when the CPU module is powered off and on or is reset, or the module operating status is changed from STOP to RUN after the restoration processing. When the data backed up using the CPU module with the new data allocation is restored to the CPU module with the conventional data allocation, the restoration processing may be completed with an error.

In this case, an error occurs when the CPU module is powered off and on or is reset, or the module operating status is changed from STOP to RUN after the restoration processing.

22 MULTIPLE CPU SYSTEM FUNCTION

With multiple CPU modules mounted on the base unit, each of the CPU modules controls their own assigned I/O modules and intelligent function modules. In addition, the CPU modules communicate with each other.

Point

- For details on the concept of the multiple CPU system configuration specification (System configuration specifications such as the mounting position of the CPU modules and assignment of CPU number/IO number), refer to the MELSEC iQ-R Module Configuration Manual.
 - For the start-up (Setting, operating procedures, etc) of the Multiple CPU system, refer to the GX Works3 Operating Manual.
-

Restriction

- The startup time of the multiple CPU system may be slowed, depending on the configuration of installed modules, boot operation, functions performed before CPU modules enter into the RUN state (e.g. setting of initial device/label values), the configuration of system parameters and CPU parameters (e.g. the number of programs to run).
 - When diagnostics of the SD memory card is performed due to operation such as power-off during access to the SD memory card, the startup time of the multiple CPU system may be slowed.
 - Create a program so that only one CPU module accesses the Q series module, if possible. If multiple CPU modules access the Q series module simultaneously, the scan time (including the execution processing of interrupt programs) may be extended due to access waiting time.
 - Before using the multiple CPU system function with the RnENCPU, check the versions of the CPU module and engineering tool used. ( Page 705 Added and Enhanced Functions)
-

22.1 Out-of-group I/O Fetch

The access range to the controlled module is different from that to the non-controlled module. To fetch the data which cannot be accessed, use the out-of-group I/O fetch function.

Accessing controlled module

The access range to the controlled module of the CPU module is the same as that to the single CPU system, and I/O refresh for the controlled module and/or reading/writing to buffer memory of the intelligent function module are enabled.

Accessing non-controlled module

Access to the non-controlled module of the CPU module is limited to reading input (DX) and buffer memory of the intelligent function module. Note that On/Off data of input (X)/output (Y) of the non-controlled module can be fetched using the out-of-group I/O fetch function. (☞ Page 372 Out-of-group I/O fetch setting)

○: Accessible, ×: Not accessible

Communication method	Access target		Access range	
			When "Import" is selected in the settings for out-of-group I/O fetch	When "Not Imported" is selected in the settings for out-of-group I/O fetch
Communication through refresh	Input (X)	Read to another CPU module	○*1	× (Non-processing)
		Output (Y)	Write to another CPU module	
	Output (Y)	Read to another CPU module	○*1	× (Cannot be specified from engineering tools)
		The buffer memory of the intelligent function module	Read	
	Link direct device	Write	× (Cannot be specified from engineering tools)	× (Cannot be specified from engineering tools)
		The buffer memory of the intelligent function module	Write	
Communication through direct access	Input (DX)	Read to another CPU module	○	○
		Output (DY)	Write to another CPU module	
	Output (DY)		Read to another CPU module	× (Cannot be specified)
		The buffer memory of the intelligent function module	Read	○
	Link direct device		Write	× (An error occurs in the CPU module.)
		Link direct device	Read	× (An error occurs.)
Write	× (An error occurs.)		× (An error occurs.)	

*1 Cannot read from CPU modules which are synchronized through the inter-module synchronization function.

Precautions

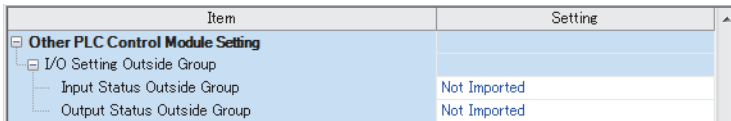

An error is not detected in reading input (DX) for the non-controlled module and buffer memory of the intelligent function module.

Out-of-group I/O fetch setting

In this menu item, whether or not out-of-group I/O status is fetched can be specified.

 [System Parameter] ⇒ [Multiple CPU Setting] ⇒ [Other PLC Control Module Setting] ⇒ [I/O Setting Outside Group]

Window

Item	Setting
Other PLC Control Module Setting	
I/O Setting Outside Group	
Input Status Outside Group	Not Imported
Output Status Outside Group	Not Imported

Displayed items

Item	Description	Setting range	Default
Input Status Outside Group	Specify whether or not out-of-group input status is fetched.	<ul style="list-style-type: none">• Not Imported• Import	Not Imported
Output Status Outside Group	Specify whether or not out-of-group output status is fetched.	<ul style="list-style-type: none">• Not Imported• Import	Not Imported

Fetching input (X)

When "Import" is selected for "Input Status Outside Group" in "I/O Setting Outside Group", the input refresh before the start of the program operation fetches On/Off data from the input module and/or intelligent function module controlled by other CPU modules.

■ Modules from which input (X) can be fetched

Input (X) can be fetched from the following modules mounted on the base/extension base unit.

- Input module
- I/O combined module *1
- Intelligent function module

*1 Data in the areas assigned to the output portion (area not used) are not fetched. On/Off state is maintained.

Restriction

Input (X) cannot be fetched from the Q series modules.

Fetching output (Y)

When "Import" is selected for "Output Status Outside Group" in "I/O Setting Outside Group", the output refresh before the start of the program operation fetches On/Off data output to the output module and/or intelligent function module controlled by other CPU modules into output (Y) for the host CPU module.

■ Modules from which output (Y) can be fetched

Output (Y) can be fetched from the following modules mounted on the base/extension base unit.

- Output module
- I/O combined module
- Intelligent function module

Restriction

Output (Y) cannot be fetched from the Q series modules.

Output to output/intelligent function module

On/off data cannot be output to non-controlled modules. When turning on or off output of the output module and/or intelligent function module controlled by other CPU modules by the program or others, the output is turned on or off within the CPU module. However, it is not output to output/intelligent function module.

Accessing buffer memory of intelligent function module

■Reading data on buffer memory

The following instructions can be used to read data stored in the buffer memory of the intelligent function module.

- FROM instruction
- Instruction using the CPU module access device (Un\Gn)

■Writing data to buffer memory

The following instructions cannot be used to write data to the buffer memory of the intelligent function module.

- TO instruction
- Instruction using the CPU module access device (Un\Gn)

Accessing a module by using link direct devices

The CPU module can access only to modules under its control by using link direct devices. Non-controlled modules cannot be accessed.

22.2 Operation Settings

This section describes the operation settings of the multiple CPU system function.

Stop setting

An operating status, whether to stop the operation of all the CPU modules or not, if a major or moderate error occurs in any of the CPU modules is set.

 [System Parameter] ⇒ [Multiple CPU Setting] ⇒ [Operation Mode Setting] ⇒ [Stop Setting]

Window

Item	Setting
Operation Mode Setting	
Stop Setting	
PLC No. 1	Major: All Station Stop, Moderate: All Stat
PLC No. 2	Major: All Station Stop, Moderate: All Stat
PLC No. 3	Major: All Station Stop, Moderate: All Stat
PLC No. 4	Major: All Station Stop, Moderate: All Stat

Displayed items

Item	Description	Setting range	Default
PLC No.1	Set whether to stop the operation of all the CPU modules or not if a major or moderate error occurs in CPU No.1.	<ul style="list-style-type: none"> Major: All Station Stop, Moderate: All Station Stop Major: All Station Stop, Moderate: All Station Continue Major: All Station Continue, Moderate: All Station Continue 	Major: All Station Stop, Moderate: All Station Stop
PLC No.2	Set whether to stop the operation of all the CPU modules or not if a major or moderate error occurs in CPU No.2.		
PLC No.3	Set whether to stop the operation of all the CPU modules or not if a major or moderate error occurs in CPU No.3.		
PLC No.4	Set whether to stop the operation of all the CPU modules or not if a major or moderate error occurs in CPU No.4.		

Applicable errors to the stop setting

The following table lists the applicable errors to the setting that specifies the operation of all the CPU modules of when a major or moderate error has occurred in any of the CPU modules.

Error name	Error code
Another CPU module moderate error	1220H
Another CPU module major error	2461H, 2462H, 2470H

Synchronous startup setting

Startup time is synchronized among the CPU modules. This setting eliminates the need for an interlock program that monitors the startup time of another CPU module when accessing it. Note, however, that the startup of the entire system delays because the system starts up with the last CPU module.

 [System Parameter] ⇒ [Multiple CPU Setting] ⇒ [Operation Mode Setting] ⇒ [Synchronous Startup Setting]

Window

Item	Setting
[-] Synchronous Startup Setting	
PLC No. 1	Synchronize
PLC No. 2	Synchronize
PLC No. 3	Synchronize
PLC No. 4	Synchronize

Displayed items

Item	Description	Setting range	Default
PLC No.1	Set the CPU modules whose startup time is synchronized in the multiple CPU system.	<ul style="list-style-type: none"> • Synchronize • Do not Synchronize 	Synchronize
PLC No.2			
PLC No.3			
PLC No.4			

Point

- Group setting for the synchronized start-up is available. For example, a setting in which only CPUs No.1 and No.2 start synchronously within a multiple CPU system with four CPU modules is possible.
- If a reserved (empty) CPU is specified to synchronize, it is skipped and the other CPUs in the group start synchronously.
- This setting is designed to access to each CPU module without interlock in the multiple CPU system. It is not intended to be used for starting operation processing at the same time across CPU modules after startup.

Program to check start-up of each CPU module

It is recommended to create a program that checks start-up of each CPU module using SM220 to SM223 (CPUs No.1 to No.4 preparation completed) when the multiple CPU synchronized startup is disabled. If a certain instruction is issued against a CPU module that has not started, the instruction executes no processing.

Ex.

Program to check start-up of CPU module of CPU No.2

To synchronize the start of operation processing across CPU modules, a program is required to check whether individual CPU modules are ready to start operation processing or not.

The following is an example of the configuration of a program which synchronizes the start of operation processing across CPU modules and programs which should start operation processing synchronously.

Program	Execution type	Description
Program to synchronize the start of operation processing	Scan	This is a program used to synchronize the start of operation processing across all CPU modules. This program must be specified as one for running at the beginning of the scan execution type of program. Also, when all the CPU modules are ready to start operation processing, the flag indicating an operation start turns on for only one scan.
Program to start operation processing synchronously	Event	This is a program which should be executed when all the CPU modules are ready to start operation processing. This program must be specified as an event execution type program which is triggered when the operation start flag is turned on.

Program example

- Devices to be used for programs to start operation processing synchronously

Device to be used	Application
M0	Flag that indicates the operation processing is ready to be started (after a flag that indicates the operation start turns on, this flag turns off.)
M1	Flag that indicates an operation start (this flag turns on for only one scan.)
U3En\G2048	The synchronization counter of each CPU module (n=0: CPU No.1, n=1: CPU No.2, n=2: CPU No.3, n=3: CPU No.4)
D2 to D9	The storage location for values of the synchronization counter of each CPU module
M2 to M9	The operation processing start wait state of each CPU module

- Example of a program to synchronize the start of operation processing

Clock data

CPUs No.2 to No.4 automatically synchronize their clock data to the one set for CPU No.1 (even if setting up clock data individually for each CPU, they will be overwritten). Therefore, simply setting up the clock data for CPU No.1 allows to manipulate a unified clock data across the entire multiple CPU system ( Page 148 Time Setting)

Point

As with clock data, the same settings as those for CPU No.1 apply to CPU Nos. 2 to 4.

- Time zone setting ( Page 150 Setting Time Zone)
 - Daylight saving time setting ( Page 151 Daylight Saving Time Function)
-

22.3 Multiple CPU Parameter Checking

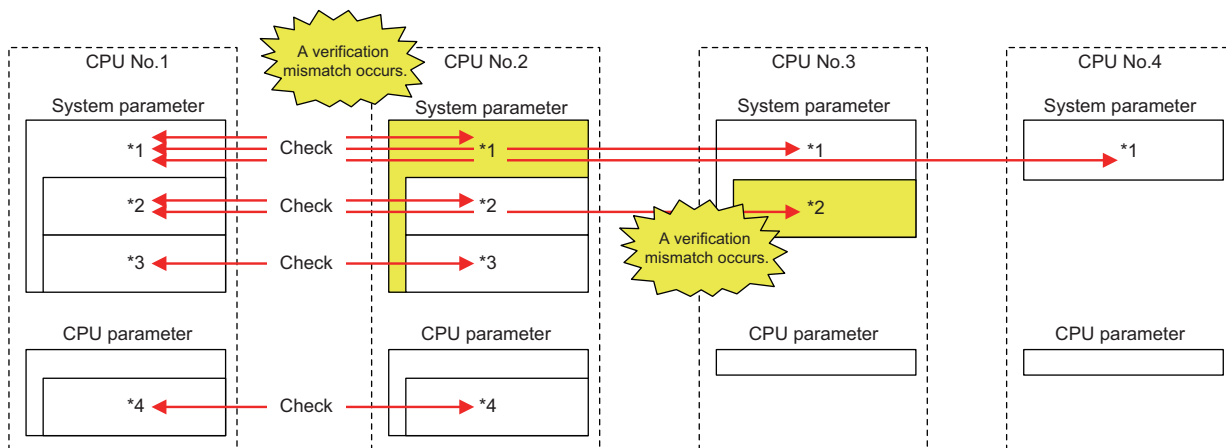

Whether the same setting is configured for between the system parameter of each CPU module and multiple CPU refresh number of points of CPU parameter is checked by the multiple CPU system at the timing shown below. However, as for the fixed scan communication setting and inter-module synchronization setting, checking is done only for the module using the functions.

- At power-on
- At reset of the CPU No.1
- At operating status change (STOP to RUN) after parameter change

Timing	Parameters to check	Checking conditions for CPU No.1	Checking conditions for CPU No.2 and later
At power-on or reset of the CPU No.1	System parameters (other than fixed scan communication setting and inter-module synchronous setting)	Checking is not conducted.	Compares with the parameters of the CPU of the lowest number.
	Settings of fixed scan communication	Checking is not conducted by the CPU module of the number for which the fixed scan communication setting is not configured. The CPU module of the number for which the fixed scan communication setting is configured will compare the parameters with those of the CPU of the lowest number.	
	Inter-module synchronization setting	Checking is not conducted by the CPU module of the number for which the Inter-module synchronization setting is not configured. The CPU module of the number for which the Inter-module synchronization setting is configured will compare the parameters with those of the CPU of the lowest number.	
	CPU parameters (number of points of refresh settings)	Checking is not conducted by the CPU module of the number for which the fixed scan communication setting is not configured. The CPU module of the number for which the fixed scan communication setting is configured will compare the parameters with those of the CPU of the lowest number.	
At operating status change (STOP to RUN) after parameter change	—	Compares with the parameters of the host CPU module before parameters are changed.	

Ex.

An error occurs in the module of each CPU No.2 and 3, and the module of each CPU No.1 and 4 starts up normally when parameter checking. (Operation in error)

○: there is setting (if the number immediately next is the same number, it refers to the same parameter), ×: there is no setting

Item		Setting conditions for the CPUs of each number			
		PLC No.1	PLC No.2	PLC No.3	PLC No.4
With or without the setting for each parameter	System parameters (other than fixed scan communication setting and inter-module synchronous setting) ^{*1}	○1	○5	○1	○1
	Settings of fixed scan communication ^{*2}	○2	○2	○6	×
	Inter-module synchronization setting ^{*3}	○3	○3	×	×
	CPU parameters (number of points of refresh settings) ^{*4}	○4	○4	×	×

22.4 Data Communication Between CPU Modules

CPU modules within a multiple CPU system can send and transfer data to each other. The refresh communication and direct access communication enable data writing or reading between CPU modules. The following table lists the data communication method.

Communication method	Application	Description
Data communication with CPU buffer memory	This method is used when data is sent or received at the timing of each CPU module.	The CPU module for sending the data writes data into the CPU Buffer memory of the host CPU module. The CPU module for receiving data reads data from the CPU Buffer memory of the sender CPU module (other CPU modules).
Data communication with fixed scan communication area	This method is used when data is sent or received through adjusting the timing between CPU modules.	The CPU module for sending the data writes data into the fixed scan communication area (send area) of the host CPU module. The CPU module for receiving data reads data from the fixed scan communication area (receive area) of the host CPU module of the send source CPU module.

Memory to be used

CPU buffer memory is utilized for data communication between the CPU modules.

Memory configuration of CPU buffer memory

This section describes the memory configuration of CPU buffer memory.

Memory	Communication method	Description	Area size
CPU buffer memory	Communication through direct access	This area is used to read/write data from/to the areas of the host CPU module or other CPU modules.*1 (☞ Page 392 Communication through direct access)	512K words fixed
Refresh area	Communication through refresh	Data communication is conducted through refresh at END processing. (☞ Page 388 Communication through refresh)	
Fixed scan communication area	Communication through direct access	This area communicates the data to the fixed scan communication area of the host CPU module, and is used when the host CPU module area and another CPU module area transfer the data at the fixed scan communication cycles. (☞ Page 392 Communication through direct access)	It is possible to change within the range of 0 to 24K words in total. The send area as per unit can be set within the range of 0 to 12K words. (☞ Page 383 Setting fixed scan communication area)
The Refresh Area in the Fixed Scan Communication Area	Communication through refresh	The refresh operation is conducted at the fixed scan communication cycle. (☞ Page 388 Communication through refresh)	

*1 Data cannot be written to the areas of other CPU modules.

■ Avoidance of 64-bit data inconsistency

To avoid 64-bit data inconsistency, access the CPU buffer memory by specifying the start address as a multiple of four similarly to the device to be specified.

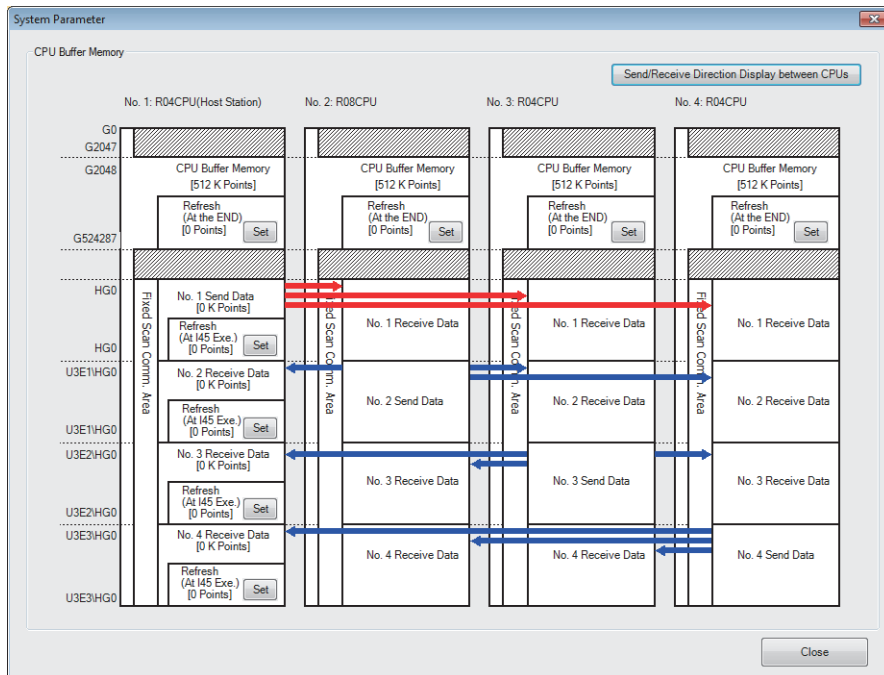

- (1) The CPU module assures a 64-bit data and write the data to the CPU buffer memory. (TO U3E0 K2052 D0 K4)
- (2) The CPU module assures a 64-bit data and write the data to the CPU buffer memory. (TO U3E0 K2056 D4 K4)
- (3) The CPU module assures a 64-bit data and read the data from the CPU buffer memory. (FROM U3E0 K2052 D100 K4)
- (4) The CPU module assures a 64-bit data and read the data from the CPU buffer memory. (FROM U3E0 K2056 D104 K4)

Checking for the memory configuration

This section describes the CPU buffer memory configuration of each CPU No. The refresh setting can be configured in both the CPU parameter and the window shown below. (☞ Page 391 Refresh settings)

☞ [System Parameter] ⇒ [Multiple CPU Setting] ⇒ [Communication Setting between CPUs] ⇒ [CPU Buffer Memory Setting] ⇒ [Detailed Setting]

Window

Displayed items

Item	Description	Setting range	Default
[Set] button of each refresh area	This menu item sets up the refresh settings used for data communication between CPU modules. (The settings are linked with the refresh settings of CPU parameter)	—	0 points
[Send/Receive Direction Display between CPUs] button	Click the button and arrows that indicate the send/receive direction appear.	—	—

Setting the data communication with fixed scan communication area

This section describes the setting for making the data communication with fixed scan communication area.

■Setting whether or not it should be used

To communicate data with the fixed scan communication area, "Enable" must be set to "Fixed Scan Communication Function".

🔗 [System Parameter] ⇒ [Multiple CPU Setting] ⇒ [Communication Setting between CPUs] ⇒ [Fixed Scan Communication Function]

Window

Item	Setting
Fixed Scan Communication Function	Not Use

Displayed items

Item	Description	Setting range	Default
Fixed Scan Communication Function	Specify whether or not the fixed scan communication function should be used.	<ul style="list-style-type: none"> • Not Use • Use 	Not Use

■Setting fixed scan communication area

This menu item sets up the range of send area for each CPU in the fixed scan communication area (the refresh area and the total of areas used for direct access communication). Only the fixed scan communication area can be changed with the parameter settings. The other areas are not configurable.

🔗 [System Parameter] ⇒ [Multiple CPU Setting] ⇒ [Communication Setting between CPUs] ⇒ [Fixed Scan Communication Area Setting]

Window

Item	Setting
Fixed Scan Communication Area Setting	
Total [K Word]	0 K Word
PLC No. 1 [Start XY: U3E0]	0 K Word
PLC No. 2 [Start XY: U3E1]	0 K Word
PLC No. 3 [Start XY: U3E2]	0 K Word
PLC No. 4 [Start XY: U3E3]	0 K Word

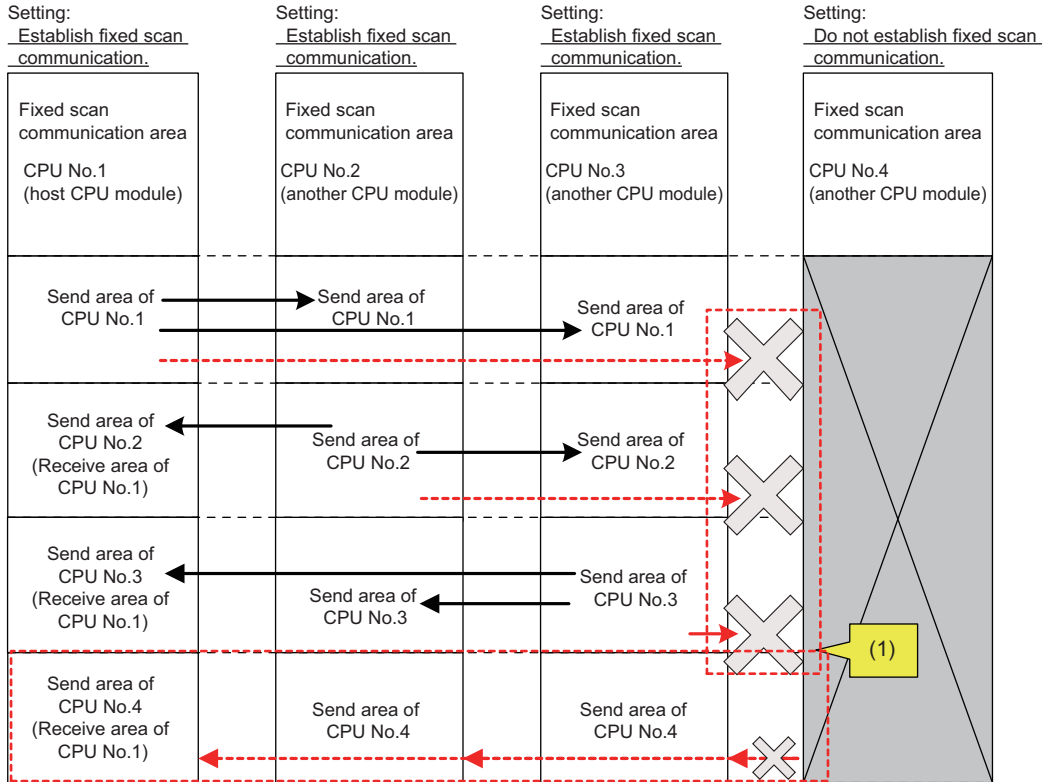

Displayed items

Item	Description	Setting range	Default
Total [K Word]	View the total value.	Entire system: 0 to 24K words ^{*1}	—
PLC No. 1 [Start XY: U3E0]	Set the send area size for CPU No.1.	0 to 12K words	0K word
PLC No. 2 [Start XY: U3E1]	Set the send area size for CPU No.2.	0 to 12K words	0K word
PLC No. 3 [Start XY: U3E2]	Set the send area size for CPU No.3.	0 to 12K words	0K word
PLC No. 4 [Start XY: U3E3]	Set the send area size for CPU No.4.	0 to 12K words	0K word

*1 The max area size that can be set through setting of the fixed scan communication area differs depending on the fixed scan communication cycle.

Fixed scan communication cycle	Max area size that can be set through setting of the fixed scan communication area
0.10ms	12K points
0.15ms	20K points
Except for shown above	24K points

When there exists a CPU module for which "Disable" is set to "Fixed Scan Communication Function", if the send area of the fixed scan communication area is set to a CPU module for which "Disable" is set to "Fixed Scan Communication Function" (unspecified) in the parameter setting on the host CPU module, no error is generated because the unspecified CPU module is considered as a reserved one for future configuration. Example: in four module configuration with the host CPU module is set to CPU No.1 and the fixed scan communication function of CPU No.4 set to "Disable"

(1) Since the setting does not allow fixed scan communication, this CPU module does not send data to the other CPU modules although send areas have been reserved. This CPU module does not receive data from the other CPU modules.

Fixed scan communication setting

This menu item sets up the interval for data transfer between CPU modules. The data transfer interval can be synchronized with the timing for inter-module synchronization cycle. (MELSEC iQ-R Inter-Module Synchronization Function Reference Manual)

[System Parameter] ⇒ [Multiple CPU Setting] ⇒ [Fixed Scan Communication Setting] ⇒ [Fixed Scan Interval Setting of Fixed Scan Communication]

Window

Displayed items

Item	Description	Setting range	Default
0.05ms Unit Setting	Specify whether to set the fixed scan communication cycle in increments of 0.05ms.	<ul style="list-style-type: none"> • Not Set • Set 	Not Set
Fixed Scan Interval Setting (Not Set by 0.05ms)	Select the fixed scan communication cycle from the drop-down list. The same option should be specified only for CPU modules which will use the fixed scan communication function.	<ul style="list-style-type: none"> • 0.222ms^{*1} • 0.444ms^{*1} • 0.888ms • 1.777ms • 3.555ms • 7.111ms 	0.888ms
Fixed Scan Interval Setting (Set by 0.05ms)	Specify the fixed scan communication cycle freely in increments of 0.05ms.	<ul style="list-style-type: none"> • R00CPU, R01CPU, R02CPU: 0.50 to 10.00ms • Other CPU modules: 0.10 to 10.00ms 	<ul style="list-style-type: none"> • R00CPU, R01CPU, R02CPU: 0.50ms • Other CPU modules: 0.10ms
Fixed Scan Communication Function and Inter-module Synchronization Function	Set whether the fixed scan communication cycle cooperates with the inter-module synchronization cycle.	<ul style="list-style-type: none"> • Not Cooperated • Cooperate 	Not Cooperated

*1 This item is not displayed on the R00CPU, R01CPU, and R02CPU.

Point

The send image for the fixed scan communication can be reviewed through the "Fixed Scan Communication Function Operation Image Display".

Restriction

The minimum value for the fixed scan interval setting that can be set in the R00CPU, R01CPU, and R02CPU is 0.50ms.

Therefore, when building the multiple CPU system including the R00CPU, R01CPU, and R02CPU, set the interval to 0.50ms or more for the CPU module to be used with.

Error detection setting

When data is communicated among the CPU modules in a multiple CPU system, some data writing timing may lead to a failure of the complete data communication in the fixed scan communication cycle after the data writing and data inconsistency may occur. In this setting, set whether to detect a continuation error or not in this case. (Page 169 Error detection setting)

Module-by-module data guarantee

In data communication, data is handled in units of 64 bits. Therefore, when data larger than 64 bits is handled, old and new data may be mixed for each CPU module depending on the timing between data reading by the host CPU module and data writing by other CPU modules/data receiving from other CPU modules. (Data inconsistency) To avoid this problem, the system conducts the refresh operation by exchanging handshake signals between the CPU modules for guaranteeing refresh data on a module-by-module basis.

Prevention of data inconsistency by module-by-module data guarantee

The following table shows the preventive control against data inconsistency according to the presence or absence of module-by-module data guarantee.

○: With the preventive control against data inconsistency by the system, ×: Without the preventive control against data inconsistency by the system*¹

Communication method	CPU buffer memory		Fixed scan communication area	
	Module-by-module data guarantee enabled	Module-by-module data guarantee disabled	Module-by-module data guarantee enabled	Module-by-module data guarantee disabled
Communication through refresh	○	×	○	×
Communication through direct access	×	×	○* ²	×

*1 The countermeasure by the program is required. ( Page 395 Data assurance by program)

*2 Limited to the case of access within the multiple CPU synchronous interrupt program (I45). ( Page 397 When accessing fixed scan communication area)

Module-by-module data guarantee

Set up the module-by-module data guarantee.

 [System Parameter] ⇒ [Multiple CPU Setting] ⇒ [Communication Setting between CPUs] ⇒ [PLC Unit Data]

22

Window

Item	Setting
PLC Unit Data	Disable

Displayed items

Item	Description	Setting range	Default
PLC Unit Data	Specify whether data is guaranteed on a module-by-module basis.	<ul style="list-style-type: none"> • Disable • Enable 	Disable

Point

- For communications by the direct access with the CPU buffer memory other than the fixed scan communication area, data is not guaranteed on a module-by-module basis even when this setting is enabled, because the data on the CPU buffer memory of other CPU modules is directly read after execution of the read instruction.
- Data send/receive timing coincides with an update interval of the CPU module with the slowest scan time, because the next send/receive starts only after all CPU modules have completed data reception.

Communication through refresh

The device data for each CPU module is written/read only by the parameter settings. Using refresh areas allows data communication between all or a part of the CPU modules in the multiple CPU system, thereby enabling devices of other CPU modules to be used by the host CPU module.

Types of refresh

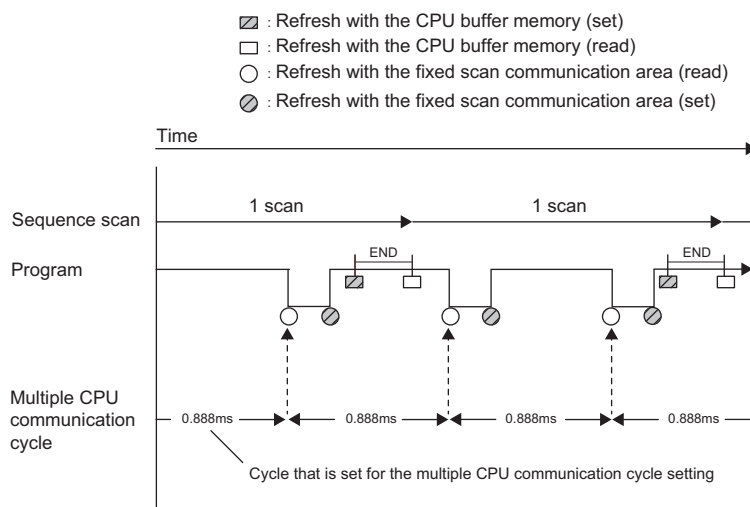

The following table shows the types of refresh.

Refresh timing	Application	Memory to be used
At the END processing	For data communication of devices in synchronization with the scan	CPU buffer memory
At the execution of multiple CPU synchronous interrupt program (I45)*1*2	For data communication of devices at the period specified in the fixed scan communication setting	Fixed scan communication area

*1 The fixed scan communication area is refreshed on the cycle specified in the fixed scan communication setting.

*2 Refresh fails if the multiple CPU synchronous interrupt program (I45) does not exist on the program.

The following figure shows the timing of each refresh.

Refresh using CPU buffer memory

At the END processing of the host CPU module, device data of the host CPU module is written to the refresh area within the CPU buffer memory on the host CPU module. The data written to the refresh area is transferred to the device of another CPU module at the END processing of another CPU module.

Ex.

When CPU No.1 refreshes 32 points (B0 to B1F) and CPU No.2 refreshes 32 points (B20 to B3F):

Refresh using fixed scan communication areas

At the period specified in the fixed scan communication setting, the device data of the host CPU module is written to the refresh area within the fixed scan communication area of the host CPU module. The data written to the refresh area is sent to the refresh area within the fixed scan communication area of another CPU, which in turn reads the transferred data into the device.

Ex.

When CPU No.1 refreshes 32 points (B0 to B1F) and CPU No.2 refreshes 32 points (B20 to B3F):

Executing refresh

Refresh is executed when the CPU module is in RUN and/or STOP (PAUSE) state. For details on the behavior when the CPU module is in stop error state, refer to CPU module operation upon error detection setting. (Page 170 CPU module operation upon error detection setting)

■Behavior during the multiple CPU synchronous interrupt program (I45) execution

If refresh is set to be performed during the multiple CPU synchronous interrupt program (I45) execution, the refresh behavior when the CPU module is in RUN state varies depending on either of the following conditions. (Page 399 Multiple CPU Synchronous Interrupt)

- A program (I45 to IRET) which includes the multiple CPU synchronous interrupt program (I45) exists.
- Event execution type program exists.

The following table lists the refresh behaviors.

○: Execute refresh, ×: Not execute refresh

Execution type		Refresh behavior		Refresh behavior after the program control instruction is executed
		STOP state	RUN state	RUN state
Other than event execution type	The I45 interrupt pointer doesn't exist	○	×	×
	The I45 interrupt pointer exists	○	○	○
Event execution type (I45 interrupt specified)		○	○	× (stop after changing the execution type ^{*1})

*1 The PSCAN/PSTOP instruction changes after the next scan, and the POFF instruction changes after the next two scans.

○: Execute refresh, ×: Not execute refresh, —: Execution disabled

Execution type		Refresh behavior triggered by operating status change of the CPU module							
		RUN state	Upon addition of the I45 interrupt pointer during online program change	Upon removal of the I45 interrupt pointer during online program change	RUN to STOP state	STOP state	After the refresh setting is changed; when parameters are written	STOP to RUN state	Power off and on/Reset
Other than event execution type	The I45 interrupt pointer doesn't exist	×	○	×	○	○	○ ^{*3}	×	×
	The I45 interrupt pointer exists	○	○	×	○ ^{*2}	○	○ ^{*3}	○ ^{*3}	○ ^{*4}
Event execution type (I45 interrupt specified)		○	—	—	○ ^{*2}	○	○ ^{*3}	○ ^{*3}	○ ^{*4}

*2 Not affect to the behavior.

*3 Operates with the pre-change parameters.

*4 Operates with the post-change parameters.

Configurable data

This section lists the configurable data with the refresh settings.

■Maximum number of settings

Maximum of 32 settings can be configured per CPU module for any refresh setting.

■Data number of points

Data number of points can be configured within the number of points assigned to the area (within the send range of the fixed scan communication area) in increments of two points. Device duplication between multiple setting numbers is not allowed.

■Data that can be specified

The device other than local device can be specified. However, when "Use File Register of Each Program" is enabled, file registers cannot be specified. Doing so may prevent the device from operating at file registers for each program depending on the CPU operating status.

Type	Devices that can be specified
Bit device*1	X, Y, M, L, B
Word Device	D, W, R, ZR, RD

*1 This device can be specified only in units of 16 points (one word).

Refresh settings

The refresh can be set up with "Refresh Setting between Multiple CPUs" in "CPU Parameter".

 [CPU Parameter] ⇨ [Refresh Setting between Multiple CPUs]

Operating procedure

"Refresh Setting between Multiple CPUs" window

Item	Setting
Refresh Setting (At the END)	<Detailed Setting>
Refresh Setting (At I45 Exe.)	<Detailed Setting>

"Detailed Setting" window

Setting No.	Device		
	Points	Start	End
No. 1(Send)			
Total	0/522240 Points		
1			
2			
3			

1. Click "Detailed Setting" at the execution timing for each refresh.
2. Enter the start/end of the device.

Point

Set a blank column for "Head" and "End" and set only number of points so that the setting by which auto refresh is not conducted can be configured. (It is possible to perform setting which does not allow the refresh data of other CPU modules, which is unwanted for the host CPU module, to be obtained.)

■Enabling timing of refresh settings

The refresh settings are enabled at the following timing:

- When CPU module is powered off and on or is reset.

CPU module operating status and refresh behavior

When the refresh timing coincides with the period specified in the fixed scan communication setting, the refresh behavior depends on the operating status of the CPU module.

CPU module operating status	Refresh enabled/disabled	Refresh timing	
		CPU buffer memory	Fixed scan communication area
RUN (including a continuation error period)	Execute refresh	During the END processing	Before and after the multiple CPU synchronous interrupt program (I45) execution*1
STOP (including a stop error period due to a moderate error)	Execute refresh	During the END processing	During the END processing
STOP (major error period)	Not execute refresh	—	—
PAUSE	Execute refresh	During the END processing	During the END processing

*1 In the disabling interrupt state by the DI instruction, the refresh is not operational, because the multiple CPU synchronous interrupt program (I45) does not work.

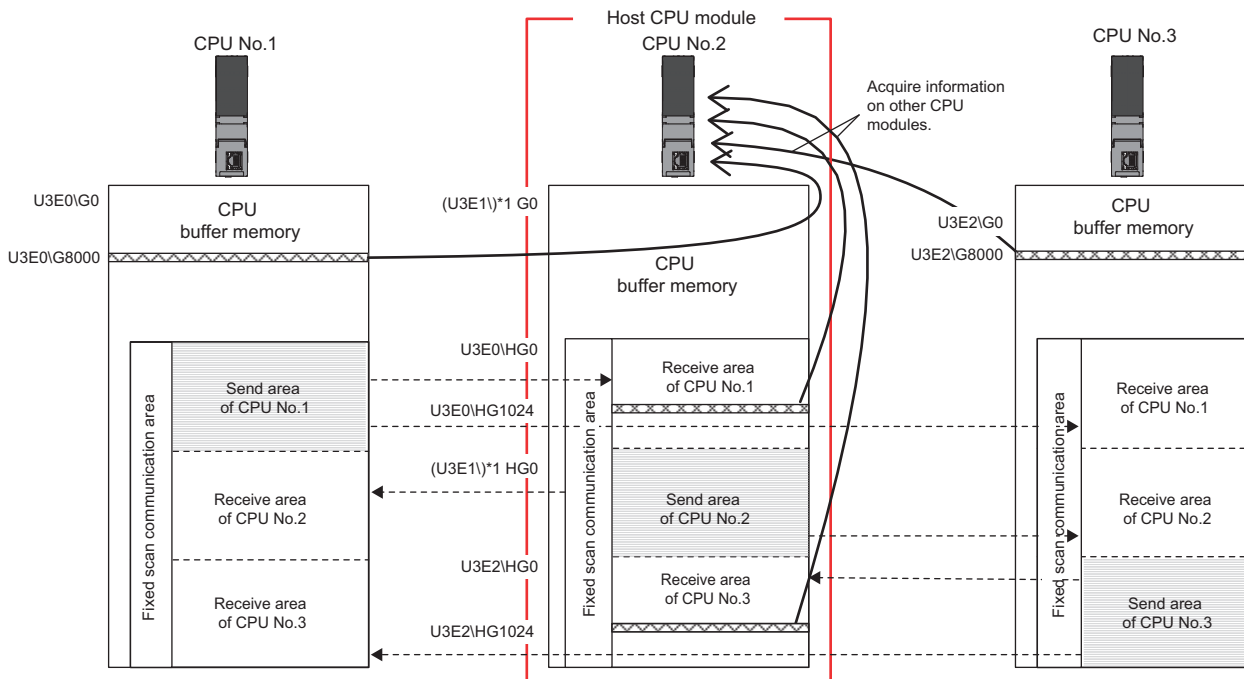

Communication through direct access

This method uses programs to communicate with other CPU modules. The following table lists the communications using the direct access method.

Communication method	Description	Instruction to be used
Communication using CPU buffer memory	Data between CPU modules are transferred using any area on the CPU buffer memory.	<ul style="list-style-type: none"> • FROM/TO instruction • DFROM/DTO instruction • Instruction using the CPU buffer memory access device (U3En\G□)
Communication using the fixed scan communication area	Data between CPU modules are transferred using the fixed scan communication area.	Instruction using the CPU buffer memory access device (U3En\HG□)
Communication by a dedicated instruction	Data between CPU modules in the multiple CPU system are transferred and/or control commands are sent to other CPU modules by using a dedicated instruction.	DDWR/DDRD instruction and others

Specification method through CPU buffer memory access device

Specify the CPU buffer memory as "U3En\Gn" or the fixed scan communication area as "U3En\HGn" when accessing the memory or area. (Page 440 CPU Buffer Memory Access Device)

■ Obtaining information stored on the CPU buffer memory

Access the CPU buffer memory.

■ Obtaining information stored on the fixed scan communication area for other CPUs

Access the fixed scan communication area on the host CPU module. Obtain data sent to the fixed scan communication area on the host CPU module at the fixed scan communication cycle.

Communication using CPU buffer memory and fixed scan communication area

This section describes the communication using CPU buffer memory and fixed scan communication area.

Available area for communication

The following area can be used for communication.

Area	Description
CPU buffer memory	All the CPU buffer memory area except for the refresh area is available. The start address of the available area for each CPU module varies depending on the refresh settings. The end address of the area is fixed by CPU module models.
Fixed scan communication area	All the fixed scan communication area except for the refresh area is available. The start address of the available area for each CPU module is HG0 and the end address varies depending on the refresh settings.

Instructions to be used for communication

Communication with each CPU module is enabled by issuing the following read/write instructions to each area.

- Write instruction: the instructions using the CPU buffer memory access device^{*1} and the TO/DTO instruction
- Read instruction: the instructions using the CPU buffer memory access device^{*1} and the FROM/DFROM instruction

*1 Specify "U3En\G□" when accessing the CPU buffer memory and "U3En\HG□" when accessing the fixed scan communication area.

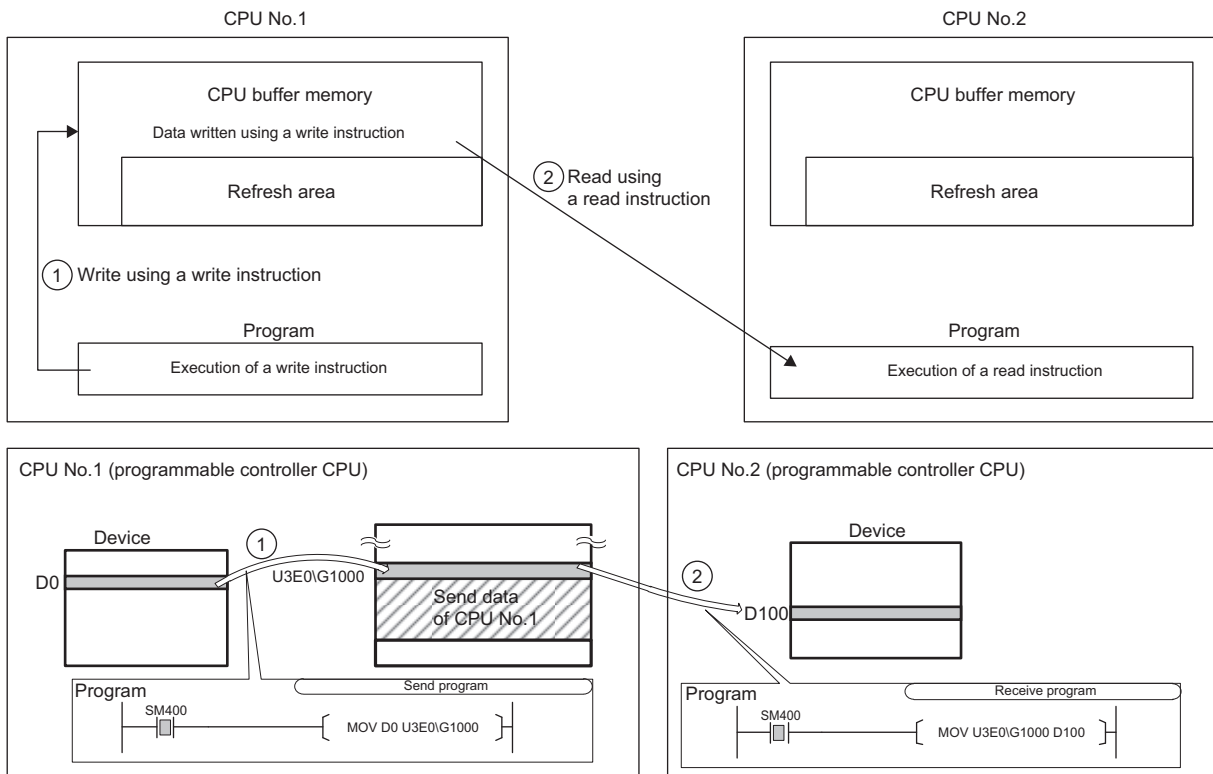

Data communication behavior

- When using an area within the CPU buffer memory

Data written to the area within the CPU buffer memory on the host CPU module using the write instruction can be read by other CPU modules using the read instruction. Unlike the refresh, data registered during the instruction execution can be directly read.

Ex.

When data written to the CPU buffer memory on the CPU No.1 using the write instruction is read by CPU No.2 using the read instruction:

- When using an area within the fixed scan communication area

Data written to the area within the fixed scan communication area on the host CPU module using the write instruction is sent to other CPU modules at the period specified in the fixed scan communication setting. Other CPU modules read the received data using the read instruction. Unlike the refresh, data registered during the instruction execution can be directly read.

Ex.

When data written to the fixed scan communication area on the CPU No.1 using the write instruction is read by CPU No.2 using the read instruction:

Data assurance by program

This section describes how to avoid the inconsistency of data larger than 64 bits using the program. To set up the module-by-module data guarantee using the parameters, use the multiple CPU setting. (Page 387 Module-by-module data guarantee)

Data assurance in communication through the refresh

Inconsistency of transferred data can be avoided by setting the interlock device to a transfer number lower than the one for the transferred data, because data is transferred in descending order from the highest setting number in the refresh settings.

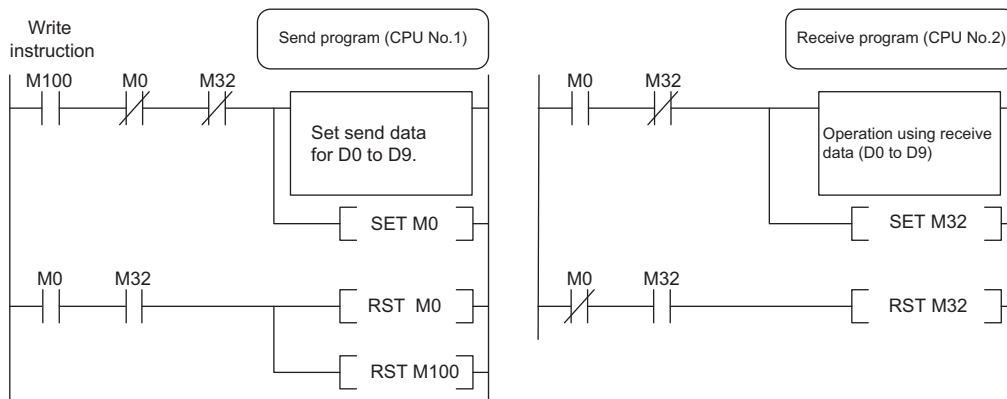

Ex.

Interlock program in communication by refresh

- Parameter settings

CPU No.1 refresh setting							Direction	CPU No.2 refresh setting						
CPU No.	Transfer No.	Send/receive range for each CPU module			Send/receive device setting			CPU No.	Transfer No.	Send/receive range for each CPU module			Send/receive device setting	
		Number of points	start	end	start	end				Number of points	start	end	start	end
CPU No.1	Transfer No.1	2	0	1	M0	M31	→	CPU No.1	Transfer No.1	2	0	1	M0	M31
	Transfer No.2	10	2	11	D0	D9			Transfer No.2	10	2	11	D100	D109
CPU No.2	Transfer No.1	2	0	1	M32	M63	←	CPU No.2	Transfer No.1	2	0	1	M32	M63

- Program example

Data assurance for communication through direct access

The behavior varies depending on the area to be accessed.

■When accessing CPU buffer memory:

The program reads data in ascending order from the start address of the CPU buffer memory other than the refresh area, and the write instruction writes send data in descending order from the end address of the CPU buffer memory other than the refresh area. Therefore data inconsistency can be avoided by setting an interlock device at the start position of data to be communicated.

Ex.

Interlock program in communication by direct access (when accessing CPU buffer memory)

- Program example

(1) CPU No.1 creates send data.

(2) CPU No.1 turns on the data setting complete bit.

[Data transfer with CPU No.2 END processing]

(3) CPU No.2 detects send data setting complete.

(4) CPU No.2 performs receive data processing.

(5) CPU No.2 turns on receive data processing complete.

[Data transfer with CPU No.1 END processing]

(6) CPU No.1 detects receive data processing complete, and turns off the data setting complete bit.

[Data transfer with CPU No.2 END processing]

(7) CPU No.2 detects that send data setting complete is turned off, and turns off receive data processing complete.

When accessing fixed scan communication area

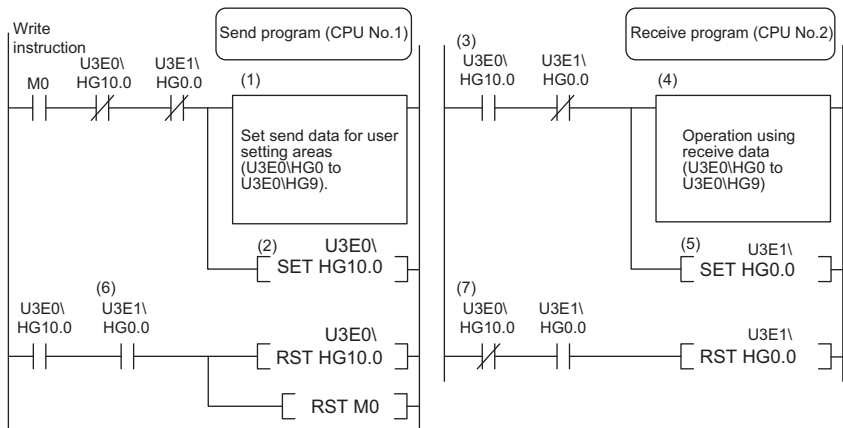

When accessing within the multiple CPU synchronous interrupt program (I45), enabling the setting of module-by-module data guarantee eliminates the need of an interlock circuit. When this refresh area is accessed within a program other than the above, or when the setting of module-by-module data guarantee is disabled, an interlock circuit is required, as with the access to the CPU buffer memory. (Page 386 Module-by-module data guarantee)

The program reads data by transferring it in the order that it is written to the CPU buffer memory (fixed scan communication area). Data inconsistency can be prevented by using devices written after the transfer data for interlocks, regardless of the device type or address.

Ex.

Interlock program in communication by direct access (when accessing fixed scan communication area)

- Program example

- (1) CPU No.1 creates send data.
- (2) CPU No.1 turns on the data setting complete bit.
[Data transfer with multiple CPU communication cycle]
- (3) CPU No.2 detects send data setting complete.
- (4) CPU No.2 performs receive data processing.
- (5) CPU No.2 turns on receive data processing complete.
[Data transfer with multiple CPU communication cycle]
- (6) CPU No.1 detects receive data processing complete, and turns off the data setting complete bit.
[Data transfer with multiple CPU communication cycle]
- (7) CPU No.2 detects that send data setting complete is turned off, and turns off receive data processing complete.

Also, with instructions such as BMOV instructions that involve writing data with two or more words to the CPU buffer memory, data is written from the end address to the start address. If combining and writing send data with interlock signals with a single instruction, data inconsistency can be prevented with an interlock signal at the start of the data.

Communication between CPU modules in error state

The following section describes communication between CPU modules in an error state.

Behavior in receive data error state

A CPU module receiving illegal data due to noise and/or failure discards the received data. If a received data is discarded, the receive-side CPU module keeps the last data received before discarding. When the CPU module receives the next correct data, it updates the received data.

Refresh execution in an error state

The following table lists the refresh and send/receive operation between CPU modules when the host CPU module detects a self diagnostic error. If one of the CPU modules enters into stop error state, the other CPU modules which are not in stop error state keep data stored before the stop error occurs.

Error		Refresh ^{*1}	Data communication between CPU modules ^{*2}
Minor error		○	○
Moderate error	Causes other than the following item	○	○
	Parameter error for fixed scan communication function (including the consistency check during start-up)	× ^{*3*4}	× ^{*3*4}
Major error		× ^{*3}	× ^{*3}

*1 This item indicates data transfer between user devices and the fixed scan communication area on the host CPU module.

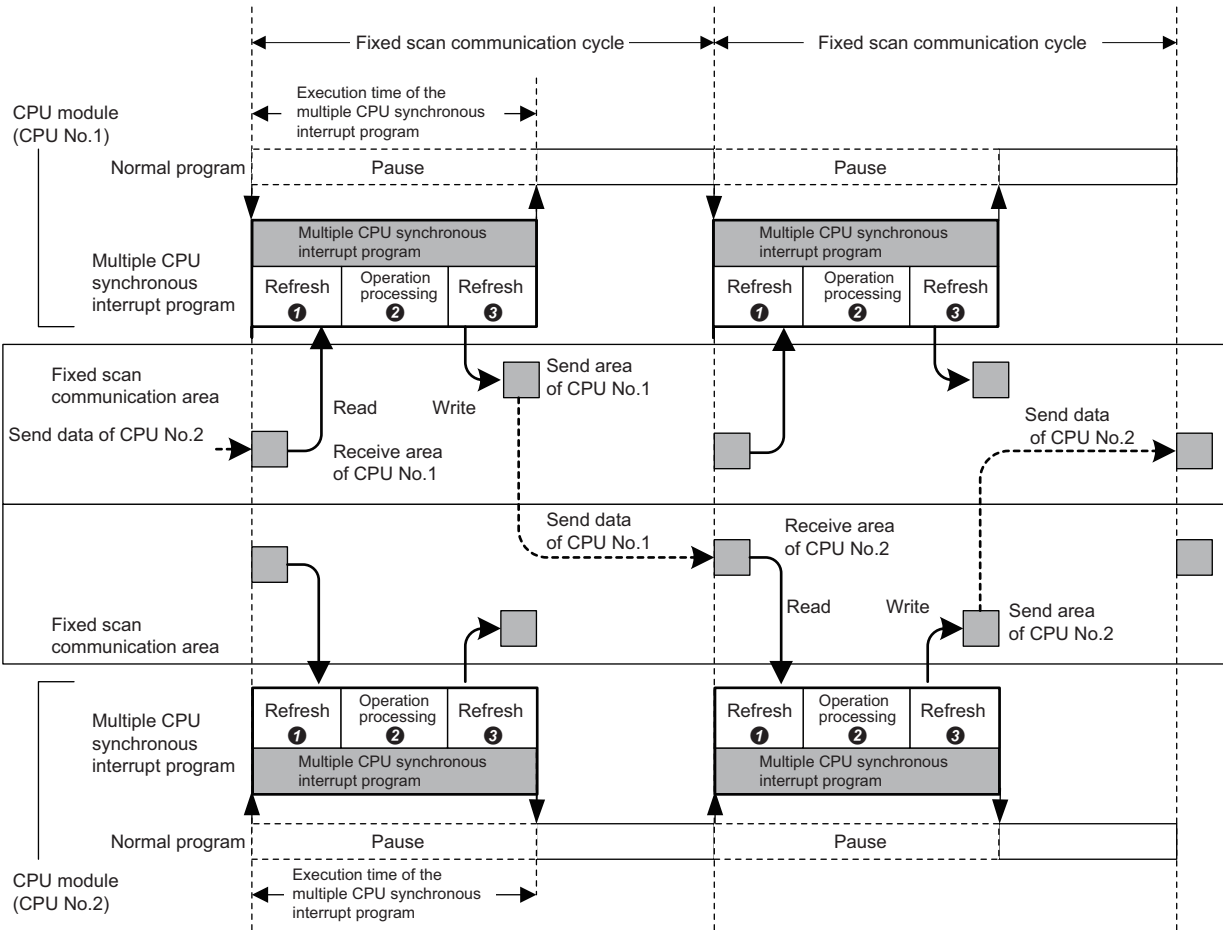

*2 This item indicates data communication between the fixed scan communication areas on the host CPU module and other CPU modules.

*3 When an error occurs during normal operation, normal data generated immediately before the error occurs is continued to be sent between the fixed scan communication areas on the host CPU module and other CPU modules.

*4 If the consistency check fails due to a parameter change in normal operation, refresh and data send/receive between the CPU modules are continued.

22.5 Multiple CPU Synchronous Interrupt

This function triggers an interrupt program at the fixed scan communication cycle set in a parameter. An interrupt program executed at the fixed scan communication cycle is called a multiple CPU synchronous interrupt program. Using the multiple CPU synchronous interrupt enables synchronizing with the fixed scan communication cycle so that data communication between CPU modules can be made. (It allows synchronizing the data communication timing between CPU modules.)

- ❶ Data reading of other CPU modules (refresh): Data sent from other CPU modules is read to a device or a label. (Data is read from the receive area of the host CPU module.)
- ❷ Operation processing: The multiple CPU synchronous interrupt program is executed.
- ❸ Data sending of other CPU modules (refresh): Data to be sent to other CPU modules is written from a device or a label. (Data is written to the send area of the host CPU module.)

Point

The operation methods required when an interrupt factor occurs and the program creating methods are the same as those for normal interrupt program. (Page 99 Interrupt Program)

Execution timing

The multiple CPU synchronous interrupt program (I45) is executed at the timing for the fixed scan communication cycle. The fixed scan communication cycle can be changed through the fixed scan communication setting. (☞ Page 385 Fixed scan communication setting)

Point

It is also possible to perform refresh during the multiple CPU synchronous interrupt program (I45) in execution. (☞ Page 388 Communication through refresh)

Multiple interrupt

For the multiple interrupt of the multiple CPU synchronous interrupt program, refer to the multiple interrupt function. (☞ Page 114 Multiple interrupt function)

Precautions

The precautions for the multiple CPU synchronous interrupt program are mentioned below.

- Create a multiple CPU synchronous interrupt program so that it has the execution processing time shorter than the fixed scan communication cycle. If the interrupt program has the execution processing time equal to or longer than the cycle, the multiple CPU synchronous interrupt interval cannot be guaranteed. (☞ Page 100 Operation upon occurrence of an interrupt factor) The execution time of the multiple CPU synchronous interrupt program (I45) can be monitored using the RAS setting of the CPU parameter. (☞ Page 169 Error detection setting)
- To send data successfully in the next fixed scan communication cycle, select "Detect" for "Program Execution Section Exceed (I45)" in "RAS Setting" of [CPU Parameter]. (☞ Page 169 Error detection setting) With this setting, when data is written with the multiple CPU synchronous interrupt program after the host CPU module starts data transfer, SM484 (Execution section excess error flag for multiple CPU synchronization interrupt program) is turned on and the number of data sending errors in the next cycle is stored in SD484 (Number of execution section excess errors for multiple CPU synchronization interrupt program). In addition, when the data is written while the data cannot be sent in the fixed scan communication cycle set in a parameter, an error can be detected. (The CPU module continues its operation.)

- (1) CPU No.1 receives send data (A) of CPU No.2 in the next scan.
- (2) CPU No.1 receives send data (B) of CPU No.2 after two scans.
- (3) SM484 turns on and SD484 counts up because CPU No.2 continuously executes its program even after the start of data communication.
- (4) Send data (A) of CPU No.2 is written.
- (5) Send data (B) of CPU No.2 is written.
- (6) This data is sent in the next scan because it has been written before data update.
- (7) This data is sent after two scans because it has been written after data update.

23 SECURITY FUNCTION

This function serves to protect the user property stored in a personal computer and the user property inside modules in the MELSEC iQ-R series system against threats such as theft, tampering, faulty operation, and unauthorized execution due to the unauthorized access by an outsider. Use an appropriate security function according to the purpose as shown in the following table:

- (1) Protection is provided against theft, tampering, and faulty operation resulting from unauthorized access by an outsider. (Protection for user property on a personal computer)
- (2) Protection is provided against theft, tampering, faulty operation, and unauthorized execution resulting from unauthorized access by an outsider. (Protection for user property in CPU modules)

Data to be protected	Purpose	Function	Reference	
GX Works3	Project	Prevents unauthorized access to programs (in units of POU). (A password is used.)	Block password function	GX Works3 Operating Manual
		Prevents unauthorized access to programs (in units of program file). (A security key is used.) Project data locked with a security key can only be viewed with an engineering tool for which the same security key has been registered.	Security key authentication function for a project	
CPU module	Program	Prevents unauthorized execution of programs. (A security key is used.) Programs locked with a security key can only be executed at modules for which the same security key has been set.	Security key authentication function for a CPU module	Page 402 Security key authentication for a CPU module
	File	Prevents unauthorized read and write of files. (A password is used.)	File password function ^{*1}	<ul style="list-style-type: none"> • GX Works3 Operating Manual • MELSEC iQ-R Ethernet User's Manual (Application) • SLMP Reference Manual • MELSEC iQ-R Serial Communication Module User's Manual (Application)
	Access	Blocks access from an invalid IP address by identifying the IP address of an external device via Ethernet.	IP filter function	MELSEC iQ-R Ethernet User's Manual (Application)
		Restricts access via Ethernet that is taking a different route from specific communication routes. (A password is used.)	Remote password function ^{*1}	
Device data	Protects arbitrary device data from being tampered with. (Writing to devices from engineering tools and GOTs is disabled.)	Write-protect function for device data (from outside the CPU module)	<ul style="list-style-type: none"> • Page 403 Write-Protect Function for Device Data (from Outside the CPU Module) • GX Works3 Operating Manual 	

*1 These functions disable the password authentication for a certain duration of time after a certain number of failed authentication attempts. For details, refer to the manuals for each function.

If a personal computer with a security key registered is abused by an outsider, there is no way to prevent the outflow of the program property, and thus the user needs to take adequate measures as shown below:

- Preventive measures against the theft of a personal computer (for example, wire locking)
- Management of users of the personal computer (for example, deletion of unnecessary user accounts, strict control of login information, and implementation of fingerprint authentication)

Furthermore, if a personal computer with a security key registered has failed, the locked project data cannot be viewed and edited. We assume no responsibility whatsoever for any damage or loss to the user and any other individual or organization, resulting from such a situation. Therefore, the user needs to take adequate measures as shown below:

- Import the registered security key to another personal computer.
- Export the registered security key to a file and store the file in a safe place.

Security key authentication for a CPU module

This function prevents an unauthorized execution of programs written in a CPU module.

The operations are restricted by detecting a mismatch between the security key of the program file written in a CPU module and the security key of a CPU module.

If the security key of only one program does not match the security key of the CPU module, all the other programs in the CPU module are not executed as well.

The security key written in the CPU module is retained even after power-off of the CPU module.

For details, refer to the following.

 GX Works3 Operating Manual

23.1 Write-Protect Function for Device Data (from Outside the CPU Module)

This function disables writing to devices from engineering tools and GOTs. Protected devices and their ranges can be set by the user. Therefore, desired device data can be protected from tampering.

Even when the write-protect range is set, the operation of the set CPU module and device data writing by the execution of functions (internal device data writing such as device data writing by instructions) are not disabled.

Point

This function applies to a global label to which a device is assigned. Therefore, when a device assigned to a global label is protected from writing, write processing cannot be performed.

Restriction

When using the write-protect function for device data (from outside the CPU module), check the versions of the CPU module and engineering tool used. (Page 705 Added and Enhanced Functions)

Setting method

Set the write-protect range in "Device Setting" of the CPU parameter.

[CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Device/Label Memory Area Detailed Setting] ⇒ [Device Setting] ⇒ [Detailed Setting]

Window

Item	Symbol	Device		Local Device			Latch (1)	Latch (2)	Write Protection Setting		
		Points	Range	Start	End	Points			Start	End	Points
Input	X	12K	0 to 2FFF								
Output	Y	12K	0 to 2FFF								
Internal Relay	M	12K	0 to 12287				No Setting	No Setting			
Link Relay	B	8K	0 to 1FFF				No Setting	No Setting			
Link Special Relay	SB	2K	0 to 7FF								
Annunciator	F	2K	0 to 2047				No Setting	No Setting			
Edge Relay	V	2K	0 to 2047				No Setting	No Setting			
Step Relay	S	0									
Timer	T	1K	0 to 1023				No Setting	No Setting			
Long Timer	LT	1K	0 to 1023				No Setting	No Setting			
Retentive Timer	ST	0					No Setting	No Setting			
Long Retentive Time	LST	0					No Setting	No Setting			
Counter	C	512	0 to 511				No Setting	No Setting

Data Register	D	18K	0 to 18431				No Setting	No Setting			
Link Register	W	8K	0 to 1FFF				No Setting	No Setting			
Link Special Register	SW	2K	0 to 7FF				No Setting	No Setting			
Latch Relay	L	8K	0 to 8191					No Setting			
File Register	ZR										
Total Device			38.4K Word			0.0K Word					
Total Word Device			34.5K Word			0.0K Word					
Total Bit Device			62.0K Bit			0.0K Bit					

(1) One range can be set per device by specifying "Start" and "End".*1

*1 The device assignment method can be changed to "Points/Start" by right-clicking in the setting window and selecting "Setting Method".

Target devices

The following table lists the devices to which write-protect ranges can be set with this function. Note that the following devices includes the digit-specified bit devices and the bit-specified word devices.

Type	Device	
User device	Bit	X*1, Y*1, M, B, F, SB, V, S, L
	Bit/word	T, ST, C
	Bit/double word	LT, LST, LC
	Word	D, W, SW
File register	Word	R*2, ZR

*1 X and Y that are accessed in direct mode (DX and DY) are also included.

*2 Specify the write-protect range for the file register in ZR.

Operations and functions

The following table lists the operations and functions that cannot be executed for devices in the write-protect range.

Operation and function				
Operation from the engineering tool	Current value change in the watch window			
	Remote operation	Remote RUN ^{*1}		
	CPU memory operation	Device/label memory value clear	Device/label zero clear	
			File register zero clear	
			Device/label/file register latch clear	
Writing data to the programmable controller	Device memory			
	Device initial value ^{*2}			
	File register			
Operation using a GOT	Device write			
	File write			
Operation using SLMP	Device write using SLMP			
	File write/change using SLMP ^{*3}			
Operation using FTP	File write using the file transfer function (FTP server) ^{*3}			
Operation using instructions	Device write from another CPU module			
	Device write from the programmable controller of another station			
	Remote RUN at device memory clear specification from the programmable controller of another station			
Other operations	Device write using the simple CPU communication function			
	Predefined protocol support function			
	Device test using the Web server function ^{*4}			

*1 This function cannot be executed when the device memory clear is specified.

*2 When this function is enabled, the files cannot be written.

*3 The file register file and initial device value file cannot be written or changed.

*4 In "Account Settings" of "Web Server Settings", set "Write Device" to "Enable".

■ Operation using SLMP

Device write processing is disabled when the write-protect range is set in the device write using SLMP. In addition, device write processing is disabled when the following commands are executed in the operations such as the predefined protocol support function, SLMP frame send instruction, or access from an external device.

Type	Operation	Command	Subcommand
Device	Write	1401	00□0, 00□1
			00□2, 00□3
	Write Random	1402	00□0, 00□1
			00□2, 00□3
	Write Block	1406	00□0
			00□2
Label	Array Label Write	141A ^{*1}	0000
	Label Write Random	141B ^{*1}	0000
Remote Control	Remote Run	1001 ^{*2}	0000
	Remote Latch Clear	1005	0000

*1 Device write processing is disabled only when a device is assigned to a label.

*2 Device write processing is disabled only when the device memory clear is specified.

Write processing is disabled when a file write using SLMP is performed to the device initial value file and file register file. In addition, write processing is disabled when the following commands are executed in the operations such as the SLMP frame send instruction or access from an external device.

Type	Operation	Command	Subcommand
File	New File	1820	0000, 0040
	Copy File	1824	0000, 0004, 0040
	Open File	1827 ^{*3}	0000, 0004, 0040
	Write File	1829	0000

*3 Write processing is disabled only when the open mode is for writing (0100H).

■Operation using the file transfer function (FTP server)

Write processing is disabled when a file write using the file transfer function (FTP server) is performed to the initial device value file and the file register file.

Function	Command	Subcommand
Writing to file	put	—
	mput	—
File name change	rename ^{*1}	—
FTP server subcommand send (RUN operation)	quote ^{*2}	run

*1 Write processing is disabled when the file extension is changed to DID or QDR.

*2 Write processing is disabled only when the device clear is specified.

■Operation using instructions

Write processing is disabled when the device write is performed by a multiple CPU dedicated instruction or a module dedicated instruction (including a device clear instruction (dedicated instruction)) to devices in the write-protect range.

Major classification	Classification		Instruction name
Writing device data from another station	Module dedicated instruction	Writing data to the programmable controller on another station	JP.WRITE, GP.WRITE
		Writing data to the programmable controller on another station (with notification) ^{*1}	JP.SWRITE, GP.SWRITE
		Reading data from the programmable controller on another station (with notification) ^{*1}	JP.SREAD, GP.SREAD
		Writing data to the target station	J(P).RIWT, G(P).RIWT
Writing device data from another CPU module	Multiple CPU dedicated instruction	Writing device data to another CPU module	D(P).DDWR, M(P).DDWR
Clearing device data another station	Module dedicated instruction	Remote RUN ^{*2}	J(P).RRUN, G(P).RRUN, Z(P).RRUN, J(P).REQ, G(P).REQ

*1 Writing to notification devices is also disabled.

*2 Write processing is disabled only when the device clear is specified.

Precautions

- When this function is enabled, a device write operation with indirect specification cannot be performed. Perform a device write operation with normal device specification. (Do not use indirect specification.)
- When this function is enabled and writing to the file register is disabled, perform a device write operation specifying the ZR device. If the R device is specified, a device write operation may not be disabled.
- When this function is enabled, a device write operation with index modification cannot be performed when the write-protect range is set in the accessible area. When the write-protect range exists in the accessible area, perform a device write operation with normal device specification. (Do not use index modification.)
- When this function is enabled, CPU parameters that disables the function and the device memory where values are set to the write-protect device in the CPU module cannot be written to the programmable controller at the same time. Write CPU parameters to disable the function, and then write the device memory where the values are set to the programmable controller.

24 SEQUENCE SCAN SYNCHRONIZATION SAMPLING FUNCTION

This function allows a module to collect data of the CPU module in synchronization with the sequence scan of the CPU module.

This function is available to the following modules:

- MES interface module (high-speed access)
- High speed data logger module (high-speed collection)
- C intelligent function module (data sampling in sequence scan)
- High speed data communication module (high-speed collection)

The following table lists the number of modules that can execute this function on a single CPU module and the total number of collectable points.

Item	R00CPU, R01CPU, R02CPU	Other CPU module
Number of executable modules	Two	Four
Total number of collectable points	16K points	32K points

For details on the function using the sequence scan synchronization sampling function and collectable data for each module, refer to the manual for the module used.

Precautions

Use points in 8K-point increments to use all of the total number of points that can be collected.

The points are assigned in 8K-point increments as follows:

- 6K points used → 8K points to be assigned
- 9K points used → 16K points to be assigned

MEMO

25 ROUTING SETTING

The user can configure any communication route to perform transient transmission to stations in a different network. This setting can be used when the system has a network module which does not support dynamic routing or when it is necessary to clearly specify a communication route.

25.1 Setting Method

The user must specify the following: The network number and the station number of the own network (relay station) which will be pass through to another network, and the network number of the final arrival network (destination station). The maximum 238 routing settings can be specified.

[CPU Parameter] ⇔ [Routing Setting]

Window

No.	Relay Station		➡	Target Station
	Network No.	Station No.		Network No.
1				
2				
3				
4				

Displayed items

Item		Description	Setting range	Default
Relay Station	Network No.	Sets the network number of the first relay station to pass through to the destination station network.	1 to 239	—
	Station No.	Sets the station number of the first relay station to pass through to the destination station network.	0 to 120	—
Target Station	Network No.	Sets the network number of the final arrival network.	1 to 239	—

Point

The S(P).RTWRITE instruction can be used to temporarily change or add a routing setting during operation (setting made by the S(P).RTWRITE instruction is cleared when the CPU module is powered off or reset). Also, the S(P).RTREAD instruction can be used to read setting details of the parameters. For details on these instructions, refer to the following.

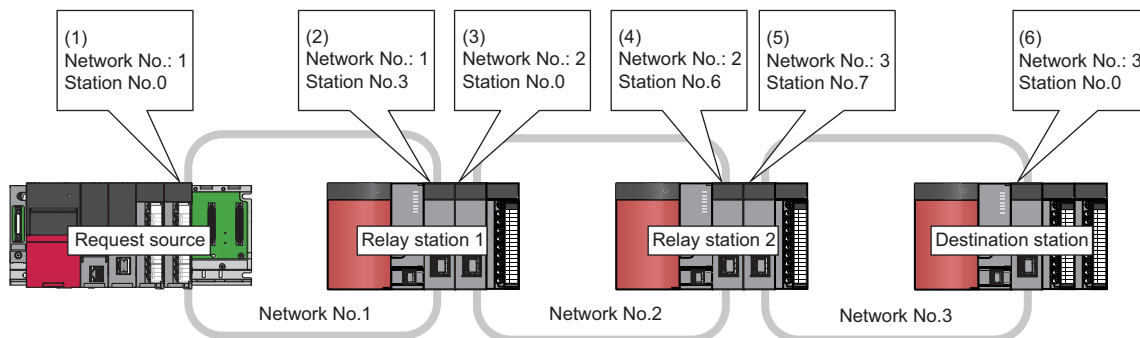

📖 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

25.2 Setting Example

The following is an example of the routing setting.

Ex.

Transient transmission from the request source (Network No.1) to the target (Network No.3) via Network No.2.

Station	Request route	Response route									
Request source	<p>(1)</p> <table border="1"> <thead> <tr> <th colspan="2">Relay station</th> <th>Destination station</th> </tr> <tr> <th>Network No.</th> <th>Station No.</th> <th>Network No.</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>3</td> <td>3</td> </tr> </tbody> </table> <p>The data is transferred to the relay station (2) of the own network to go to the network No.3.</p>	Relay station		Destination station	Network No.	Station No.	Network No.	1	3	3	<p>(1)</p>
Relay station		Destination station									
Network No.	Station No.	Network No.									
1	3	3									
Relay station 1	<p>(2)</p> <p>(3)</p> <table border="1"> <thead> <tr> <th colspan="2">Relay station</th> <th>Destination station</th> </tr> <tr> <th>Network No.</th> <th>Station No.</th> <th>Network No.</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>6</td> <td>3</td> </tr> </tbody> </table> <p>The data is transferred to the relay station (4) of the own network to go to the network No.3.</p>	Relay station		Destination station	Network No.	Station No.	Network No.	2	6	3	<p>(2)</p> <p>(3)</p> <p>The data has been transferred to the network No.1, and is to be transferred to (1).</p>
Relay station		Destination station									
Network No.	Station No.	Network No.									
2	6	3									
Relay station 2	<p>(4)</p> <p>(5)</p> <p>The data has been transferred to the network No.3, and is to be transferred to (6).</p>	<p>(4)</p> <p>(5)</p> <table border="1"> <thead> <tr> <th colspan="2">Relay station</th> <th>Destination station</th> </tr> <tr> <th>Network No.</th> <th>Station No.</th> <th>Network No.</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>0</td> <td>1</td> </tr> </tbody> </table> <p>The data is transferred to the relay station (3) of the own network to go to the network No.1.</p>	Relay station		Destination station	Network No.	Station No.	Network No.	2	0	1
Relay station		Destination station									
Network No.	Station No.	Network No.									
2	0	1									
Destination station	<p>(6)</p>	<table border="1"> <thead> <tr> <th colspan="2">Relay station</th> <th>Destination station</th> </tr> <tr> <th>Network No.</th> <th>Station No.</th> <th>Network No.</th> </tr> </thead> <tbody> <tr> <td>3</td> <td>7</td> <td>1</td> </tr> </tbody> </table> <p>The data is transferred to the relay station (5) of the own network to go to the network No.1.</p>	Relay station		Destination station	Network No.	Station No.	Network No.	3	7	1
Relay station		Destination station									
Network No.	Station No.	Network No.									
3	7	1									

25.3 Precautions

The precautions on the routing setting are as follows:

- For the multiple CPU system configuration, the same routing setting must be used for all CPUs.

26 FIRMWARE UPDATE FUNCTION

This function enables users to update the firmware versions of modules by using firmware update files. (For the firmware update file, please consult your local Mitsubishi representative.)

The following two methods for updating firmware are available.

Update method	Description
Update using the engineering tool	Firmware versions of multiple modules can be changed at a time by using the engineering tool.
Update using an SD memory card	The firmware version of a module can be changed just using an SD memory card. Dedicated software is not required.

For the module models that support this function, precautions that are common to those modules, and update procedure, refer to the following.

 MELSEC iQ-R Module Configuration Manual

Restriction 

Before using the firmware update function, check the versions of the CPU module and engineering tool used.
( Page 705 Added and Enhanced Functions)

Precautions

This section describes the precautions for the CPU module when using the firmware update function.

■ Incompatible firmware and CPU modules

The following table shows incompatible combinations of firmware and CPU modules.

CPU module	3rd and 4th digits from left of production information	Incompatible firmware version
R04CPU	"18" or later	"33" or earlier
	"19" or later	"47" or earlier
R08CPU	"19" or later	"33" or earlier
	"20" or later	"47" or earlier
R16CPU	"19" or later	"33" or earlier
	"20" or later	"47" or earlier
R32CPU	"16" or later	"33" or earlier
	"17" or later	"47" or earlier
R120CPU	"16" or later	"33" or earlier
	"17" or later	"47" or earlier

CPU module	3rd and 4th digits from left of production information	Incompatible firmware version	
		CPU part	Network part
R04ENCPU	"32" or later	"47" or earlier	—
	"37" ^{*1} , "38" or later		"51" or earlier
R08ENCPU	"30" or later		—
	"35" ^{*1} , "36" or later		"51" or earlier
R16ENCPU	"27" or later		—
	"32" ^{*1} , "33" or later		"51" or earlier
R32ENCPU	"30" or later		—
	"33" ^{*1} , "34" or later		"51" or earlier
R120ENCPU	"22" or later		—
	"25" ^{*1} , "26" or later		"51" or earlier

*1 A module whose first and second digits from the left of the production information are "43" or later

■ When the RnENCPU is updated

To update the firmware version from "49" (CPU part)/"46" (network part) or earlier to "54" (CPU part)/"52" (network part) or later, follow the procedure below.

• Update using the engineering tool

1. First update the firmware version of the CPU part alone to "54" or later.
2. Then, update the firmware version of the network part to "52" or later. (Updating the CPU part and the network part simultaneously generates an error. Always update the CPU part before updating the network part.)

• Update using an SD memory card

1. First update the firmware version to "54" (CPU part)/"50" (network part).
2. Update the firmware version to the desired one.

PART 7

DEVICES, LABELS, AND CONSTANTS

This part consists of the following chapters.

27 DEVICES

28 LABELS

29 LATCH FUNCTION

30 DEVICE/LABEL INITIAL VALUE SETTINGS

31 CONSTANTS

27 DEVICES

This chapter describes the devices.

27.1 Device List

This section lists the devices.

Classification	Type	Device name	Symbol	Number of points of Default	Parameter-set range	Notation
User device	Bit	Input	X	12K points ^{*5}	Unchangeable	Hexadecimal
	Bit	Output	Y	12K points ^{*5}		Hexadecimal
	Bit	Internal relay	M	12K points ^{*5}	Changeable (☞ Page 416 Device Setting)	Decimal
	Bit	Link relay	B	8K points		Hexadecimal
	Bit	Annunciator	F	2K points		Decimal
	Bit	Link special relay	SB	2K points		Hexadecimal
	Bit	Edge relay	V	2K points		Decimal
	Bit	Step relay ^{*3}	S	0 points		Decimal
	Bit/word	Timer	T	1K points ^{*5}		Decimal
	Bit/word	Retentive timer	ST	0 points		Decimal
	Bit/double word	Long timer	LT	1K points ^{*5}		Decimal
	Bit/double word	Long retentive timer	LST	0 points		Decimal
	Bit/word	Counter	C	512 points ^{*5}		Decimal
	Bit/double word	Long counter	LC	512 points ^{*5}		Decimal
	Word	Data register	D	18K points ^{*5}		Decimal
	Word	Link register	W	8K points		Hexadecimal
	Word	Link special register	SW	2K points		Hexadecimal
	Bit	Latch relay	L	8K points		Decimal
System Device	Bit	Function input	FX	16 points	Unchangeable	Hexadecimal
	Bit	Function output	FY	16 points		Hexadecimal
	Word	Function register	FD	5 points × 4 words		Decimal
	Bit	Special relay	SM	4K points		Decimal
	Word	Special register	SD	4K points		Decimal
Link Direct Device	Bit	Link input	Jn\X	160K points (Max.) ^{**16}	Unchangeable	Hexadecimal
	Bit	Link output	Jn\Y	160K points (Max.) ^{**16}		Hexadecimal
	Bit	Link relay	Jn\B	640K points (Max.) ^{**16}		Hexadecimal
	Bit	Link special relay	Jn\SB	5120 points (Max.) ^{**16}		Hexadecimal
	Word	Link register	Jn\W	2560K points (Max.) ^{**16}		Hexadecimal
	Word	Link special register	Jn\SW	5120 points (Max.) ^{**16}		Hexadecimal
Module access device	Word	Module access device	Un\G	268435456 points (Max.) ^{*1}	Unchangeable	Decimal
CPU buffer memory access device	Word	CPU buffer memory access device	U3En\G	268435456 points (Max.) ^{*1}	Unchangeable	Decimal
			U3En\HG	12288 points maximum	Changeable	Decimal
Index register	Word	Index register	Z	20 points	Changeable (☞ Page 442 Index register setting)	Decimal
	Double word	Long index register	LZ	2 points		Decimal
File register	Word	File register	R/ZR	0 points	Changeable	Decimal
Refresh data register	Word	Refresh data register	RD	512K points	Changeable	Decimal
Nesting	—	Nesting	N	15 points	Unchangeable	Decimal
Pointer	—	Pointer	P	8192 points ^{**2}	Changeable (☞ Page 451 Pointer setting)	Decimal
	—	Interrupt pointer	I	1024 points	Unchangeable	Decimal

Classification	Type	Device name	Symbol	Number of points of Default	Parameter-set range	Notation
Other devices	—	Network No. specification device	J	—	Unchangeable	Decimal
	—	I/O No. specification device	U	—		Hexadecimal
	—	SFC block device ^{*3}	BL	320 points ^{*5}		Decimal
	—	SFC transition device ^{*3*4}	TR	0 points		Decimal

*1 These are the maximum points that can be handled in the CPU module. The number of points actually used differs depending on the module used.

*2 The default number of points is 16384 for the R120CPU and R120ENCPU.

*3 The device can be collected by using the CPU module where the SFC function can be used. ( Page 705 Added and Enhanced Functions)

*4 Can be used as a device comment in the SFC program.

*5 The default number of points for the R00CPU, R01CPU, and R02CPU are as follows.

- Input (X), Output (Y), Internal relay (M): 8K points
- Timer (T): 2K points
- Long timer (LT), Long counter (LC): 0 point
- Counter (C): 1K points
- Data register (D): 12K points
- SFC block device (BL): 128 points

*6 The maximum number of points differs depending on the "Link Direct Device Setting" of the engineering tool. Before using the "Link Direct Device Setting", check the version of the CPU module and engineering tool used. ( Page 705 Added and Enhanced Functions)

27.2 Device Setting

The number of points of each user device can be changed (☞ Page 418 User Device)

☞ [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Device/Label Memory Area Detailed Setting] ⇒ [Device Setting] ⇒ [Detail Setting]

Window

Item	Symbol	Device	
		Points	Range
Input	X	12K	0 to 2FFF
Output	Y	12K	0 to 2FFF
Internal Relay	M	12K	0 to 12287
Link Relay	B	8K	0 to 1FFF
Link Special Relay	SB	2K	0 to 7FF
Annunciator	F	2K	0 to 2047
Edge Relay	V	2K	0 to 2047
Step Relay	S		0
Timer	T	1K	0 to 1023
Lone Timer	LT	1K	0 to 1023
Retentive Timer	ST		0
Lone Retentive Timer	LST		0
Counter	C	512	0 to 511
Lone Counter	LC	512	0 to 511
Data Register	D	18K	0 to 18431
Link Register	W	8K	0 to 1FFF
Link Special Register	SW	2K	0 to 7FF
Latch Relay	L	8K	0 to 8191
Total Device			38.4K Word
Total Word Device			34.5K Word
Total Bit Device			62.0K Bit

- (1) The capacity of each area can be changed. (☞ Page 127 Device/label memory area setting)
- (2) The number of points of user devices can be changed.

Point

Specify each item so that the total number of points for each user device does not exceed the capacity of the device area. (☞ Page 127 Device/label memory area setting)

Range of use of device points

The following table lists the range of use of device points to be set in the device setting.

Type	Device name	Symbol	Range of use ^{*1}	Setting unit
Bit	Input	X	X0 to X2FFF	—
Bit	Output	Y	Y0 to Y2FFF	—
Bit	Internal relay	M	M0 to M161882111	64 points
Bit	Link relay	B	B0 to B9A61FFF	64 points
Bit	Annunciator	F	F0 to F32767	64 points
Bit	Link special relay	SB	SB0 to SB9A61FFF	64 points
Bit	Edge relay	V	V0 to V32767	64 points
Bit	Step relay ^{*2}	S	S0 to S16383	1024 points
Word	Timer	T	T0 to T8993439	32 points
Word	Retentive timer	ST	ST0 to ST8993439	32 points
Word	Long timer	LT	LT0 to LT2529407	1 points
Word	Long retentive timer	LST	LST0 to LST2529407	1 points
Word	Counter	C	C0 to C8993439	32 points
Word	Long counter	LC	LC0 to LC4761215	32 points
Word	Data register	D	D0 to D10117631	4 points
Word	Link register	W	W0 to W9A61FF	4 points
Word	Link special register	SW	SW to SW9A61FF	4 points
Bit	Latch relay	L	L0 to L32767	64 points

*1 This is the maximum number of points for the R120CPU with an extended SRAM cassette (16MB) (NZ2MC-16MBS). The number of points varies depending on the model of the CPU module used, whether to use an extended SRAM cassette, and the type of its cassette.

*2 The CPU module where the SFC function can be used supports this device. (📖 Page 705 Added and Enhanced Functions)

27.3 User Device

This section describes the user device.

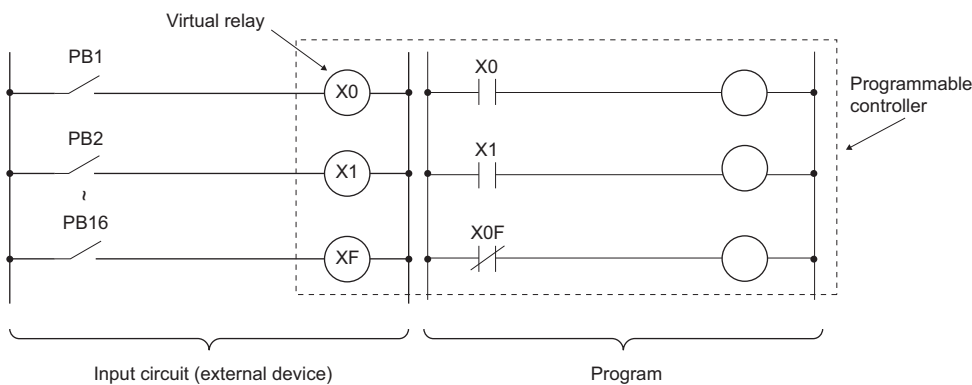

Input (X)

This device provides the CPU module with commands and/or data using an external device, such as pushbutton, transfer switch, limit switch, and digital switch.

Concept of input

Assume that one virtual relay X_n is incorporated into the CPU module for each input point. In the program, a normally open contact and normally closed contact for the X_n are used.

Also, the input can be used as a target re-flesh (CPU module side) device of the remote input (RX), such as the CC-Link IE Field Network.

Output (Y)

This device outputs the control results of the program to various devices, such as external signal light/digital HMI/ electromagnetic switch (contactor)/solenoid.

Internal relay (M)

This device is used as an auxiliary relay within the CPU module. The following operations turn off all the internal relays.

- Powering off and on the CPU module
- Reset
- Latch clear

Latch relay (L)

This device is an auxiliary relay which enables latching (data retention during power failure). This device is used within the CPU module. This device latches operation results (ON/OFF information) even after the following operations.

- Powering off and on the CPU module
- Reset

Link relay (B)

This device is used as a CPU side device when refreshing bit data between the network module, such as the CC-Link IE Controller Network module and the CPU module.

Refreshing network modules using link relay

Data are transferred/received between the link relay (B) within the CPU module and the link relay (LB) of the network module, such as the CC-Link IE Controller Network module. The refresh range is specified using parameters on the network module. The part which is not used for refreshing can be used for other applications.

Annunciator (F)

This device is an internal relay used for a customer-created program which detects malfunction/failure of the equipment. When the annunciators are turned on, SM62 (Annunciator) is turned on, the number of activated annunciators and their device numbers are stored in SD62 (Annunciator number) to SD79 (Table of detected annunciator numbers).

Ex.

Failure detection program

(1) Outputs the annunciator number of the annunciator that turned on.

(2) ON detection of the annunciator

Also the number of the annunciator that turned on first (the number stored in SD62) is registered in the event history.

Only one annunciator number is registered in the event history while power is turned on.

On/off method for annunciator

Annunciators are turned on by either the SET F□ instruction or the OUT F□ instruction. Annunciators are turned off by the RST F□ instruction or the LEDR instruction or the BKRST instruction.

Point

When the annunciators are turned on/off using any methods (e.g. the MOV instruction) other than shown above, the operation is the same as that of internal relays. As a result, SM62 is not turned on and annunciator numbers are not stored into SD62 and SD64 (Table of detected annunciator numbers) to SD79.

■ Operations when annunciators are turned on

1. The annunciator numbers that turned on are stored sequentially into SD64 to SD79.
2. The annunciator number stored into SD64 is stored into SD62.
3. SD63 value (Number of annunciators) is incremented by one.

■ Operations when annunciators are turned off

1. The number of the annunciator deactivated is removed, and the numbers of annunciators, which were lined up behind the removed one, move forward one by one.
2. When the annunciator number stored into SD64 is turned off, the annunciator number newly stored into SD64 is stored into SD62.
3. The value of SD63 is decremented by one. When the SD63 value gets decremented to 0, SM62 is turned off.

If more than 16 annunciators are turned on, the 17th annunciator onwards are not stored into SD64 to SD79. However, if the numbers of annunciators registered in SD64 to SD79 are turned off, the lowest numbers, which are not registered in SD62 to SD79, of the numbers of annunciators which were turned on for the 17th on and after, are stored into SD64 to SD79.

- (1) Annunciators have been stored for the maximum number (16).
- (2) Because annunciators have been stored for the maximum number, the value does not change.
- (3) The smallest number is stored.
- (4) Turn on the 17th device.
- (5) Turn on the 18th device.
- (6) Turn off the first device.

Link special relay (SB)

The communication status and error detection status of network modules, such as the CC-Link IE Controller Network module, are output to the link special relay (J□\SB□) on the network. The link special relay (SB) is a device for using as a refreshing target of link special relays in the network. The part which is not used for refreshing can be used for other applications.

- (1) The network status is checked.

Edge relay (V)

The edge relay is a device that memorizes operation results (on/off information) from the head of the ladder block, allowing its use only by the EGP/EGF instruction. This device is executed for various objectives such as the rising (from off to on) detection in the structured programs by the index modification.

*1 Edge relay V0Z1 memorizes on/off information of X0Z1.

Step relay (S)

This device is used when specifying SFC program steps. This device is also used when specifying step No. through such methods as verifying (monitor, current value changes) SFC programs with SFC control instructions or the engineering tool. (MELSEC iQ-R Programming Manual (Program Design))

Point

This device is designed only for SFC programs, and cannot be used as a substitute for an internal relay in a sequence program. If it is used, an error may occur, causing a system failure.

Timer

This device starts measurement when the timer coil is turned on. When the current value reaches a setting value, time is up and the contact is turned on. This timer is an up-timing type device and therefore the current value matches a setting value when the timer time is up.

Types of timers

There are two types of timers: timer (T) which retains the current value in 16-bit units and long timer (LT) which retains it in 32-bit units. The timer (T) and the long timer (LT) are different devices and the number of device points can be set for each of them. In addition, there are the retentive timer (ST) and the long retentive timer (LST), both of which retain the current value even if the coil is turned off.* 1

Types of timers			
Timer	Current value = 16 bits	Timer (T)	Low-speed timer
			High-speed timer
	Current value = 32 bits	Retentive timer (ST)	Low-speed retentive timer
			High-speed retentive timer
		Long timer (LT)	
		Long retentive timer (LST)	

*1 For the timer (T)/long timer (LT), the current value returns to 0 when the coil is turned off.

■Timer (T)

This device starts measurement when the coil of the timer is turned on. When the timer current value matches a setting value, time is up and the timer contact is turned on. When the timer coil is turned off, the current value returns to 0 and the timer contact is turned off.

■Long timer (LT)

This device can count from 0 to 4294967295 to measure the time. If the measuring unit is set to 0.01ms, the measurable time range of this device is from 0 to about 11.9 hours. The current value of the long timers is updated by adding a difference of the counter which is used in the system when the OUT LTI instruction is executed. Proper time can be measured even when the coil instruction of the long timer cannot be executed once per scanning because the counters used in the system count asynchronously with scanning. When the long timer coil is turned on, measurement starts and when the long timer current value matches a setting value, time is up and the long timer contact is turned on. When the long timer coil is turned off, the current value returns to 0 and the long timer contact is turned off.

*1 This figure shows the example when the long timer time limit value setting is 0.01ms.

Point

- The long timer contact is turned on in the next or subsequent coil execution after the long timer coil is turned on. The long timer contact is not turned on simultaneously when the long timer coil is turned on.
- The long timer (LT) can be used in interrupt programs. (📖 Page 99 Interrupt Program)

■Retentive timer (ST)

This device counts the sum of time duration in which the coil is turned on. When the retentive timer coil is turned on, measurement starts and when the timer current value matches a setting value (when time is up), the retentive timer contact is turned on. The current value and the contact on/off state is retained even when the retentive timer coil is turned off. When the coil is turned on again, measurement starts with the retained current value. To clear the retentive timer current value and turn off the contact, issue the RST ST□ instruction.

- (1) Even though the coil (1)) turns off, the current value is held.
 (2) Even though the coil (1)) turns off, the contact remains on.

■Long retentive timer (LST)

This device counts the sum of time duration in which the coil is turned on. When the long retentive timer coil is turned on, measurement starts and when the timer current value matches a setting value (when time is up), the contact is turned on. The current value and the contact on/off state is retained even when the long retentive timer coil is turned off. When the coil is turned on again, measurement starts with the retained current value. To clear the long retentive timer current value and turn off the contact, issue the RST LST□ instruction.

- (1) Even though the coil turns off, the current value is held.
 (2) Even though the coil turns off, the contact remains on.

The long retentive timer (LST) can be used in interrupt programs. (☞ Page 99 Interrupt Program)

■Low-speed/high-speed timer (T/ST)

The low-speed timer and high-speed timer are the same device which is set to a low speed or high speed timer by writing the instruction accordingly to specify it on the timer. For example, specifying OUT T0 generates a low-speed timer and specifying OUTH T0 produces a high-speed timer even when using the same T0 device. This also applies to the retentive timer.

Timer time limit value

Although the low-speed timer and high-speed timer are the same device, timer limit value are different depending on how to specify the timer device (how to write the instruction). For example, specifying OUT T0 generates a low-speed timer and specifying OUT H T0 produces a high-speed timer even when using the same T0 device. This also applies to the retentive timer. The long timer cannot be set to a low-speed or high speed device. The time limit value for each timer is set in "Timer Limit Setting".

■Timer limit setting

The following window is to set the timer time limit values.

 [CPU Parameter] ⇒ [Operation Related Setting] ⇒ [Timer Limit Setting]

Window

Item	Setting
Timer Limit Setting	
Low Speed Timer/Low Speed Retentive Timer	100 ms
High Speed Timer/High Speed Retentive Timer	10.00 ms
Long Timer/Long Retentive Timer	0.001 ms

Displayed items

Item	Description	Setting range	Default
Low Speed Timer/Low Speed Retentive Timer	Set the timer time limit value of T and ST used for the low-speed timer and low-speed retentive timer.	1 to 1000ms (unit: 1ms)	100ms
High Speed Timer/High Speed Retentive Timer	Set the timer time limit value of T and ST used for the high-speed timer and high-speed retentive timer.	0.01 to 100ms (unit: 0.01ms)	10.00ms
Long timer/Long retentive timer	Set the timer time limit value of LT and LST used for the long timer and long retentive timer.	0.001 to 1000ms (unit: 0.001ms)	0.001ms

Timer current value and the measurable range

This sections describes the timer current value and the measurable range.

■Timer (T/ST)

The current value range is 0 to 32767. The measurable time range is from 0 to (timer time limit value × 32767).

■Long timer (LT/LST)

The setting range of the current value is 0 to 4294967295, which is the same as the range of unsigned 32-bit integers. The measurable time range is from long timer time limit value to (timer time limit value × 4294967295).

Handling timers

When executing the timer coil (the OUT T□ instruction), the timer coil is turned on/off, the current value is updated, and the contact is turned on/off.

Accuracy of timers

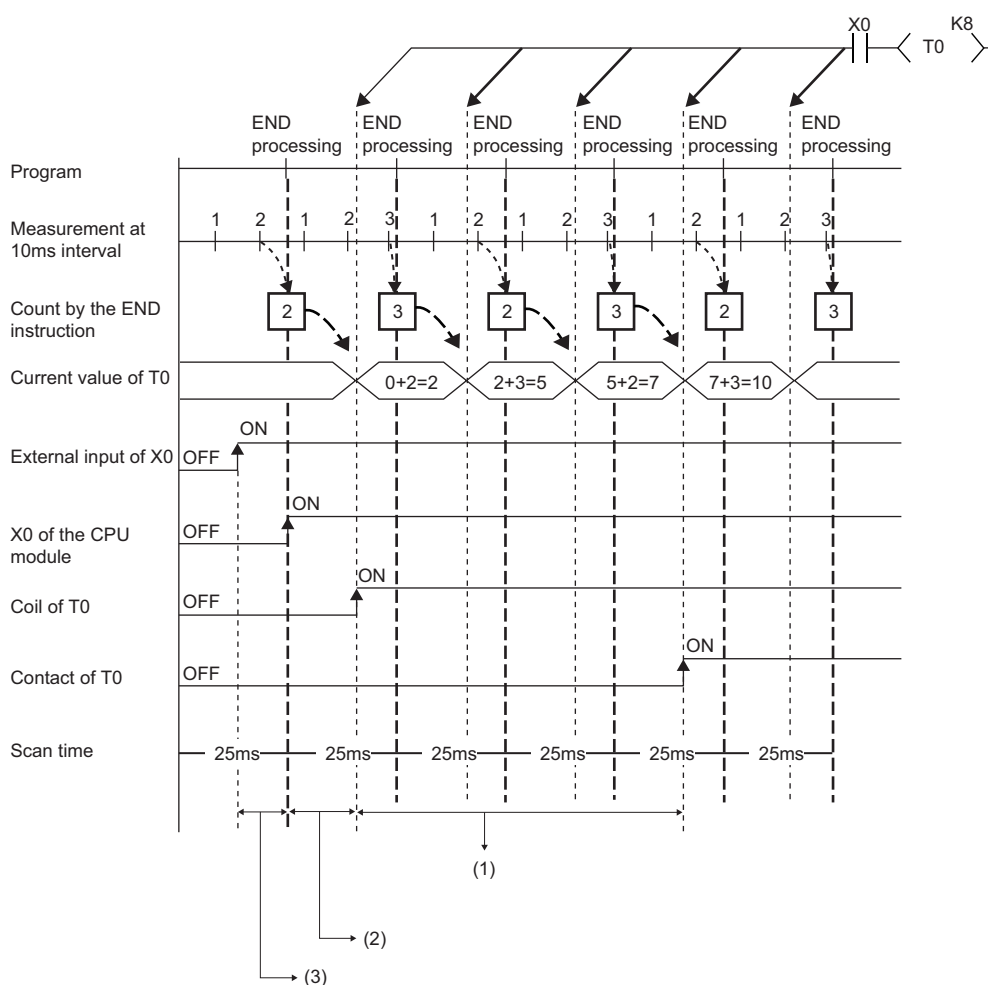

This sections describes the accuracy of timers.

■Timer (T/ST)

The scan time value measured by the END instruction is added to the current value when the OUT T□ instruction is executed. If the timer coil is turned off when the OUT T□ instruction is executed, the current value is not updated. The maximum response accuracy of the timer (the time duration from capture of an input (X) to output of it) is "2 scan time + timer time limit setting".

Ex.

Timer limit setting = 10ms, setting value of T0 = 8 (10ms × 8 = 80ms), scan time = 25ms

- (1) Accuracy from when the coil of the timer turns on until when the contact of the timer turns on
 - (1 scan time + timer limit setting) to (1 scan time)
 (2) Timing when the coil of the timer turns on
 (3) Input fetching timing

■ Long timer (LT/LST)

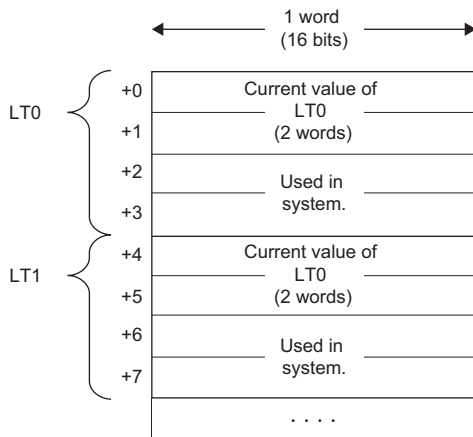

In the following program, the accuracy of T_p (the time duration from the long timer coil activation to long timer contact activation) is $(T_s - T_u) \leq T_p < (T_s + T_u)$.

- (1) C_p is updated.
 - (2) LT0 is initialized to 0.
 - (3) The result of $(C_t - C_p)$ is added.: $0 + (12 - 10) = 2$
 - (4) The result of $(C_t - C_p)$ is added.: $2 + (13 - 12) = 3$
 - (5) The result of $(C_t - C_p)$ is added.: $3 + (15 - 13) = 5$
- T_p : time duration from the long timer coil activation to long timer contact activation
 T_s : setting value of the long timer
 T_u : time limit value of the long timer

Data configuration of long timer (LT/LST)

The long timer (LT) and the long retentive timer (LST) use four words (64 bits) for each point. If the most significant two words are changed in a program, it is impossible to measure the time properly, because they are used by the system.

Point

The current value of the long timer (LT) and the long retentive timer (LST) is 32-bit data. It can be specified by the instructions which can specify signed or unsigned 32 bit data. (It cannot be specified with the BK + Instruction.)

Precautions

This section describes the precautions when using the timer and long timer.

■Precautions about timer usage

- Do not describe more than one coil (the OUT T□ instruction) on the same timer during a single scanning. Doing so results in improper measurement because the timer current value is updated when the coil for each timer is executed.
- When timer is not used for data collection for each scan: While the coil of a timer (e.g. T1) is turned on, the timer coil (the OUT T□ instruction) cannot be skipped by the instructions such as the CJ. When the timer coil is skipped, proper measurement is impossible because the timer current value is not updated. In addition, when the timer exists in a subroutine program, be sure to execute a subroutine call including T1 coil only once for each scanning operation while the coil of the timer (e.g. T1) is turned on. Otherwise proper measurement is impossible.
- The timer cannot be used in the initial execution type program, the fixed scan execution type program, or the event execution type program where the occurrence of an interrupt is set to be a trigger. The timer can be used in standby type programs if the coil of timer (OUT T□ instruction) is executed one time for one scan using a subroutine program.
- The timer cannot be used in interrupt programs. The timer can be used in subroutine programs or FB programs if the coil of timer (OUT T□ instruction) is executed one time for one scan.
- When setting value is 0: The contact is turned on when the OUT T□ instruction is executed.
- Even when the setting value is increased after the timer time is up, the timer status does not change (time continues to be up) and the timer does not operate.
- Do not set the timer setting value to 32768 or above. If used when set to 32768 or above, the timer contact may not turn on.

■Precautions about long timer usage

This section describes the precautions when using long timers (LT/LST).

- The long timer cannot be used in initial execution type programs.
- Even when the setting value is increased after the long timer time is up, the long timer status does not change (time continues to be up) and the long timer does not operate.

■Timer setting value and timer limit setting

When the condition is "Timer setting value < Scan time + Timer limit setting", the coil and the contact may be turned on at the same time depending on the timing when the coil turns on. When the condition is not satisfied, reduce the timer limit setting value to satisfy the condition.

Ex.

When changing the low-speed timer to high-speed timer and reducing the timer limit setting value (scan time: 20ms)

Before change (low-speed timer)

■Timer limit setting

Low Speed Timer/Low Speed Retentive Timer: 100ms
 Timer setting value (100ms × 1 = 100ms) < Scan time (20ms) + Timer limit setting (100ms)

After change (high-speed timer)

■Timer limit setting

High Speed Timer/High Speed Retentive Timer: 10.00ms
 Timer setting value (10.00ms × 10 = 100ms) < Scan time (20ms) + Timer limit setting (10ms)

The following shows an example of when the coil and the contact are turned on at the same time when the condition is "Timer setting value < Scan time + Timer limit setting".

Ex.

In the case where the values are set as follows (timer setting value: 1 (1 × 100ms), scan time: 20ms, and timer limit setting: 100ms), when the coil of the timer (T0) turns on in the next scan after the coefficient of the END instruction becomes equal to or higher than the timer setting value, the coil and the contact turn on at the same time because the timer current value becomes equal to the timer setting value at startup of the timer.

(1) The coefficient of the END instruction becomes equal to or higher than the timer setting value. Therefore, when the coil turns on during this period, the contact also turns on at the same time.

Ex.

In the case where the values are set as follows (timer setting value: 2 (2 × 100ms), scan time: 110ms, and timer limit setting: 100ms), when the coil of the timer (T0) turns on in the next scan after the coefficient of the END instruction becomes equal to or higher than the timer setting value, the coil and the contact turn on at the same time because the timer current value becomes equal to the timer setting value at startup of the timer.

(1) The coefficient of the END instruction becomes equal to or higher than the timer setting value. Therefore, when the coil turns on during this period, the contact also turns on at the same time.

Counter

This device counts the number of rising operation of the input condition in the program. The counter is an up-timing type device and therefore when the count value matches a setting value, the count reaches its upper limit and the contact is turned on.

Types of counters

There are two types of counters: counter (C) which retains the counter values in 16-bit units and long counter (LC) which retains them in 32-bit units. The counter (C) and the long counter (LC) are different devices and the number of device points can be set for each of them.

Counter (C)

This device uses one word for each point. The measurable range is 0 to 65535.

Long counter (LC)

This device uses two words for each point. The measurable range is 0 to 429467295.

Point

The long counter (LC) can be used in interrupt programs. (Page 99 Interrupt Program)

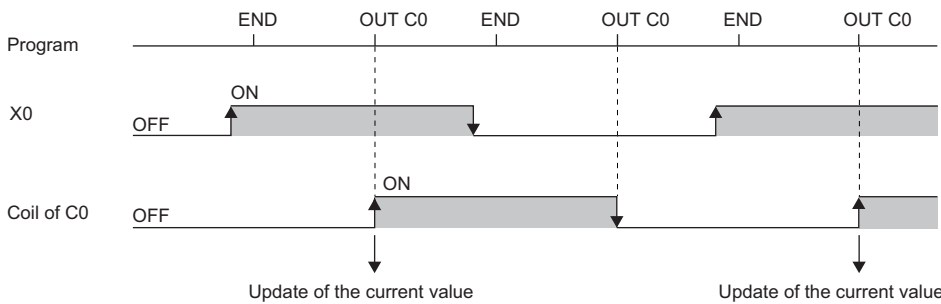

Counting process

When executing the counter coil (OUT C□ instruction / OUT LC□ instruction), the counter coil is turned on/off, the current value is updated (count value +1), and the contact is turned on/off. The current value is updated (count value +1), when the counter coil input is rising (from off to on). The current value is not updated when the coil input is off, remains on, and is turned off.

[Ladder example]

[Update timing of the current value]

Resetting counters

The counter current value is not cleared even when the counter coil input is turned off. To clear the counter current value (resetting) and turn off the contact, issue the RST C□/RST LC□ instruction. When executing the RST C□ instruction, the counter value is cleared and the contact is turned off.

[Ladder example]

[Reset timing of the counter]

(1) The count value is cleared, and the contact turns off.

■Precautions about counter reset

When executing the RST C□ instruction, the coil for C□ is also turned off. If the execution condition for the OUT C□ instruction is turned on after the RST C□ instruction is executed, the coil of C□ is turned on and the current value is updated (count value +1) when the OUT C□ instruction is executed.

In the above ladder example, the coil of C0 is turned on by turning on M0 and as a result the current value is updated. When C0 count reaches its upper limit, C0 contact is turned on and C0 current value is cleared by execution of the RST C0 instruction. At this time C0 coil is also turned off. When M0 is turned on at the next scanning, the current value is updated because C0 coil is turned on during the OUT C0 instruction execution (the current value is changed to 1).

(1) The current value update contact turns on.

(2) The current value is updated because the coil of C0 turns on.

(3) The count value is cleared, and the contact turns off.

To address the above problem, insert a normally closed contact of the execution condition for the OUT C0 instruction into the execution condition for the RST C0 instruction to prevent C0 coil from being turned off while the execution condition (M0) of the OUT C0 instruction is turned on as shown in the following ladder example.

Maximum counting speed for counters

Counting is possible only when on/off time of the input condition is longer than the execution interval of the same OUT C□ instruction. Maximum counting speed for counters can be obtained by the following equation:

$$\text{Maximum counting speed } C_{\text{max}} = \frac{n}{100} \times \frac{1}{T} \text{ [times/s]}$$

*1 Duty (n) is a value which expresses the ratio of on/off time of the count input signal as a percent (%) value.

Data register (D)

This device can store numerical values.

Link register (W)

This device is used as a CPU module side device when refreshing word data between the network module, such as the CC-Link IE Controller Network module and the CPU module.

Refreshing network modules using link register

Data are transferred/received between the link register (W) within the CPU module and the link register (LW) of the network module, such as the CC-Link IE Controller Network module. The refresh range is specified using parameters on the network module. The part which is not used for refreshing can be used for other applications.

Link special register (SW)

Word data information on the communication status and error detection status of a network, such as CC-Link IE Controller Network, are output into the link special register (J□SW□) on the network. The link special register (SW) is a device for using as a refreshing target of link special registers in the network. The part which is not used for refreshing can be used for other applications.

(1) The network status is checked.

27.4 System Device

The system device is used by the system. Assignment/capacity is fixed and cannot optionally be altered.

Function device (FX/FY/FD)

This device is used for the subroutine programs with argument passing. Data is written/read between the subroutine call sources with argument passing and the subroutine programs with argument passing. When using the function device in a subroutine program, the device used in each subroutine program call source can be determined. As a result, when using the same subroutine program, it can be used without being aware of the call source of other subroutine programs.

Function input (FX)

This device is used when passing on/off data to a subroutine program. In the subroutine program, bit data specified in a subroutine call instruction with argument passing are captured and used for operation. All the bit data specification devices of the CPU module are available.

Function output (FY)

This device is used when passing operation results (on/off data) in a subroutine program to a subroutine program call source. Operation results are stored into the device specified in the subroutine program with argument passing. The bit data specification device other than the CPU module input (X) are available.

Function register (FD)

This device is used for writing/reading between the subroutine call source and the subroutine program. The input/output condition of the function register is automatically identified by the CPU module. "Source data" in a subroutine program means data inputted into the subroutine program. "Destination data" in a subroutine program means data outputted from the subroutine program. One point of a function register occupies maximum of four words and can store 16-bit data, 32-bit data, 64-bit data, single-precision real number, and double-precision real number. However the number of words to be used depends on the instruction in the subroutine program.

For example, for the destination of addition instruction (+instruction) of 16-bit signed integer, one word is used.

(1) The data is stored in one point of D0.

Besides, for the destination of addition instruction (ED+instruction) of double-precision real number, four words are used.

(1) The data is stored in four points of D0 to D3.

Special relay (SM)

This is the internal relay for which the specification is defined in the CPU module, where the status of the CPU module is stored. (☞ Page 581 List of Special Relay Areas)

Special register (SD)

This is the internal register for which the specification is defined in the CPU module, where the status (diagnostics information, system information, etc) of the CPU module is stored. (☞ Page 604 List of Special Register Areas)

27.5 Link Direct Device

This device directly accesses link relays and/or link registers of the network module in CC-Link IE TSN, CC-Link IE Controller Network, and/or CC-Link IE Field Network.

Specification method

Specify a link direct device as shown below: The link register 10 (W10) of the network number 2 can be specified as "J2\W10".

For bit devices, digit specification is allowed. (Example: J1\K1X0, J10\K4B0)

Specification range

All the link devices of the network module can be specified. The link devices which fall outside the range specified with "Refresh Setting" can also be specified.

For the following modules, specify the "Extended Mode (iQ-R Series Mode)" in the "Link Direct Device Setting" of the CPU parameter. (Default setting is "Q Series Compatible Mode".)^{*1}

- CC-Link IE TSN master/local module
- Motion module
- CC-Link IE Controller Network-equipped module to which the link points extension is set.^{*2}

 [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Link Direct Device Setting]

Window

Item	Setting
Link Direct Device Setting	
Link Direct Device Setting	Extended Mode (iQ-R Series Mode)

Point

When the network module to be administered contains any of the following modules when specifying the link direct device, set the "Extended Mode (iQ-R Series Mode)" to the "Link Direct Device Setting".

- CC-Link IE TSN master/local module
- Motion module
- CC-Link IE Controller Network-equipped module to which the link points extension is set.^{*2}

Other modules operate in the both mode.

^{*1} Before using, check the versions of the CPU module and engineering tool used. ( Page 705 Added and Enhanced Functions)

^{*2} Applies when the "Link points extended setting" of the module parameter is set to "Extend" and the extended link device is specified. ( MELSEC iQ-R CC-Link IE Controller Network User's Manual (Application))

Specification range for writing

Writing should be done in the range which is within the link device range specified as a send range of network parameters, and outside the range specified as the refresh range for "Refresh Setting".^{*1}

Note that writing in the range specified as the refresh range overwrites link device data of the network module during refresh process. When writing data to a writing range of another station using the link direct device, data is overwritten with received data during data reception from another station.

^{*1} There is only one network module to which the link direct device can write data for each network number. When more than one network module with the same network number is mounted, the network module with the lowest slot number is the target for writing by the link direct device.

Specification range for reading

Data can be read from the entire range of link devices of the network module.^{*1}

^{*1} There is only one network module for which reading is allowed with the link direct device for each network number. When more than one network module with the same network number is mounted, the network module with the lowest slot number is the target for reading by the link direct device.

Difference from link refresh

The following table shows the difference between the link direct device and link refresh.

Item		Link direct device	Link refresh
Description method in program	Input	Jn\K4X0...	X0...
	Output	Jn\K4Y0...	Y0...
	Link relay	Jn\K4B0...	B0...
	Link register	Jn\W0...	W0...
	Link special relay	Jn\K4SB0...	SB0... Or module label
	Link special register	Jn\SW0...	SW0... Or module label
Access range in relation to network module		All the link devices for each network module	The range specified in "Refresh Setting"
Guarantee range of access data		In word (16-bit) units	In word (16-bit) units

27.6 Module Access Device

This device directly accesses from the CPU module to the buffer memory of the intelligent function module mounted on the main base unit and extension base unit.

Specify this device with 'Un\Gn'. (Example: U5\G11)

Specified item		Value to be specified
Un	Start I/O number of intelligent function modules	Upper two digits when a start I/O number is described in three digits (00H to FFH) Example: 1F stands for X/Y1F0
Gn	Buffer memory address	0 to 268435455 (decimal)

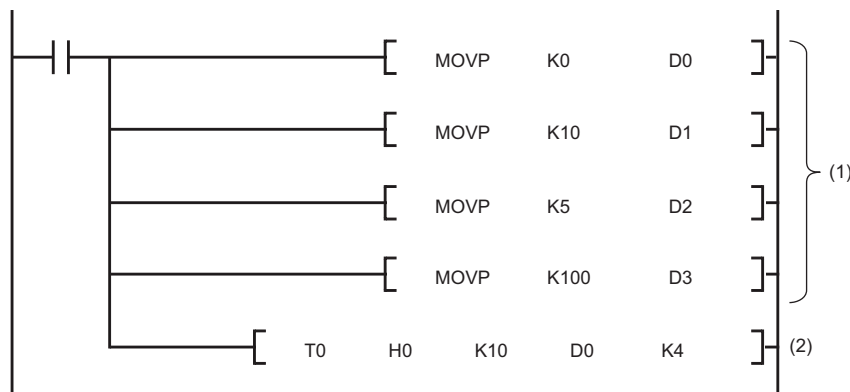

Point

When reading/writing the buffer memory data using the module access device more than twice within a program, the processing speed can be increased by conducting read/write operations at a single point of the program using the FROM/TO instruction.

- When data is written using the module access device more than twice:

- When data is written at a single point of the program using the TO instruction:

- (1) Store data to devices such as the data register (D).
- (2) Write data to only one point in the program.

Precautions

The following describes the precautions for when the module access device is used.

- If data is written to the refresh-target memory using a program while the refresh function is being used, the CPU module overwrites the data in the target memory at the execution of the refresh function. Thus, the expected operation may not be acquired. When the refresh function is used, do not write the data directly to the refresh-target memory but write it to the refresh-source memory.

*1 When the data is transferred from the CPU module to the module, the target memory is the buffer memory or link device. When the data is transferred from the module to the CPU module, the target memory is the specified device of the CPU module.

27.7 CPU Buffer Memory Access Device

This device accesses memory used by the built-in function of the CPU module, such as data writing/reading between CPU modules on the multiple CPU system and Ethernet function ( Page 392 Specification method through CPU buffer memory access device)

Specification method

Specify this device with 'Un\Gn'. (Example: U3E1\G4095, U3E2\HG1024)

Specified item		Value to be specified
Un (I/O number of the CPU module)	CPU No.1	3E0
	CPU No.2	3E1
	CPU No.3	3E2
	CPU No.4	3E3
G (CPU buffer memory area)	CPU buffer memory	G
	Fixed scan communication area	HG
n (CPU buffer memory address)		0 to 268435455 (decimal)

27.8 Index Register (Z/LZ)

This device is used for the index modification of the device. The index modification is the indirect specification using the index register.

Specify the device with the number obtained from "Device number of device targeted for modification" + "Contents of index register".

16-bit index modification

The device number is modified using the index register (Z). The modification range for the device in the case of the 16-bit index modification is -32768 to 32767.

Ex.

Modifying D0 with Z0

(1) Access D0Z0 = D100.

32-bit index modification

The device number is modified using the long index register (LZ). The modification range for the device in the case of the 32-bit index modification is -2147483648 to 2147483647.

Ex.

Modifying D0 with LZ0

(1) Access D0LZ0 = D100000.

In addition, 32-bit index modification with ZZ expression using two index registers is also available.

Device for which index modification can be performed

The following table lists the devices that can be targeted for index modification.

Item	Description
16-bit index modification	X, DX, Y, DY, M, L, B, F, SB, V, S ^{*4} , T ^{*1} , LT ^{*1} , ST ^{*1} , LST ^{*1} , C ^{*1} , LC ^{*1} , D, W, SW, SM, SD, Jn\X, Jn\Y, Jn\B, Jn\SB, Jn\W, Jn\SW, Un\G, U3En\G, U3En\HG, R, ZR, RD, P ^{*3} , I ^{*3} , BL ^{*4} , BLn\S ^{*4} , J, U, K, H
32-bit index modification	M, B, SB, T ^{*1} , LT ^{*1} , ST ^{*1} , LST ^{*1} , C ^{*1} , LC ^{*1} , D, W, SW, Jn\B ^{*2} , Jn\W ^{*2} , Un\G ^{*2} , U3En\G ^{*2} , U3En\HG ^{*2} , R, ZR, RD, K, H

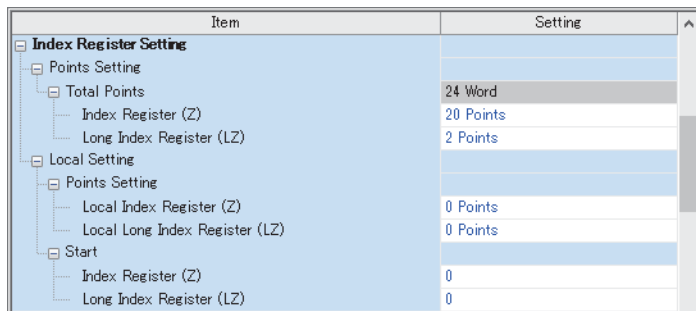

- *1 The devices can be used for the contact, coil and current value.
- *2 For network numbers and the specification source of I/O numbers, 32-bit index modification cannot be performed.
- *3 When the devices are used as an interrupt pointer, index modification cannot be performed.
- *4 The device can be specified by using the CPU module where the SFC function can be used. (📖 Page 705 Added and Enhanced Functions)

Index register setting

The following window allows to specify the number of points for the index register (Z) and long index register (LZ) and the range where they are used as a local device. The total number of points of the index register (Z) and the long index register (LZ) must be set to 24 words.

🔗 [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Index Register Setting]

Window

Displayed items

Item	Description	Setting range	Default		
Number of points setting	Total Points	Check the total number of points for index register and long index register.	—		
	Index register (Z)	Set the number of points for the index registers.	0 to 24 points (in two-point increments)	20 points	
	Long index register (LZ)	Set the number of points for the long index registers.	0 to 12 points (in one-point increments)	2 points	
Local setting	Number of points setting	Local Index register (Z)	Set the number of points for index registers used as a local device. Set within the range of the index register.	0 to 24 points (in one-point increments)	0 points
		Local long index register (LZ)	Set the number of points for long index registers used as a local device. Set within the range of the long index register.	0 to 12 points (in one-point increments)	0 points
	Head	Index register (Z)	Set the start number for the local index registers. Set within the range of the index register.	0 to 23	0
		Long index register (LZ)	Set the start number for the local long index registers. Set within the range of the long index register.	0 to 11	0

Combination of index modification

This section describes the combination of index modification.

Modification order for the device specification and index modification

According to the priority order shown below, the device specification (digit specification, bit specification, indirect specification) and index modification can be applied. However, some word devices may not follow the priority order shown below.

Order of priority	When the device targeted for the device specification and index modification is the bit device	When the device targeted for the device specification and index modification is the word device
High ↑ ↓ Low	1: Index modification 2: Digit specification	1: Index modification 2: Indirect specification 3: Bit specification

27

Specification method combined with device specification

The device targeted for specification is modified in order of: 1st modification, 2nd modification and then 3rd modification. Besides, the following contents can be used only for the device for which the 1st modification can be applied. (For example, index modification + digit specification is impossible for the function input (FX).)

Device targeted for specification	1st modification	2nd modification	3rd modification	Example
Bit device	Index modification	Digit specification	—	K4M100Z2
Word device	Index modification	Bit specification	—	D10Z2.0
	Index modification	Indirect specification	—	@D10Z2
	Bit specification	Index modification	—	D10.8Z2
	Indirect specification	Bit specification	—	@D10.8
	Index modification	Indirect specification	Bit specification	@D10Z2.8
	Indirect specification	Bit specification	Index modification	@D10.8Z2

Precautions

This section describes the precautions on using index modification.

Index modification between the FOR and NEXT instructions

Between the FOR instruction and the NEXT instruction, pulse output is provided through the edge relay (V). However, pulse output by the PLS, PLF, or pulse conversion (□P) instruction is not available (☞ Page 422 Edge relay (V))

Index modification by the CALL instruction

In the CALL instruction, pulse output is provided through the edge relay (V). However, pulse output by the PLS, PLF, or pulse conversion (□P) instruction is not available (☞ Page 422 Edge relay (V))

Device range check for index modification

For details on the device range check when index modification is performed, refer to the following.

☞ MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

Change of the index modification range due to switching from 16-bit to 32-bit

To change the index modification range for switching from 16-bit to 32-bit, the user must:

- Review the index modification block(s) within the program.
- To perform the 32-bit index modification specification with ZZ expression, review the range of the index register (Z). Note that the range within the LZ cannot be specified.
- For 32-bit index modification with ZZ expression, because the specified index register (Zn) and the immediately following index register (Zn+1) are used, caution must be taken to prevent duplicated index registers from being used.
- Review the number of points of the index register (Z) and that of the long index register (LZ), which are specified in "Index Register Setting" (☞ Page 442 Index register setting)

When values are stored in the index registers

For 16-bit index modification using the index register (Z), the range is -32768 to 32767. Therefore, when values within the range from 32768 to 65535 are stored in the index register (Z) for an instruction which processes unsigned data, the instruction does not work in design because the range of the index modification will be -32768 to 32767. For the range of values larger than or equal to 32768, the long index register (LZ) must be used so that 32-bit-based index modification can be applied.

Ex.

Operation for Index modification

(1) When unexpected operation is executed

(2) When proper operation is executed

(1) When the value 65535 is stored in the index register (Z), D50000(-1) to D49999 are accessed because the value is turned into -1 when an index modification is performed.

(2) When a value larger than or equal to 32768 is used for an index modification, the value must be stored in the long index register (LZ). In doing so, the value 65535 is used as such for an index modification using the long index register (LZ) and D50000 (65535) to D115535 become accessible.

27.9 File Register (R/ZR)

This device is a word device for extension. This device is specifically a file register file which exists in the file storage area on the device/label memory.

Specification method

There are two types of the specification methods for the file register: block switching and serial number methods.

Block switching method

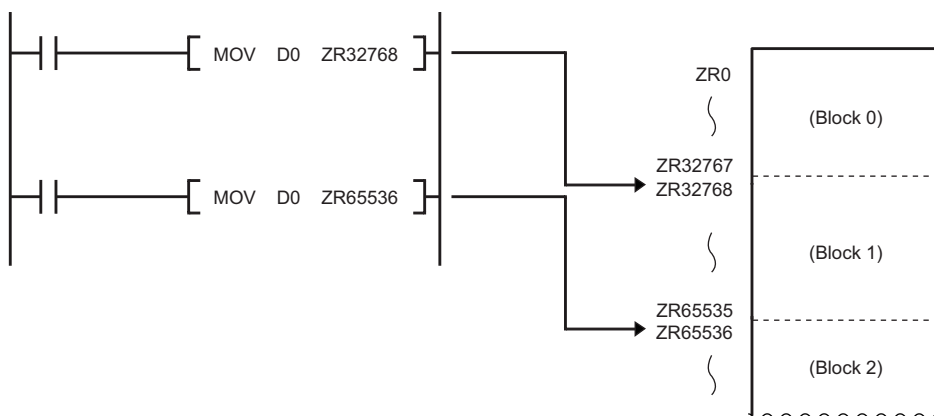

In this method the number of points of file register being used is specified by being divided in increments of 32K point (R0 to R32767). When using more than one block, specification is conducted by switching to the block number used by the RSET instruction. "R" is used as the device symbol. The range of "R" is from R0 to R32767. However in the following cases the upper limit of the device number is "block size (unit: word) -1".

- The file register file size is smaller than 64K bytes.
- The file register file size is not a multiple of 64K bytes and the end block is specified in the RSET instruction.

Serial number method

In this method file registers having more than 32K points are specified using serial device numbers. File registers of the multiple blocks can be used as consecutive file registers. "ZR" is used as the device symbol. The range of ZR is from ZR0 to (file register file size (unit: word) -1).

Setting file registers

This section describes the settings required to use the file registers.

Configuration procedure

This section describes the procedure to use the file registers.

1. Set the file register usage with [CPU Parameter].
 2. To use the file register for each program, previously create the device memory which will become the file register file. (📖 GX Works3 Operating Manual)
 3. When using the file registers, which are common for all programs, a file register file with the name and capacity set in the file register setting is created.* 1
- *1 If the capacity is not set, it must be set when creating a file register file and writing it to the programmable controller in the same manner as the procedure 2.
4. Write parameters and file register files into the CPU module.

File register setting

This setting must be completed before using the file registers.

🔗 [CPU Parameter] ⇒ [File Setting] ⇒ [File Register Setting]

Window

Item	Setting
File Register Setting	
Use Or Not Setting	Not Use
Capacity	
File Name	

Displayed items

Item	Description	Setting range	Default
Use Or Not Setting	Specify whether or not file registers should be used.	<ul style="list-style-type: none"> • Not Use • Use File Register of Each Program • Use Common File Register in All Programs 	Not Use
Capacity	Specify the capacity of the file register in increments of 1K words when "Use Common File Register in All Programs" is selected.	This value depends on whether or not the extended SRAM cassette is mounted and its capacity. (📖 Page 128 The setting range of the capacity of each area)	—
File name	Assign a file name to the file register when "Use Common File Register in All Programs" is selected.	1 to 60 characters	—

■Precautions

To access the CPU module from either of the following modules or engineering tools, the size of the file register needs to be 5696K words or less with an extended SRAM cassette (NZ2MC-16MBS) of 16MB.

- C Controller module
- MES interface module
- GOT2000 (when the programmable controller program monitor (R ladder) is used)
- Engineering tool version 1.015R or earlier
- CPU Module Logging Configuration Tool version 1.49B or earlier
- GX LogViewer version 1.49B or earlier
- MX Component version 4.10L or earlier

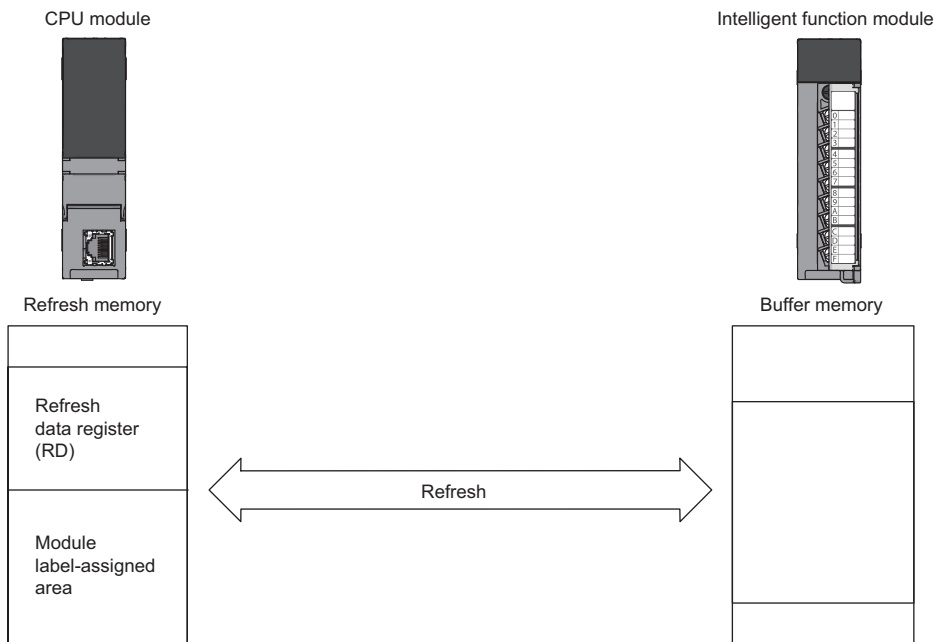

Clearing file registers

To clear the file registers, use the following methods (📖 Page 135 Memory Operation)

- Clearing in the program: write 0 into the file register range to be cleared.
- Clearing with engineering tool: clear them using engineering tool (📖 GX Works3 Operating Manual)

27.10 Refresh Data Register (RD)

This device is provided for using as a refreshing target of buffer memory on the various devices, such as an intelligent function module. Refresh Data Register (RD) is assigned into the refresh memory area. (👉 Page 131 Refresh memory)

Refresh memory setting

🔗 [CPU Parameter] ⇄ [Memory/Device Setting] ⇄ [Refresh Memory Setting]

Window

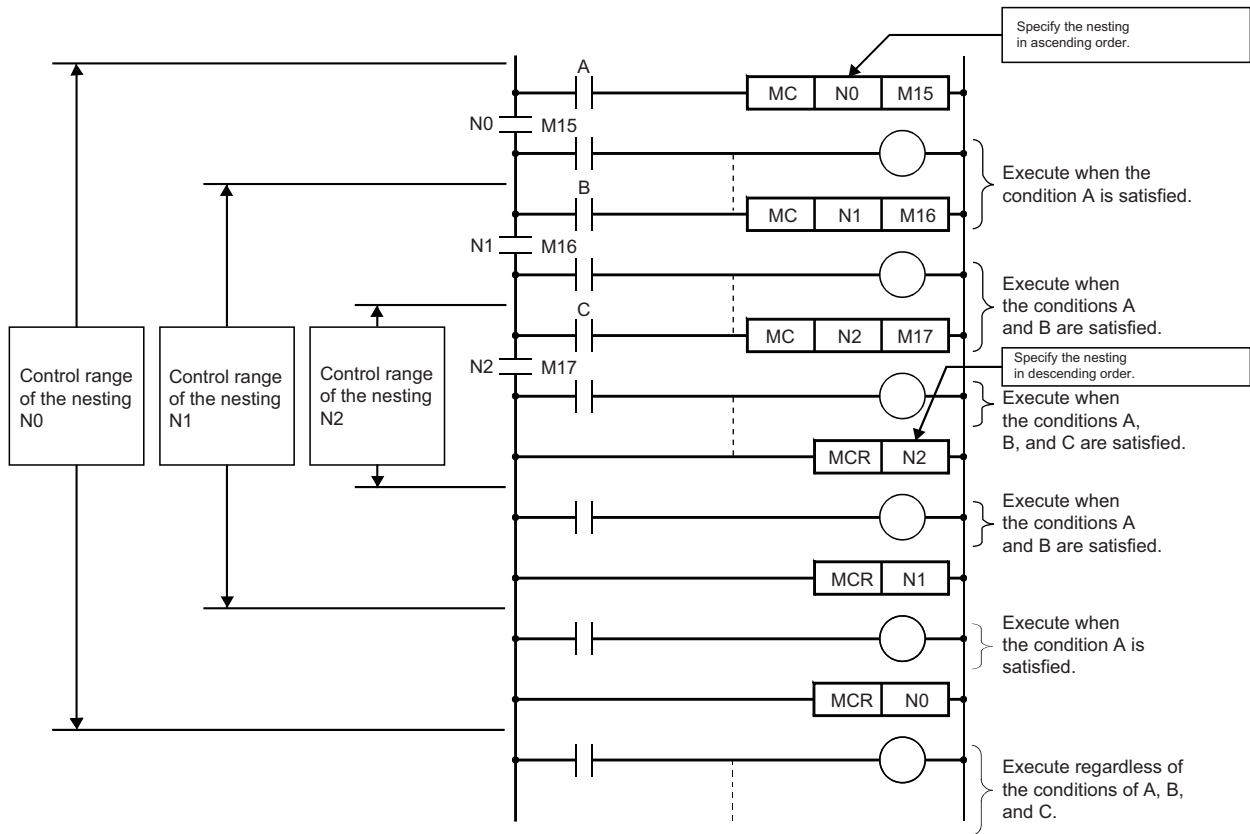

Item	Setting
Refresh Memory Setting	
Total Points	1024 K Point
Refresh Data Register (RD) Area	512 K Point
Module Label Assignment Area	512 K Point

Displayed items

Item	Description	Setting range	Default
Total Points	Check the total number of points for the refresh data register and the assigned area.	—	1024K Point
Refresh Data Register (RD) area	Set the number of points of refresh data register.	0 to 1024K points (in one-point increments)	512K Point
Module Label Assignment Area	Set the number of points for the module label assigned area.	0 to 1024K points (in one-point increments)	512K Point

27.11 Nesting (N)

This device is used in the master control instructions (the MC/MCR instruction)*1 and enables the programming of operation conditions in a nesting structure. Specify this device from outside the nesting structure starting with the lowest number (in ascending order from N0 to N14).

*1 This instruction creates an effective ladder-switching program using opening/closing the common rail of the ladders.

27.12 Pointer (P)

This device is used in the jump instructions (the CJ/SCJ/JMP instruction) and/or subroutine program call instructions (such as the CALL instruction). There are two types of pointer: the global pointer and the local pointer. Use the pointer when:

- Specifying the jump destination and label of the jump instructions (the CJ/SCJ/JMP instruction).
- Specifying the call destination and label (the head of subroutine program) of the subroutine call instructions (such as the CALL instruction).

Global pointer

This is the pointer which enables calling by the subroutine call instruction from all the program being executed.

Effective use of number of points

The number of points for global pointers can be obtained with the following formula: "pointer number of points specified by the parameter" - "the total point number of local pointer being used for each program".

Precautions

This section describes the precautions when the global pointer is used.

- A global pointer with the same pointer number cannot be set as a label in multiple points.

Local pointer

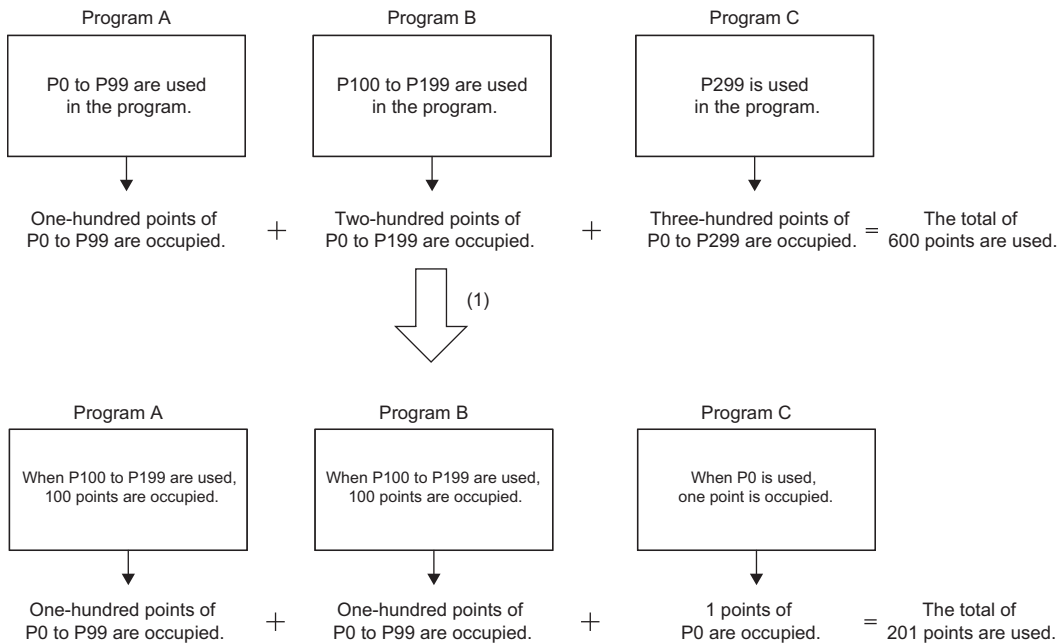

This is the pointer to be independently used in each program where the same pointer number can be used. This pointer is specified in the following format: # (pointer number) (Example: #P0) (Page 457 Specification method for the local devices).

(1) The local pointers with the same number can be used between different programs.

Effective use of number of points

Local pointer number of points are shared among all the programs. The range of the local pointer number of points used by each program is from #P0 to the maximum value of the local pointer being used in that program. For example, even when a program actually uses only #P99, 100 points (#P0 to #P99) are considered to be used. When using local pointers in multiple programs, they can be effectively used by using them in ascending order from #P0 in each program group.

(1) The number of total required local pointers can be reduced from 600 to 201 by using them in ascending order from #P0 in each program group.

Pointer setting

The following menu item is to set pointers.

[CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Pointer Setting]

Window

Displayed items

Item	Description	Setting range	Default
Global Pointer Start	Set the start number of the global pointer.	P0 and over ^{*1}	0
Total Points	Check the total number of points for the pointer.	—	16384 points ^{*2}
Global Pointer	Set the number of points of the global pointer.	<ul style="list-style-type: none"> R120CPU, R120ENCPU: 0 to 32768 points (in increments of 1 point) Other CPU modules: 0 to 16384 points (in increments of 1 point) 	4096 points ^{*3}
Local Pointer	Set the number of points of the local pointer.		4096 points ^{*3}
Pointer Type Label	Set the number of points for the pointer type label assignment area.		8192 points ^{*4}

- *1 Up to the number of "Total points of pointer device area" - "Number of points of global pointer".
- *2 The default number of points is 32768 for the R120CPU and R120ENCPU.
- *3 The default number of points is 8192 for the R120CPU and R120ENCPU.
- *4 The default number of points is 16384 for the R120CPU and R120ENCPU.

Point

Specify a pointer number which is equal to or lower than "(end number of the pointer range specified in the parameter) - (number of points of the global pointers)".

27.13 Interrupt Pointer (I)

This device is used as a label located at the head of the interrupt program. This pointer can be used in all the programs being executed.

Point

Setting the execution type of program to the event execution type eliminates the need to write (I□) the interrupt pointer. (☞ Page 91 Interrupt occurrence by the interrupt pointer (I))

Interrupt factors of the interrupt pointer numbers

The interrupt factors of the interrupt pointer numbers are indicated.

Interrupt factor	Interrupt pointer number	Description
Interrupt from module	I0 to I15	This is a pointer used for modules which have the interrupt function.
Interrupt by the internal timer	I28 to I31	This interrupt pointer is used in fixed scan interrupts by the internal timer.
Inter-module synchronous interrupt	I44	This fixed scan interrupt pointer is used in the inter-module synchronization function.
Multiple CPU synchronous interrupt	I45	This fixed scan interrupt pointer is used in the multiple CPU synchronization function.
High-speed internal timer interrupt 2	I48	This interrupt pointer is used in fixed scan interrupts by the internal timer and can be specified in a shorter interval than interrupt pointer numbers I28 to I31.
High-speed internal timer interrupt 1	I49	
Interrupt from module	I50 to I1023	This is a pointer used for modules which have the interrupt function.

The priority for the interrupt pointer numbers and interrupt factors

The priority for the interrupt pointer numbers and interrupt factors are indicated.

Interrupt pointer number	Interrupt factor	Interrupt priority	Interrupt priority order	
I0	Interrupt from module	5 to 8	9	
I1			1st point	10
I2			2nd point	11
I3			3rd point	12
I4			4th point	13
I5			5th point	14
I6			6th point	15
I7			7th point	16
I8			8th point	17
I9			9th point	18
I10			10th point	19
I11			11th point	20
I12			12th point	21
I13			13th point	22
I14			14th point	23
I15			15th point	24
I28	Interrupt by the internal timer	4	8	
I29			7	
I30			6	
I31			5	
I44	Inter-module synchronous interrupt	3	4	
I45	Multiple CPU synchronous interrupt		3	
I48	High-speed internal timer interrupt 2	2	2	
I49	High-speed internal timer interrupt 1	1	1	
I50 to I1023	Interrupt from module	5 to 8	25 to 998	

Point

- The interrupt priority is the order which is executed at the time of the multiple interrupt. (👉 Page 114 Interrupt priority)
- The interrupt priority order is the order which is executed when the interrupt factor with the same interrupt priority is generated. (👉 Page 117 Multiple interrupt execution sequence)

27.14 Network No. Specification Device (J)

This device is used when specifying a network number with the Link dedicated instruction. (📖 MELSEC iQ-R Programming Manual (Module Dedicated Instructions))

27.15 I/O No. Specification Device (U)

This device is used when specifying an I/O number with the intelligent function module dedicated instruction. (📖 MELSEC iQ-R Programming Manual (Module Dedicated Instructions))

27.16 SFC Block Device (BL)

This device is used when specifying SFC program blocks. This device is also used when specifying step No. through such methods as verifying (monitor, current value changes) SFC programs with SFC control instructions or the engineering tool. (📖 MELSEC iQ-R Programming Manual (Program Design))

27.17 SFC Transition Device (TR)

This device is used when specifying SFC program transition conditions. This device can only be used for device comments for transition conditions. (📖 MELSEC iQ-R Programming Manual (Program Design))

27.18 Global Device

This device can be shared by all the programs. All the devices that do not set as local device are handled as global device.

27.19 Local Device

This device can be used independently in each program. When creating multiple programs, programming can be completed without being aware of devices used in other programs.

Point

The local device area must be reserved independently from the global device area. Therefore a local device and global device with the same device number can exist.

Devices available as local device

The following devices are available as local devices.

- Internal relay (M)
- Edge relay (V)
- Timer (T, LT, ST, LST)
- Counter (C, LC)
- Data register (D)
- Pointer (P)

Point

Because the index register (Z, LZ) saves/returns during program execution, it should be regarded separately as the local index register unlike other local devices. ( Page 441 Index Register (Z/LZ))

Local device area

The CPU module reserves the local device area on the device/label memory based on the number of points setting of the local device when:

- CPU module is powered off and on or is reset.
- Operating status of the CPU module is changed from STOP to RUN.

When local device is used in subroutine program

Local devices to be used vary depending on whether SM776 (Local device setting at CALL) is turned on or off. Local index register to be used is also determined according to the SM776 setting.

SM776	Local device to be used
Off	Uses local devices of the program file from which subroutine program is called.
On	Uses local devices of the program file into which the subroutine program is stored.

Restriction

- In terms of on/off setting for SM776, the value (on or off) used when the subroutine call occurs is considered to be effective. Therefore when on/off setting for SM776 is switched in the subroutine program, the modified value (on or off) is not effective until the next subroutine call occurs.
- On/off setting for SM776 cannot be specified for each program file because it is enabled for each CPU module.

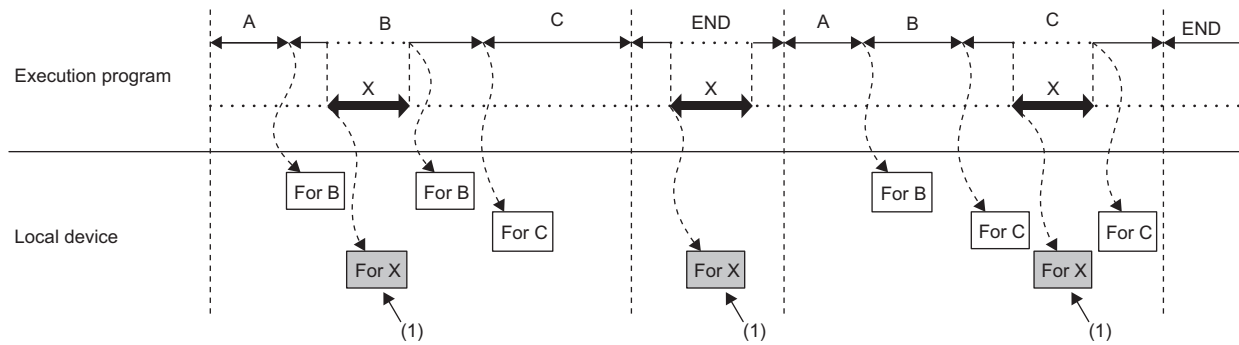

When local device is used in interrupt and other programs

When using a local device for an interrupt program / a fixed scan execution type program / an event execution type program triggered by occurrence of an interrupt, turn on SM777 (Local device setting in interrupt programs). The programs will not function properly if SM777 is turned off.

Ex.

Operation if SM777 is turned on in following setting

Program name	Execution type	Local device use/not use
A	Scan	Not Use
B	Scan	Use
C	Scan	Use
X	Fixed scan	Use

(1) Uses the program X local device.

For local index register, the register of the program file which has been executed before these programs is used regardless of the SM777 setting.

Restriction

- For SM777, the value (on/off) set at the execution of an interrupt program / a fixed scan execution type program / an event execution type program triggered by occurrence of an interrupt is valid. For this reason, when the set value is changed while a program is being executed, the value changed does not become valid until the next time any of these programs is executed.
- On/off setting for SM777 cannot be specified for each program file because it is enabled for each CPU module.
- When the local device monitor is executed, the monitor switches to the applicable local device. Consequently, if SM777 is off, when an interrupt occurs immediately after switching, and a local device is accessed, the local device being monitored by the local device monitor is used. (The local device for the program being run prior to the interrupt (program immediately before END) is not accessed.)

Clearing local device

Local device can be cleared to 0 by the following operations:

- CPU module is powered off and on or is reset.
- CPU module status is changed from STOP to RUN.
- CPU module status is changed from PAUSE to RUN.

Setting method for the local devices

Set the range where each device will be used as a local device and also set whether or not it should be used.

■Range setting

The range setting for local devices is common to all the programs. Therefore the range for local devices cannot be set for each program.

Operating procedure

"Device/Label Memory Area Detailed Setting" window

Item	Setting
Device/Label Memory Area Detailed Setting	
Device Setting	<Detailed Setting>
Latch Type Setting of Latch Type Label	Latch (1)

"Device Setting" window

Item	Symbol	Local Device		
		Start	End	Points
Input	X			
Output	Y			
Internal Relay	M			
Link Relay	B			
Link Special Relay	SB			
Annunciator	F			
Edge Relay	V			
Step Relay	S			
Timer	T			
Long Timer	LT			
Retentive Timer	ST			
Long Retentive Time	LST			
Counter	C			
Long Counter	LC			
Data Register	D			
Link Register	W			
Link Special Register	SW			
Latch Relay	L			
Total Device				0.0K Word
Total Word Device				0.0K Word
Total Bit Device				0.0K Bit

1. Click "Detailed Setting" on the "Device Setting" window.

 [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Device/Label Memory Area Detailed Setting] ⇒ [Device Setting] ⇒ [Detail Setting]

2. Set the range where each device will be used as a local device.

Point

Configure the setting range of the local device within the range which has been set for the number of device points. The number of local devices used is calculated by the following calculation formula. Set the number of local devices used so that the number is equal to or less than the capacity of the local device area.

Total number of local devices used = $((A \div 16) + B + (C \times 2) + (D \times 4) + ((E \times 2) \div 16)) \times F$

- A: Number of points of the local devices M and V
- B: Number of points of the local devices D, T (current value), ST (current value), and C (current value)
- C: Number of points of the local device LC (current value)
- D: Number of points of the local devices LT and LST
- E: Number of points of the local devices T (contact/coil), ST (contact/coil), C (contact/coil), and LC (contact/coil)
- F: Number of programs using the local device

■Setting unit

The increment of setting of a local device is the same as that of a global device. ( Page 417 Range of use of device points)

Setting whether or not it should be used

Whether or not local devices should be used can be set for each program. Since the local device area of program for which "Do not use" has been set is not assured, it can suppress unnecessary consumption of device/label memory.

 [CPU Parameter] ⇒ [Program Setting]

Operating procedure

"Program Setting" window

Item	Setting
Program Setting	<Detailed Setting>

"Detailed Setting" window

Execute Order	Program Name	Execution Type		Refresh Group Setting	Device/File Use or not
		Type	Detailed Setting Information		
1	MAIN	Scan		(Do not Set)	<Detailed Setting>
2					

"Setting of Device/File Use Or Not" window

Execute Order	Program Name	Execution Type	Local Device Local Index Register Use or not	File Use Or Not	
				File Registers	Device Initial Value
1	MAIN	Scan	Use	Use File Setting	Use File Setting
2			Use	Use File Setting	Use File Setting
3			Use	Use File Setting	Use File Setting

1. Click "Detailed Setting" on the "Program Setting" window.
2. Click "Detailed Setting" of "Device/File Use or not".
3. Set whether or not it should be used for each program in the setting of "Local Device Local Index Register Use or not".

27

Restriction

Do not use local devices in a program which is configured not to use local devices.

Specification method for the local devices

To specify the local device in the program, add "#".

Ex.

For example, #D100, K4#M0, and @#D0 can be used.

Point

Local device is listed with a preceding # symbol in the program. This symbol is helpful to differentiate local devices from global devices.

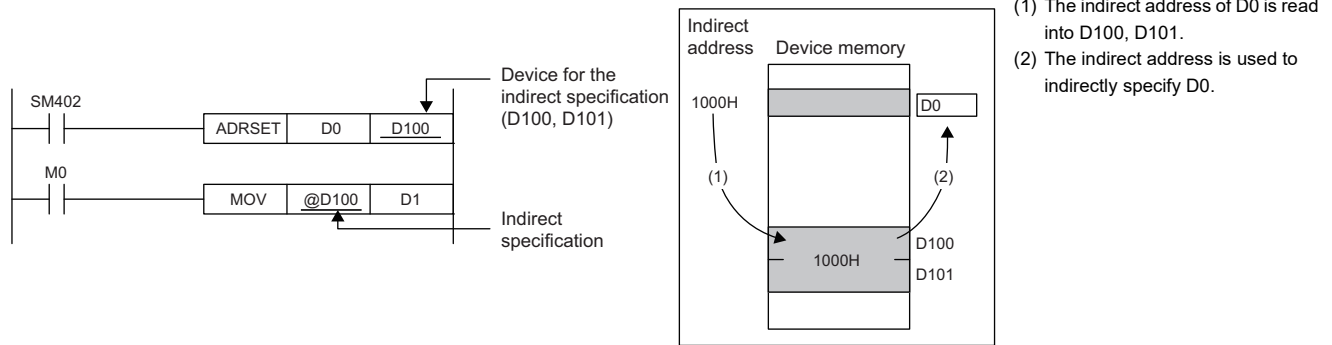

Precautions

This section describes the precautions when using local devices.

- Like global devices, the timer (T, LT, ST, LST) and counter (C, LC) specified as a local device cannot be checked for the device range. Therefore when operates the address in the index modification or indirect specification, be careful not to exceed the specified device range.
- Accessing the range including both global and local devices by the index modification is not allowed.
- When the range of the 32-bit index modification is across the setting ranges of local devices of the index register, proper index modification is impossible.
- Local devices are not latched.

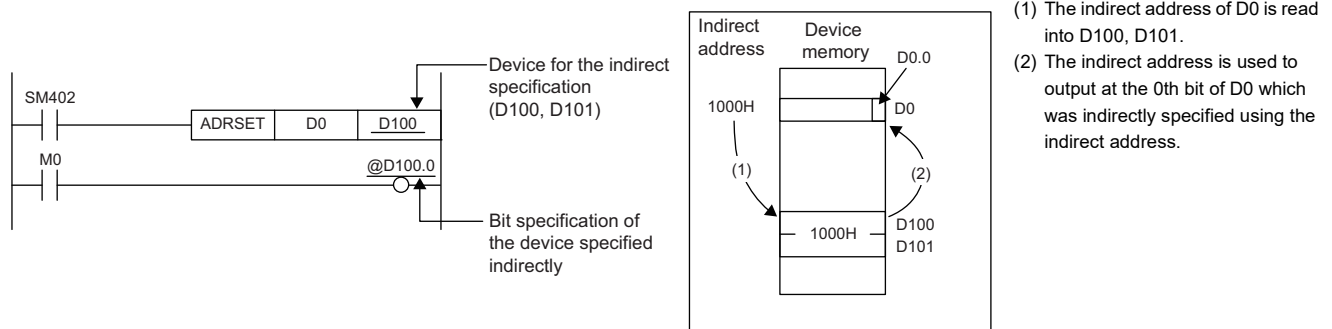

27.20 Indirect Specification

Specify the device using the indirect address of device. Store the indirect address of device to be specified into the device for indirect specification, and write as "@ + Device for indirect specification".

- (1) The indirect address of D0 is read into D100, D101.
- (2) The indirect address is used to indirectly specify D0.

Besides, specifying a bit of a word device allows the indirect specification for the instruction that specifies bits.

- (1) The indirect address of D0 is read into D100, D101.
- (2) The indirect address is used to output at the 0th bit of D0 which was indirectly specified using the indirect address.

The indirect specification can be used in the device/label memory or refresh memory.

Indirect address of device

To specify, use the 32-bit data, and to hold the value, use the device of two words. The indirect address of the device can be obtained with the ADRSET instruction. The ADRSET instruction specifies the indirect address of the device using instructions that handle 32-bit data. For the ADRSET instruction, refer to the following.

MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

Point

When the block or the file of the file register is switched through the RSET or QDRSET instruction, the indirect address refers to the one of the block or the file before they are switched. To allow the indirect address in the device for indirect specification to specify the block or file after the file register is switched, specify the ADRSET instruction to obtain the indirect address again after block or file are switched.

Devices that can allow indirect specification

This section lists devices that can allow indirect specification.

Type	Device ^{*3}
Devices that can allow indirect specification where @ is added ^{*1}	T, ST, C, D, W, SW, FD, SD, Un\G, Jn\W, Jn\SW, U3En\G, U3En\HG, R, ZR, RD
Device that can acquire the indirect address through the ADRSET instruction ^{*2}	X, Y, M, L, B, F, SB, T, ST, C, D, W, SW, FX, FY, FD, SM, SD, R, ZR, RD

*1 Also can be used for the local device. (e.g.: @D0)

*2 The indirect address of device can be obtained for the local device as well. (e.g.: ADRSET #D0 D100)

*3 Devices that cannot be used as operands of instructions cannot be used even when they are indirectly specified.

28 LABELS

A label is a variable consisting of a specified string used in I/O data or internal processing.

Programs can be created without considering the size of devices and buffer memory by using labels. For this reason, a program using labels can be reused easily even in a system having a different module configuration.

When labels are used, there are some precautions on programming and functions used. For details, refer to the following.

 Page 473 Precautions

Point

There are two types of labels described in this manual.

- Global labels
- Local labels

There are other types of labels available in addition to the global labels and local labels.

[System labels]

A system label is a label that provides the same data in all projects compatible with iQ Works. It can be referenced from the GOT and the CPU modules and Motion controllers on other stations, and used for monitoring and accessing data.

For details, refer to the following.

 Let's start iQ Works Version 2

[Module labels]

A module label is a label defined uniquely by each module. A module label is automatically generated by the engineering tool from the module used, and can be used as a global label.

For details, refer to the following.

 Function Block Reference for the module used

28.1 Global Labels

A global label is a label that provides the same data within a single project. It can be used in all programs in the project.

A global label can be used in program blocks and function blocks.

The settings of a global label include a label name, class, and data type.

By opening global labels, they can be referenced from GOT and other stations, and can be used for monitoring and accessing data.

Device assignment

Devices can be assigned to global labels.

Item	Description
Label to which no device is assigned	<ul style="list-style-type: none">• Programming without being aware of devices is possible.• Defined labels are allocated to the label area or latch label area in the device/label memory.
Label to which a device is assigned	<ul style="list-style-type: none">• If a device is to be programmed as a label against a device that is being used for input or output, the device can be assigned directly.• Defined labels are allocated to the device area in the device/label memory.

28.2 Local Labels

A local label is a label that can be used only in the declared POU. Local labels outside the declared POU cannot be used.

The settings of a local label include a label name, class, and data type.

28.3 Classes

The label class indicates from which POU and how a label can be used.
Different classes can be selected depending on the type of POU.

Global label				
Class	Description	Applicable POU		
		Program block	Function block (FB)	Function (FUN)
VAR_GLOBAL	A common label that can be used in both program blocks and function blocks	○	○	×
VAR_GLOBAL_CONSTANT	A common constant that can be used in both program blocks and function blocks	○	○	×
VAR_GLOBAL_RETAIN	A latch type label that can be used in both program blocks and function blocks	○	○	×
Local label				
Class	Description	Applicable POU		
		Program block	Function block (FB)	Function (FUN)
VAR	A label that can be used within the range of a declared POU. This label cannot be used in other POUs.	○	○	○
VAR_CONSTANT	A constant that can be used within the range of a declared POU. This label cannot be used in other POUs.	○	○	○
VAR_RETAIN	A latch type label that can be used within the range of a declared POU. This label cannot be used in other POUs.	○	○	×
VAR_INPUT	A label that inputs a value into a function or function block. This label receives a value, and the received value cannot be changed in a POU.	×	○	○
VAR_OUTPUT	A label that outputs a value from a function or function block	×	○	○
VAR_OUTPUT_RETAIN	A latch type label that outputs a value from a function block	×	○	×
VAR_IN_OUT	A local label that receives a value and outputs the value from a POU. The value can be changed in a POU.	×	○	×
VAR_PUBLIC	A label that can be accessed as the public variable from other POUs	×	○	×
VAR_PUBLIC_RETAIN	A latch type label that can be accessed as the public variable from other POUs	×	○	×

28.4 Data Types

The data types of a label are classified according to the bit length, processing method, and value range. There are two data types.

- Primitive data type
- Generic data type (ANY type)

Primitive data type

The following table lists the data types included in the primitive data type.

Data type	Description	Value range	Bit length	
Bit	BOOL	Represents the alternative status, such as on or off.	0 (FALSE), 1 (TRUE)	1 bit
Word [unsigned]/bit string [16 bits]	WORD	16-bit array	0 to 65535	16 bits
Double word [unsigned]/bit string [32 bits]	DWORD	32-bit array	0 to 4294967295	32 bits
Word [signed]	INT	Positive and negative integer values	-32768 to 32767	16 bits
Double word [signed]	DINT	Positive and negative double-precision integer values	-2147483648 to 2147483647	32 bits
Single-precision real number ^{*1}	REAL	Numerical values of decimal places (single-precision real number values)	-2 ¹²⁸ to -2 ⁻¹²⁶ , 0, 2 ⁻¹²⁶ to 2 ¹²⁸ E-3.402823+38 to E-1.175495-38, 0, E1.175495-38 to E3.402823+38	32 bits
Double-precision real number ^{*1}	LREAL	Numerical values of decimal places (double-precision real number values)	-2 ¹⁰²⁴ to -2 ⁻¹⁰²² , 0, 2 ⁻¹⁰²² to 2 ¹⁰²⁴ E-1.79769313486231+308 to E-2.22507385850721-308, 0, E2.22507385850721-308 to E1.79769313486231+308	64 bits
Time ^{*2}	TIME	Numerical values as day, hour, minute, second, and millisecond	T#-24d20h31m23s648ms to T#24d20h31m23s647ms ^{*3}	32 bits
String	STRING	Characters represented by ASCII code or Shift JIS code	255 one-byte characters maximum	Variable
String [Unicode]	WSTRING	Characters represented by Unicode	255 characters maximum	Variable
Timer	TIMER	Structure corresponding to the device, timer (T)	☞ Page 462 Timer and counter data types	
Retentive timer	RETENTIVETIMER	Structure corresponding to the device, retentive timer (ST)		
Long timer	LTIMER	Structure corresponding to the device, long timer (LT)		
Long retentive timer	LRETENTIVETIMER	Structure corresponding to the device, timer (LST)		
Counter	COUNTER	Structure corresponding to the device, counter (C)		
Long counter	LCOUNTER	Structure corresponding to the device, counter (LC)		
Pointer	POINTER	Type corresponding to the device, pointer (P) (☞ Page 449 Pointer (P))		

*1 For the number of significant digits and input range of real number data input by the engineering tool, refer to the following.

☞ MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

*2 The time type is used in a time data type function of standard functions. For standard functions, refer to the following.

☞ MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

*3 For the notation of time, refer to the following.

☞ Page 492 Notation of time

Point

- The bit data in the word type label can be used by specifying a bit number.
- The bit type array label can be used as 16-bit or 32-bit data by specifying the number of digits.

For the bit specification and digit specification methods, refer to the following.

☞ MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

■Timer and counter data types

The data types of the timer, counter, long counter, retentive timer, long retentive timer, and long timer are the structures having a contact, coil, or current value.

Data type		Member name	Member data type	Description	Value range
Timer	TIMER	S	Bit	Indicates a contact. The operation is the same as the contact (TS) of a timer device.	0 (FALSE), 1 (TRUE)
		C	Bit	Indicates a coil. The operation is the same as the coil (TC) of a timer device.	0 (FALSE), 1 (TRUE)
		N	Word [unsigned]/bit string [16 bits]	Indicates the current value. The operation is the same as the current value (TN) of a timer device.	0 to 65535 ^{*1}
Retentive timer	RETENTIVETIMER	S	Bit	Indicates a contact. The operation is the same as the contact (STS) of a retentive timer device.	0 (FALSE), 1 (TRUE)
		C	Bit	Indicates a coil. The operation is the same as the coil (STC) of a retentive timer device.	0 (FALSE), 1 (TRUE)
		N	Word [unsigned]/bit string [16 bits]	Indicates the current value. The operation is the same as the current value (STN) of a retentive timer device.	0 to 65535 ^{*1}
Long timer	LTIMER	S	Bit	Indicates a contact. The operation is the same as the contact (LTS) of a long timer device.	0 (FALSE), 1 (TRUE)
		C	Bit	Indicates a coil. The operation is the same as the coil (LTC) of a long timer device.	0 (FALSE), 1 (TRUE)
		N	Double word [unsigned]/bit string [32 bits]	Indicates the current value. The operation is the same as the current value (LTN) of a long timer device.	0 to 4294967295 ^{*1}
Long retentive timer	LRETENTIVETIMER	S	Bit	Indicates a contact. The operation is the same as the contact (LSTS) of a long retentive timer device.	0 (FALSE), 1 (TRUE)
		C	Bit	Indicates a coil. The operation is the same as the coil (LSTC) of a long retentive timer device.	0 (FALSE), 1 (TRUE)
		N	Double word [unsigned]/bit string [32 bits]	Indicates the current value. The operation is the same as the current value (LSTN) of a long retentive timer device.	0 to 4294967295 ^{*1}
Counter	COUNTER	S	Bit	Indicates a contact. The operation is the same as the contact (CS) of a counter device.	0 (FALSE), 1 (TRUE)
		C	Bit	Indicates a coil. The operation is the same as the coil (CC) of a counter device.	0 (FALSE), 1 (TRUE)
		N	Word [unsigned]/bit string [16 bits]	Indicates the current value. The operation is the same as the current value (CN) of a counter device.	0 to 65535
Long counter	LCOUNTER	S	Bit	Indicates a contact. The operation is the same as the contact (LCS) of a long counter device.	0 (FALSE), 1 (TRUE)
		C	Bit	Indicates a coil. The operation is the same as the coil (LCC) of a long counter device.	0 (FALSE), 1 (TRUE)
		N	Double word [unsigned]/bit string [32 bits]	Indicates the current value. The operation is the same as the current value (LCN) of a long counter device.	0 to 4294967295

*1 The unit of the current value is set in CPU parameters ("Timer Limit Setting").

For details on the operation of each device, refer to the following.

☞ Page 414 DEVICES

The specification method of each member is the same as that of the structure data type. (☞ Page 468 Structures)

Generic data type (ANY type)

The generic data type is the data type of the labels which summarize several primitive data types.

Generic data types are used when multiple data types are allowed for function and function block arguments and return values.

Labels defined in generic data types can be used in any sub-level data type.

For the types of generic data types and the primitive data types, refer to the following.

 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

Definable data types and initial values

The following tables list the definable data types and initial value setting possibilities for each label class.

Global label		
Class	Definable data type	Initial value setting possibility
VAR_GLOBAL	Primitive data type, array, structure, function block	○
VAR_GLOBAL_CONSTANT	Primitive data type ^{*1*2}	×
VAR_GLOBAL_RETAIN	Primitive data type ^{*1} , array, structure	○

Local label (program block)		
Class	Definable data type	Initial value setting possibility
VAR	Primitive data type, array, structure, function block	○
VAR_CONSTANT	Primitive data type ^{*1*2}	×
VAR_RETAIN	Primitive data type ^{*1} , array, structure	○

Local label (function)		
Class	Definable data type	Initial value setting possibility
VAR	Primitive data type ^{*2} , array, structure	×
VAR_CONSTANT	Primitive data type ^{*1*2}	×
VAR_INPUT	Primitive data type ^{*1*2} , array, structure	×
VAR_OUTPUT		×
Return value		×

Local label (function block)		
Class	Definable data type	Initial value setting possibility
VAR	Primitive data type, array, structure, function block	○
VAR_CONSTANT	Primitive data type ^{*1*2}	×
VAR_RETAIN	Primitive data type ^{*1} , array, structure	○
VAR_INPUT		○
VAR_OUTPUT		○
VAR_OUTPUT_RETAIN		○
VAR_IN_OUT		×
VAR_PUBLIC		○
VAR_PUBLIC_RETAIN		○

*1 The pointer type cannot be defined.

*2 None of the timer, retentive timer, long timer, long retentive timer, counter, and long counter types can be defined.

Point 

- The initial value of the global label where the device has been assigned follows that in the device.
- The initial value of the function block follows the local label setting within the function block.
- The initial value of the structure type follows that of the structure definition.

28.5 Arrays

An array represents a consecutive aggregation of same data type labels as a single name. Primitive data types and structures can be defined as arrays.

Ex.

Array image and setting in engineering tool

- One-dimensional array (The number of elements is 4.)

- Two-dimensional array (The number of elements is 5 × 4.)

- Three-dimensional array (The number of elements is 6 × 5 × 4.)

- Settings in the engineering tool

	Label Name	Data Type	Class
1	bLabel1	Bit(0..3)	VAR
2	bLabel2	Bit(0..4,0..3)	VAR
3	bLabel3	Bit(0..5,0..4,0..3)	VAR

Defining arrays

■Array elements

When an array is defined, the number of elements, or the length of array, must be determined. For the range of the number of elements, refer to the following.

☞ Page 467 Range of the number of array elements

■Dimension number of multidimensional array

Up to three-dimensional array can be defined.

■Definition format

The following table lists definition format.

The range from the array start value to the array end value is the number of elements.

Number of array dimensions	Format	Remarks
One dimension	Array of primitive data type/structure name (array start value..array end value) [Definition example] Bit (0..15)	<ul style="list-style-type: none"> For the primitive data type: ☞ Page 461 Primitive data type For the structure name: ☞ Page 468 Structures
Two dimensions	Array of primitive data type/structure name (array start value..array end value, array start value..array end value) [Definition example] Bit (0..1, 0..15)	
Three dimensions	Array of primitive data type/structure name (array start value..array end value, array start value..array end value, array start value..array end value) [Definition example] Bit (0..2, 0..1, 0..15)	

■Initial value

One initial value can be set for a single array definition. (Different initial values cannot be set for each element.)

The same initial value is stored in all the array elements.

How to use arrays

To use an array, add an index enclosed by '[']' after each label name to identify individual labels.

An array with two or more dimensions should be represented with indexes delimited by a comma (,) in '[']'.

The following table lists the types of indexes that can be specified for arrays.

Type	Specification example	Remarks
Constant	<code>bLabel1[0]</code>	An integer can be specified.
Device	<code>bLabel1[D0]</code>	A word device, double-word device, decimal constant, or hexadecimal constant can be specified. (ST, LST, G, and HG cannot be specified.)
Label	<code>bLabel1[uLabel2]</code>	The following data types can be specified. <ul style="list-style-type: none"> Word [unsigned]/bit string [16 bits] Double word [unsigned]/bit string [32 bits] Word [signed] Double word [signed]
Expression	<code>bLabel1[5+4]</code>	Expressions can be specified only in ST language.

- The data storage location becomes dynamic by specifying a label for the array index. This enables arrays to be used in a program that executes loop processing. The following is a program example that consecutively stores "1234" in the "uLabel4" array.

- The element number of the array can be omitted in ladder diagram. If the element number is omitted, it is regarded as the start number and converted. For example, when the defined label name is "boolAry" and the data type is "Bit (0..2, 0..2)", the operation of "boolAry[0,0]" is the same as that of "boolAry".
- When a multidimensional array is specified as setting data of instructions, functions, and function blocks that use arrays, the rightmost element is regarded as a one-dimensional array.

Range of the number of array elements

The maxim number of array elements varies depending on the data type.

Data type	Setting range
Bit Word [unsigned]/bit string [16 bits] Word [signed]	1 to 2147483648
Double word [unsigned]/bit string [32 bits] Double word [signed] Single-precision real number Time	1 to 1073741824
Timer Counter Retentive timer Long counter Long retentive timer Long timer	1 to 32768
Double-precision real number	1 to 536870912
String	1 to 67108864
String [Unicode]	1 to 33554432
Structure type Function block	1 to 32768

Precautions

■When an interrupt program is used

When a label or device is specified for the array index, the operation is performed with a combination of multiple instructions. For this reason, if an interrupt occurs during operation of the label defined as an array, data inconsistency may occur producing an unintended operation result.

To prevent data inconsistency, create a program using the DI/EI instructions that disables/enables interrupt programs as shown below.

For the DI/EI instructions, refer to the following.

📖 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

■Array elements

When accessing the element defined in an array, access it within the range of the number of elements.

If a constant out of the range defined for the array index is specified, a compile error will occur.

If the array index is specified with data other than a constant, a compile error will not occur. The processing will be performed by accessing another label area or latch label area.

28.6 Structures

A structure is a data type containing one or more labels and can be used in all POUs. Members (labels) included in a structure can be defined even when their data types are different.

Creating structures

To create a structure, first define the structure, and then define members in the structure.

How to use structures

To use a structure, register a label using the defined structure as the data type. To specify each member in a structure, add the member name after the structure label name with a period '.' as a delimiter in between.

Ex.

Specifying a member in the structure

Point

- When labels are registered by defining multiple data types in a structure and used in a program, the order the data is stored after operation is not the order the data types were defined. When programs are converted using the engineering tool, labels are classified into type and data type, and then assigned to the memory (memory assignment by packing blocks).

 GX Works3 Operating Manual

- If the label of a structure is specified for an instruction that uses control data (a group of operands that determines operation of the instruction), the labels are not assigned in the order defined by packing blocks.

Structure arrays

A structure can also be used as an array.

When a structure is declared as an array, add an index enclosed by '[']' after the structure label name.

A structure array can also be specified as an argument of a function or function block.

Ex.

Specifying an element of a structure declared as an array

Data types that can be specified

The following data types can be specified as structure members.

- Primitive data type
- Pointer type
- Array
- Other structures

Types of structures

Each of the following labels is predefined as a structure.

Type	Reference
Module label	Function Block Reference for the module used
Timer type	Page 461 Data Types
Retentive timer type	
Counter type	
Long timer type	
Long retentive timer type	
Long counter type	

28.7 Label Access Setting from External Device

Set the parameters to enable external devices, such as GOT and SLMP-compatible devices, to specify global label names.

This function cannot be used in the R00CPU, R01CPU, and R02CPU.

The CPU modules with the firmware version "40" or later control global labels in the global label settings by block.

One global label setting is shown as one block as below.

Set the global label setting for each label used with GOT in units of blocks.

When "Perform the label name resolution in global label block unit" is selected in the GT Designer3 setting, the label name resolution after online change is processed efficiently. However, during online change that involves addition of blocks, label names are resolved collectively, not in units of blocks.

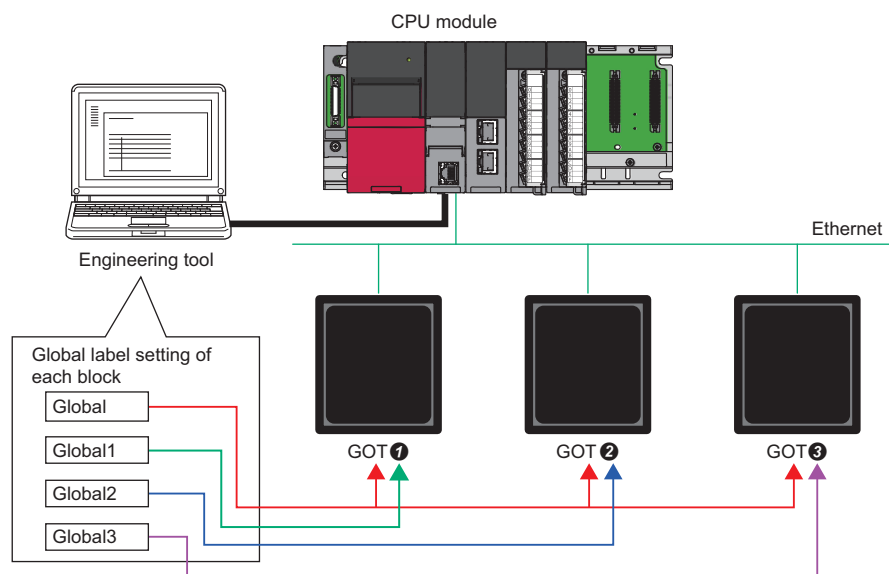

For the GT Designer3 setting, refer to the following.

📖 GT Designer3 (GOT2000) Screen Design Manual

The following shows an example of access to three GOT units.

- "Global": Global label setting that compiles labels accessed from multiple GOTs (GOT ① to GOT ③)
- "Global1": Global label setting that compiles labels accessed from GOT ①
- "Global2": Global label setting that compiles labels accessed from GOT ②
- "Global3": Global label setting that compiles labels accessed from GOT ③

In this case, because global labels in each global label setting are accessed in units of blocks, the number of times of updating label communication data from GOT decreases.

Configuration procedure

This section describes the configuration procedure to enable access by specifying the global label from external devices.

Operating procedure

"Global Label Setting" window

"Setting of File/Data Use or Not in Memory Card windows

Item	Setting
Setting of File/Data Use or Not in Memory Card	
Data for Label Communication	Not Used
Module Extended Parameter	Not Used

1. Set the label in "Global Label Setting" and select the "Access from External Device" checkbox.
2. Check the capacity of the label communication data.
3. Enable "Data for Label Communication" to use the label communication data stored in the SD memory card (or store the label communication data in the SD memory card).
 [Memory Card Parameters] ⇔ [Setting of File/Data Use or Not in Memory Card] ⇔ [Data for Label Communication]
4. Write parameters, global label setting, and global label assignment information files to the CPU module.

Point

Data storage to the data memory, not using the SD memory card, does not need the setting of procedure 3.

Label communication data storage location and operation at the time of each setting operation

This section describes the storage location for label communication data and the accessibility according to the setting of whether to use the file/data in a memory card.

○: Access from external device possible (Communication memory indicated in parentheses) ×: Access from external device not possible (Generates communication error)

Label communication data storage location	When "Enable" is set in the setting for the usage status of the file/data in a memory card	When "Disable" is set in the setting for the usage status of the file/data in a memory card
Data memory	×*1	○ (Data memory)
SD memory card	○ (SD memory card)	×
Data memory and SD memory card	○ (SD memory card)	○ (Data memory)

*1 An error occurs in the CPU module.

File operation

The label communication data can be written from an engineering tool. Reading and deleting*1 are not possible.

*1 Deleting an entire folder is possible.

28.8 Precautions

Functions with restrictions

The following functions have restrictions on the use of labels.

Item	Description
CPU parameter	<ul style="list-style-type: none"> • Trigger of an event execution type program • Refresh setting among multiple CPU modules
Module parameter	<ul style="list-style-type: none"> • Predefined protocol support function • Refresh setting of intelligent function module • Refresh setting of network module (SB/SW only) • Refresh setting of network module (other than SB/SW)
Data logging function Memory dump function Real-time monitor function	<p>Use devices because global labels nor local labels cannot be specified for these functions.*1</p> <p>Use module labels for these functions. Use devices if module labels are not used.*1</p> <p>Use devices because global labels nor local labels cannot be specified for these functions.*1</p> <p>Use devices if there is a possibility for using these functions because global labels nor local labels cannot be specified for these functions.*1*2</p> <p>In addition, if a device cannot be assigned to a global label, add the transfer instruction (copying the global label to a different device) on the scan program so that the instruction is executed every scan, and use that device.</p>

*1 Global labels can be used as devices by assigning a device.

*2 Global labels or local labels can be specified depending on the CPU module for the data logging function. For the CPU modules which support the label specification, refer to the following.

☞ Page 705 Added and Enhanced Functions

■Defining and using a global label with a device assigned

Define a global label following the procedure below, and use it when the functions having restriction on the use of labels are executed.

Since the device area in the device/label memory is used, secure the device area capacity.

1. Secure the device area to be used.

☞ [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Device/Label Memory Area Setting]

2. Define a label as a global label, and assign a device manually.

3. Use the label defined in step 2 for the functions having no restrictions on the use of labels. Use the device assigned to the label for the function having restrictions on the use of labels.

■Copying the value of a label used to a different device

If a device cannot be assigned to a global label, copy the value of the label to a different device and use the device for the function having restrictions on the use of labels.

Since the device area in the device/label memory is used, secure the device area capacity.

1. Secure the device area to be used.

☞ [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Device/Label Memory Area Setting]

2. Create a program using the label. The following is the program example for copying the data. (The data logging function uses the data in udLabel1.)

3. Use the device where the data has been transferred in step 2 for the function having restrictions on the use of labels. (In the program example in step 2, use D0.)

Point

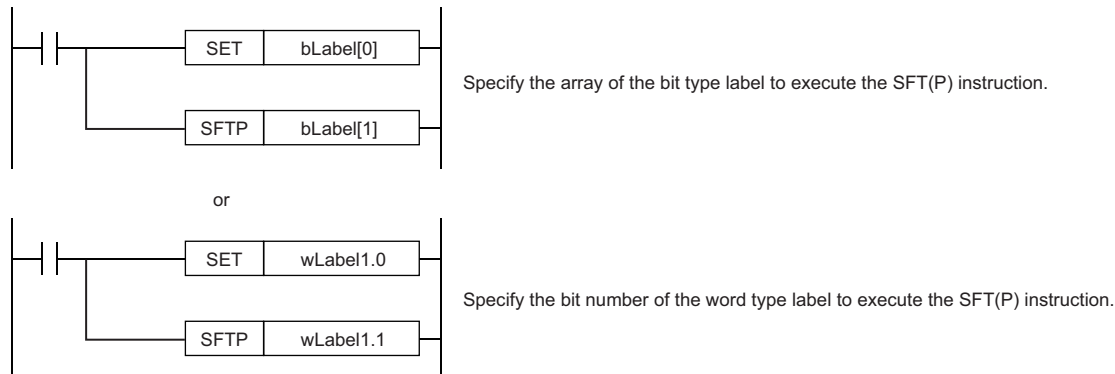

- The number of steps increases because of the transfer instruction. (The scan time increases.)
- Decide the transfer instruction position considering the timing of writing data to the label and executing the function.

Precautions for creating programs

When specifying a label as an operand used in instructions, match the data type of the label with that of the operand. In addition, when specifying a label as an operand used in instructions that control continuous data, specify the data range used in instructions within the data range of the label.

Ex.

SFT(P) instruction

Ex.

SER(P) instruction

Specify a label which has a larger data range than the search range (n) points.

Restrictions on naming labels

The following restrictions apply when naming labels.

- Start the name with a character or underline (_). Numbers cannot be used at the beginning of label names.
- Reserved words cannot be used.

For details on the reserved words, refer to the following.

GX Works3 Operating Manual

Program of external devices

When the global label which is set to the "Access from External Device" is deleted or the online change including label name change is executed, change the program of external devices that refer to the global label deleted/changed.

29 LATCH FUNCTION

29.1 Latch with Battery

The data in each device/label of the CPU module is cleared to its default value in the following cases:

- When the CPU module is powered off and on
- When the CPU module is reset
- When a power failure exceeding the allowable momentary power failure time occurs

The data in each device/label with latch setting is retained by using the battery on the CPU module unit even under the above described conditions. For this reason, control can be continued with the retained data even if the power of the CPU module is turned off or a power failure exceeding the allowable momentary power failure time occurs while the data is managed by a sequential control.

Point

The R00CPU, R01CPU, and R02CPU retain the data in each device/label with latch setting without a battery during power failure.

The other programmable controller CPUs retain the data in each device/label with latch setting without a battery during power failure by inserting a battery-less option cassette to the CPU module. (👉 Page 482 Latch with Battery-less Option Cassette)

29

Types of latch

The following types of latch are available:

- Latch (1): Data in this range can be cleared by a latch clear operation
- Latch (2): Data in this range cannot be cleared by a latch clear operation

Applicable devices and labels

This section describes the devices/labels that can be latched.

Applicable devices

The devices below can be latched. However, local devices cannot.

Device	Specification method	Applicable latch type
Internal relay (M)	Specify the latch range.	Latch (1) or Latch (2)
Link relay (B)	Specify the latch range.	Latch (1) or Latch (2)
Annunciator (F)	Specify the latch range.	Latch (1) or Latch (2)
Edge relay (V)	Specify the latch range.	Latch (1) or Latch (2)
Timer (T)/Long timer (LT)/Retentive timer (ST)/Long retentive timer (LST)	Specify the latch range.	Latch (1) or Latch (2)
Counter (C) and Long counter (LC)	Specify the latch range.	Latch (1) or Latch (2)
Data register (D)	Specify the latch range.	Latch (1) or Latch (2)
Link register (W)	Specify the latch range.	Latch (1) or Latch (2)
Latch relay (L)	Specify the number of points (latch is performed the same number of times as the specified number of points).	Latch (2) only
File register (R, ZR)	Specify the number of points (latch is performed the same number of times as the specified number of points). Specify the latch range.* ¹	Latch (2) only

*1 When "Use Common File Register in All Programs" is enabled, any of the number of points is registered within the range for Latch (2). Also, the range can be specified in "Latch (2)" of "Latch Range Setting" (values out of the specified range are cleared to 0).

Point

- When "Use File Register of Each Program" is enabled, the latch range for file registers cannot be specified (the whole range for file registers is retained).
- When the file register file which should be used is changed by the QDRSET instruction, the latch range setting for file registers is disabled. After the change, the whole range for file registers is retained regardless of the latch range setting.

Applicable labels

The labels below can be latched.

Label type	Class
Global label	VAR_GLOBAL_RETAIN
Local label of a program block	VAR_RETAIN
Local label of a function block	VAR_RETAIN
	VAR_OUTPUT_RETAIN
	VAR_PUBLIC_RETAIN

Setting latch on devices

Multiple latch ranges can be set for a device type. A total of 32 latch ranges between latch (1) and latch (2) can be set. However, the ranges of latch (1) and latch (2) must not overlap.

Setting a latch range

Set the device to latch, its range, and the latch type.

Operating procedure

"Device Setting" window

Item	Symbol	Latch (1)	Latch (2)
Input	X		
Output	Y		
Internal Relay	M	No Setting	No Setting
Link Relay	B	No Setting	No Setting
Link Special Relay	SB

Total Bit Device			

"Latch Range Setting" window

Latch (1)		Latch (2)		
No.	Device	Points (Decimal)	Start	End
1				
2				
3				
4				

1. Click "Detailed Setting" on the "Device Setting" window.

[CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Device/Label Memory Area Detailed Setting] ⇒ [Device Setting] ⇒ [Detailed Setting]

2. In the "Device Setting" window, select the type of latch for the target device. The "Latch Range Setting" window is displayed.

3. Check the tab for the latch type, select the device to set and set the latch range (Start, End).

Setting the latch interval

The user can specify the operation which should be performed at a latch interval ( Page 480 Setting the latch interval) within the effective range of the latch interval setting*1.

*1 The effective range of the latch interval means the range of devices which is enabled on the "The Valid Range of Latch Interval Setting" window. For other ranges (ranges of devices which are not enabled on the "The Valid Range of Latch Interval Setting" window), this setting is not applied, the END processing is accelerated, and latching is performed in real time.

 [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Device Latch Interval Setting]

Operating procedure

"The Valid Range of Latch Interval Setting" window

1. On the "Valid Range Confirmation of Latch Interval Setting" window, check the effective range for the latch timing setting. Specify the latch interval operation within the effective range.

"Device Latch Interval Setting" window

2. In "Latch Interval Operation Setting", select the timing of the latch processing. When "Time Setting" is selected, specify the time interval of latching.

Displayed items

Item	Description	Setting range	Default
Latch Interval Operation Setting	Sets the timing of the latch processing.	<ul style="list-style-type: none"> Per Scan Time Setting 	Time Setting
Interval Setting at Time Setting	Sets the time interval of latching (when "Time Setting" is selected).	1 to 2000ms (in units of 1ms)	10ms
Valid Range Confirmation of Latch Interval Setting	Shows the effective range for the latch interval setting.	—	—

For device latching, increasing the device range in the device setting of CPU parameters eliminates the latch processing from the END processing for the devices and enables real-time latching. For example, assume the following configuration for R04CPU: (1) 0K word is specified for the file storage area and 168K words for the device area in "Device/Label Memory Area Capacity Setting", (2) 100K points is specified for the data register (D) on the "Device Setting" window, and (3) D33151 and later are specified as the latch target devices. In this configuration, D33152 and later data registers (D) can be latched in real time as well as the devices (W, SW, and L) which are out of the effective range.

The image shows two software windows. The left window is a table of device settings:

Item	Symbol	Local Device			Latch (1)	Latch (2)
		Start	End	Points		
Link Relay	B				No Setting	No Setting
Special Link Relay	SB				No Setting	No Setting
Annunciator	F				No Setting	No Setting
Edge Relay	V				No Setting	No Setting
Timer	T				No Setting	No Setting
Long Timer	LT				No Setting	No Setting
Retentive Timer	ST				No Setting	No Setting
Long Retentive Time	LST				No Setting	No Setting
Counter	C				No Setting	No Setting
Long Counter	LC				No Setting	No Setting

Below this is a "Latch Range Setting" window with a table:

No.	Device	Points (Decimal)	Start	End
1	D	69249	33151	102399
2				
3				

The right window is "The Valid Range of Latch Interval Setting" for device D00047. It contains a table of device ranges:

Item	Symbol	Range
Input	X	0 to 2FFF
Output	Y	0 to 2FFF
Internal Relay	M	0 to 12287
Link Relay	B	0 to 1FFF
Link Special Relay	SB	0 to 1FFF
Annunciator	F	0 to 2047
Edge Relay	V	0 to 2047
Step Relay	S	
Timer (Contact, Coil)	T	0 to 1023
Retentive Timer (Contact, Coil)	ST	
Counter (Contact, Coil)	C	0 to 511
Long Counter (Contact, Coil)	LC	0 to 511
Timer (Current Value)	T	0 to 1023
Long Timer	LT	0 to 1023
Retentive Timer (Current Value)	ST	
Long Retentive Timer	LST	
Counter (Current Value)	C	0 to 511
Long Counter (Current Value)	LC	0 to 511
Data Register	D	0 to 102399
Link Register	W	0 to 1FFF
Link Special Register	SW	0 to 7FF
Latch Relay	L	0 to 5191

Legend: Enable (Yellow), Mixed (Green), Disable (Dark Green). The ranges for Data Register (D), Link Register (W), Link Special Register (SW), and Latch Relay (L) are highlighted in dark green, indicating they are disabled for latching.

(1) D33152 or later areas of the data register (D) and areas of the devices (W, SW, and L) in disabled ranges can be latched in real time.

■ Timing of the latch processing

The timing of the latch processing is determined based on the effective range of the latch interval setting and the operation setting for the specified latch interval ( Page 478 Setting the latch interval)

- When set to "Time Setting"

Latch processing is started in the END processing executed after the set time.

Point

- The more the latch points, the more it takes to complete the latch processing. If the set time elapses while latch processing is still executing, the next one is executed in the END processing that follows the completion of the previous latch processing. Set a latch interval longer than the latch processing time so that the specified time does not elapse during latch processing.
- If the latch interval is shorter than the scan time, latch timing occurs more than once within one scan. However, latch processing is executed once during the END processing.

- When set to "Per Scan"

Latch processing is executed in the END processing of every scan. This setting allows to always retain the device of the previous scan because the devices are latched at every scan. However, it may increase the scan time.

Setting latch on labels

This section describes latch setting on labels.

Operating procedure

Label edit window

"Device/Label Memory Area Detailed Setting" window

1. In the label edit window, specify "RETAIN" for label attribute.
2. There are two types of latch for labels: latch (1) and latch (2). Select one. The selected latch type is applied to labels of all latch attributes.

 [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Device/Label Memory Area Detailed Setting] ⇒ [Latch Type Setting of Latch Type Label]

Clearing latch range data

Latch range data is cleared by either of the operations below. ( Page 135 Memory Operation)

- Latch clear: Performed from the engineering tool. ( GX Works3 Operating Manual)
- Latch clear by program: Execute the RST instruction for latched devices, or clear by transferring K0 by using the MOV or FMOV instruction.

Precautions

This section describes the precautions when using the latch function.

- When using a CPU module other than the R00CPU, R01CPU, and R02CPU, the data in a device/label within the latch range is retained by using the battery on the CPU module unit. Therefore, data cannot be retained during power failure if this battery runs out. Use the battery-less option cassette for retaining the data without a battery during power failure. ( Page 482 Latch with Battery-less Option Cassette)
- If the latch range and number of device points are modified by using parameters, latch is performed on the modified latch range. However, if the value of the parameter setting the latch range is different between the previous and current operations because the CPU module was powered off and on or is reset, and the latch range has been increased, the device range in the increased portion is not latched.

29.2 Latch with Battery-less Option Cassette

Programmable controller CPUs retain the data in each device/label with latch setting without a battery during power failure by inserting a battery-less option cassette to the CPU module.

The applicable devices and labels and the latch setting are the same as the ones for the latch with the battery. (☞ Page 475 Latch with Battery)

Point

This function cannot be used for the R00CPU, R01CPU, and R02CPU because these CPUs do not need a battery-less option cassette to retain data in latch-set devices/labels during power failure.

Usage procedure

This section describes how to use the latch with the battery-less option cassette.

Setup procedure

Insert/remove a battery-less option cassette / a battery while the programmable controller is powered off.

1. Insert a battery-less option cassette to the CPU module.

Open the cassette cover (1) located on the side of the CPU module.

Hold the top and bottom of the protruded part (2) of the battery-less option cassette (with the notched edge facing to the right). Insert the cassette straight to the connector, taking care not to tilt it. Check the connection for looseness.

Close the cassette cover (1).

2. Remove the battery from the CPU module. When disconnecting the connector, pull out the connector part so as not to damage the battery cable.
3. Mount the CPU module on the base unit.
4. Power on the programmable controller.
5. Monitor SM624 (Battery-less option cassette insertion flag) and check that it is on.

Point

Insertion of the battery-less option cassette can be checked from the following items in the engineering tool.

- "Product Information List" in "System Monitor"
- "Module Information List" in "Module Diagnostics"

6. Set "Mounted" for "Battery-less Option Cassette Setting" in "CPU Parameter" with the engineering tool.

☞ [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Device/Label Memory Area Setting] ⇒ [Cassette Setting] ⇒ [Battery-less Option Cassette Setting]

7. Set "Battery Error" of "CPU Parameter" as "Not Detected".

☞ [CPU Parameter] ⇒ [RAS Setting] ⇒ [Error Detections Setting] ⇒ [Battery Error]

8. Set "Time Setting" in "Module Parameter".

☞ [Module Parameter] ⇒ [Application Settings] ⇒ [Time Setting]

The clock data is initialized when the battery-less option cassette is initialized. Clock data cannot be retained during power failure when no battery is mounted. Therefore, set "Time Setting (SNTP Client)". (📖 MELSEC iQ-R Ethernet User's Manual (Application))

9. Write the set parameter to the CPU module, and then power off and on, or reset the CPU module.
10. When the uninitialized error is displayed, use the engineering tool to initialize the battery-less option cassette. After the initialization, power off and on, or reset the CPU module.

 [Online] ⇒ [CPU Memory Operation]

Select "Device/Label Memory" on the "Memory Management" window, and click the [Initialization] button.

Point

If the battery-less option cassette is initialized during execution of the latch with the battery-less option cassette, only the files in the file storage area in the device/label memory are deleted.

11. Monitor SM625 (Battery-less function execution flag) and check that it is on.

Clearing procedure

Remove/insert a battery-less option cassette / a battery while the programmable controller is powered off.

1. Read the data on the device/label memory from the CPU module, and save it in advance using the engineering tool in advance. (When the battery-less option cassette is removed, all of the data on the device/label memory are erased.)
2. Power off the programmable controller.
3. Remove the CPU module from the base unit.
4. Remove the battery-less option cassette from the CPU module.

Open the cassette cover (1) located on the side of the CPU module.

Hold the top and bottom of protruded part (2) of the battery-less option cassette and pull it straight, taking care not to tilt it.

Close the cassette cover (1).

5. Install a battery to the CPU module.
6. Mount the CPU module on the base unit.
7. Power on the programmable controller.
8. Set "Not Mounted" for "Battery-less Option Cassette Setting" in "CPU Parameter" with the engineering tool.

 [CPU Parameter] ⇒ [Memory/Device Setting] ⇒ [Device/Label Memory Area Setting] ⇒ [Cassette Setting] ⇒ [Battery-less Option Cassette Setting]

9. Set "Battery Error" of "CPU Parameter" to "Detect".

 [CPU Parameter] ⇒ [RAS Setting] ⇒ [Error Detections Setting] ⇒ [Battery Error]

10. Write the CPU parameter to the CPU module, and then power off and on, or reset the CPU module.

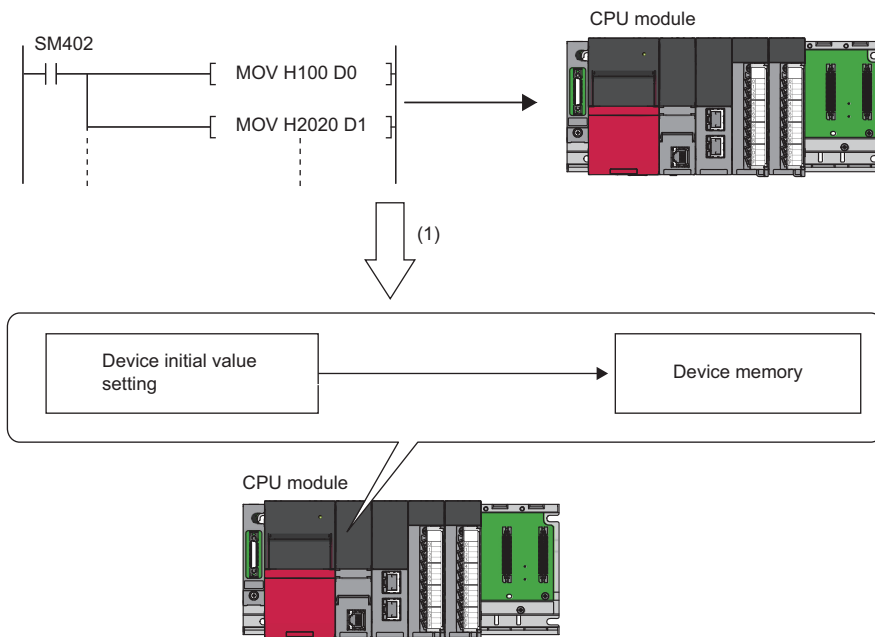

Precautions

This section describes precautions on using the latch with the battery-less option cassette.

- When a battery-less option cassette is inserted, the current consumption of the CPU module increases by 0.15A at maximum.
- Insert or remove a battery-less option cassette while the programmable controller is powered off. If it is inserted or removed while the programmable controller is powered on, a stop error occurs in the CPU module and data may not be retained.
- Clock data cannot be retained during power failure when no battery is mounted. Therefore, it is recommended to set "Time Setting (SNTP Client)" in the module parameter. (📖 MELSEC iQ-R Ethernet User's Manual (Application))
- The scan time during the execution of the latch with a battery-less option cassette is longer than the scan time of when the latch with a battery-less option cassette is not executed. As for the instructions specifying the data retained during power failure such as the file register for the arguments, the instruction processing time will be longer. (👉 Page 649 Processing Time, 📖 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks))
- When the latch with a battery-less option cassette is canceled, the data retained during power failure by using the battery-less option cassette with latch setting is not taken over.
- The extended SRAM cassette and battery-less option cassette cannot be used together.

30 DEVICE/LABEL INITIAL VALUE SETTINGS

This function sets the initial values of devices and labels used in the program directly (not via the program) to the devices, labels, and buffer memory areas of intelligent function modules.

(1) If initial device values are used, a program to set data to the devices becomes unnecessary.

30.1 Setting Initial Device/Label Values

This section describes the settings required to use initial device/label values.

Setting initial device values

This section describes the settings of initial device values.

Setting procedure

The procedure for using initial device values is as follows.

1. First, the user must create an initial device value file. To set initial values to a local device, create an initial device value file with the same name as the program which sets these values, and specify the range of the values. To set initial values to a global device, create an initial device value file (with any name) which sets these initial values, and specify the range of the values.
2. On the device memory, set up initial device value data within the range specified in the initial device value file.
( GX Works3 Operating Manual)
3. In the "Device Memory Register Diversion", select the device memory which was set up in Step 2. Setting "Device Memory Register Diversion" enables data set up on the device memory to be used as initial device values for the device which is specified in the initial device value file.
( GX Works3 Operating Manual)
4. Configure CPU parameters. ( Page 486 Initial value setting)
5. Write the set initial device value file and the CPU parameters to the CPU module.
( GX Works3 Operating Manual)
6. The data in the specified initial device value file is automatically set to the specified device or buffer memory of the intelligent function module when the CPU module is powered off and on, reset, or the status changes from STOP to RUN.

Initial value setting

Configure the initial value setting.

 [CPU Parameter] ⇒ [File Setting] ⇒ [Initial Value Setting]

Window

Item	Setting
Initial Value Setting	
Target Memory	Data Memory
Setting of Device Initial Value Use Or Not	Not Used
Global Device Initial Value File Name	

Displayed items

Item	Description	Setting range	Default
Target Memory	Sets the storage memory for the initial device value file, initial global label value file, and initial local label value file.	<ul style="list-style-type: none">• Data Memory• Memory Card^{*2}	Data Memory
Setting of Device Initial Value Use Or Not	Selects whether or not to use initial device values.	<ul style="list-style-type: none">• Not Used• Use	Not Used
Global Device Initial Value File Name	Sets the name of the initial global device value file. ^{*1}	60 characters or less	—

*1 If nothing is specified, initial global device values are not applied.

*2 It cannot be set in the R00CPU.

Applicable range of initial device value files

The applicable range of initial device value files is as follows.

Target device	Applicable range
Global device	Initial device values set up in the initial value file of the global device are used.
Buffer memory	
Local device	Initial device values set up in the initial value file of the local device (Program Name.DID) are used.
File register	<ul style="list-style-type: none">• When "Use File Register of Each Program" is set, initial device values set up in the initial value file of the local device (Program Name.DID) are used. If there is a program which doesn't have its file register (a file register with the same name as the program), it is not assumed as an error but the initial device values are not used.• When a common file register is used across all programs, initial device values set up in the initial value file of the global device are used.

Number of initial device value settings and maximum range of one range

Up to 1000 ranges can be set in one initial device value file. Up to 8000 data points can be set in one range.

Setting initial label values

This section describes the settings of initial label values. For labels assigned to a device, the initial value setting follows the initial device value.

30

Setting procedure

The procedure for using initial label values is as follows.

1. Set up initial label values using a global label and local label.
2. Configure CPU parameters ( Page 486 Initial value setting).
3. The CPU parameters, programs, initial global label value file, and initial local label value file are written to the CPU module.
( GX Works3 Operating Manual)
4. The data in the specified initial global label value file and initial local label value file is automatically set to the specified label when the CPU module is powered off and on, reset, or the status changes from STOP to RUN.

30.2 Applicable Devices/Labels

For details on devices/labels to which initial device/label values can be set, refer to the following.

 GX Works3 Operating Manual

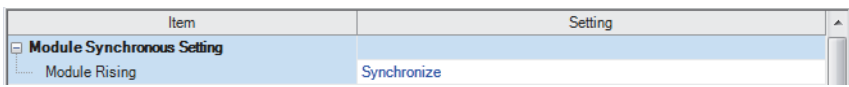

30.3 Precautions

This section describes the precautions when using the initial device/label value setting.

- When initial device values or initial label values are overlapped with the latch range, these initial values take precedence over the latch range. Therefore, even if a device or label is already latched, its values are changed to the specified initial values.
- The initial device value and label initial value are also set when the CPU module status changes from STOP to RUN. Therefore, the initial device value and initial label value cannot be used for areas that are not desirable to be set when the CPU module status changes from STOP to RUN (because they should be set when the power is turned off and on, and changed by the program). By using the MOV instruction, for example, create a program to set an initial value to the specified device or label. In addition, if it is a module access device, make sure to write the initial value in the buffer memory by using the TO instruction.
- To make the CPU module hold a device only when its values fall into the range of device initial setting (such as module access device and link direct device), the start-up time between the device and the CPU module must be synchronized using the CPU parameter, "Module Synchronous Setting".

 [CPU Parameter] ⇒ [Operation Related Setting] ⇒ [Module Synchronous Setting]

Window

Item	Setting
Module Synchronous Setting	
Module Rising	Synchronize

- When "Setting of Device Initial Value Use Or Not" is to be set to "Use", write the specified initial global device value file to the CPU module. If the specified initial global device value file does not exist, an error occurs. If the other file (initial local device value file, initial global label value file, or initial local label value file) does not exist or if the name of the initial global device value file is not specified, an initial value is not used and an error does not occur.
- When using the initial global label value file or initial local label value file while the target memory is set to "Memory Card", write the global label setting file, program file, and FB file at the same time. Then, if the total capacity of all the files is equal to or less than the capacity of the data memory, set all the files for boot operation. If the total capacity of all the files exceeds the capacity of the data memory, do not set either the initial global label value file or initial local label value file for boot operation. If only the initial device value file is used, it can be written separately from the other files. ( Page 191 BOOT OPERATION)

31 CONSTANTS

This section describes constants.

31.1 Decimal Constant (K)

Use this type of constants when specifying decimal data in a program. Specify the decimal constant using K□ character (e.g. K1234). The specification range depends on the argument data type of the instruction using the decimal constant as shown in the following table:

Argument data type of the instruction		Specification range for decimal constant
Data size	Data type name	
16 bit	Word (signed)	K-32768 to K32767
	Word (unsigned)/bit string (16 bit)	K0 to K65535
	16-bit data	K-32768 to K65535
32 bit	Double word (signed)	K-2147483648 to K2147483647
	Double word (unsigned)/bit string (32 bit)	K0 to K4294967295
	32-bit data	K-2147483648 to K4294967295

31.2 Hexadecimal Constant (H)

Use this type of constants when specifying hexadecimal data in a program. Specify the hexadecimal constant using H□ character (e.g. H1234). To specify data in BCD, specify each digit of hexadecimal value with numerical characters 0 to 9. The specification range depends on the argument data type of the instruction using the hexadecimal constant. The range is H0 to HFFFF for 16-bit data size, and H0 to HFFFFFFFF for 32-bit data size.

31.3 Real Constant (E)

Use this type of constants when specifying a real number in a program. There are two types of real numbers: single-precision real number and double-precision real number. Specify it using E□ character. (e.g. E1.234).

Setting range for real numbers

The setting ranges are different between the single-precision real number and double-precision real number.

Specification range for single-precision real numbers

The following is the specification range for single-precision real numbers.

$$-2^{128} < \text{device} \leq -2^{-126}, 0, 2^{-126} \leq \text{device} < 2^{128}$$

(E-3.40282347+38 to E-1.17549435-38, 0, E1.17549435-38 to E3.40282347+38)

Specification range for double-precision real number

The following is the specification range for single-precision real numbers.

$$-2^{1024} < \text{device} \leq -2^{-1022}, 0, 2^{-1022} \leq \text{device} < 2^{1024}$$

(E-1.7976931348623157+308 to E-2.2250738585072014-308, 0, E2.2250738585072014-308 to E1.7976931348623157+308)

Point

For the number of significant digits and input range of real number data input by the engineering tool, refer to the following.

 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

Processing when operation is in progress

This section describes the processing when operation is in progress.

When overflow and/or underflow occurs:

If an overflow and/or underflow occurs when the operation is in progress, the following process is performed:

- When overflow occurs: An error is returned.
- When underflow occurs: 0 is returned (no error occurs).

When a special value is input:

When a special value^{*1} is used for the input data operation, an error is returned. Note that when "-0" is generated during the operation is in progress, it is handled as "+0", and therefore "-0" is not returned as an operation result.

*1 The special values include -0, denormalized number, nonnumeric number, and $\pm\infty$.

31.4 Character String Constant

The character string can be specified by enclosing it with single quotation marks (') or double quotation marks ("). (Example: "ABCDE") Note that the NULL character (00H) becomes the termination character.

Point

For details on character string data, refer to the following.

 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

31.5 Notation of Constants

This section describes the notation of constants.

Type	Notation	Example	Applicable data type	
Boolean value	Set "FALSE" or "TRUE".	TRUE, FALSE	Bit	
	Add "K" or "H" before "0" or "1".	K0, K1, H0, H1		
Integral	Binary	Add "2#" before a binary number.	<ul style="list-style-type: none"> • Word [unsigned]/bit string [16 bits] • Double word [unsigned]/bit string [32 bits] • Word [signed] • Double word [signed] 	
	Octal	Add "8#" before an octal number.		2#0010, 2#01101010, 2#1111_1111
	Decimal	Directly enter a signed or unsigned decimal number.		8#0, 8#337, 8#1_1
		Add "K" before a signed or unsigned decimal number.		123, +123, -123, 12_3
	Hexadecimal	Add "16#" before a hexadecimal number.		K123, K-123
Add "H" before a hexadecimal number.		16#FF, 16#1_1		
Real number	Decimal notation	Directly enter a signed or unsigned real decimal number with a decimal point.	<ul style="list-style-type: none"> • Single-precision real number • Double-precision real number 	
		Add "E" before a signed or unsigned real decimal number with a decimal point.		2.34, +2.34, -2.34, 3.14_15
	Exponential notation	Add "E" and a signed or unsigned exponent (decimal) at the end of the real number.		E2.34, E-2.34
		Add a signed exponent (decimal) at the end of the real number with "E".		1.0E6, 1.0E-6
String	String	Enclose a string in single quotation marks (' ').	String	
	String [Unicode]	Enclose a string in double quotation marks (" ").	String [Unicode]	
Time	Add "T#" or "TIME#" at the beginning. (📄 Page 492 Notation of time)	T#1h, T#1d2h3m4s5ms, TIME#1h	Time	

Point 

In the notation of binary, octal, decimal, hexadecimal, and real numbers, the numbers can be separated using an underscore (_) to make programs easy to see. For example, the double word [unsigned] in the notation of binary is as follows.

```
2#1100_1100_1100_1100
```

The separations by underscores (_) are ignored in program processing.

Notation of time

In the notation of time, add "T#" or "TIME#" at the beginning of the value specified in units of time; d (day), h (hour), m (minute), s (second), and ms (millisecond). The following table lists the effective range for each unit of time.

Item	Effective range
d (day)	0 to 24
h (hour)	0 to 23
m (minute)	0 to 59
s (second)	0 to 59
ms (millisecond)	0 to 999

- Each unit of time can be omitted sequentially from the beginning to the end or in reverse order.
T#31m23s, T#31m0s648ms
- A sign can be added only before the first unit of time.
T#-31m23s
- An unsigned real decimal number with a decimal point can be used for the last unit of time. The values after the decimal point of ms (millisecond) are rounded down.
T#-24d20h31m23s648.123 ms (The time is treated as T#-24d20h31m23s648 ms.)
T#1.2345 ms (The time is treated as T#1 ms.)
- Only for the first unit of time other than d, the following values within the effective range can be input.
h: 0 to 596
m: 0 to 35791
s: 0 to 2147483
ms: 0 to 2147483647

Special character (escape sequence)

"\$" is used as an escape sequence in a string. The following characters can be input as escape sequences with "\$".

Symbol used in a string or printer code	Escape sequence
\$	\$\$
'	\$'
"	\$"
Line feed	\$L or \$l
Line break	\$N or \$n
Page feed	\$P or \$p
Return	\$R or \$r
Tab	\$T or \$t
Two hexadecimal digits and characters that correspond to the ASCII code	Two hexadecimal digits following \$

If the two hexadecimal digits following "\$" do not correspond to the ASCII code, a conversion error occurs.

This part consists of the following chapters.

32 TROUBLESHOOTING PROCEDURE

33 TROUBLESHOOTING BY SYMPTOM

34 ERROR CODES

35 EVENT LIST

32 TROUBLESHOOTING PROCEDURE

This chapter describes errors that may occur during system operation, error causes, and actions to be taken. For the troubleshooting specific to each module, refer to the manual for the module used.

Point

Saving the program and devices at the time of an error helps to analyze the error cause.

For reading data from the programmable controller, refer to the following.

 GX Works3 Operating Manual

When the system has any trouble, perform troubleshooting in the following order.

- 1.** Check the LED status of the power supply module.
( MELSEC iQ-R Module Configuration Manual)
- 2.** Check the LED status of the CPU module. ( Page 495 LED status of the CPU module)
- 3.** Check the LED status of each I/O module and intelligent function module. ( User's Manual (Application) for the module used)
- 4.** Connect an engineering tool, and execute the system monitor function. The error module can be identified. ( Page 496 System monitor)
- 5.** Select the error module, and execute the module diagnostics function. The error cause and the action to be taken can be displayed. ( Page 496 Module diagnostics)
- 6.** If the error cause cannot be identified by the module diagnostics, check the executed operations and detected error logs on the event history window. ( Page 497 Event history)
- 7.** If the error cause cannot be identified in steps 1 to 6, perform troubleshooting by symptom. ( User's Manual (Application) for the module used)

32.1 Troubleshooting with LED Indicators

Check the LED status of each module as primary diagnostics.

LED status of the CPU module

The following table lists the check points on the LED status of the CPU module.

The error status can be checked visually using the READY LED and ERROR LED.

LED indicator		Error status	Program execution status	Description	Action
READY	ERROR				
On	Off	No error	Continued	Normal operation	—
	On	Minor error		A minor error or warning has been detected. Program execution and data communications with network stations are continued.	Identify the error cause using the engineering tool, and take an action.
	Flashing	Moderate error	Stopped	A programming error, parameter setting error, or temporal noise has been detected. Program execution and data communications with network stations are stopped.	Identify the error cause using the engineering tool, and take an action.
Off	On/ flashing	Major error		A hardware failure has been detected. No operation cannot be performed.	Perform troubleshooting for the error module. If the problem still exists after troubleshooting, replace the error module. (📖 Page 498 When the READY LED of the CPU Module Turns Off)
		Hardware failure		A hardware failure has been detected. No operation cannot be performed.	Check that the power is supplied to the system. If the power is supplied properly, the possible cause is a hardware failure. Perform troubleshooting for the error module. If the problem still exists after troubleshooting, replace the error module. (📖 Page 498 When the READY LED of the CPU Module Turns Off)
	No error	Power is not supplied or power went out.		—	
Flashing	Off	No error		The READY LED is flashing every 2s: Initial processing is being performed.	—

Point 

The LED status can also be checked on the module diagnostics window using the engineering tool. (📖 GX Works3 Operating Manual)

32.2 Troubleshooting Using the Engineering Tool

Check the error or history using the engineering tool, and identify the error cause. More detailed information on the error as well as the error cause and action to be taken can be checked by using the engineering tool.

The engineering tool has the following functions for troubleshooting.

Function	Description
System monitor	Displays the module configuration, and detailed information and error status of each module. (Page 496 System monitor)
Module diagnostics	Diagnoses the module. (The current error and its details can be checked.) (Page 496 Module diagnostics)
Event history	Displays the event information collected by the CPU module, such as errors occurred in each module, executed operations, and network errors. (Page 497 Event history)

For details on each function, refer to the following.

 GX Works3 Operating Manual

System monitor

This function displays the module configuration, and detailed information and error status of each module.

For the error module identified, the module diagnostics function can be executed from this window.

 [Diagnostics] ⇒ [System Monitor]

Point

When the RnENCPU is used, information of the RnENCPU (CPU part) and RnENCPU (network part) is displayed individually. When an error occurs, the module diagnostics function can be executed for each module.

Module diagnostics

This function diagnoses the module. (The current error and its details can be checked.)

Information required for troubleshooting, such as the current error, details and cause of the error, and action to be taken, are displayed. The incorrect parameter setting and program error location can also be identified by selecting the error and clicking the [Error Jump] button.

On the [Module Information List] tab, the LED status and the switch status of the target module can be checked.

 [Diagnostics] ⇒ [System Monitor] ⇒ Double-click the error module.

Restriction

In a multiple CPU system, when the I/O assignment setting in a system parameter differs from the configuration of the modules actually mounted, correct information may not be displayed on "Module Information List".

Event history

This function displays the event information, such as errors occurred in the module(s) mounted, executed operations, and network errors.

Since information collected before the CPU module is powered off or reset can also be displayed, the error cause can be identified based on the past operations and errors.

The displayed information can also be saved in CSV file format.

 [Diagnostics] ⇒ [System Monitor] ⇒ [Event History] button

Point

Use this function for the following purposes:

- To check the error status and identify the cause of error occurred in machinery or equipment
 - To check when and how the program and parameters of the programmable controller have been changed
 - To check for unauthorized access
-

For details on this function and collected information, refer to the following.

 Page 177 Event History Function

33 TROUBLESHOOTING BY SYMPTOM

If any function of the CPU module does not operate as designed, perform troubleshooting by checking the following items. If the ERROR LED or USER LED is on or flashing, eliminate the error cause using the engineering tool.

33.1 When the POWER LED of the Power Supply Module Turns Off

For troubleshooting, refer to the following:

 MELSEC iQ-R Module Configuration Manual

33.2 When the READY LED of the CPU Module Turns Off

Check the following:

Check item	Action
Check if the CPU module is mounted on the main base unit properly.	Remove the CPU module from the main base unit, and mount it back on the main base unit.
Check if the READY LED of another module is on.	If the READY LED of another module is on, the CPU module detected a major error. Replace the CPU module.
Check if the READY LED turns on when the power supply module is replaced and the power is restored to the system. (Check the LED status after the power supply module on the extension base unit is also replaced.)	If the READY LED turns on, an error has occurred in the power supply module(s) before the replacement. Replace the power supply module.
Check if the READY LED does not turn on even after the power supply module is replaced and the power is restored to the system. (Check the LED status after the power supply module on the extension base unit is also replaced.)	If the READY LED does not turn on, an error has occurred in a module other than the power supply module. Repeatedly supply power to the system, returning the modules back to the system one by one. The last module mounted immediately before the READY LED turned off has been failed. Replace the module.
Check if the system was powered on immediately after power-off.	Wait for five seconds or longer after power-off and power on the system again.

If the READY LED of the CPU module does not turn on even after the items above are checked and the actions are taken, the possible cause is a hardware failure of the power supply module. Please consult your local Mitsubishi representative.

33.3 When the Specific Extension Base Unit Cannot Be Recognized

For troubleshooting, refer to the following:

📖 MELSEC iQ-R Module Configuration Manual

33.4 When the Specific Q Series Extension Base Unit Cannot Be Recognized

For troubleshooting, refer to the following:

📖 MELSEC iQ-R Module Configuration Manual

33.5 When Data Cannot Be Written to the Programmable Controller

Check the following:

Check item	Action
Check if password is not registered.	Authenticate a password using the engineering tool.
Check if the SD memory card is write-protected while the SD memory card is being targeted for writing.	Clear the write-protect for the SD memory card.
When the target of the write is an SD memory card, check that the SD memory card has been formatted.	Carry out formatting for the SD memory card.
Check if the data to be written exceeds the capacity of CPU built-in memory or SD memory card.	Check the CPU built-in memory or SD memory card for their free space.

If data cannot be written to the programmable controller even after the items above are checked and the actions are taken, the possible cause is a hardware failure. Please consult your local Mitsubishi representative.

33.6 When Data Cannot Be Read from the Programmable Controller

Check the following:

Check item	Action
Check if password is not registered.	Authenticate a password using the engineering tool.
Check if the target memory to be read is correctly specified.	Check the read target memory (CPU built-in memory, SD memory card, or intelligent function module).
Check if program restoration information has not been written.	When program restoration information has not been written, data cannot be read from the programmable controller. When writing data to the programmable controller, write program restoration information.

If data cannot be read from the programmable controller even after the items above are checked and the actions are taken, the possible cause is a hardware failure. Please consult your local Mitsubishi representative.

33.7 When the Operating Status of the CPU Module Cannot Be Changed

Check the following:

Check item	Action
Check if a stop error has been occurred.	Check the error cause using an engineering tool and eliminate the error cause.
Check if the online change processing is left suspended.	Execute the online change again.

If the CPU module operating status cannot be changed even after the items above are checked and the actions are taken, the possible cause is a hardware failure. Please consult your local Mitsubishi representative.

33.8 When the Ethernet Function Cannot Be Used

For troubleshooting, refer to the following:

 MELSEC iQ-R Ethernet User's Manual (Application)

33.9 When the CC-Link IE Field Network Basic Function Cannot Be Used

For troubleshooting, refer to the following:

 CC-Link IE Field Network Basic Reference Manual

33.10 When the CPU Module Database Access Function Cannot Be Used

When the data source name cannot be set

Check the following:

Check item	Action
Check if use prohibited characters are used in "Data Source Name".	Set "Data Source Name" without using prohibited characters.
Check if the number of use prohibited characters in "Data Source Name" exceeds the range of use.	Set "Data Source Name" with the number of characters within the range of use.

When the connection test fails

When the connection test fails at the data source setting, check the following:

Check item	Action
Check if the CPU module supports the CPU module database access function.	Check that the CPU module supports the CPU module database access function. (☞ Page 705 Added and Enhanced Functions)
Check if the IP address of the CPU module set in "Server" is correct.	Set the correct IP address of the CPU module in "Server". (☞ Page 330 Adding a database to the ODBC data source)
Check if 61461 is set in "Port".	Set 61461 in "Port". (☞ Page 330 Adding a database to the ODBC data source)
Check if the absolute path of the database of the CPU module set in "Database" is correct.	Set the correct absolute path of the database in "Database". (☞ Page 330 Adding a database to the ODBC data source)

When the ODBC server of the CPU module cannot be connected

When the ODBC server of the CPU module cannot be connected from the personal computer, check the following:

Check item	Action
Check if "invalid login/password" is displayed in the error message on the personal computer.	Check that the login name and password that are set in the module parameter of the engineering tool match those that are input to connect to the server. (☞ Page 328 Built-in database access setting)
Check if "cannot open connection to server; open init timeout" is displayed in the error message on the personal computer.	Check that the correct data source is selected to connect to the database of the CPU module.
Check if "Communication link failure" is displayed in the error message on the personal computer.	The maximum number of concurrently connectable databases (number of connections) is used (☞ Page 318 Database specifications) End unused applications connected with the database of the CPU module and connect with the database again.

When the connection is disconnected

When the connection of the personal computer and the CPU module to the ODBC server is disconnected, check the following:

Check item	Action
Check if the built-in database access timer setting in the module parameter of the engineering tool is too short.	Set the longer time for the built-in database access timer setting. (☞ Page 328 Built-in database access setting)

34 ERROR CODES

The CPU module stores the corresponding error code in the special register (SD) upon detection of an error by the self-diagnostic function. If an error occurs when the data communications are requested from the engineering tool, intelligent function module, or network system connected, the CPU module returns the corresponding error code to the request source. The error details and cause can be identified by checking the error code. The error code can be checked in either of the following ways:

- Module diagnostics of the engineering tool (📖 GX Works3 Operating Manual)
- Special register (SD0 (Latest self-diagnostics error code), SD10 to SD25 (Self-diagnostic error number)) (📄 Page 604 List of Special Register Areas)

This section describes errors that may occur in the CPU module and actions to be taken for the errors.

34.1 Error Code System

All error codes are given in hexadecimal format (4 digits) (16-bit unsigned integer). The type of error includes the error, which is detected through the self-diagnostic function of each module, and the common error, which is detected during data communications between modules. The following table lists the error detection type and the error code ranges.

Error detection type		Range	Description
By the self-diagnostic function of each module	Minor error	1000H to 1FFFFH	Error code specific to each module, such as self-diagnostic errors
	Moderate error	2000H to 3BFFFH	
	Major error	3C00H to 3FFFFH	
During data communications between modules		4000H to 4FFFFH	Error in the CPU module
		6F00H to 6FFFFH	Error in the redundant function module
		7000H to 7FFFFH	Error in the serial communication module
		B000H to BFFFFH	Error in the CC-Link module
		C000H to CFBFH	Error in the Ethernet-equipped module
		CFC0H to CFFFFH	Error in CC-Link IE Field Network Basic
		D000H to DFFFFH	Error in the CC-Link IE Field Network module or CC-Link IE TSN master/local module
		E000H to EFFFFH	Error in the CC-Link IE Controller Network module
		F000H to FFFFFH	Error in the MELSECNET/H network module or MELSECNET/10 network module

Detailed information

Upon detection of an error by the self-diagnostic function, the detailed information of the error cause is stored together with an error code. The detailed information can be checked using the engineering tool. The following detailed information is added to each error code. (Up to two types of information are stored together with an each error code. The types differ depending on the error code.) Detailed information 1 and 2 for the latest error code can also be checked in the special register (SD). ( Page 604 List of Special Register Areas)

Detailed information	Item	Description
Detailed information 1	Error location information ^{*1}	Information on the location in a program, such as step numbers
	Drive/file information	Information on the corresponding drive name and file name
	Parameter information	Information on the parameter, such as parameter storage location and parameter type
	System configuration information	Information on the system configuration, such as I/O numbers and power supply numbers
	Frequency information	Information on the frequency, such as the number of writes to memory
	Time information	Information on time
	Failure information	Information on failures
Detailed information 2	Drive/file information	Information on the corresponding drive name and file name
	Annunciator information	Information on the annunciator areas
	Parameter information	Information on the parameter, such as parameter storage location and parameter type
	System configuration information	Information on the system configuration, such as I/O numbers and power supply numbers
	Program error information	Program error code

*1 The step number which is displayed in the error location information, is the one that is counted from the start of the file. It may differ from the step number of the program which is displayed in error jump of the engineering tool.

34.2 Operation When an Error Occurs

There are two types of errors: continuation errors and stop errors.

Stop error

If a stop error occurs, the CPU module stops its operation and the operating status changes to STOP. Modules can communicate with the CPU module even after the stop error occurs in the CPU module. The external output of each module is controlled in accordance with the output mode setting in error. (☞ Page 169 CPU module operation upon error detection setting) Besides, if the stop error occurs when the multiple CPU system is configured, the stop error target CPU module (all CPU modules or only the corresponding CPU module) can be set in parameter. (☞ Page 374 Stop setting)

Continuation error

If a continuation error occurs, the CPU module continues its operation. (The operating status remains the same.)

34.3 How to Clear Errors

Continuation errors can be cleared. For the error clear method, refer to the following.

☞ Page 174 Error Clear

34.4 List of Error Codes

Codes of errors detected by the self-diagnostic function (1000H to 3FFFH)

The following table lists error codes detected by the self-diagnostic function.

Error code	Error name	Error details and cause	Stop/continue	Action	Detailed information	Diagnostic timing
1000H	Power shutoff	<ul style="list-style-type: none"> A momentary power failure has occurred. The power supply has been shut off. 	Continue	<ul style="list-style-type: none"> Check the power supply status. 	—	Always
1010H	Power shutoff (either of the redundant power supply modules)	<ul style="list-style-type: none"> Power has been shut off or the power supply voltage has dropped in either of the redundant power supply modules on the redundant power supply base unit. Or, only one redundant power supply module is mounted. 	Continue	<ul style="list-style-type: none"> Check the power supplied to the power supply modules on the base unit. Check that two power supply modules are mounted on the base unit. If the same error code is displayed again, the possible cause is a hardware failure of the power supply module. Please consult your local Mitsubishi representative. When not detecting errors, change the error detection setting in the CPU parameter. 	System configuration information	Always
1020H	Failure (either of the redundant power supply modules)	<ul style="list-style-type: none"> A failure has been detected in either of the redundant power supply modules on the redundant power supply base unit. 	Continue	<ul style="list-style-type: none"> The possible cause is a hardware failure of the power supply module. Please consult your local Mitsubishi representative. When not detecting errors, change the error detection setting in the CPU parameter. 	System configuration information	Always
1030H	Invalid power supply module	<ul style="list-style-type: none"> An invalid power supply module has been mounted on the redundant power supply base unit. 	Continue	<ul style="list-style-type: none"> Mount only applicable power supply modules. If the same error code is displayed again, the possible cause is a hardware failure of the power supply module. Please consult your local Mitsubishi representative. 	System configuration information	Always

Error code	Error name	Error details and cause	Stop/continue	Action	Detailed information	Diagnostic timing
1031H	Power supply module configuration error	<ul style="list-style-type: none"> A power supply module other than the redundant power supply module has been mounted on the redundant power supply base unit. 	Continue	<ul style="list-style-type: none"> Mount only applicable power supply modules. If the same error code is displayed again, the possible cause is a hardware failure of the power supply module. Please consult your local Mitsubishi representative. 	System configuration information	Always
1080H	ROM write count error	<ul style="list-style-type: none"> The number of writes to the flash ROM (data memory, program memory, and system memory (memory used by the system when the CPU module executes its function)) exceeded 100000 times. Files are frequently written by the event history function. (Number of writes > 100000)	Continue	<ul style="list-style-type: none"> Replace the CPU module. 	Frequency information	At power-on, at RESET, at write

Stop	<ul style="list-style-type: none"> Check the firmware version of the CPU module, and replace the CPU module with the one supporting the use of redundant extension base units. Disconnect the unsupported base unit. If all the base units are supported, the possible cause is a hardware failure of the CPU module or base unit. Please consult your local Mitsubishi representative. Disconnect the GOT bus-connected to the Q series extension base unit. 	System configuration information	At power-on, at RESET
2080H	Inter-module synchronization configuration error	<ul style="list-style-type: none"> An inter-module synchronization signal error has been detected. 	Stop	<ul style="list-style-type: none"> The possible cause is a hardware failure of the CPU module, base unit, or module (I/O module or intelligent function module) connected. Please consult your local Mitsubishi representative. 	System configuration information	At power-on, at RESET
2100H	Memory error	<ul style="list-style-type: none"> No extended SRAM cassette is inserted. The capacity of extended SRAM cassette set in does not match "Extended SRAM Cassette Setting" in the CPU parameter with the actual capacity of the cassette inserted. 	Stop	<ul style="list-style-type: none"> Check that an extended SRAM cassette is inserted. Or, correct the capacity set in "Extended SRAM Cassette Setting" in the CPU parameter so that it matches with the actual capacity of the cassette inserted. If the same error code is displayed again, the possible cause is a hardware failure of the CPU module or extended SRAM cassette. Please consult your local Mitsubishi representative. 	Drive/file information, parameter information	At power-on, at RESET
2101H	Memory error	<ul style="list-style-type: none"> An extended SRAM cassette or a battery-less option cassette is inserted or removed while the programmable controller is powered on. 	Stop	<ul style="list-style-type: none"> Do not insert or remove an extended SRAM cassette or a battery-less option cassette during operation. Check if an extended SRAM cassette or a battery-less option cassette is securely inserted to the CPU module. If the same error code is displayed again, the possible cause is a hardware failure of the extended SRAM cassette or battery-less option cassette. Please consult your local Mitsubishi representative. 	Drive/file information	Always
2102H	Memory error	<ul style="list-style-type: none"> An error has been detected in the extended SRAM cassette or the battery-less option cassette. 	Stop	<ul style="list-style-type: none"> Check if an extended SRAM cassette or a battery-less option cassette is securely inserted to the CPU module. If the same error code is displayed again, the possible cause is a hardware failure of the extended SRAM cassette, battery-less option cassette, or CPU module. Please consult your local Mitsubishi representative. 	Drive/file information	Always
2103H	Memory error	<ul style="list-style-type: none"> An unsupported extended SRAM cassette or battery-less option cassette is inserted. 	Stop	<ul style="list-style-type: none"> Replace the extended SRAM cassette or battery-less option cassette with the one supported by the CPU module. 	Drive/file information	Always
2104H	Memory error	<ul style="list-style-type: none"> A battery-less option cassette with the factory default settings or one that was used in another CPU module is inserted. 	Stop	<ul style="list-style-type: none"> Select [Device/Label Memory] in the memory initialization operation of the engineering tool, and initialize the battery-less option cassette. If the same error code is displayed again, the possible cause is a hardware failure of the battery-less option cassette or CPU module. Please consult your local Mitsubishi representative. 	—	At power-on, at RESET

Error code	Error name	Error details and cause	Stop/continue	Action	Detailed information	Diagnostic timing
2105H	Memory error	• "Battery-less Option Cassette Setting" in the CPU parameter is set as "Mounted", but no battery-less option cassette is inserted.	Stop	• Check that a battery-less option cassette is inserted. Or, correct "Battery-less Option Cassette Setting" in the CPU parameter. If the same error code is displayed again, the possible cause is a hardware failure of the CPU module or battery-less option cassette. Please consult your local Mitsubishi representative.	Drive/file information, parameter information	At power-on, at RESET
2106H	Memory error	• "Battery-less Option Cassette Setting" in the CPU parameter is set as "Not Mounted", but a battery-less option cassette is inserted.	Stop	• Remove the battery-less option cassette. Or, correct "Battery-less Option Cassette Setting" in the CPU parameter. If the same error code is displayed again, the possible cause is a hardware failure of the CPU module. Please consult your local Mitsubishi representative.	Drive/file information, parameter information	At power-on, at RESET
2120H	Memory card error	• The memory card was removed without the card being disabled.	Stop/continue	• Disable the memory card, and then remove it.	Drive/file information	Always
2121H	Memory card error	• An error has been detected in the memory card.	Stop/continue	• Format the memory card, re-insert the memory card, or replace the memory card. If the same error code is displayed again, the possible cause is a hardware failure of the CPU module. Please consult your local Mitsubishi representative.	Drive/file information	Always
2122H	Memory card error	• The CPU module did not start because the memory card was not restored during the startup processing.	Stop	• Reset the CPU module. If the same error code is displayed again, the possible cause is a hardware failure of the memory card. Replace the memory card.	Drive/file information	At power-on, at RESET
2150H	Initial processing time error	• Since the initial processing takes time, the host CPU in a multiple CPU system cannot respond to communication requests from other CPU modules in initial communications. (Other CPU modules cannot start up.)	Stop	Take the following action to shorten the initial processing time. • Check and correct the restoration setting and the number of files to be restored if the automatic data restoration function is being executed.	—	At power-on, at RESET
2160H	IP address duplication error	• Overlapping IP addresses have been detected.	Stop	• Check and correct the IP addresses.	—	Always
2180H	Invalid file	• An invalid file has been detected.	Stop	• Check the detailed information (drive/file information) of the error by executing module diagnostics using the engineering tool, select the correct file name, and write the specified file to the CPU module. If the same error code is displayed again, the possible cause is a hardware failure of the CPU module. Please consult your local Mitsubishi representative.	Drive/file information	At power-on, at RESET, at STOP → RUN state
2181H	Invalid file	• Due to firmware update or restoration (after the firmware update) of the CPU module, a program file of which file structure is not supported by the new version of the firmware or the operation mode of the CPU module has been written.	Stop	• After reading program files from the programmable controller, format the memory and write the program files. Then, reset the CPU module and run it again.	Drive/file information	At power-on, at RESET
2182H	Invalid file	• The program file is incorrect. Or, the program file is not correctly written.	Stop	• Write the program file to the CPU built-in memory again.	Drive/file information	At power-on, at RESET

Error code	Error name	Error details and cause	Stop/continue	Action	Detailed information	Diagnostic timing
21A0H	File specification error	<ul style="list-style-type: none"> The file specified in the CPU parameters does not exist. The memory card is disabled by tuning on SM606 (SD memory card forced disable instruction). The file register file does not exist in the specified memory when the file register setting is set to "Use Common File Register in All Programs" and the file capacity is not set in the CPU parameters ("File Setting"). The file specified in the memory card parameters ("Boot Setting") does not exist in the memory card. 	Stop	<ul style="list-style-type: none"> Turn off SM606. (Cancel the disabled state.) Codes of errors detected by other than the self-diagnostic function (4000H to 4FFFH)

The following table lists the codes of errors, other than those detected by the self-diagnostic function of the CPU module.

Error codes returned to request source during communications with the CPU module

- Errors generated when the data communications are requested from the engineering tool, intelligent function module, or network system connected
- Errors generated with the data logging function

These error codes are not stored in SD0 because they are not detected by the self-diagnostic function of the CPU module.

Error code	Error name	Error details and cause	Action
4000H	Common error	<ul style="list-style-type: none"> • Serial communication sum check error 	<ul style="list-style-type: none"> • Connect the serial communication cable correctly. • Take measures to reduce noise.

The engineering tool has been exited or a communication error has occurred during the firmware update processing. 	<ul style="list-style-type: none"> Perform the firmware update again.
4D4AH	Firmware update function error (Via engineering tool)	<ul style="list-style-type: none"> The firmware update has been performed to the module that the CPU No.1 does not support. The firmware update has been performed using the firmware update file that the CPU No.1 does not support. An invalid firmware update file has been used. 	<ul style="list-style-type: none"> Update the CPU No.1 to the latest firmware version and perform the firmware update again. Ensure that the name or contents of the firmware update file is not changed from its original state.
4D4BH	Firmware update function error (Via engineering tool)	<ul style="list-style-type: none"> The CPU modules of CPU No.2 and later do not support the firmware update using the engineering tool. 	<ul style="list-style-type: none"> Update the CPU modules of CPU No.2 and later to the latest version by performing the firmware update using an SD memory card, and perform the operation again.
4D4CH	Firmware update function error (Via engineering tool)	<ul style="list-style-type: none"> The module to be updated cannot be updated on the extension base unit. The firmware update file set in the engineering tool cannot be used for the module on the engineering tool. 	<ul style="list-style-type: none"> Mount the module to be updated to the main base unit and perform the firmware update again. Set the correct firmware update file for the module to be updated in the engineering tool, and perform the firmware update again.

Error code	Error name	Error details and cause	Action
4D4DH	Firmware update function error (Via engineering tool)	<ul style="list-style-type: none"> A firmware data error has been detected during the firmware update processing. 	<ul style="list-style-type: none"> Perform the firmware update again.
4D4EH	Firmware update function error (Via engineering tool)	<ul style="list-style-type: none"> The specified operation cannot be performed because the firmware update is being performed. The specified operation cannot be performed because the CPU No.1 was not reset after the firmware update. 	<ul style="list-style-type: none"> Reset the CPU module after the completion of the firmware update and perform the specified operation again.
4D4FH	Firmware update function error (Via engineering tool)	<ul style="list-style-type: none"> The firmware update has been performed to the module controlled by the CPU module of CPU No.2 or later. 	<ul style="list-style-type: none"> Set its control CPU to the CPU No.1 and perform the firmware update again. Update the firmware of CPU No.1 to the latest version and perform the firmware update again.
4D50H	Firmware update function error (Via engineering tool)	<ul style="list-style-type: none"> A remote operation has been performed to the CPU module of CPU No.2 or later during the firmware update processing. The firmware update has been performed while the CPU module of CPU No.2 or later is the RUN state. 	<ul style="list-style-type: none"> Reset the CPU module and perform the firmware update again. Change the operating status of the CPU module of CPU No.2 or later to STOP. Reset the CPU module and perform the firmware update again.
4D52H	Firmware update function error (Via engineering tool)	<ul style="list-style-type: none"> The control CPU does not support firmware updates using the engineering tool. 	<ul style="list-style-type: none"> Update the control CPU to a version supporting the firmware update function, and perform the firmware update again.
4D53H	Firmware update function error (Via engineering tool)	<ul style="list-style-type: none"> Performed an update on a module controlled by a CPU module executing another function. 	<ul style="list-style-type: none"> Check that the control CPU is not executing another function, and perform the firmware update again.

Codes of errors detected by other than the self-diagnostic function (C000H to CFFFH)

The following table lists the codes of errors related to the Ethernet-equipped module and CC-Link IE Field Network Basic. These error codes are not stored in SD0 because they are not detected by the self-diagnostic function of the CPU module.

Error code	Error name	Error details and cause	Action
C000H to CFBFH	 MELSEC iQ-R Ethernet User's Manual (Application)		
CFC0H	Cyclic transmission error (master station)	<ul style="list-style-type: none"> Unable to execute cyclic transmission because multiple master stations exist in the same network address. 	<ul style="list-style-type: none"> Check the existence status of master station in network.
CFC1H	Cyclic transmission error (master station)	<ul style="list-style-type: none"> Unable to execute cyclic transmission because the error occurred in cyclic transmission. 	<ul style="list-style-type: none"> Take measures to reduce noise. If the same error is displayed again, please contact your local Mitsubishi representative.
CFC8H	Cyclic transmission error (master station)	<ul style="list-style-type: none"> Unable to execute cyclic transmission because the slave station controlled by other master station exists. 	<ul style="list-style-type: none"> Check the existence status of master station in network. Check the slave station where the error occurred.
CFC9H	Cyclic transmission error (master station)	<ul style="list-style-type: none"> Unable to execute cyclic transmission because the slave station of the same IP address exists in the same network address. 	<ul style="list-style-type: none"> Check the existence status of slave station in network. Check the slave station where the error occurred.
CFD0H	Master station error	<ul style="list-style-type: none"> The port No. (61450) used in CC-Link IE Field Network Basic has already been used. 	<ul style="list-style-type: none"> Check the port No. used in Ethernet function.
CFD1H	Master station error	<ul style="list-style-type: none"> Invalid value has been set in subnet mask. 	<ul style="list-style-type: none"> Check the parameter setting.
CFE0H	Cyclic transmission error (slave station)	<ul style="list-style-type: none"> The cyclic transmission was executed for the slave station controlled by other master station. 	<ul style="list-style-type: none"> Check the existence status of master station in network. Check the slave station where the error occurred.
CFE1H	Cyclic transmission error (slave station)	<ul style="list-style-type: none"> The unusable number of occupied stations has been specified from master station. 	<ul style="list-style-type: none"> Check the number of occupied stations setting in master station parameter (Network Configuration Settings). Check the slave station where the error occurred.
CFE8H	Cyclic transmission error (slave station)	<ul style="list-style-type: none"> There is no response from slave station. 	<ul style="list-style-type: none"> Check the slave station disconnection detection setting in master station parameter (Network Configuration Settings). Check the existence status of slave station in network. Check the slave station which is disconnected. Take measures to reduce noise.
CFE9H	Cyclic transmission error (slave station)	<ul style="list-style-type: none"> The slave station of the same IP address has existed in the same network address. 	<ul style="list-style-type: none"> Check the slave station where the error occurred
CFF0H	Slave station error	<ul style="list-style-type: none"> The error occurred in slave station. 	<ul style="list-style-type: none"> Check the slave station where the error occurred.

35 EVENT LIST

The CPU module collects information, such as errors detected by the module; operations performed for the module; and network errors, from modules, and stores the collected data into the data memory or an SD memory card. (👉 Page 177 Event History Function)

When an event occurs, its event code and details can be read by using an engineering tool.

For details on events occurred in each module, refer to the manual for the module used.

35.1 How to Read the Event List

The event list contains the following information.

Item	Description
Event code	ID number assigned to an event
Event type	Type of an event
Event category	Category of an event
Detected event	Description of a detected event
Detailed information 1 to 5	Details of a detected event

Detailed information

The following table lists the details of information displayed in the detailed information 1 to 5.

Detailed information	Item	Description
Detailed information 1	Operation source information	Information on the operation source <ul style="list-style-type: none"> • Connection port (such as Ethernet and USB) • I/O number • CPU number (a number assigned to CPU modules in a multiple CPU system) • Network number • Station number • IP address
	Event history file information	Information on the event history file
	Module information	Information on the target module (I/O number)
	Firmware update information (RnCPU)	Information (firmware versions before and after update) on the firmware update using an SD memory card for the RnCPU
	Firmware update information (RnENCPU (CPU part))	Information (firmware versions before and after update) on the firmware update using an SD memory card for the RnENCPU (CPU part)
	Daylight saving time status	Information on the daylight saving time status (start/end)
	CPU module data backup/restoration information	Information on the CPU module data backup/restoration function (operation, result, error, data specification, initialization, latest data, special relay, special register, operation mode)
	CPU module data backup setting information	Information on the CPU module backup setting (backup function setting, error codes)
	Data backup/restoration information of iQ Sensor Solution	Information on the data backup/restoration function of iQ Sensor Solution (operation, target device, execution unit, target module, folder number setting method, total number of executions, number of successful executions, number of executions completed with an error, folder number)
	Information on the execution status of the data backup/restoration function of iQ Sensor Solution	Information on the execution status of the data backup/restoration function of iQ Sensor Solution (result, error category, error code)
Information on the right to use the data backup/restoration function of iQ Sensor Solution	Information on the right to use the data backup/restoration function of iQ Sensor Solution (right-to-use number, operation)	

Detailed information	Item	Description
Detailed information 2	Communication speed and communication mode	Information on the communication speed and the communication mode
	Communication status	Information on the communication status
	Security key operation information	Information on the corresponding security key
	Remote password information	Information on the corresponding remote password
	File password information	Information on the corresponding file password
	Blocked IP address information	Information on the blocked IP address
	Drive/file information	Information on the corresponding drive name and file name
	Drive number and file name	Information on the corresponding drive number and file name
	Copy source drive/file information	Information on the corresponding drive name and file name
	Operation target information	Information on the operation target: I/O number
	Clock information (before change)	Clock information before change
	Remote operation type information	Information on the remote operation type
	Device/label information	Information on device/label clearing
	Device/label clearing information	
	Device name information	Information on the device name
	Device name information (user-specified)	Information on the device name (at index modification/indirect specification)
	Label name information	Information on the label name
	Label name information (user-specified)	Information on the label name (at index modification/indirect specification)
	Program start information	Information on the start of a specified program
	Program stop information	Information on the stop of a specified program
	Target folder information of the CPU module data backup/restoration function	Information on the data backup/restoration target folder (folder specification, date, number)
	Target device information of the data backup/restoration function of iQ Sensor Solution	Information on the data backup/restoration target device (station number, station sub-ID number, ID number, IP address)
	Firmware update information (RnENCPU (network part))	Information (firmware versions before and after update) on the firmware update using an SD memory card for the RnENCPU (Network part)
Firmware update information	Information (firmware versions before and after update, modules whose firmware versions are updated) on the firmware update that is performed using the engineering tool	
Restricted event category	Category of event subject to the event history logging restriction	
Detailed information 3	Clock information (after change)	Clock information after change
	Copy destination drive/file information	Information on the corresponding drive name and file name
	Number of points	Information on the number of points
	Written value	Information on the written value
Detailed information 4	Device name information (target device)	Information (device name, address) on the device actually accessed
	Written value	Information on the written value
Detailed information 5	Target bit No.	Information on the target bit number
	Device name information (target device)	Information (device name, address) on the device actually accessed

35.2 Event List

The following table lists events related to the CPU module.

Event code	Event type	Event category	Detected event	Description	Detailed information				
					1	2	3	4	5
00100	System	Info	Link-up	The CPU module has entered into the link-up state as a result of an operation such as connecting a network cable between the CPU module and an external device.	Operation source information	Communication speed and communication mode	—	—	—
00110			Communication start/end (TCP)	Data communications with an external device through TCP connection started. Or, data communications with an external device through TCP connection ended.		Communication status			
00120			FTP connection start/end	FTP connection with an external device started. Or, FTP connection with an external device ended.					
00130			Receive frame error	A receive frame error was detected.	—				
00140			SNTP server time synchronization failure	Time setting by the time synchronization function failed because there was no response from the SNTP server.					
00172			Co-recording trigger sending/receiving	As the trigger has been notified from the module compatible with co-recording function, the module has notified the trigger to other modules.	—				
00400			Power-on/reset	The CPU module has been power-on or reset.					
00410			Boot operation	Boot operation was performed.					
00420			Event history file generation	An event history file was generated.	Event history file information				
00421			Event history logging restricted	Event history logging from the module was restricted.	Module information	Restricted event category ^{*2}			
00430			SFC program continue start not possible	An SFC program could not be resumed, and an initial start was performed.	—	—			
00450			Daylight saving time start/end	Daylight saving time started. Or, daylight saving time ended.	Daylight saving time status				

Event code	Event type	Event category	Detected event	Description	Detailed information				
					1	2	3	4	5
00800	System	Warning	Link-down	The CPU module has entered into the link-down state as a result of an operation such as disconnecting a network cable between the CPU module and an external device.	Operation source information	Communication speed and communication mode	—	—	—
00904			Socket communication send error	Sending a message over socket communication failed.					
00906			Alive check error	The alive status of an external device could not be checked within the period specified by the response monitoring timer.					
00907			Divided message receive timeout error	<ul style="list-style-type: none"> All the data could not be received within the period specified by the response monitoring timer. Data of the total data length could not be received. The remaining part of the message divided into the TCP/IP level could not be received within the period specified by the response monitoring timer. 					
00908			IP composition timeout error	An IP composition timeout error occurred. (The specified period of time expired without receiving all of the divided data.)					
00909			TCP-specified port number error	A port number being used for opened connection was set (for TCP/IP).					
0090A			UDP-specified port number error	A port number being used for opened connection was set (for UDP/IP).					
1000 and after	System	Error	When a self-diagnostic error occurs, the error is stored as an event.						

Event code	Event type	Event category	Detected event	Description	Detailed information				
					1	2	3	4	5
10100	Security	Info	Security key registration/deletion	A security key was registered or deleted.	Operation source information	Security key operation information	—	—	—
10200			Remote password lock	The remote password was set.		Remote password information			
10201			Remote password unlock	The remote password unlock processing was successfully completed.					
10202			Remote password unlock failed	The remote password unlock processing failed.					
10300			Access from an IP address blocked by the IP filter setting	An access from an IP address blocked by the IP filter setting was accepted.			Blocked IP address information		
10400			File password registration/change/deletion	A file password was successfully registered, changed, or deleted.			Operation source information	File password information	
10401			File password registration/change/deletion failed	Registration, change, or deletion of a file password failed.					
10402			File password unlock	A file password was successfully unlocked.					
10403			File password unlock failed	Unlock of a file password failed.					
10500			Forced invalidation setting	Forced invalidation was set.	—	—			
10501			Forced invalidation cancel	Forced invalidation was canceled.					

Event code	Event type	Event category	Detected event	Description	Detailed information				
					1	2	3	4	5
20100	Operation	Info	Error clear	The error was cleared.	Operation source information	Operation target information	—	—	—
20200			Event history clear	The event history was cleared.					
20210			Scan time clear	The scan time was cleared.					
20300			SD memory card enabled	The SD memory card was enabled.	—				
20301			SD memory card forcibly disabled	The SD memory card forced disable function was executed and the SD memory card became ready to be removed.					
20400			Firmware update successful via SD memory card (RnCPU)	RnCPU firmware update using the SD memory card was performed and completed successfully.	Firmware update information (RnCPU)				
20401			Firmware update failed via SD memory card (RnCPU)	RnCPU firmware update using the SD memory card was performed and was not completed successfully.					
20414			Firmware update successful via engineering tool	Firmware update using the engineering tool was performed and completed successfully.	Operation source information	Firmware update information			
20415			Firmware update failed via engineering tool	Firmware update using the engineering tool was performed and was not completed successfully.					
20420			Firmware update successful via SD memory card (RnENCPU)	RnENCPU firmware update using the SD memory card was performed and completed successfully.	Firmware update information (RnENCPU (CPU part))	Firmware update information (RnENCPU (network part))			
20421			Firmware update failed via SD memory card (RnENCPU)	RnENCPU firmware update using the SD memory card was performed and was not completed successfully.					
20500			CPU module data backup succeeded	Data in the CPU module were successfully backed up.	CPU module data backup/ restoration information	Target folder information of the CPU module data backup/ restoration function			
20501			CPU module data backup failed	Backup of data in the CPU module failed.					
20502			CPU module data restoration succeeded	Data were successfully restored to the CPU module.					
20503			CPU module data restoration failed	Restoration of data to the CPU module failed.					
20510	CPU module data backup setting disabled	Backup function cannot be set	CPU module data backup setting information	—					

Event code	Event type	Event category	Detected event	Description	Detailed information				
					1	2	3	4	5
20600	Operation	Info	iQ Sensor Solution data backup succeeded	Data in the target device supporting iQ Sensor Solution were successfully backed up.	Information on the execution status of the data backup/restoration function of iQ Sensor Solution	Target device information of the data backup/restoration function of iQ Sensor Solution	—	—	—
20601			iQ Sensor Solution data backup failed	Backup of data in the target device supporting iQ Sensor Solution failed.					
20602			iQ Sensor Solution data restoration succeeded	Data were successfully restored to the target device supporting iQ Sensor Solution.					
20603			iQ Sensor Solution data restoration failed	Restoration of data to the target device supporting iQ Sensor Solution failed.					
20610			iQ Sensor Solution data backup start/cancel/end	The data backup processing of the target device supporting iQ Sensor Solution started, canceled, or ended.					
20611			iQ Sensor Solution data restoration start/cancel/end	The data restoration processing of the target device supporting iQ Sensor Solution started, canceled, or ended.					
20620			Right-to-use acquisition/release	The right to use the data backup/restoration function of iQ Sensor Solution was acquired or released.	Information on the right to use the data backup/restoration function of iQ Sensor Solution				
24000			Clock setting	The clock data was set.	Operation source information	Clock information (before change)	Clock information (after change)		
24001			Remote operation request accepted	A remote request (RUN, STOP, or PAUSE) was accepted.				Remote operation type information	—
24100			Operating status change (RUN)	The operating status of the CPU module was changed to RUN.	—	—			
24101			Operating status change (STOP)	The operating status of the CPU module was changed to STOP.					
24102			Operating status change (PAUSE)	The operating status of the CPU module was changed to PAUSE.					
24120			Starting the program	The program was started.	Operation source information	Program start information			
24121			Stopping the program	The program was stopped.		Program stop information			
24200	Creation of new folders, writes to files/folders *1	<ul style="list-style-type: none"> A new folder was created. A new file was created or data was written to a file. 	Drive/file information						
24201	File copy*1	A file was copied.	Copy source drive/file information	Copy destination drive/file information					
24202	Folder/file rename*1	A folder name or file name was changed.							

Event code	Event type	Event category	Detected event	Description	Detailed information				
					1	2	3	4	5
24A00	Operation	Info	Write Device in word units (1 point)	Data was written to the device in word units.	Operation source information	Device name information	Written value	—	—
24A01						Device name information (user-specified)		Device name information (target device) ^{*3}	
24A10			Write Device in bit units (1 point)	Data was written to the device in bit units.	Device name information	—			
24A11					Device name information (user-specified)	Device name information (target device) ^{*3}	Target bit No. ^{*3}		
24A20			Write Device in double-word units (1 point)	Data was written to the device in double-word units.	Device name information	—			
24A21					Device name information (user-specified)	Device name information (target device) ^{*3}			
24A40			Write Device in word units (n points)	Data was written to the device in word units.	Device name information	Number of points	Written value		
24A50								Write Device in bit units (n points)	Data was written to the device in bit units.
24B00			Write Device in word units (1 point)	Data was written to the device in word units.	Device name information (user-specified)	Written value	—		
24B01							Device name information (target device) ^{*3}		
24B10			Write Device in bit units (1 point)	Data was written to the device in bit units.	Device name information	—			
24B11					Device name information (user-specified)	Device name information (target device) ^{*3}	Target bit No. ^{*3}		
24B20			Write Device in double-word units (1 point)	Data was written to the device in double-word units.	Device name information	—			
24B21					Device name information (user-specified)	Device name information (target device) ^{*3}			
24B30			Write Device in quad-word units (1 point)	Data was written to the device in quad-word units.	Device name information	—			
24B31					Device name information (user-specified)	Device name information (target device) ^{*3}			

Event code	Event type	Event category	Detected event	Description	Detailed information				
					1	2	3	4	5
24B40	Operation	Info	Write Device in word units (n points)	Data was written to the device in word units.	Operation source information	Device name information	Number of points	Written value	—
24B50			Write Device in bit units (n points)	Data was written to the device in bit units.					
24B60			Write Device in double-word units (n points)	Data was written to the device in double-word units.					
24B70			Write Device in quad-word units (n points)	Data was written to the device in quad-word units.					
24C00			Write Label in word units (1 point)	Data was written to the label in word units.					
24C01					Label name information (user-specified)	Device name information (target device) ^{*3}			
24C10			Write Label in bit units (1 point)	Data was written to the label in bit units.	Label name information	—	—		
24C11					Label name information (user-specified)			Device name information (target device) ^{*3}	Target bit No. ^{*3}
24C20			Write Label in double-word units (1 point)	Data was written to the label in double-word units.	Label name information	—	—		
24C21					Label name information (user-specified)			Device name information (target device) ^{*3}	
24C30			Write Label in quad-word units (1 point)	Data was written to the label in quad-word units.	Label name information	—	—		
24C31					Label name information (user-specified)			Device name information (target device) ^{*3}	
24C40			Write Label in word units (n points)	Data was written to the label in word units.	Label name information	—	—		
24C41					Label name information (user-specified)			Written value ^{*3}	Device name information (target device) ^{*3}
2A200			Memory initialization ^{*1}	The memory was initialized.	Drive/file information	—	—	—	
2A201			Device/label zero clear	Values in a device or label were cleared to zero.	Device/label information/ Device/label clearing information	—	—	—	
2A202			Folder/file deletion ^{*1}	A folder or file was deleted.	Drive/file information	—	—	—	
2A205			Battery-less option cassette initialization	The battery-less option cassette was initialized.	Drive number and file name	—	—	—	

*1 As for file-related events such as writing and deleting a file, the following files are targeted:

- Program file
- FB program file
- Parameter file
- Data logging setting file (common setting file, individual setting file)
- Memory dump setting file

*2 Detailed information 2 is stored only when detailed information 1 is CPU module (3E00H).

*3 The information may not be displayed depending on the target device or label.

Appendix 2 Compliance with EMC and Low Voltage Directives

Method of ensuring compliance

To ensure that Mitsubishi Electric programmable controllers maintain the EMC and Low Voltage Directives or other regulations when incorporated into other machinery or equipment, certain measures may be necessary. Please refer to one of the following manuals.

- MELSEC iQ-R Module Configuration Manual (SH-081262ENG)
- Safety Guidelines (IB-0800525)

Certification marks on the side of the programmable controller indicate compliance with the relevant regulations.

Additional measures

To ensure that this product maintains the EMC and Low Voltage Directives or other regulations, please refer to the following.

- MELSEC iQ-R Module Configuration Manual (SH-081262ENG)
- Safety Guidelines (IB-0800525)

Appendix 3 Functional Availability by CPU Module Model

The following table lists the availability of functions by CPU module model.

Rn: RnCPU, RnEN: RnENCPU, RnP(P): Process CPU (process mode), RnP(R): Process CPU (redundant mode), RnPSF: SIL2 Process CPU, RnSF: Safety CPU

○: Supported, ×: Not supported

Function		Availability ^{*1}					
		Rn	RnEN	RnP(P)	RnP(R)	RnPSF	RnSF
Constant scan		○	○	○	○	○	○
Device/label access service processing setting		○	○	○	○	○	○
Device/label access service processing constant wait function		×	×	○	○	×	×
Interrupt function	Multiple interrupt function	○	○	○	○	○	○
Output mode setting when the status changed from STOP to RUN		○	○	○	○	○	○
Device/label memory area setting		○	○	○	○	○	○
Internal buffer capacity setting		○ ^{*3}	○	○	○	×	○
SD memory card forced disable		○ ^{*3}	○	○	○	○	○
Clock function		○	○	○	○	○	○
Writing data to the CPU module	Writing data to the programmable controller	○	○	○	○	○	○
	Online change (ladder block)	○	○	○	○	○	○
	Online change (files)	○	○	○	○	○	○
RAS function	Scan monitoring function	○	○	○	○	○	○
	Self-diagnostics function	○	○	○	○	○	○
	FB hierarchy information	○	○	○	○	×	×
	Error clear	○	○	○	○	○	○
	Event history function	○	○	○	○	○	○
	Online module change	×	×	○	○	○	×
	Program cache memory auto recovery function	○	○	○	○	○	○
Remote operation		○	○	○	○	○	○
Boot operation		○ ^{*3}	○	○	○	×	×
Monitor function	Circuit monitor	○	○	○	○	○	○
	Device/buffer memory batch monitor	○	○	○	○	○	○
	Watch	○	○	○	○	○	○
	Program monitor list	○	○	○	○	○	○
	Interrupt program monitor list	○	○	○	○	○	○
	Real-time monitor function	○	○	×	×	×	○
	Scan time measurement	○	○	×	×	×	×

*3 The R00CPU does not support the use of these functions.

Appendix 4 List of Special Relay Areas

The following table lists items in the list.

Item	Description
No.	Special relay number
Name	Special relay name
Data stored	Data stored in the special relay and its meaning
Details	Detailed description of the data stored
Set by (setting timing)	Set side of data (system or user) and timing when data is set by the system <Set by> <ul style="list-style-type: none">• S: System• U: User (program, engineering tool, GOT, or other testing operations from external device)• U/S: User and system <Set timing> <ul style="list-style-type: none">• Every END: Data is set every time END processing is performed.• Initial: Data is set when initial processing is performed (e.g. powering on the system, changing the operating status from STOP to RUN).• Status change: Data is set when the status is changed.• Error: Data is set when an error occurs.• Instruction execution: Data is set when an instruction is executed.• Request: Data is set when requested by a user (using the special relay).• Writing: Data is set when a user performs a writing operation.• During END: Data is set when END processing is performed.• Power-on to RUN or STOP to RUN: Data is set when the operating status changes from power-on to RUN or from STOP to RUN.

Point

Do not change the data set by the system in a program or by a device test. Doing so may result in system down or communication failure.

Diagnostic information

The following is the list of special relay areas relating to the diagnostic information.

No.	Name	Data stored	Details	Set by (setting timing)
SM0	Latest self-diagnostic error (including annunciator ON)	Off: No error On: Error	<ul style="list-style-type: none"> This relay turns on when the self-diagnostics returns an error (including the case when an error is detected by turning the annunciator ON). The ON state is maintained even after the error has been later cleared. 	S (Error)
SM1	Latest self-diagnostic error (not including annunciator ON)	Off: No error On: Error	<ul style="list-style-type: none"> This relay turns on when the self-diagnostics returns an error (not including the case when an error is detected by turning the annunciator ON). The ON state is maintained even after the error has been later cleared. 	S (Error)
SM50	Error reset	Off→On:Error reset request On→Off:Error reset complete	<ul style="list-style-type: none"> This relay clears the error state when the mode transfers from off to on. This relay switches from on to off when the error reset has been completed. 	U/S (Status change)
SM51	Battery low latch	Off: Normal On: Battery low	<ul style="list-style-type: none"> This relay switches to on when the battery voltage of the CPU module drops below the specified value. The ON state is maintained even after the battery voltage has been later recovered to the normal value. This relay synchronizes with BAT LED. 	S (Error)
SM52	Battery low	Off: Normal On: Battery low	This relay has the same function as SM51 except for switching to off after the battery voltage has been recovered to a normal value.	S (Error)
SM53	AC/DC DOWN	Off: No AC/DC DOWN detection On: AC/DC DOWN is detected	<ul style="list-style-type: none"> This relay switches to on when a momentary power failure within 20ms is detected while the AC power supply module is in use. This relay can be reset when power is turned off and on. This relay switches to on when a momentary power failure within 10ms is detected while the DC power supply module is in use. This relay can be reset when power is turned off and on. 	S (Error)
SM56	Instruction execution fault	Off: Normal On: Instruction execution fault state	<ul style="list-style-type: none"> This relay switches to on when an error which can be classified as instruction execution fault is returned. The ON state is maintained even after the error has been later cleared. 	S (Error)
SM60	Fuse Blown	Off: Normal On: Fuse blown is detected	<ul style="list-style-type: none"> This relay is on when at least one output module is in fuse blown state and the ON state is maintained even after later recovering to the normal state. The fuse blown state check is also done for output modules on the remote I/O station. 	S (Error)
SM61	I/O module verification error	Off: Normal On: Error	<ul style="list-style-type: none"> This relay switches to on when the state of the I/O module is different from one registered during power-on, and the ON state is maintained even after later recovering to the normal state. I/O module verification is also done for modules on the remote I/O station. 	S (Error)
SM62	Annunciator	Off: Not detected On: Detected	<ul style="list-style-type: none"> This relay switches to on when at least one annunciator is turned on. This relay returns to off when all the annunciators are turned off. 	S (Instruction execution)
SM80	Detailed information 1: Flag in use	Off: Not used On: In use	This relay switches to on if the detailed information n exists when SM0 switched to on.	S (Status change)
SM112	Detailed information 2: Flag in use			

No.	Name	Data stored	Details	Set by (setting timing)
SM150* ¹	Power-off/power supply voltage drop detection	Off: Power-on/normal power supply voltage On: Power-off/voltage drop detected/power supply module not mounted	<ul style="list-style-type: none"> This relay turns on when one or more of the power supply modules whose power has been shut off or power supply voltage has dropped (not including a momentary power failure), or one or more of empty slots for the power supply module are detected on the redundant power supply base unit. This relay turns on if causes to turn on any bits of SD150 have been occurred. This relay turns off if causes to turn on any bits of SD150 have been removed. In a multiple CPU system, the flags are stored only to the CPU No.1. 	S (Status change)
SM151* ¹	Power supply module failure detection	Off: Not detected/power-off/no power supply module On: Detected	<ul style="list-style-type: none"> This relay turns on when one or more power supply module failures have been detected on the redundant power supply base unit. This relay turns on if causes to turn on any bits of SD151 have been occurred. This relay turns off if causes to turn on any bits of SD151 have been removed. In a multiple CPU system, the flags are stored only to the CPU No.1. 	S (Status change)
SM152* ¹	Momentary power failure detection (power supply module 1)	Off: Not detected On: Detected	<ul style="list-style-type: none"> This relay turns on when a momentary power failure of the input power supply to the power supply 1 or 2 is detected one or more times. After turning on, this relay remains on even if the power supply recovers from the momentary power failure. This register monitors the status of the power supply module mounted on the main base unit and counts the number of momentary power failures. This relay turns off the flags (SM152 and SM153) of the power supply 1 and 2 when the CPU module starts up. When one of the two power supply modules is powered off, this relay turns off the corresponding flag to one powered off. In a multiple CPU system, the flags are stored only to the CPU No.1. 	S (Status change)
SM153* ¹	Momentary power failure detection (power supply module 2)			S (Status change)
SM154* ¹	Invalid power supply module	Off: Valid/power-off/no power supply module On: Invalid	<ul style="list-style-type: none"> This relay turns on when one or more of invalid power supply modules have been detected on the redundant power supply base unit. This relay turns on if a factor to turn on any bits of SD154 have been occurred. This relay turns off if all the factors to turn on any bits of SD154 have been removed. In a multiple CPU system, the flags are stored only to the CPU No.1. 	S (Status change)

*1 There are restrictions on the firmware version of the supported CPU module. (Page 705 Added and Enhanced Functions)

System information

The following is the list of special relay areas relating to the system information.

No.	Name	Data stored	Details	Set by (setting timing)
SM203	STOP contact	Off: Other than STOP state On: STOP state	This relay is on in STOP state.	S (Status change)
SM204	PAUSE contact	Off: Other than PAUSE state On: PAUSE state	This relay is on in PAUSE state. Note that this relay is on during the END processing of the scan which the specified PAUSE contact turns on if PAUSE state is generated at the PAUSE contact.	S (Status change)
SM210	Clock data set request	Off→On: setting request is detected On→Off: setting is completed	<ul style="list-style-type: none"> Clock data stored in SD210 to SD216 is written into the CPU module when this relay is switched from off to on. This relay switches from on to off when writing of clock data stored in SD210 to SD216 into the clock element is completed. 	U/S (Status change)
SM211	Clock data set error	Off: No error On: Error	This relay switches to on when an error is generated in values from SD210 to SD216, and to off when no error is generated.	S (Request)
SM213	Clock data read request	Off: Non-processing On: Reading request	Clock data is loaded into SD210 to SD216 when this relay is in the ON state.	U
SM217 ^{*1}	Daylight saving time status flag	Off: Not during daylight saving time On: During daylight saving time	Turns on if during daylight saving time with daylight saving time function. Turns off if not during daylight saving time.	S (Status change)
SM220	CPU No.1 preparation completed	Off: Not completed On: Completed	<ul style="list-style-type: none"> This relay switches to on at the time when access from the CPU module on other CPUs to the CPU module for CPU No. n is enabled during power-on or resetting. This relay is used as an interlock to access the CPU module for the CPU No. n when the multiple CPU synchronization setting is configured to asynchronous mode. 	S (Status change)
SM221	CPU No.2 preparation completed			
SM222	CPU No.3 preparation completed			
SM223	CPU No.4 preparation completed			
SM230	No.1 CPU error flag	Off: CPU No.n normal On: CPU No.n stop error state	<ul style="list-style-type: none"> This relay is off when the CPU module for the CPU No.n is normal (including a continuation error period). This relay is on when the CPU module for the CPU No.n is in stop error state. 	S (Status change)
SM231	No.2 CPU error flag			
SM232	No.3 CPU error flag			
SM233	No.4 CPU error flag			
SM240	No.1 CPU reset flag	Off: CPU No.n not being reset On: CPU No.n in reset mode	<ul style="list-style-type: none"> This relay switches to off when the CPU module of the CPU No.1 is not being reset. This relay is on while the CPU module of the CPU No.1 is being reset (including the case when the CPU module is removed from the base unit). Other CPUs also enter into reset mode. 	S (Status change)
SM241	No.2 CPU reset flag		<ul style="list-style-type: none"> This relay switches to off when the CPU module of the CPU No.2 is not being reset. This relay is on while the CPU module of the CPU No.2 is being reset (including the case when the CPU module is removed from the base unit). Errors occur in the other CPU modules. 	S (Status change)
SM242	No.3 CPU reset flag		<ul style="list-style-type: none"> This relay switches to off when the CPU module of the CPU No.3 is not being reset. This relay is on while the CPU module of the CPU No.3 is being reset (including the case when the CPU module is removed from the base unit). Errors occur in the other CPU modules. 	S (Status change)
SM243	No.4 CPU reset flag		<ul style="list-style-type: none"> This relay switches to off when the CPU module of the CPU No.4 is not being reset. This relay is on while the CPU module of the CPU No.4 is being reset (including the case when the CPU module is removed from the base unit). Errors occur in the other CPU modules. 	S (Status change)

No.	Name	Data stored	Details	Set by (setting timing)
SM384 ^{*1}	System operation setting request	Off: Request accepted On: Request submitted	<ul style="list-style-type: none"> This relay is turned from off to on to send a setting request and write/delete data to/in the setting storage area (system memory) with the value set in SD384. Regardless of whether it was successful or not, this relay turns off when the setting request is accepted. 	U/S (Status change)
SM385 ^{*1}	System operation setting error	Off: No error On: Error	<ul style="list-style-type: none"> This relay turns on when writing into the setting storage area (system area) fails. 	S (Status change)
SM386 ^{*1}	Program restoration information write status LED control setting mode	Off: LED flashing On: Without LED flashing	<ul style="list-style-type: none"> This relay indicates the LED control setting status of program restoration information. 	S (Initial)
SM387 ^{*1}	Program restoration information write status	Off: All written On: Not all written	<ul style="list-style-type: none"> This relay indicates the write status of program restoration information in the CPU module. This relay turns off when all program restoration information is written. This relay turns on if there is any program whose program restoration information is not in the CPU module. 	S (Status change)
SM388 ^{*2}	File batch online change operation setting status	Off: Program file only On: Program file/FB file/global label setting file	This relay indicates the operating status of the file batch online change.	S (Status change)

*1 There are restrictions on the firmware version of the supported CPU module and software version of the engineering tool. ( Page 705 Added and Enhanced Functions)

*2 There are restrictions on the firmware version of the supported CPU module and software version of the engineering tool. ( Page 705 Added and Enhanced Functions)

For the R00CPU, R01CPU, and R02CPU, the operation setting status is always set to "program file/FB file/global label setting file" regardless of whether this relay is on or off.

SFC information

The following is a list of special relay areas relating to SFC information.

(There are restrictions on the firmware version of the supported CPU module and software version of the engineering tool.

 Page 705 Added and Enhanced Functions)

No.	Name	Data stored	Details	Set by (setting timing)
SM320	Presence/absence of SFC program	Off: No SFC program On: SFC program	<ul style="list-style-type: none"> This relay switches to on if an SFC program has been registered, and switches to off if it has not. 	S (Initial)
SM321	Start/stop SFC program	Off: SFC program not executed (stop) On: SFC program executed (start)	<ul style="list-style-type: none"> The same value as SM320 is set for the default value. (This relay automatically turns on if there is an SFC program.) SFC program execution is stopped if this relay switches from on to off, and execution is restarted when it switches from off to on. If this relay switches off before SFC program processing, execution of the SFC program is not started. 	S (Initial)/U
SM322	SFC program start status	Off: Initial start On: Resumption	<ul style="list-style-type: none"> If the SFC program start mode in the parameters is off for initial start, off is set for the default, and if resumption, on is set. 	S (Initial)/U
SM323	Presence/absence of continuous transition for entire block	Off: No continuous transition On: Continuous transition	<ul style="list-style-type: none"> Sets whether there is a continuous transition for blocks for which no SFC information device continuous transition bit has been set. No continuous transition when off. Continuous transition when on. There is no effect on operation for blocks for which the continuous transition bit has been set. 	U
SM324	Continuous transition prevention flag	Off: When transition executed On: When there is no transition	<ul style="list-style-type: none"> This relay switches to off during operation in modes with continuous transition, or during continuous transition, and switches to on when it is not a continuous transition. The relay is always on during operation in modes with no continuous transition. 	S (Status change)
SM325	Output mode at block stop	Off: Off On: Hold	<ul style="list-style-type: none"> Selects whether to retain coil output for active steps during block stoppages. The default value when the output mode for block stoppages in the parameters is coil output off is off, and on when coil output is retained. All coil outputs are turned off when off. Coil outputs are retained when on. 	S (Initial)/U
SM326	SFC device/label clear mode	Off: Device/label clear On: Device/label retain	<ul style="list-style-type: none"> Select the device status (all devices and labels (including latch labels) excluding step relay (S)) when the CPU module status changes from STOP → program write → RUN. This relay is valid only when an SFC program exists after program writing. This relay is valid not only when an SFC program is written, but also when the program file and the parameter file are written. 	U
SM327	Output mode at execution of the end step	Off: Hold step output off On: Hold step output retained	<ul style="list-style-type: none"> When this relay switches to off, coil output is turned off for steps (SC, SE, ST) for which transition is established and that are on hold reach the END step. When this relay switches to on, coil output is retained (step becomes inactive) for steps (SC, SE, ST) for which transition is established and that are on hold reach the END step. However, coils are turned off following forced termination. 	U
SM328	Clear processing mode when the sequence reaches the end step	Off: Clear processing performed On: Clear processing not performed	<ul style="list-style-type: none"> Selects whether to perform clear processing if an active step other than those retained in the block exists when the END step is reached. When this relay switches to off, all active steps are forcibly terminated, and the block is terminated. When this relay switches to on, block execution is continued as is. When the END step is reached, if no active steps other than those retained exist, all retained steps are terminated, and the block is terminated. 	U
SM329	Online change (SFC block) status flag	Off: Not being executed On: Being executed	This relay turns on while the online change (SFC block) is being executed.	S (Status change)

Point

For details on the SFC program, refer to the following.

 MELSEC iQ-R Programming Manual (Program Design)

System clock

The following is the list of special relay areas relating to the system clock.

No.	Name	Data stored	Details	Set by (setting timing)
SM400	Always On	ON _____ OFF	Always On	S (Power-on to RUN/STOP to RUN/every END ^{*2})
SM401	Always Off	ON OFF _____	Always Off	S (Power-on to RUN/STOP to RUN/every END ^{*2})
SM402	After RUN, ON for 1 scan only	ON  OFF	<ul style="list-style-type: none"> This relay is on during only one scan after RUN mode starts. This relay is enabled only for the scan execution type program. 	S (Status change/ every END ^{*2})
SM403	After RUN, OFF for 1 scan only	ON  OFF	<ul style="list-style-type: none"> This relay is off during only one scan after RUN mode starts. This relay is enabled only for the scan execution type program. 	S (Status change/ every END ^{*2})
SM409	0.01 second clock		<ul style="list-style-type: none"> This relay repeats on/off at 5ms intervals. This relay does not turn on/off per scan, but turns on/off whenever the specified time interval is reached. The initial state when the CPU module is powered on or reset is off. 	S (Status change)
SM410	0.1 second clock		<ul style="list-style-type: none"> This relay repeats on/off at certain intervals. This relay does not turn on/off per scan, but turns on/off whenever the specified time interval is reached. The initial state when the CPU module is powered on or reset is off. 	S (Status change)
SM411	0.2 second clock		<ul style="list-style-type: none"> This relay repeats on/off at certain intervals. This relay does not turn on/off per scan, but turns on/off whenever the specified time interval is reached. The initial state when the CPU module is powered on or reset is off. 	S (Status change)
SM412	1 second clock		<ul style="list-style-type: none"> This relay repeats on/off at certain intervals. This relay does not turn on/off per scan, but turns on/off whenever the specified time interval is reached. The initial state when the CPU module is powered on or reset is off. 	S (Status change)
SM413	2 second clock		<ul style="list-style-type: none"> This relay repeats on/off at certain intervals. This relay does not turn on/off per scan, but turns on/off whenever the specified time interval is reached. The initial state when the CPU module is powered on or reset is off. 	S (Status change)
SM414	2n second clock		<ul style="list-style-type: none"> This relay repeats on/off at regular intervals specified in SD414 (in units of seconds). (When the value in SD414 is changed, the elapsed time count that has started when the ON/OFF state of SM414 last changed continues, and the ON/OFF state changes when the new specified time is elapsed.^{*1}) This relay does not turn on/off per scan, but turns on/off whenever the specified time interval is reached. The initial state when the CPU module is powered on or reset is off. 	S (Status change)
SM415	2n millisecond clock		<ul style="list-style-type: none"> This relay repeats on/off at regular intervals specified in units of milliseconds on the SD415. (When the value in SD415 is changed, the elapsed time count that has started when the ON/OFF state of SM415 last changed continues, and the ON/OFF state changes when the new specified time is elapsed.^{*1}) This relay does not turn on/off per scan, but turns on/off whenever the specified time interval is reached. The initial state when the CPU module is powered on or reset is off. 	S (Status change)

No.	Name	Data stored	Details	Set by (setting timing)
SM420	User timing clock No.0		<ul style="list-style-type: none"> This relay repeats on/off at specified scan intervals. The initial state when the CPU module is powered on or reset is off. The on/off scan interval is set using the DUTY instruction. (n1: ON scan interval, n2: OFF scan interval) 	S (Every END)
SM421	User timing clock No.1			
SM422	User timing clock No.2			
SM423	User timing clock No.3			
SM424	User timing clock No.4			
SM440	On only initial I44 execution after RUN		<ul style="list-style-type: none"> This relay is on during the first execution of the inter-module synchronous interrupt program (I44) after RUN mode starts and off during the second execution onwards. Note that the relay status while the DI instruction is executed is as follows: On during the first execution of the inter-module synchronous interrupt program (I44) after the DI instruction is cleared and Off during the second execution onwards. (no change after the second DI clear). This contact is enabled only for the inter-module synchronous interrupt program. 	S (Status change)
SM441	On only initial I45 execution after RUN		<ul style="list-style-type: none"> This relay is on during the first execution of the multiple CPU synchronous interrupt program (I45) after RUN mode starts and off during the second execution onwards. Note that the relay status while the DI instruction is executed is as follows: On during the first execution of the multiple CPU synchronous interrupt program (I45) after the DI instruction is cleared and Off during the second execution onwards. (no change after the second DI clear). This contact is enabled only for the multiple CPU synchronous interrupt program. 	S (Status change)
SM1184 *3	System clock (SM400 to SM403) every end update setting request	Off: Request accepted Off→On: Request submitted	<ul style="list-style-type: none"> This relay is turned off and on when a setting request of the value stored in SD1184 (System clock (SM400 to SM403) every end update setting) is submitted. Regardless of whether the setting is successful or not, this relay turns off when the setting request is accepted. The setting takes effect when the CPU module is powered off and on. 	U (Status change)
SM1185 *3	System clock (SM400 to SM403) every end update setting error	Off: No error On: Error	This relay turns on when writing of the setting has failed.	S (Status change)
SM1186 *3	System clock (SM400 to SM403) every end update setting status	Off: Disabled On: Enabled	This relay indicates the system clock (SM400 to SM403) every end update status.	S (Initial)

*1 The following figures show operation examples of SM414/SM415 when a value in SD414/SD415 is changed.

Ex.

When a value in SD414 is changed from 3 to 10:

- (1) The elapsed time after the ON/OFF state of SM414 changes remains.
- (2) Value change

Ex.

When a value in SD414 is changed from 10 to 3:

- (1) If the new interval in SD414 has already elapsed after the last change of the ON/OFF state of SM414, the ON/OFF state changes as soon as a value in SD414 is changed.
- (2) Value change

- *2 To enable the setting timing of "Every END" for these special relay areas, set both SM1184 and SD1184 (System clock (SM400 to SM403) every end update setting).
- *3 The CPU module with the following firmware versions supports these special relay areas.
 - R00CPU, R01CPU, R02CPU: "24" or later
 - CPU modules other than R00CPU, R01CPU, and R02CPU: "57" or later

Fixed scan function information

The following is the list of special relay areas relating to the fixed scan function information.

No.	Name	Data stored	Details	Set by (setting timing)
SM480	Cycle error flag for inter-module synchronous interrupt program (I44)	Off: No error for the inter-module synchronization program (Normal) On: Error state for the inter-module synchronization program	<ul style="list-style-type: none"> This relay switches to on when the inter-module synchronous interrupt program (I44) has not been completed within the specified inter-module synchronization cycle or the program cannot be executed due to various reasons, such as execution of a higher-priority interrupt program and interrupt disabling by the instruction execution. The ON state is maintained even after the program is later completed within the specified inter-module synchronization cycle (Clear by turning power off and on or resetting). 	S (Status change)
SM481 ^{*1}	Cycle error flag for multiple CPU synchronization interrupt program (I45)	Off: No error for the multiple CPU synchronization program (Normal) On: Error state for the multiple CPU synchronization program	<ul style="list-style-type: none"> This relay switches to on when the multiple CPU synchronization program (I45) has not been completed within the specified fixed scan communication cycle or the program cannot be executed due to various reasons, such as execution of a higher-priority interrupt program and interrupt disabling by the instruction execution. The ON state is maintained even after the program is later completed within the specified fixed scan communication cycle (Clear by turning power off and on or resetting). 	S (Status change)
SM484 ^{*1}	Execution section excess error flag for multiple CPU synchronization interrupt program	Off: No execution section excess error for the multiple CPU synchronization interrupt program (Normal) On: Execution section excess error state for the multiple CPU synchronization interrupt program	<ul style="list-style-type: none"> This relay switches to on when the program is executed exceeding the program execution section within the specified multiple CPU synchronization cycle. The ON state is maintained even after the program is later completed within the multiple CPU synchronous interrupt program execution section (cleared by turning power off and on or resetting). 	S (Status change)
SM488	Inter-module synchronization error (out of synchronization was detected on the CPU module)	Off: No error (Normal) On: Error	<ul style="list-style-type: none"> This relay switches to on when the inter-module synchronization signal cannot be identified within the inter-module synchronization cycle specified in the parameter or more than one signal has been identified within the same inter-module synchronization cycle. The ON state is maintained even after the inter-module synchronization signal can be later identified within the specified inter-module synchronization cycle (cleared by turning power off and on or resetting). 	S (Status change)
SM522 ^{*1}	Scan time clear request	Off: Do not clear the scan time. On: Clear the scan time.	<ul style="list-style-type: none"> This relay clears the maximum/minimum scan time. Turning off and on this relay clears the scan time. This relay automatically turns off when the scan time has been cleared. 	U/S (Status change)

*1 There are restrictions on the firmware version of the supported CPU module and software version of the engineering tool. (Page 705 Added and Enhanced Functions)

Drive information

The following is the list of special relay areas relating to the drive information.

No.	Name	Data stored	Details	Set by (setting timing)
SM600 ^{*1}	Memory card usable flags	Off: Disabled On: Enabled	This relay is on when an SD memory card is enabled (This relay switches to on when a valid SD memory card is inserted and prepared for use).	S (Status change)
SM601 ^{*1}	Memory card protect flag	Off: Not protected On: Protected	This relay is on when the write protect switch of the SD memory card is set to on.	S (Status change)
SM603 ^{*1}	Memory card (drive 2) flag	Off: No SD memory card inserted On: SD memory card inserted	This relay is on when an SD memory card is inserted. (This relay switches to on when an SD memory card is inserted regardless of its state (enabled/disabled) and type).	S (Status change)
SM604 ^{*1}	Memory card in-use flag	Off: Not used On: In use	This relay is on when the SD memory card is being used.	S (Status change)
SM605 ^{*1}	Memory card remove/insert prohibit flag	Off: Allowed to remove/insert On: Not allowed to remove/insert	Turn on this relay to prohibit the SD memory card from being removed/inserted. When this relay is on, if SM607 is set to on, the system switches it to off.	U/S
SM606 ^{*1}	SD memory card forced disable instruction	Off: Cancel instruction On: Forced disable instruction	<ul style="list-style-type: none"> This relay can be switched to on to issue the instruction that forces the SD memory card to be disabled. However, whenever any function accesses the SD memory card, the disabling process does not start until the access is completed. This relay can be switched to off to cancel the instruction that forces the SD memory card to be disabled. 	U/S (Status change)
SM607 ^{*1}	SD memory card forced disable status flag	Off: Not disabled On: Disabled	<ul style="list-style-type: none"> This relay switches to on when the SD memory card is disabled by switching SM606 to on. This relay switches to off when the forcibly-disabled SD memory card is enabled by switching SM606 to off. 	S (Status change)
SM624 ^{*3}	Battery-less option cassette insertion flag	Off: Not inserted On: Inserted	This relay is on when the battery-less option cassette is inserted.	S (Status change)
SM625 ^{*3}	Battery-less function execution flag	Off: Battery-less function not executed On: Battery-less function executed	This relay is on while the battery-less function is being executed.	S (Status change)
SM626 ^{*2}	Extended SRAM cassette insertion flag	Off: Not inserted On: Inserted	This relay is on when the extended SRAM cassette is inserted.	S (Status change)
SM628	Program memory write error	Off: No write operation/normal On: Write error	This relay switches to on when a write error is detected during write operation to the program memory. This relay switches to off when the write instruction is issued.	S (Writing)
SM629	Program memory write flag	Off: No write operation On: Executing write operation	This relay is on when the write process to the program memory is in progress. The relay is switched to off when the write process is completed.	S (Writing)
SM630	Program memory overwrite count error flag	Off: The number of rewrite operations is less than 100000 On: The number of rewrite operations reaches 100000	This relay switches to on when the number of program memory rewriting operations reaches 100000 (CPU module must be replaced).	S (Writing)
SM632	Data memory write error	Off: No write operation/normal On: Write error	This relay switches to on when a write error is detected during write operation to the data memory. This relay switches to off when the write instruction is issued.	S (Writing)
SM633	Data memory write flag	Off: No write operation On: Executing write operation	This relay is on when the write process to the data memory is in progress. The relay is switched to off when the write process is completed.	S (Writing)
SM634	Number of rewriting operations error to data memory flag	Off: The number of rewrite operations is less than 100000 On: The number of rewrite operations reaches 100000	This relay switches to on when the number of data memory rewriting operations reaches 100000 (CPU module must be replaced).	S (Writing)
SM652 ^{*3}	Function memory clear request	Off→On:Clear request exists On→Off:Function memory cleared	<ul style="list-style-type: none"> The function memory of the CPU module is initialized (cleared) when this relay is turned off and on while the operating status of the CPU module is in STOP. The system turns off this relay when the initialization (clear) of the function memory is completed (regardless of whether it was successful or not). 	S (Status change)/ U

No.	Name	Data stored	Details	Set by (setting timing)
SM653 ^{*3}	File transfer to data memory request	Off→On:Transfer executed On→Off:Transfer completed	<ul style="list-style-type: none"> Files saved in the function memory (SDRAM) are transferred to the data memory when this relay is changed from off to on. The system turns off this relay when the file transfer is completed (regardless of whether it was successful or not). Note that the files in the function memory are not deleted.	S (Status change)/ U

*1 The CPU module where the SD memory card can be used supports these special relay areas.

*2 The CPU module where the extended SRAM cassette can be used supports these special relay areas.

*3 There are restrictions on the firmware version of the supported CPU module and software version of the engineering tool. ( Page 705 Added and Enhanced Functions)

Instruction related

The following is the list of special relay areas relating to the instruction-related items.

No.	Name	Data stored	Details	Set by (setting timing)
SM699	Dedicated instruction skip flag	Off: Instruction being executed or completed On: Instruction not executed	<ul style="list-style-type: none"> This relay indicates whether the built-in Ethernet function instruction (the SP.SOCOPEN/SP.SOCCLOSE/SP.SOCRCV/S.SOCRCVS/SP.SOCSND/SP.ECPRTCL/SP.SLMPSND/SP.FTPPUT/SP.FTPGET instruction), intelligent function module dedicated instruction, or multiple CPU dedicated instruction has been skipped. (Checking this flag immediately after the instruction issue allows to determine whether or not the dedicated instruction is non-processing (skipped) in the internal processing.) This relay saves/returns while the interrupt program is being executed. 	S (Status change)
SM700	Carry flag	Off: Carry off On: Carry on	<ul style="list-style-type: none"> This relay is a carry flag used while the application instruction is executing. This relay saves/returns while the interrupt program is being executed. 	S (Instruction execution)
SM701	Number of output characters selection	Off: Outputs until reaching NULL code On: Outputs 16 characters	<ul style="list-style-type: none"> ASCII codes are output until reaching NULL (00H) code, when SM701 is off. 16 characters of ASCII codes are output, when SM701 is on. This relay saves/returns while the interrupt program is being executed. 	U
SM702	Search method	Off: Sequential search On: Dichotomizing search	<ul style="list-style-type: none"> The search method in the search instruction can be specified by using this relay. To use the dichotomizing search, data must be sorted. This relay saves/returns while the interrupt program is being executed. 	U
SM703	Data sort instruction sort order	Off: Ascending On: Descending	<ul style="list-style-type: none"> This relay can be used to specify how to arrange data in the data sort instruction: ascending or descending. This relay saves/returns while the interrupt program is being executed. 	U
SM704	Block comparison	Off: Mismatch is detected On: Completely match	<ul style="list-style-type: none"> This relay switches to on when all the data conditions are met in the block data comparison instruction. This relay saves/returns while the interrupt program is being executed. 	S (Instruction execution)
SM705 ^{*1}	Number of conversion digits selection	Off: Fixed number of digits On: Desired number of digits	<ul style="list-style-type: none"> When SM705 is off, the conversion data is specified and output with the fixed number of digits. When SM705 is on, the conversion data is specified and output with the desired number of digits. This relay saves/returns while the interrupt program is being executed. 	U
SM709	DT/TM instruction improper data detection flag	Off: No improper data On: Improper data is detected	<ul style="list-style-type: none"> This relay switches to on when the comparison target data is date data or cannot be recognized as clock data, or the comparison target device (three words) exceeds the specified device range in the DT/TM instruction. This relay saves/returns while the interrupt program is being executed. 	S (Instruction execution)/U
SM752	Dedicated instruction End bit control flag	Off: Automatically controlled On: Not automatically controlled	This relay can be used to set whether the system automatically controls the on/off operation of End bit being used for the dedicated instruction and other (control of End bit which is registered in the End processing of the instruction completion and turned on for only the next one scan (Off: turned on for only one scan after the instruction is completed as well as normal/error End bit, On: turned on when the instruction is completed and the On status is maintained after that)).	U

No.	Name	Data stored	Details	Set by (setting timing)
SM753	File being accessed	Off: Not in progress On: In progress	<ul style="list-style-type: none"> This relay is on during file access by the SP.DEVST instruction. This relay is on while the SP.FTPPUT/SP.FTPGET instruction is being executed. This relay is on while a database access instruction is being executed. *1*3 This relay is on during access to the SD memory card and data memory. This relay is on while a file operation instruction is being executed.*3 	S (Status change)
SM754	BIN/DBIN instruction error control flag	Off: Executes error detection On: No execute error detection	This relay can be switched to on when the error detection is not desirable in the BIN/DBIN instruction.	U
SM755	Scaling data check settings	Off: Performs data check On: Not perform data check	This relay can be used to enable/disable the check whether the scaling data is sorted in ascending order when the SCL/DSCL/SCL2/DSCL2 instruction is being executed.	U
SM756	Module access completion wait control flag	Off: Not wait the completion On: Waits the completion	This relay can be used to determine whether the system must wait until the access is completed before starting the next instruction when the write access instruction to the buffer memory of another module is being executed.	U
SM772*2	CCD/CRC instruction conversion mode (16-bit/8-bit) selection	Off: 16-bit conversion mode On: 8-bit conversion mode	This relay can be used to select 16-bit conversion mode or 8-bit conversion mode with the CCD/CRC instruction.	U
SM773*2	SMOV instruction BCD conversion prohibit flag	Off: BCD conversion enabled On: BCD conversion disabled	This relay switches to on when disabling conversion from BIN data to BCD data with the SMOV instruction.	U
SM774*3	Data table sort instruction sort order	Off: Ascending On: Descending	This relay can be used to specify how to arrange data in the data table sort instruction: ascending or descending.	U
SM775	Selection of refresh processing during the COM instruction execution	Off: Executes all the refresh processings On: Executes the refresh processing specified in SD775	This relay can be used to select the refresh processing target when the COM instruction is executed from two options: all refresh processing or only refresh processing specified in SD775.	U
SM776	Local device setting at CALL	Off: Disables local devices On: Enables local devices	This relay can be used to determine whether the local devices on the subroutine program called when the CALL instruction is being executed are enabled or not.	U
SM777	Local device setting in interrupt programs	Off: Disables local devices On: Enables local devices	This relay can be used to determine whether the local devices are enabled or not when the interrupt program is being executed.	U
SM792	PID bumpless processing (for the complete differentiation PIDCONT instruction)	Off: Matching On: Not matching	This relay can be used to specify whether to match SV to PV in manual mode.	U
SM794	PID bumpless processing (for the inexact differential S.PIDCONT instruction)	Off: Matching On: Not matching	This relay can be used to specify whether to match SV to PV in manual mode.	U
SM796*2	Number of used blocks information for the multiple CPU dedicated instruction (for CPU No.1)	Off: The specified number of blocks is reserved On: The number of blocks specified in SD796 is not reserved	<ul style="list-style-type: none"> This relay switches to on when the number of remaining blocks in the dedicated instruction transfer area to be used in the multiple CPU dedicated instruction (target machine: CPU No.1) drops below the number of blocks specified in SD796. This relay is also on when the instruction is being executed. This relay switches to off when there exist free blocks during the END processing. 	S (Instruction execution/During END)
SM797*2	Number of used blocks information for the multiple CPU dedicated instruction (for CPU No.2)	Off: The specified number of blocks is reserved On: The number of blocks specified in SD797 is not reserved	<ul style="list-style-type: none"> This relay switches to on when the number of remaining blocks in the dedicated instruction transfer area to be used in the multiple CPU dedicated instruction (target machine: CPU No.2) drops below the number of blocks specified in SD797. This relay is also on when the instruction is being executed. This relay switches to off when there exist free blocks during the END processing. 	S (Instruction execution/During END)

No.	Name	Data stored	Details	Set by (setting timing)
SM798 ^{*2}	Number of used blocks information for the multiple CPU dedicated instruction (for CPU No.3)	Off: The specified number of blocks is reserved On: The number of blocks specified in SD798 is not reserved	<ul style="list-style-type: none"> This relay switches to on when the number of remaining blocks in the dedicated instruction transfer area to be used in the multiple CPU dedicated instruction (target machine: CPU No.3) drops below the number of blocks specified in SD798. This relay is also on when the instruction is being executed. This relay switches to off when there exist free blocks during the END processing. 	S (Instruction execution/During END)
SM799 ^{*2}	Number of used blocks information for the multiple CPU dedicated instruction (for CPU No.4)	Off: The specified number of blocks is reserved On: The number of blocks specified in SD799 is not reserved	<ul style="list-style-type: none"> This relay switches to on when the number of remaining blocks in the dedicated instruction transfer area to be used in the multiple CPU dedicated instruction (target machine: CPU No.4) drops below the number of blocks specified in SD799. This relay is also on when the instruction is being executed. This relay switches to off when there exist free blocks during the END processing. 	S (Instruction execution/During END)

*1 The programmable controller CPU with firmware version "28" or later supports these special relay areas. However, there are no restrictions on the version of the R00CPU, R01CPU, and R02CPU.

*2 There are restrictions on the firmware version of the supported CPU module and software version of the engineering tool. (Page 705 Added and Enhanced Functions)

*3 The CPU module where this function can be used supports this special relay area.

Latch area

The following is the list of special relay areas relating to the latch area.

(The CPU module where each function can be used supports these special relay areas.  Page 705 Added and Enhanced Functions)

No.	Name	Data stored	Details	Set by (setting timing)
SM922	Firmware update completion with/without an error	Off: Update completed without an error (including successful completion) On: Update completed with an error	This relay switches to on when the firmware update function (firmware update using an SD memory card) is completed with an error. (switching to on when SD922 is 0100H to 0300H)	S (Initial)
SM940	Operation setting of the device test with execution conditions	Off: Registration disabled On: Registration not disabled	Set the operation when files relevant to the device test with execution conditions are changed.	U
SM953	CPU module data backup error check flag	Off: No error On: Error	<ul style="list-style-type: none"> This relay turns on if an error occurs at the execution of backup of the CPU module. This relay turns off at the start of the CPU module data backup. 	S (Status change)
SM959	CPU module data restoration error check flag	Off: No error On: Error	<ul style="list-style-type: none"> This relay turns on if an error occurs at the execution of restoration of the CPU module. This relay turns off at the start of restoration of the CPU module. 	S (Status change)
SM960	Upper limit setting flag for the number of CPU module backup data	Off: Backup continued On: Backup stopped	<p>This relay specifies the operation of backup when the number of backup data of the CPU module reaches the upper limit. (This relay is valid only when bit 5 of SD944 is on.)</p> <p>Off: After deleting the oldest date stamp folder, the backup is continued.</p> <p>On: The backup is not continued if the upper limit of the number of backup data is exceeded. (In this case, the backup is completed with an error.)</p>	U
SM961	Automatic backup retry failure flag	Off: Retry not executed/Retry being executed On: Retry failed	This relay turns on when the retry of the automatic backup of the CPU module is failed even after the specified number of retries are attempted. This relay turns off at the start of the automatic backup. (This relay does not turn off when SM1351 is on.)	S (Status change)

Data logging function

The following is the list of special relay areas relating to the data logging function. (The R00CPU does not support the use of these functions.)

No.	Name	Data stored	Details	Set by (setting timing)
SM1200	Auto logging setting file and registration status	Off: Mismatch On: Matching	<ul style="list-style-type: none"> This relay is on when the auto logging setting executed (registered) matches with the content of the configuration file stored in the target memory. This relay is off when the setting does not match with the content. 	S (Status change)
SM1201	SD memory card setting file in use flag	Off: Not used On: In use	<ul style="list-style-type: none"> This relay switches to on when the data logging configuration file stored in an SD memory card is being used. This relay switches to on when one or more data logging of the settings No.1 to 10 is registered. The ON state is maintained even when the data logging later enters into suspend/waiting for start without collection/waiting for RUN without collection mode. However, the relay switches to off when all the data logging stops. 	S (Status change)
SM1202	Data memory setting file in use flag	Off: Not used On: In use	<ul style="list-style-type: none"> This relay switches to on when the data logging configuration file stored in the data memory is being used. This relay switches to on when one or more data logging of the settings No.1 to 10 is registered. The ON state is maintained even when the data logging later enters into suspend/waiting for start without collection/waiting for RUN without collection mode. However, the relay switches to off when all the data logging stops. 	S (Status change)
SM1203	Data logging file transfer stop request	Off→On:Stop request exists On→Off:Transfer stopped	<ul style="list-style-type: none"> This relay stops the data logging file transfer according to the value specified in SD1203 when this relay is changed from off to on. This relay turns off when the data logging file transfer is stopped. 	U/S (Status change)
SM1210	Data logging setting No.1 Data logging preparation	Off: Not prepared On: Prepared	<ul style="list-style-type: none"> This relay switches to on when the data logging preparation is completed. The ON state is maintained even when the data logging later enters into suspend/waiting for start without collection/waiting for RUN without collection mode. This relay switches to off when the data logging stops. 	S (Initial)
SM1211	Data logging setting No.1 Data logging start	Off: Suspended/waiting for start On: Start	<ul style="list-style-type: none"> This relay switches to on when the data logging starts. The relay turns off when the data logging is in suspend/waiting for start without collection mode. Associated special relay, such as Data logging collection, Data logging end, Data logging trigger, and After data logging trigger, switches to off simultaneously. This relay also switches to off when the CPU module is moved from RUN to STOP mode and therefore the data collection is halted. 	S (Status change)
SM1212	Data logging setting No.1 Data logging collection	Off: Not in progress On: In progress	This relay switches to on when the data logging starts data collection.	S (Status change)
SM1213	Data logging setting No.1 Data logging end	Off: Not completed On: Completed	This relay switches to on when the data logging is completed. For continuous logging, the corresponding bit switches to on when writing reaches the maximum number of storage files and data logging is completed (with "Stop" set for the operation at the time when the number of save files exceeds the limit). For trigger logging, the corresponding bit switches to on when data collection for the specified number of records has been completed followed by writing into the SD memory card after the trigger condition was satisfied. The bit also switches to on when an error is generated (except for data logging error caused by online program change) during the data logging execution.	S (Status change)
SM1214	Data logging setting No.1 Data logging trigger	Off→On:Triggered	The system switches this relay to on when the specified trigger condition is satisfied.	S (Status change)

No.	Name	Data stored	Details	Set by (setting timing)
SM1215	Data logging setting No.1 After data logging trigger	Off: Not post triggering On: Post triggering	<ul style="list-style-type: none"> This relay switches to on once data logging triggering occurs. The ON state is maintained even when the data logging is completed. However, this relay is off when the data logging is in suspend/waiting for start without collection/stop mode This relay also switches to off when the CPU module is moved from RUN to STOP mode and therefore the data collection is halted. 	S (Status change)
SM1216	Data logging setting No.1 Data logging error	Off: No error On: Error	<ul style="list-style-type: none"> This relay switches to on when a data logging function error is generated. This relay switches to off when the setting is registered or by the stop command from CPU Module Logging Configuration Tool. 	S (Status change)
SM1217	Data logging setting No.1 Data logging data saving in progress	Off: Not in progress On: In progress	This relay turns on when data in the internal buffer is being saved in the SD memory card or function memory with the data logging.	S (Status change)
SM1218	Data logging setting No.1 Logging data storage file switching in progress	Off: Not in progress On: In progress	This relay switches to on when storage file switching is in progress.	S (Status change)
SM1219	Data logging setting No.1 Data logging file transfer execution status flag	Off: Not executed On: Being executed	<ul style="list-style-type: none"> This relay turns on at the start of the data logging file transfer function or transferring of data logging files to the data memory. This relay turns off at the completion of the data logging file transfer function or transferring of data logging transfer files to the data memory. 	S (Status change)
SM1220 to SM1229	Data logging setting No.2	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SM1210 to SM1219).	Same configuration as the setting No.1
SM1230 to SM1239	Data logging setting No.3	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SM1210 to SM1219).	Same configuration as the setting No.1
SM1240 to SM1249	Data logging setting No.4	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SM1210 to SM1219).	Same configuration as the setting No.1
SM1250 to SM1259	Data logging setting No.5	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SM1210 to SM1219).	Same configuration as the setting No.1
SM1260 to SM1269	Data logging setting No.6	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SM1210 to SM1219).	Same configuration as the setting No.1
SM1270 to SM1279	Data logging setting No.7	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SM1210 to SM1219).	Same configuration as the setting No.1
SM1280 to SM1289	Data logging setting No.8	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SM1210 to SM1219).	Same configuration as the setting No.1
SM1290 to SM1299	Data logging setting No.9	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SM1210 to SM1219).	Same configuration as the setting No.1
SM1300 to SM1309	Data logging setting No.10	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SM1210 to SM1219).	Same configuration as the setting No.1
SM1312 to SM1321	Data logging setting No.1 to 10 Data logging suspend/resume flag	Off→On:Suspend On→Off:Resume	<ul style="list-style-type: none"> When this relay changes from off to on, the data logging function is suspended. In an off state of the data logging start SM, no processing is performed. When this relay changes from on to off, the data logging function resumes. In an ON state of the data logging start SM, no processing is performed. 	U

CPU module data backup/restoration function

The following is the list of special relay areas relating to the CPU module data backup/restoration function. (The R00CPU, R01CPU, and R02CPU do not support the use of these functions.)

No.	Name	Data stored	Details	Set by (setting timing)
SM1350	CPU module data backup status flag	Off: Not being executed On: Being executed	This relay turns on during the backup of the CPU module.	S (Status change)
SM1351	CPU module data backup execution request	Off→On: Backup requested On→Off: Backup completed	<ul style="list-style-type: none"> At the timing when this relay turns from off to on, the backup of the CPU module is executed. This relay turns off at the completion of the backup of the CPU module. 	S (Status change)/ U
SM1353	CPU module data restoration status flag	Off: Not being executed On: Being executed	This relay turns on during the restoration of the CPU module.	S (Status change)
SM1354	CPU module data restoration execution request	Off→On: Restoration requested On→Off: Restoration completed	<ul style="list-style-type: none"> At the timing when this relay turns from off to on during STOP, the restoration of the CPU module is executed. This relay turns off at the completion of the restoration of the CPU module. 	S (Status change)/ U
SM1356	Retry status flag for CPU module data automatic backup	Off: Not being executed On: Being executed	This relay turns on during the retry of the automatic backup of the CPU module.	S (Status change)

iQ Sensor Solution data backup/restoration function

The following is the list of special relay areas relating to the iQ Sensor Solution data backup/restoration function. (The R00CPU does not support the use of these functions.)

No.	Name	Data stored	Details	Set by (setting timing)
SM1360	Right-to-use request for iQ Sensor Solution data backup	Off→On: Right to use requested On→Off: Right to use acquired/ released	<ul style="list-style-type: none"> This relay requests acquiring or releasing the right to use of the data backup/restoration of iQ Sensor Solution. At the timing when this relay turns from off to on, the relay requests the right to use with the value specified in SD1360. This relay turns off when the right to use has been acquired or released. 	S (Status change)/ U
SM1361	iQ Sensor Solution backup request	Off→On: Backup requested On→Off: Backup completed	<ul style="list-style-type: none"> This relay requests the data backup of iQ Sensor Solution. At the timing when this relay turns from off to on, the backup of the set device(s) is executed. This relay turns off at the completion of the data backup of iQ Sensor Solution. This relay turns from on to off when the right to use is acquired. 	S (Status change)/ U
SM1362	iQ Sensor Solution backup normal completion	Off: Other than normal completion On: Completed normally	<ul style="list-style-type: none"> This relay turns on when the iQ Sensor Solution data backup is completed normally. When the iQ Sensor Solution data backup is completed with an error, SM1363 turns on and this relay remains off. This relay turns from on to off when the right to use is acquired or the backup is requested. 	S (Status change)
SM1363	iQ Sensor Solution backup error completion	Off: Other than error completion On: Completed with an error	<ul style="list-style-type: none"> This relay turns on when the iQ Sensor Solution data backup is completed with an error. The error code is stored into SD1376 or SD1377. When the iQ Sensor Solution data backup is completed normally, SM1362 turns on and this relay remains off. This relay turns from on to off when the right to use is acquired or the backup is requested. 	S (Status change)
SM1364	iQ Sensor Solution restoration request	Off→On: Restoration requested On→Off: Restoration completed	<ul style="list-style-type: none"> This relay requests the iQ Sensor Solution data restoration. At the timing when this relay turns from off to on, the restoration of the set device(s) is executed. This relay turns off at the completion of the iQ Sensor Solution data restoration. This relay turns from on to off when the right to use is acquired. 	S (Status change)/ U

A

No.	Name	Data stored	Details	Set by (setting timing)
SM1365	iQ Sensor Solution restoration normal completion	Off: Other than normal completion On: Completed normally	<ul style="list-style-type: none"> This relay turns on when the iQ Sensor Solution data restoration is completed normally. When the iQ Sensor Solution data restoration is completed with an error, SM1366 turns on and this relay remains off. This relay turns from on to off when the right to use is acquired or the restoration is requested. 	S (Status change)
SM1366	iQ Sensor Solution restoration error completion	Off: Other than error completion On: Completed with an error	<ul style="list-style-type: none"> This relay turns on when the iQ Sensor Solution data restoration is completed with an error. The error code is stored into SD1376 or SD1377. When the iQ Sensor Solution data restoration is completed normally, SM1365 turns on and this relay remains off. This relay turns from on to off when the right to use is acquired or the restoration is requested. 	S (Status change)
SM1367	iQ Sensor Solution backup/restoration suspend request	Off→On: Suspension requested On→Off: Suspension completed	<ul style="list-style-type: none"> This relay requests the suspension of the iQ Sensor Solution data backup/restoration. At the timing when this relay turns from off to on, the iQ Sensor Solution data backup/restoration is suspended. This relay turns off at the suspension completion of the iQ Sensor Solution data backup/restoration. This relay turns from on to off when the right to use is acquired or the backup/restoration is requested. 	S (Status change)/ U

File transfer function (FTP client)

The following is the list of special relay areas relating to the file transfer function (FTP client).

(The CPU module where this function can be used supports these special relay areas.  MELSEC iQ-R Ethernet User's Manual (Application))

No.	Name	Data stored	Details	Set by (setting timing)
SM1392	FTP client connection status	Off: Not connected (disconnected) On: Connected	This relay turns on when the connection with the FTP server is established. This relay turns off when the connection with the FTP server is cut off.	S (Status change, END processing)

Global label assignment information

The following is the list of special relay areas relating to global label assignment information. (The R00CPU, R01CPU, and R02CPU do not support the use of these functions.)

No.	Name	Data stored	Details	Set by (setting timing)
SM1398	Operation setting during global label assignment information update	Off: Response available during update On: Response unavailable during update	This relay configures the operation setting while global label assignment information is being updated.	U

Memory dump function

The following is the list of special relay areas relating to the memory dump function. (The R00CPU does not support the use of these functions.)

No.	Name	Data stored	Details	Set by (setting timing)
SM1472	Memory dump in progress	Off: Memory dump not executed On: Memory dump in progress	Turns on if memory dump is in progress, and turns off if memory dump is not executed.	S (Status change)
SM1473	Memory dump completed	Off: Not completed On: Completed	Turns on at the time when collection of the data and save to the SD memory card are completed after the establishment of the trigger condition. Thereafter, the ON state remains even if memory dump is executed again. If the trigger condition is established again, On changes to Off.	S (Status change)

Event history function

The following is the list of special relay areas relating to the event history function.

(The CPU module where this function can be used supports these special relay areas.  Page 182 Event history logging restriction)

No.	Name	Data stored	Details	Set by (setting timing)
SM1464	Event history logging restriction status	Off: Not restricted On: Restricted	Turns on when the event history logging has been restricted. The relay remains on even after the restriction is lifted. Restricted modules can be identified in SD1464 to SD1467. SM1466 turns on when the event history logging of the CPU module is restricted and the event category is error (minor error), and SM1467 is turned on when the event history logging of the CPU module is restricted and the event category is information or warning.	S (Status change)
SM1466	Event history logging restriction status of CPU module (minor error)	Off: Not restricted On: Restricted	Turns on when CPU module event history logging whose event category is error (minor error) was restricted. The relay remains on even after the restriction is lifted.	S (Status change)
SM1467	Event history logging restriction status of CPU module (information, warning)	Off: Not restricted On: Restricted	Turns on when CPU module event history logging whose event category is information or warning was restricted. The relay remains on even after the restriction is lifted.	S (Status change)

CPU module database access function

The following is the list of special relay areas relating to the CPU module database access function. (The R00CPU, R01CPU, and R02CPU do not support the use of these functions.)

No.	Name	Data stored	Details	Set by (setting timing)
SM1497	Memory card free space flag for CPU module database	Off: 20MB or more free space On: Less than 20MB free space	Turns on when the free space of the SD memory card storing the CPU module database is 20MB or less.	S (Status change)
SM1498	CPU module database start-up flag	Off: Before start-up On: After start-up	Turns on only when the CPU module database access function is enabled by the module parameter setting and the database can be accessed.	S (Status change)
SM1499	CPU module database start-up failure	Off: Not failed On: Failed	Turns on only when the CPU module database access function is enabled by the module parameter setting but the database start-up is failed.	S (Status change)

Ethernet function

The following is the list of special relay areas relating to the Ethernet function.

No.	Name	Data stored	Details	Set by (setting timing)
SM1512 *3	FTP server function file path name switching setting Enable	Off: Disabled On: Enabled	<ul style="list-style-type: none"> When this relay is changed from off to on, the directory delimiter in a file path name of the CPU module is switched from "\" to "/". The drive number of the file path name can be omitted depending on the stored value in SD1512 when the relay is turned off and on. This setting is enabled while this relay is on. When the directory delimiter is changed from "\" to "/", the CPU module can receive a command with "\" as the directory delimiter, however, the CPU module sends only a command with "/" as the directory delimiter. This relay is on when the setting is enabled by executing the FTP command (quote path-delimiter). Do not turn on and off/off and on this relay during operation. Doing so may cause malfunction. 	S (Status change)/U
SM1513 *3	FTP server function file path name switching setting error	Off: No error On: Error	<ul style="list-style-type: none"> This relay is turned on when FTP server function file path name switching setting is failed to enable and the relay is turned off when the setting is enabled. The error cause is stored in SD1513. This relay is turned off when SM1512 is changed from on to off, the setting is enabled by executing the FTP command (quote path-delimiter), or the setting is turned off (SM1512 is off). 	S (Status change)
SM1520	IP address storage area write request	Off→On:Write request exists On→Off:Writing completed	<ul style="list-style-type: none"> When this relay is changed from off to on, IP address settings stored in SD1518 to SD1525 are written to the IP address storage area (system memory*1) of the CPU module. Once write to the IP address storage area (system memory*1) is completed (regardless of whether it was successful or not), this relay is turned off. 	S (Status change)/U
SM1521	IP address storage area write error	Off: No error On: Error	This relay is turned to on when write to the IP address storage area (system memory*1) failed, and off when it was successful.	S (Status change)
SM1522	IP address storage area clear request	Off→On:Clear request exists On→Off:Storage area cleared	When this relay is changed from off to on, the IP address storage area (system memory*1) is cleared. Once clear of the IP address storage area (system memory*1) is completed (regardless of whether it was successful or not), this relay is turned off.	S (Status change)/U
SM1523	IP address storage area clear error	Off: No error On: Error	This relay is turned to on when clear of the IP address storage area (system memory*1) failed, and off when it was successful.	S (Status change)
SM1524	Initial processing successful completion state	Off: Completed with an error On: Completed normally	This relay is turned on when the initial processing for the Ethernet function was completed successfully.*2 When the initial processing was completed with an error, SM1525 is turned on and SM1524 stays off.	S (Status change)
SM1525	Initial processing error completion state	Off: Completed normally On: Completed with an error	This relay is turned on when the initial processing for the Ethernet function was completed with an error.*2 When the initial processing was completed successfully, SM1524 is turned on and SM1525 stays off.	S (Status change)

*1 This is the memory used by the system when the CPU module is executing functions.

*2 Ethernet function initial processing involves updating parameters set for data communication to Ethernet-equipped modules to enable communication with external devices. Initial processing of Ethernet-equipped modules is performed by setting Ethernet parameters, writing them to the CPU module, and then powering off and on or resetting the CPU module. Note that if Ethernet parameters are not set, initial processing of Ethernet-equipped modules will be performed based on default parameters. (SM1524 (initial processing successful completion status) turns on the moment initial processing is complete, and communication with external devices becomes possible.)

*3 The CPU module where this function can be used supports this special register area. (MELSEC iQ-R Ethernet User's Manual (Application))

CC-Link IE Field Network Basic function

The following is the list of special relay areas relating to the CC-Link IE Field Network Basic function.

(The CPU module where this function can be used supports these special relay areas.  Page 705 Added and Enhanced Functions)

No.	Name	Data stored	Details	Set by (setting timing)
SM1536	Cyclic transmission status	Off: Not performed On: Being performed	<ul style="list-style-type: none">• This relay turns on when the cyclic transmission starts.• This relay is turned off when the cyclic transmission stops.	S (Every END)
SM1540	Data link status	Off: All stations normal On: One or more faulty stations	<ul style="list-style-type: none">• This relay turns on when an error exists even in one slave station.• The status of each slave station can be checked in SD1540 to SD1543.	S (Every END)

Appendix 5 List of Special Register Areas

The following table lists items in the list.

Item	Description
No.	Special register number
Name	Special register name
Data stored	Data stored in the special register
Details	Detailed description of the data stored
Set by (setting timing)	Set side of data (system or user) and timing when data is set by the system <Set by> <ul style="list-style-type: none">• S: System• U: User (program, engineering tool, GOT, or other testing operations from external device)• U/S: User and system <Set timing> <ul style="list-style-type: none">• Every END: Data is set every time END processing is performed.• Initial: Data is set when initial processing is performed (e.g. powering on the system, changing the operating status from STOP to RUN).• Status change: Data is set when the status is changed.• Error: Data is set when an error occurs.• Instruction execution: Data is set when an instruction is executed.• Request: Data is set when requested by a user (using the special relay).• Switch change: Data is set when the switch of the CPU module is changed.• Card insertion/removal: Data is set when an SD memory card is inserted or removed.• Writing: Data is set when a user performs a writing operation.• During END: Data is set when END processing is performed.

Point

Do not change the data set by the system in a program or by a device test. Doing so may result in system down or communication failure.

Diagnostic information

The following is the list of special register areas relating to the diagnostic information.

No.	Name	Data stored	Details	Set by (setting timing)
SD0	Latest self-diagnostics error code	Latest self-diagnostics error code	Error codes are stored in a hexadecimal value when the diagnostics detects an error.	S (Error)
SD1	Latest self-diagnostics error time	Latest self-diagnostics error time	The year value (four digits) of the date/time when SD0 data was updated is stored as a BIN code.	S (Error)
SD2			The month value of the date/time when SD0 data was updated is stored as a BIN code.	
SD3			The day value of the date/time when SD0 data was updated is stored as a BIN code.	
SD4			The hour value of the date/time when SD0 data was updated is stored as a BIN code.	
SD5			The minute value of the date/time when SD0 data was updated is stored as a BIN code.	
SD6			The second value of the date/time when SD0 data was updated is stored as a BIN code.	
SD7			The day of the week value of the date/time when SD0 data was updated is stored as a BIN code. (0: Sun, 1: Mon, 2: Tue, 3: Wed, 4: Thu, 5: Fri, 6: Sat)	
SD10	Self-diagnostic error number	Self-diagnostic error number 1	The maximum of 16 types of error codes are stored into SD10 onwards when the diagnostics detects an error (The same error code as one already stored in SD10 onwards is not stored). The 17th error code onwards are not stored. Also error codes are not stored when 16 types of error codes have already been stored into SD10 to SD25.	S (Error)
SD11		Self-diagnostic error number 2		
SD12		Self-diagnostic error number 3		
SD13		Self-diagnostic error number 4		
SD14		Self-diagnostic error number 5		
SD15		Self-diagnostic error number 6		
SD16		Self-diagnostic error number 7		
SD17		Self-diagnostic error number 8		
SD18		Self-diagnostic error number 9		
SD19		Self-diagnostic error number 10		
SD20		Self-diagnostic error number 11		
SD21		Self-diagnostic error number 12		
SD22		Self-diagnostic error number 13		
SD23		Self-diagnostic error number 14		
SD24		Self-diagnostic error number 15		
SD25		Self-diagnostic error number 16		
SD49 ^{*1}	Error detection invalidation setting	Error detection invalidation setting	Specify a function for which detection of continuation errors is invalidated. (On: Invalidate (do not detect an error), Off: Do not invalidate (detect an error)) <div style="text-align: right; margin-right: 20px;">b0</div> <div style="border: 1px solid black; width: 100px; height: 15px; margin-left: auto; margin-right: 0;"></div> <p>b0: Built-in Ethernet port communication error</p>	U
SD53	AC/DC DOWN	The number of AC/DC DOWN detections	The value of this register increments by one and stored as a BIN code, each time input voltage drops to 85% (AC power)/65% (DC power) or less of the nominal value while the CPU module is carrying out an operation. A counting cycle from 0 to 65535 to 0 is repeated.	S (Error)
SD60	Number of module with blown fuse	Number of module with blown fuse	<ul style="list-style-type: none"> The lowest I/O number of module in which a fuse blew is stored. The fuse blown state check is also done for output modules on the remote I/O station. 	S (Error)
SD61	I/O module verify error module number	I/O module verify error module number	<ul style="list-style-type: none"> The lowest I/O number of the module which has an error detected by the I/O module verification is stored. I/O module verification is also done for modules on the remote I/O station. 	S (Error)
SD62	Annunciator number	Annunciator number	The annunciator number which is detected first is stored.	S (Instruction execution)

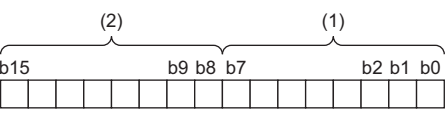

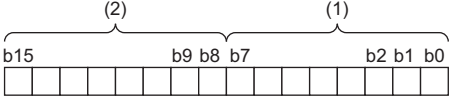

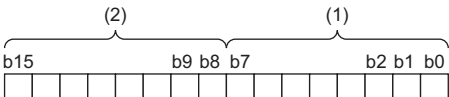

No.	Name	Data stored	Details	Set by (setting timing)
SD63	Number of annunciators	Number of annunciators	The number of detected annunciator is stored.	S (Instruction execution)
SD64 to SD79	Table of detected annunciator numbers	Detected annunciator number	<ul style="list-style-type: none"> Numbers of activated annunciators are sequentially registered into SD64 to SD79, each time an annunciator (F) is turned on by the SET F instruction. Number of the annunciator deactivated by the RST F instruction is removed from register areas SD64 to SD79, and the numbers of annunciators which were lined up behind the removed one move forward one by one. When the number of detected annunciators has already reached 16, the number of a newly detected annunciator is not stored into SD64 to SD79. For details on the annunciator, refer to the annunciator (F) (Page 419 Annunciator (F))	S (Instruction execution)
SD80	Detailed information 1 information category	Detailed information 1 information category code	<ul style="list-style-type: none"> Detailed information 1 information category code is stored. <div style="text-align: center;">  </div> <p>b0 to b7: Information category code b8 to b15: Unused (fixed to 0)</p> <ul style="list-style-type: none"> The following codes are stored into the information category code. <p>0: N/A 1: program position information 2: drive number and file name 4: Parameter information 5: System configuration information 6: number of times information 7: time information 24: Failure information 46: CPU module data backup/restoration folder information</p>	S (Error)
SD81 to SD111	Detailed information 1	Detailed information 1	<ul style="list-style-type: none"> Detailed information 1 corresponding to the error code (SD0) is stored. The type of the detailed information 1 can be obtained using SD80 (The value of the "Detailed information 1 information category code" stored in SD80 corresponds to the following (1), (2), (4) to (7), and (24).) <p>(1) Error location information SD81: With or without specification</p> <div style="text-align: center;">  </div> <p>b0: Argument number b1: SFC block number b2: SFC step number b3: SFC transition number b4: Sequence step number b5: FB number b6: File name</p> <ul style="list-style-type: none"> SD82: Argument number (stored in the range from 1) SD83: SFC block number SD84 to SD85: SFC step number SD86 to SD87: SFC transition number SD88 to SD89: Step number SD90: FB number SD91 to SD98: File name (first eight characters of Unicode string) <p>(2) Drive number and file name SD81: With or without specification</p> <div style="text-align: center;">  </div> <p>b0: Drive number b1: File name</p> <ul style="list-style-type: none"> SD82: Drive number SD83 to SD90: File name (first eight characters of Unicode string) 	S (Error)

SD151 *1	Power supply failure detection status	Power supply failure detection status (bit pattern) 0: Not detected/power-off/no power supply module 1: Detected	<ul style="list-style-type: none"> For the redundant power supply base unit, failure detection status of the power supply module is stored using the following bit pattern. Bits corresponding to power-off or empty slots for the power supply module turn off. In a multiple CPU system, the status is stored only to the CPU module No.1.  <p>(1) Failure detection status of the power supply module 1 b0: Main base unit b1 to b7: 1st to 7th level of the extension base unit (2) Failure detection status of the power supply module 2 b8: Main base unit b9 to b15: 1st to 7th level of the extension base unit</p>	S (Status change)
SD152 *1	Momentary power failure detection count (power supply module 1)	Momentary power failure detection count for power supply module 1	<ul style="list-style-type: none"> This register counts the number of momentary power failures. This register monitors the status of the power supply module mounted on the main base unit and counts the number of momentary power failures. When the CPU module starts up, the counters of the both power supplies are cleared to 0. When one of the two power supply is powered off, the corresponding counter to the one powered off is cleared to 0. The counter is incremented by one upon one momentary power failure on each power supply. A counting cycle from 0 to 65535 to 0 is repeated. In a multiple CPU system, the status is stored only to the CPU module No.1. 	S (Status change)
SD153 *1	Momentary power failure detection count (power supply module 2)	Momentary power failure detection count for power supply module 2	<ul style="list-style-type: none"> When the CPU module starts up, the counters of the both power supplies are cleared to 0. When one of the two power supply is powered off, the corresponding counter to the one powered off is cleared to 0. The counter is incremented by one upon one momentary power failure on each power supply. A counting cycle from 0 to 65535 to 0 is repeated. In a multiple CPU system, the status is stored only to the CPU module No.1. 	S (Status change)
SD154 *1	Details of the invalid power supply module	Details of the invalid power supply module (bit pattern) 0: Valid/power-off/no power supply module 1: Invalid	<ul style="list-style-type: none"> For the redundant power supply base unit, when an invalid power supply module exists, the status is stored using the following bit pattern. Bits corresponding to power-off or empty slots for the power supply module turn off. In a multiple CPU system, the status is stored only to the CPU module No.1.  <p>(1) Details of the invalid power supply module 1 b0: Main base unit b1 to b7: 1st to 7th level of the extension base unit (2) Details of the invalid power supply module 2 b8: Main base unit b9 to b15: 1st to 7th level of the extension base unit</p>	S (Status change)

*1 There are restrictions on the firmware version of the supported CPU module. (Page 705 Added and Enhanced Functions)

System information

The following is the list of special register areas relating to the system information.

No.	Name	Data stored	Details	Set by (setting timing)																								
SD160 ^{*1}	Firmware version	Firmware version	The firmware version is stored.	S (Initial)																								
SD164 to SD171 ^{*3}	Production information	Production information	<p>This register stores the production information.</p> <p>b15 ... b8b7 ... b0</p> <table border="1"> <tr> <td>SD164</td> <td>2nd digit from the left</td> <td>1st digit from the left</td> </tr> <tr> <td>SD165</td> <td>4th digit from the left</td> <td>3rd digit from the left</td> </tr> <tr> <td colspan="3" style="text-align: center;">⋮</td> </tr> <tr> <td>SD171</td> <td>16th digit from the left</td> <td>15th digit from the left</td> </tr> </table> <p>Example: The production information is 123456789ABCDEF.</p> <p>b15 ... b8b7 ... b0</p> <table border="1"> <tr> <td>SD164</td> <td>32H (2)</td> <td>31H (1)</td> </tr> <tr> <td>SD165</td> <td>34H (4)</td> <td>33H (3)</td> </tr> <tr> <td colspan="3" style="text-align: center;">⋮</td> </tr> <tr> <td>SD171</td> <td>47H (G)</td> <td>46H (F)</td> </tr> </table>	SD164	2nd digit from the left	1st digit from the left	SD165	4th digit from the left	3rd digit from the left	⋮			SD171	16th digit from the left	15th digit from the left	SD164	32H (2)	31H (1)	SD165	34H (4)	33H (3)	⋮			SD171	47H (G)	46H (F)	S (Initial)
SD164	2nd digit from the left	1st digit from the left																										
SD165	4th digit from the left	3rd digit from the left																										
⋮																												
SD171	16th digit from the left	15th digit from the left																										
SD164	32H (2)	31H (1)																										
SD165	34H (4)	33H (3)																										
⋮																												
SD171	47H (G)	46H (F)																										
SD200	Status of switch	Status of CPU switch	The switch status of the CPU module is stored as follows: 0: RUN, 1: STOP	S (Switch change)																								
SD201	LED status	CPU-LED state	<p>This register stores the information that indicates LED status (0: off, 1: on, 2: flashing (fast/slow)) of the CPU module in the following bit patterns.</p> <p>b15 b12 b11 b8 b7 b4 b3 b0</p> <p>(1) READY (2) ERROR (3) PROGRAM RUN (4) USER (5) BATTERY (6) CARD READY (7) CARD ACCESS (8) FUNCTION</p> <ul style="list-style-type: none"> • For the R00CPU, (5), (6), and (7) are fixed to 0. • For the R01CPU and R02CPU, (5) is fixed to 0. 	S (Status change)																								
SD203	Operating status of CPU	Operating status of CPU	The operating status of the CPU module is stored as follows: 0: RUN, 2: STOP, 3: PAUSE	S (Every END)																								
SD210	Clock data	Clock data (year)	The year value (four digits) of the clock data is stored as a BIN code.	S/U (Request)																								
SD211		Clock data (month)	The month value of the clock data is stored as a BIN code.	S/U (Request)																								
SD212		Clock data (day)	The day value of the clock data is stored as a BIN code.	S/U (Request)																								
SD213		Clock data (hour)	The hour value of the clock data is stored as a BIN code.	S/U (Request)																								
SD214		Clock data (minute)	The minute value of the clock data is stored as a BIN code.	S/U (Request)																								
SD215		Clock data (second)	The second value of the clock data is stored as a BIN code.	S/U (Request)																								
SD216		Clock data (day of the week)	The day of the week value of the clock data is stored as a BIN code. (0: Sun, 1: Mon, 2: Tue, 3: Wed, 4: Thu, 5: Fri, 6: Sat)	S/U (Request)																								
SD218	Time zone setting value	Time zone (in minutes)	<p>The time zone setting value specified in the parameter is stored in increments of minutes.</p> <p>Example: when the setting value of the time zone is "UTC+9," the result of the following equation is stored into SD218: 9×60 (minutes) = 540.</p>	S (Initial)																								

No.	Name	Data stored	Details	Set by (setting timing)								
SD228 ²	Multiple CPU system information	Number of CPU modules	The number of CPU modules which constitute a multiple CPU system is stored (one to four, including those reserved).	S (Initial)								
SD229 ²		CPU module number in multiple CPU system	The number of this CPU No. is stored when a multiple CPU system is configured.	S (Initial)								
SD230 ²		CPU No.1 operating status	The operation information for each CPU No. is stored (the amount of stored information depending on the number of CPU modules indicated in SD228 is stored). b15 b14 ... b8 b7 b6 b5 b4 b3 ... b0 (4) <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td style="width: 40px;"></td><td style="width: 40px;"></td><td style="width: 40px;"></td><td style="width: 40px;"></td><td style="width: 40px;"></td></tr></table>						S (During END/Error)			
SD231 ²		CPU No.2 operating status										
SD232 ²		CPU No.3 operating status										
SD233 ²	CPU No.4 operating status											
		(1) The operating status is stored in b0 to b3. • 0: RUN • 2: STOP • 3: PAUSE • 4: INITIALIZE • FH: RESET (2) The classification is stored in b4 and b5. However, minor or moderate errors will be those set in the CPU parameter RAS settings, system parameter I/O assignment settings, and multiple CPU settings. • 0: Normal • 1: Minor error (error code: 1000H to 1FFFH) • 2: Moderate error (error code: 2000H to 3BFFH) • 3: Major error (error code: 3C00H to 3FFFH) (3) The stop error flag is stored in b7. • 0: No stop error • 1: Stop error (4) The CPU module mounting status is stored in b15. • 0: Not mounted • 1: Mounted										
SD241	Extension stage number	0: base unit only 1 to 7: number of extension base units	The maximum number of implemented extension base units is stored.	S (Initial)								
SD242	Identification for whether or not Q series module can be mounted	Identification of the base type 0: Cannot be mounted (There is no base unit on which the Q series module can be mounted.) 1: Can be mounted (There is a base unit on which the Q series module can be mounted.)	Identify whether or not Q series module can be mounted. When no SD memory card is inserted, the value is fixed to 0. b7 b2 b1 b0 <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td style="width: 40px;"></td><td style="width: 40px;"></td><td style="width: 40px;"></td><td style="width: 40px;"></td><td style="width: 40px;"></td></tr></table>						S (Initial)			
SD243	Number of base slots	Number of base slots	The number of slots of the base unit, which is specified in the Base / power supply / extension cable setting of system parameters, is stored. When the number of slots of the base unit is not specified by the system parameter, that of the mounted base unit is stored. b15 b12 b11 b8 b7 b4 b3 b0 SD243 <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td style="width: 40px;">3</td><td style="width: 40px;">2</td><td style="width: 40px;">1</td><td style="width: 40px;">0</td></tr></table> SD244 <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td style="width: 40px;">7</td><td style="width: 40px;">6</td><td style="width: 40px;">5</td><td style="width: 40px;">4</td></tr></table>	3	2	1	0	7	6	5	4	S (Initial)
3				2	1	0						
7	6	5	4									
SD244	0: Main 1 to 7: Extension 1 to 7											
SD250	Loaded maximum I/O	Loaded maximum I/O number	The value obtained by dividing the last I/O number for an implemented unit plus one by 16 is stored. Example 1: Last I/O number 010FH • SD250 = 0011H Example 2: Last I/O number 0FFFH • SD250 = 0100H	S (Initial)								

No.	Name	Data stored	Details	Set by (setting timing)	
SD260	Number of points assigned to bit devices	X (L)	The number of points assigned to the X device is stored in 32 bits.	S (Initial)	
SD261		X (H)			
SD262		Y (L)	The number of points assigned to the Y device is stored in 32 bits.	S (Initial)	
SD263		Y (H)			
SD264		M (L)	<ul style="list-style-type: none"> The number of points assigned to the M device is stored in 32 bits. The number of points is stored even when the number of points assigned to M is 32K or less. 	S (Initial)	
SD265		M (H)

*1 The programmable controller CPU with firmware version "28" or later supports these special register areas. However, there are no restrictions on the version of the R00CPU, R01CPU, and R02CPU.

*2 There are restrictions on the firmware version of the supported CPU module and software version of the engineering tool. (Page 705 Added and Enhanced Functions)

*3 The CPU module with the following firmware versions supports these special register areas.

- R00CPU, R01CPU, R02CPU: "24" or later
- CPU modules other than R00CPU, R01CPU, and R02CPU: "57" or later

SFC information

The following is the special register area relating to SFC information.

(There are restrictions on the firmware version of the supported CPU module and software version of the engineering tool.

☞ Page 705 Added and Enhanced Functions)

No.	Name	Data stored	Details	Set by (setting timing)
SD329	Online change (SFC block) target block number	SFC block number	<ul style="list-style-type: none"> A target SFC block number is stored while the online change (SFC block) is being executed (SM329 = ON). FFFFH is stored when the online change (SFC block) is not executed. 	S (Status change)

System clock

The following is the list of special register areas relating to the system clock.

No.	Name	Data stored	Details	Set by (setting timing)
SD412	One second counter	The number of counts that is counted once per second.	<ul style="list-style-type: none"> The value in this register increments by one for each second after the CPU module enters in RUN mode. A counting cycle from 0 to 65535 to 0 is repeated. 	S (Status change)
SD414	2n second clock setting	Unit setting for 2n second clock	<ul style="list-style-type: none"> The n value of the 2n second clock is stored (Default: 30). Configurable range is -32768 to 32767 (0 to FFFFH). 	U
SD415	2n ms clock setting	Unit setting for 2n ms clock	<ul style="list-style-type: none"> The n value for the 2n ms clock is stored. (Default: 30). Configurable range is -32768 to 32767 (0 to FFFFH). 	U
SD420	Scan counter	The number of counts that is counted once for each scan.	<ul style="list-style-type: none"> The value in this register increments by one for each scan after the CPU module enters in RUN mode (however, the count is skipped for scans by the initial execution type program). A counting cycle from 0 to 65535 to 0 is repeated. 	S (Every END)
SD1184 *1	System clock (SM400 to SM403) every end update setting	System clock (SM400 to SM403) every end update setting	<p>A value to enable or disable the system clock (SM400 to SM403) every end update is stored.</p> <p>Turning off and on SM1184 (System clock (SM400 to SM403) every end update setting request) submits a request to set either of the following two values.</p> <ul style="list-style-type: none"> AA00H: Disabled AA55H: Enabled 	U
SD1185 *1	System clock (SM400 to SM403) every end update setting error cause	Error cause for the case when failing in writing into setting storage area	<p>This register stores an error cause when the setting value has failed to be written to the setting storage area. (This register operates together with SM1185 (System clock (SM400 to SM403) every end update setting error).)</p> <ul style="list-style-type: none"> 0000H: No error 0100H: Value in SD1184 out of range 0200H: Setting value failed to be written 	S (Status change)

*1 The CPU module with the following firmware versions supports these special register areas.

- R00CPU, R01CPU, R02CPU: "24" or later
- CPU modules other than R00CPU, R01CPU, and R02CPU: "57" or later

Fixed scan function information

The following is the list of special register areas relating to the fixed scan function information.

No.	Name	Data stored	Details	Set by (setting timing)
SD480	Number of cycle overrun events for inter-module synchronization cycle program (I44)	0: No cycle overrun event 1 to 65535: Accumulated number of cycle overrun events	The number of events in which the inter-module synchronous interrupt program (I44) has not been completed within the inter-module synchronization cycle or the program cannot be executed due to various reasons, such as execution of a higher-priority interrupt program and interrupt disabling by the instruction execution is stored. When the count exceeds 65535, it returns to 0 and starts a new cycle. The number of cycle overrun events is counted regardless of the setting content for the error check setting of the RAS setting (execution check of the inter-module synchronous interrupt (I44)).	S (Status change)
SD481 ¹	Number of cycle overrun events for multiple CPU synchronization program (I45)	0: No cycle overrun event 1 to 65535: Accumulated number of cycle overrun events	The number of events in which the multiple CPU synchronization program (I45) has not been completed within the fixed scan communication cycle or the program cannot be executed due to various reasons, such as execution of a higher-priority interrupt program and interrupt disabling by the instruction execution is stored. When the count exceeds 65535, it returns to 0 and starts a new cycle. The number of cycle overrun events is counted regardless of the setting content for the error check setting of the RAS setting (execution check of the multiple CPU synchronization program (I45)).	S (Status change)
SD484 ¹	Number of execution section excess errors for multiple CPU synchronization interrupt program	0: No error (Normal) 1 to 65535: Accumulated number of errors	The number of events in which the program is executed exceeding the program execution section within the specified multiple CPU synchronization cycle is stored. When the count exceeds 65535, it returns to 0 and starts a new cycle. Note that the number of error occurrences is counted regardless of the CPU module operation setting for error detections within the RAS setting of the CPU parameter.	S (Status change)
SD500	Execution program number	Execution program number	The program number which is currently executed is stored as a BIN value.	S (Status change)
SD518	Initial scan time	Initial scan time (unit: ms)	<ul style="list-style-type: none"> The initial scan time is stored into SD518 and SD519 (it is measured in microseconds (μs).) SD518: stores a value in the ms place (storage range: 0 to 65535) SD519: stores a value in the μs place (storage range: 0 to 999) These areas are cleared to 0 when the operating status of the CPU module is switched to STOP. 	S (Every END)
SD519		Initial scan time (unit: μ s)		
SD520	Current scan time	Current scan time (unit: ms)	<ul style="list-style-type: none"> The current scan time is stored into SD520 and SD521 (it is measured in increments of μs). SD520: stores a value in the ms place (storage range: 0 to 65535) SD521: stores a value in the μs place (storage range: 0 to 999) Example: If the current scan time is 23.6ms, the following values are stored: SD520 = 23 SD521 = 600 These areas are cleared to 0 when the operating status of the CPU module is switched from STOP to RUN. 	S (Every END)
SD521		Current scan time (unit: μ s)		
SD522	Minimum scan time	Minimum scan time (unit: ms)	<ul style="list-style-type: none"> The minimum value of the scan time other than one for the initial execution program is stored into SD522 and SD523 (it is measured in increments of μs). SD522: stores a value in the ms place (storage range: 0 to 65535) SD523: stores a value in the μs place (storage range: 0 to 999) These areas are cleared to 0 when the operating status of the CPU module is switched from STOP to RUN. 	S (Every END)
SD523		Minimum scan time (unit: μ s)		
SD524	Maximum scan time	Maximum scan time (unit: ms)	<ul style="list-style-type: none"> The maximum value of the scan time other than one for the initial execution program is stored into SD524 and SD525 (it is measured in increments of μs). SD524: stores a value in the ms place (storage range: 0 to 65535) SD525: stores a value in the μs place (storage range: 0 to 999) These areas are cleared to 0 when the operating status of the CPU module is switched from STOP to RUN. 	S (Every END)
SD525		Maximum scan time (unit: μ s)		

No.	Name	Data stored	Details	Set by (setting timing)
SD526	END processing time	END processing time (unit: ms)	<ul style="list-style-type: none"> The time period from completion of a scan program until start of the next scan is stored into SD526 to SD527 (it is measured in increments of μs). SD526: stores a value in the ms place (storage range: 0 to 65535) SD527: stores a value in the μs place (storage range: 0 to 999) These areas are cleared to 0 when the operating status of the CPU module is switched from STOP to RUN. 	S (Every END)
SD527		END processing time (unit: μs)		
SD528	Constant scan wait time	Constant scan wait time (unit: ms)	<ul style="list-style-type: none"> The waiting time specified in the constant scan setting process is stored into SD528 and SD529 (it is measured in increments of μs). SD528: stores a value in the ms place (storage range: 0 to 65535) SD529: stores a value in the μs place (storage range: 0 to 999) These areas are cleared to 0 when the operating status of the CPU module is switched from STOP to RUN. 	S (Every END)
SD529		Constant scan wait time (unit: μs)		
SD530	Scan program execution time	Scan program execution time (unit: ms)	<ul style="list-style-type: none"> The execution time of the scan program for one scan is stored into SD530 and SD531 (it is measured in increments of μs). SD530: stores a value in the ms place (storage range: 0 to 65535) SD531: stores a value in the μs place (storage range: 0 to 999) These areas are cleared to 0 when the operating status of the CPU module is switched from STOP to RUN. 	S (Every END)
SD531		Scan program execution time (unit: μs)		

*1 There are restrictions on the firmware version of the supported CPU module and software version of the engineering tool. (Page 705 Added and Enhanced Functions)

Drive information

The following is the list of special register areas relating to the drive information.

No.	Name	Data stored	Details	Set by (setting timing)												
SD600 ^{*4}	Memory card mounting status	SD memory card type	<p>This register indicates the type of mounted SD memory cards.</p> <div style="text-align: center;"> <table border="1" style="margin: auto;"> <tr> <td style="width: 20px;">b15</td> <td style="width: 20px;">b8</td> <td style="width: 20px;">b7</td> <td style="width: 20px;">b4</td> <td style="width: 20px;">b3</td> <td style="width: 20px;">b0</td> </tr> <tr> <td colspan="2" style="border: none;">┌───────────┐</td> <td colspan="2" style="border: none;">┌───┐</td> <td colspan="2" style="border: none;">┌───┐</td> </tr> </table> </div> <ul style="list-style-type: none"> • b0 to b3: Fixed to 0 • b4 to b7 <p>0: Does not exist 4: SD memory card b8 to b15: Fixed to 0</p>	b15	b8	b7	b4	b3	b0	┌───────────┐		┌───┐		┌───┐		S (Initial, card insertion/removal)
b15	b8	b7	b4	b3	b0											
┌───────────┐		┌───┐		┌───┐												
SD604 ^{*4}	SD memory card (drive 2) usage status	SD memory card (drive 2) usage status	<p>Usage status of the SD memory card is stored using the following bit pattern. (On indicates being used.)</p> <p>b0: Event history b1: Module extension parameter^{*1} b2: Label communication data b3 to b15: Not used</p>	S (Status change)												
SD606 ^{*4}	SD memory card (drive 2) capacity	SD memory card (drive 2) capacity: the lower digits (unit: K bytes)	The capacity of the SD memory card is stored in increments of 1K byte (the amount of free space for a formatted memory card is stored).	S (Initial, card insertion/removal)												
SD607 ^{*4}		SD memory card (drive 2) capacity: the higher digits (unit: K bytes)	The capacity of the SD memory card is stored in increments of 1K byte (the amount of free space for a formatted memory card is stored).	S (Initial, card insertion/removal)												
SD610 ^{*4}	SD memory card (drive 2) free space	SD memory card (drive 2) free space: the lower digits (unit: K bytes)	The amount of free space of the SD memory card is stored in increments of 1K byte.	S (at change)												
SD611 ^{*4}		SD memory card (drive 2) free space: the higher digits (unit: K bytes)	The amount of free space of the SD memory card is stored in increments of 1K byte.	S (at change)												
SD614	Device/label memory (drive 3) usage status	Device/label memory (drive 3) usage status	<p>Usage status of the device/label memory is stored using the following bit pattern. (On indicates being used.)</p> <p>b0: File register b1 to b15: Not used</p>	S (Status change)												
SD616	Device/label memory (drive 3) capacity	Device/label memory (drive 3) capacity: the lower digits (unit: K bytes)	The capacity of the device/label memory is stored in increments of 1K byte (the amount of free space for a formatted memory card is stored).	S (Initial)												
SD617		Device/label memory (drive 3) capacity: the higher digits (unit: K bytes)	The capacity of the device/label memory is stored in increments of 1K byte (the amount of free space for a formatted memory card is stored).	S (Initial)												
SD618	Device/label memory (file storage area) capacity	Device/label memory (file storage area) (drive 3) capacity: the lower digits (unit: K bytes)	The capacity of the device/label memory (file storage area) is stored in increments of 1K byte (the amount of free space for a formatted memory card is stored).	S (Initial)												
SD619		Device/label memory (file storage area) (drive 3) capacity: the higher digits (unit: K bytes)	The capacity of the device/label memory (file storage area) is stored in increments of 1K byte (the amount of free space for a formatted memory card is stored).	S (Initial)												
SD620	Data memory (drive 4) usage status	Data memory (drive 4) usage status	<p>Usage status of the data memory is stored using the following bit pattern. (On indicates being used.)</p> <p>b0: Event history b1: Module extension parameter^{*1} b2: Label communication data b3 to b15: Not used</p>	S (Status change)												
SD622	Data memory (drive 4) capacity	Data memory (drive 4) capacity: the lower digits (unit: K bytes)	The capacity of the data memory is stored in increments of 1K byte (the amount of free space for a formatted memory card is stored).	S (Initial)												
SD623		Data memory (drive 4) capacity: the higher digits (unit: K bytes)	The capacity of the data memory is stored in increments of 1K byte (the amount of free space for a formatted memory card is stored).	S (Initial)												

No.	Name	Data stored	Details	Set by (setting timing)
SD626 ⁵	Extended SRAM cassette capacity identification information	Capacity identification information of the Extended SRAM cassette	Capacity identification information of the Extended SRAM cassette is stored. Unmounted: 0, 1M: 1, 2M: 2, 4M: 3, 8M: 4, 16M: 5	S (Initial)
SD629	Program memory write (transfer) status	Write (transfer) status display (percent)	This register displays write (transfer) status to the program memory in percentage (0 to 100%). The initial value is "0". Upon completion of writing, this register is set to "100". It is set to "0" at the time when the write command is issued.	S (Writing)
SD630	Program memory write count index	Index of the number of write operations up to now	<ul style="list-style-type: none"> This register indicates the index value for the number of write operations to the program memory up to now (stored as a 32-bit BIN value). However, the number of write operations is not equal to the index value. When the index value exceeds 100000, an error is generated (the index value is continued to be counted even when it exceeds 100000). If the index value exceeds 100000, the CPU module must be replaced. 	S (Writing)
SD631				
SD633	Data memory write (transfer) status	Write (transfer) status display (percent)	This register displays write (transfer) status to the data memory in percentage. (0 to 100%). The initial value is "0". Upon completion of writing, this register is set to "100". It is set to "0" at the time when the write command is issued. ²	S (Writing)
SD634	Index for the number of data memory write operations	Index of the number of write operations up to now	<ul style="list-style-type: none"> This register indicates the index value for the number of write operations to the data memory up to now (stored as a 32-bit BIN value). However, the number of write operations is not equal to the index value. When the index value exceeds 100000, an error is generated (the index value is continued to be counted even when it exceeds 100000). If the index value exceeds 100000, the CPU module must be replaced. 	S (Writing)
SD635				
SD640	Internal buffer empty area usage status	Internal buffer empty area usage status (usage status of the internal buffer for functions where the internal buffer capacity is not set in the internal buffer capacity setting of the CPU parameters)	This register stores the following in a bit pattern: usage status of the internal buffer for functions where the internal buffer capacity is not set in the internal buffer capacity setting of the CPU parameters. (On indicates being used.) b0: Used for realtime monitor b1 to b15: Not used	S (Status change)
SD642	Internal buffer capacity	Internal buffer capacity Low-order (in K bytes)	The capacity of the internal buffer is stored in K bytes.	S (Initial)
SD643		Internal buffer capacity High-order (in K bytes)	The capacity of the internal buffer is stored in K bytes.	S (Initial)
SD644	Internal buffer free area space	Internal buffer free area space Low-order (in K bytes)	This register stores the following in K bytes: internal buffer free space that is not set in the internal buffer capacity setting of the CPU parameters.	S (Status change)
SD645		Internal buffer free area space High-order (in K bytes)	This register stores the following in K bytes: internal buffer free space that is not set in the internal buffer capacity setting of the CPU parameters.	S (Status change)
SD648 ⁶	Function memory capacity	Function memory capacity Low-order (in K bytes)	The capacity of the function memory is stored in K bytes.	S (Initial)
SD649 ⁶		Function memory capacity High-order (in K bytes)	The capacity of the function memory is stored in K bytes.	S (Initial)
SD650 ⁶	Function memory free space capacity	Function memory free space capacity Low-order (in K bytes)	The amount of free space of the function memory is stored in K bytes.	S (Status change)
SD651 ⁶		Function memory free space capacity High-order (in K bytes)	The amount of free space of the function memory is stored in K bytes.	S (Status change)
SD652 ⁶	Function memory clear error cause	Function memory clear error cause	An error cause detected at a request for clearing the function memory is stored. 0: No error Other than 0: For details on the values stored when an error occurs, refer to the list of error codes. (Page 504 List of Error Codes) The register is cleared to 0 at a request for clearing the function memory.	S (Status change)

No.	Name	Data stored	Details	Set by (setting timing)
SD653 ^{*6}	File transfer to data memory error cause	File transfer to data memory error cause	The error cause that is detected at file transfer to the data memory is stored. 0: No error Other than 0: For details on the values stored when an error occurs, refer to the list of error codes. (☞ Page 504 List of Error Codes) The register is cleared to 0 when SM653 (File transfer to data memory request) changes from off to on.	S (Status change)

*1 It is stored when used for the Ethernet function of CPU module.

*2 When the save destination for the event history is the data memory: the event history will be stored at the timing of powering off and on and resetting the CPU module. Accordingly, since the data will be written into the data memory, "100" is stored. (When the save destination for the event history is the SD memory, the initial value remains "0".)

*3 This is the memory used by the system when the CPU module is executing functions.

*4 The CPU module where the SD memory card can be used supports these special register areas.

*5 The CPU module where the extended SRAM cassette can be used supports these special register areas.

*6 There are restrictions on the firmware version of the supported CPU module and software version of the engineering tool. (☞ Page 705 Added and Enhanced Functions)

Instruction related

The following is the list of special register areas relating to the instruction-related items.

No.	Name	Data stored	Details	Set by (setting timing)
SD757	Current interrupt priority	Current interrupt priority	The priority for the interrupt of the interrupt program currently executed is stored. 1 to 8: Priority for the interrupt pointer of the interrupt program currently being executed 0: No interrupt operation (default)	S (Status change)
SD758	Interrupt disabling for each priority setting value	Interrupt disabling for each priority setting value	The interrupt priority of the interrupt program that the interrupt is disabled by using the DI instructions (Disabling interrupt programs/Disabling interrupt programs with specified priority or lower) and the EI instruction (Enabling interrupt programs) is stored in this register. 1: Interrupt programs with priority 1 or lower (all priority levels) disabled (default) 2: Interrupt programs with priority 2 or lower disabled 3: Interrupt programs with priority 3 or lower disabled 4: Interrupt programs with priority 4 or lower disabled 5: Interrupt programs with priority 5 or lower disabled 6: Interrupt programs with priority 6 or lower disabled 7: Interrupt programs with priority 7 or lower disabled 8: Interrupt programs with priority 8 or lower disabled 0: No interrupt program disabled (interrupt programs with any priority level enabled)	S (Status change)
SD760	Unicode text file faulty area in the DBIMPORT instruction	Row number of the Unicode text file (lower)	If an error in the Unicode text file is detected when the DBIMPORT(P) instruction is executed, the row number of the Unicode text file is stored. The value is stored when the error completion signal of the DBIMPORT(P) instruction is turned on and is cleared to 0 when the DBIMPORT(P) instruction is executed.	S (Status change)
SD761		Row number of the Unicode text file (upper)		S (Status change)
SD771	Specification of the number of write instruction executions to data memory	Specification of the number of write instruction executions to data memory	In this register, the maximum number of the data memory writing instruction (SP.DEVST) executions per day is specified. When the number of data memory writing instruction executions exceeds the value specified in this register, an error is generated. Setting range is from 1 to 32767. If a value is set outside the range, an error is generated during the data memory writing instruction execution.	U
SD774 ³	Execution status of data table sort instructions	Execution status of data table sort instructions	The execution statuses of SORTTBL/SORTTBL2/DSORTTBL2 instructions are stored. The bit indicating the finish of each instruction turns on when the instruction is finished. ■ SORTTBL instruction  b0: Finish (0: Status except execution finished, 1: Execution finished) b2: Execution (0: Not executed, 1: Executed) ■ SORTTBL2 instruction  b6: Finish (0: Status except execution finished, 1: Execution finished) b8: Execution (0: Not executed, 1: Executed) ■ DSORTTBL2 instruction  b9: Finish (0: Status except execution finished, 1: Execution finished) b11: Execution (0: Not executed, 1: Executed)	S (Status change)

No.	Name	Data stored	Details	Set by (setting timing)															
SD775	Selection of refresh processing during the COM instruction execution	Selection of refresh processing during the COM instruction execution	<p>In this register, whether or not each processing is executed during the COM instruction execution is selected (Default: 0). The specification on the SD775 is effective when SM775 is turned on.</p> <p>b15 ... b13 ... b6 ... b4 b3 b2 b1 b0</p> <table border="1" style="margin-left: 40px;"> <tr> <td style="width: 20px; height: 15px;"></td> <td style="width: 20px; height: 15px;"></td> <td style="width: 20px; height: 15px;"></td> <td style="width: 20px; height: 15px;"></td> <td style="width: 20px; height: 15px;"></td> <td style="width: 20px; height: 15px;"></td> <td style="width: 20px; height: 15px;"></td> <td style="width: 20px; height: 15px;"></td> <td style="width: 20px; height: 15px;"></td> <td style="width: 20px; height: 15px;"></td> <td style="width: 20px; height: 15px;"></td> </tr> </table> <p> ■ Refresh processing (0: Not executed, 1: Executed) b0: I/O refresh, I/O fetch from a group out of the multiple CPU system b1: Link refresh of the CC-Link module b2: Link refresh of the CC-Link IE Controller Network module and MELSECNET/H network module b3: Intelligent function module refresh b4: Refresh using the CPU buffer memory of the multiple CPU system (END) b6: Link refresh of the CC-Link IE Field Network module b13: Link refresh of CC-Link IE Field Network Basic ■ Device/label access service processing execution (0: Executed, 1: Not executed) b15: Device/label access service processing (communications with the engineering tool, GOT, or other external devices) </p>												U				
SD792 and SD793	PID limit setting (for complete derivative)	0: Limit restriction applied 1: No limit restriction	<p>The limit restriction for each PID loop is specified as follows: (for the PIDCONT instruction)</p> <table border="1" style="margin-left: 40px;"> <thead> <tr> <th></th> <th style="text-align: center;">b15</th> <th style="text-align: center;">to</th> <th style="text-align: center;">b1</th> <th style="text-align: center;">b0</th> </tr> </thead> <tbody> <tr> <td>SD792</td> <td style="text-align: center;">16</td> <td style="text-align: center;">to</td> <td style="text-align: center;">2</td> <td style="text-align: center;">1</td> </tr> <tr> <td>SD793</td> <td style="text-align: center;">32</td> <td style="text-align: center;">to</td> <td style="text-align: center;">18</td> <td style="text-align: center;">17</td> </tr> </tbody> </table> <p>1 to 32: Loop 1 to 32</p>		b15	to	b1	b0	SD792	16	to	2	1	SD793	32	to	18	17	U
	b15	to	b1	b0															
SD792	16	to	2	1															
SD793	32	to	18	17															
SD794 and SD795	PID limit setting (for incomplete derivative)	0: Limit restriction applied 1: No limit restriction	<p>The limit restriction for each PID loop is specified as follows: (for the S.PIDCONT instruction)</p> <table border="1" style="margin-left: 40px;"> <thead> <tr> <th></th> <th style="text-align: center;">b15</th> <th style="text-align: center;">to</th> <th style="text-align: center;">b1</th> <th style="text-align: center;">b0</th> </tr> </thead> <tbody> <tr> <td>SD794</td> <td style="text-align: center;">16</td> <td style="text-align: center;">to</td> <td style="text-align: center;">2</td> <td style="text-align: center;">1</td> </tr> <tr> <td>SD795</td> <td style="text-align: center;">32</td> <td style="text-align: center;">to</td> <td style="text-align: center;">18</td> <td style="text-align: center;">17</td> </tr> </tbody> </table> <p>1 to 32: Loop 1 to 32</p>		b15	to	b1	b0	SD794	16	to	2	1	SD795	32	to	18	17	U
	b15	to	b1	b0															
SD794	16	to	2	1															
SD795	32	to	18	17															
SD796 ^{*2}	Maximum number of blocks used for the multiple CPU dedicated instruction (for CPU No.1)	The maximum number of blocks to be used for the dedicated instruction Depending on the number of CPU modules which constitute a multiple CPU system, the range is as follows. ^{*1}	<ul style="list-style-type: none"> The maximum number of blocks used for the multiple CPU dedicated instruction is specified (for CPU No.1). When executing the multiple CPU dedicated instruction on CPU No.1, if the number of free blocks in the dedicated instruction transfer area is less than the setting value on this register, SM796 is turned on. This value is used as interlock signal for the continuous executions of the multiple CPU dedicated instruction. 	U															
SD797 ^{*2}	Maximum number of blocks setting used for the multiple CPU dedicated instruction (for CPU No.2)	When constituting two modules: 2 to 599 When constituting three modules: 2 to 299 When constituting four modules: 2 to 199 (Default: 2).	<ul style="list-style-type: none"> The maximum number of blocks used for the multiple CPU dedicated instruction is specified (for CPU No.2). When executing the multiple CPU dedicated instruction on CPU No.2, if the number of free blocks in the dedicated instruction transfer area is less than the setting value on this register, SM797 is turned on. This value is used as interlock signal for the continuous executions of the multiple CPU dedicated instruction. 	U															
SD798 ^{*2}	Maximum number of blocks setting used for the multiple CPU dedicated instruction (for CPU No.3)		<ul style="list-style-type: none"> The maximum number of blocks used for the multiple CPU dedicated instruction is specified (for CPU No.3). When executing the multiple CPU dedicated instruction on CPU No.3, if the number of free blocks in the dedicated instruction transfer area is less than the setting value on this register, SM798 is turned on. This value is used as interlock signal for the continuous executions of the multiple CPU dedicated instruction. 	U															
SD799 ^{*2}	Maximum number of blocks setting used for the multiple CPU dedicated instruction (for CPU No.4)		<ul style="list-style-type: none"> The maximum number of blocks used for the multiple CPU dedicated instruction is specified (for CPU No.4). When executing the multiple CPU dedicated instruction on CPU No.4, if the number of free blocks in the dedicated instruction transfer area is less than the setting value on this register, SM799 is turned on. This value is used as interlock signal for the continuous executions of the multiple CPU dedicated instruction. 	U															

*1 When the value out of the range is specified, operation runs while its value is being regarded as max value of each range of multiple CPU system configuration.

*2 There are restrictions on the firmware version of the supported CPU module and software version of the engineering tool. (Page 705 Added and Enhanced Functions)

*3 The CPU module where this function can be used supports these special register areas.

Firmware update function

The following is the list of special register areas relating to the firmware update function (firmware update using an SD memory card).

(The CPU module where this function can be used supports these special register areas.  Page 705 Added and Enhanced Functions)

No.	Name	Data stored	Details	Set by (setting timing)	
SD904	Latest firmware update information (network)	History information	Version after the update (network)	The firmware version after the update execution is stored. When the update is completed with an error, 0 is stored.	S (Initial)
SD905			Version before the update (network)	The firmware version before the update execution is stored.	S (Initial)
SD906	Previous firmware update information (network)	History information	Version after the update (network)	The firmware version after the update execution is stored. When the update is completed with an error, 0 is stored.	S (Initial)
SD907			Version before the update (network)	The firmware version before the update execution is stored.	S (Initial)
SD912	Latest firmware update information (CPU) ^{*1}	History information	Execution time (year)	The year value (four digits) of the date/time when the firmware update was executed is stored as a BIN code.	S (Initial)
SD913			Execution time (month)	The month value of the date/time when the firmware update was executed is stored as a BIN code.	S (Initial)
SD914			Execution time (day)	The day value of the date/time when the firmware update was executed is stored as a BIN code.	S (Initial)
SD915			Execution time (hour)	The hour value of the date/time when the firmware update was executed is stored as a BIN code.	S (Initial)
SD916			Execution time (minute)	The minute value of the date/time when the firmware update was executed is stored as a BIN code.	S (Initial)
SD917			Execution time (second)	The second value of the date/time when the firmware update was executed is stored as a BIN code.	S (Initial)
SD918			Execution time (day of the week)	The day of the week value of the date/time when the firmware update was executed is stored as a BIN code. (0: Sun, 1: Mon, 2: Tue, 3: Wed, 4: Thu, 5: Fri, 6: Sat)	S (Initial)
SD919			Version after the update (CPU)	The firmware version after the update execution is stored. When the update is completed with an error, 0 is stored.	S (Initial)
SD920			Version before the update (CPU)	The firmware version before the update execution is stored.	S (Initial)
SD921			Latest firmware update result	Target	The start I/O number of the module where the firmware update was executed is stored. • CPU module: 3FFH
SD922	Execution result	The execution result of the firmware update is stored. • 0001H: Completed successfully • 0100H: Flash ROM error • 0200H: Model mismatched • 0201H: File invalid • 0202H: Combination invalid • 0203H: Firmware update prohibited state • 0300H: Firmware data error		S (Initial)	

No.	Name	Data stored	Details	Set by (setting timing)	
SD923	Previous firmware update information (CPU)*1	History information	Execution time (year)	The year value (four digits) of the date/time when the firmware update was executed is stored as a BIN code.	S (Initial)
SD924			Execution time (month)	The month value of the date/time when the firmware update was executed is stored as a BIN code.	S (Initial)
SD925			Execution time (day)	The day value of the date/time when the firmware update was executed is stored as a BIN code.	S (Initial)
SD926			Execution time (hour)	The hour value of the date/time when the firmware update was executed is stored as a BIN code.	S (Initial)
SD927			Execution time (minute)	The minute value of the date/time when the firmware update was executed is stored as a BIN code.	S (Initial)
SD928			Execution time (second)	The second value of the date/time when the firmware update was executed is stored as a BIN code.	S (Initial)
SD929			Execution time (day of the week)	The day of the week value of the date/time when the firmware update was executed is stored as a BIN code. (0: Sun, 1: Mon, 2: Tue, 3: Wed, 4: Thu, 5: Fri, 6: Sat)	S (Initial)
SD930			Version after the update (CPU)	The firmware version after the update execution is stored. When the update is completed with an error, 0 is stored.	S (Initial)
SD931			Version before the update (CPU)	The firmware version before the update execution is stored.	S (Initial)
SD932	Previous firmware update result	Target	The start I/O number of the module where the firmware update was executed is stored. • CPU module: 3FFH	S (Initial)	
SD933		Execution result	The execution result of the firmware update is stored. • 0001H: Completed successfully • 0100H: Flash ROM error • 0200H: Model mismatched • 0201H: File invalid • 0202H: Combination invalid • 0203H: Firmware update prohibited state • 0300H: Firmware data error	S (Initial)	

*1 For the RnENCPU, information of the CPU part is displayed.

Latch area

The following is the list of special register areas relating to the latch area.

(The CPU module where each function can be used supports these special register areas.  Page 705 Added and Enhanced Functions)

No.	Name	Data stored	Details	Set by (setting timing)
SD940	Stop direction at file change on label specification	Stop direction at file change on label specification	<p>Specify the operation for changing program files or the global label setting file. When the stop direction is given, an error occurs in the corresponding function (setting No.). (On: Stop the function, Off: Do not stop the function (The function continues to operate.))</p> <p style="text-align: center;"> b15 b9b8b7b6b5b4b3b2b1b0  </p> <p> b0: Data logging setting No.1 b1: Data logging setting No.2 b2: Data logging setting No.3 b3: Data logging setting No.4 b4: Data logging setting No.5 b5: Data logging setting No.6 b6: Data logging setting No.7 b7: Data logging setting No.8 b8: Data logging setting No.9 b9: Data logging setting No.10 b15: Real-time monitor </p>	U
SD944	Backup function of the CPU module data backup/ restoration function	Backup function setting	<p>Set the backup function using the following bit pattern. (Off: Disabled, On: Enabled)</p> <p style="text-align: center;"> b15 b10 b5 b1b0  </p> <p> b0: Automatic backup setting by specification of day and time b1: Automatic backup setting by specification of time and day of the week b5: Upper limit value status for the number of the CPU module backup data b10: Retry execution for the automatic backup b15: Automatic backup setting at occurrence of the CPU stop error </p>	U
SD947		Day and time setting for automatic backup (day)	<p>Store the day when the automatic backup on the specified day and time is executed using the BIN code.</p> <ul style="list-style-type: none"> Day (1 to 31) 	U
SD948		Day and time setting for automatic backup (hour)	<p>Store the hour when the automatic backup on the specified day and time is executed using the BIN code.</p> <ul style="list-style-type: none"> Hour (0 to 23) 	U
SD949		Day and time setting for automatic backup (minute)	<p>Store the minute when the automatic backup on the specified day and time is executed using the BIN code.</p> <ul style="list-style-type: none"> Minute (0 to 59) 	U
SD950		Time and day of the week setting for automatic backup (hour)	<p>Store the hour when the automatic backup on the specified day of the week and time is executed using the BIN code.</p> <ul style="list-style-type: none"> Hour (0 to 23) 	U
SD951		Time and day of the week setting for automatic backup (minute)	<p>Store the minute when the automatic backup on the specified day of the week and time is executed using the BIN code.</p> <ul style="list-style-type: none"> Minute (0 to 59) 	U
SD952		Time and day of the week setting for automatic backup (day of the week)	<p>Set the day of the week when the automatic backup is executed using the following bit pattern. (Off: Disabled, On: Enabled)</p> <p style="text-align: center;"> b15 b6b5b4b3b2b1b0  </p> <p> b0: Sunday, b1: Monday, b2: Tuesday, b3: Wednesday, b4: Thursday, b5: Friday, b6: Saturday </p>	U
SD953		Backup error cause	<ul style="list-style-type: none"> The cause of an error that occurred during the CPU module data backup is stored. <p>0H: No error</p> <p>Other than 0H: For details on the values stored when an error occurs, refer to the list of error codes. ( Page 504 List of Error Codes)</p> <ul style="list-style-type: none"> "0" is set at the start of the CPU module data backup. 	S (Error)

No.	Name	Data stored	Details	Set by (setting timing)													
SD954	Restoration function of the CPU module data backup/ restoration function	Restoration target data setting	Set the target data to be restored with the CPU module data restoration function. 0: All the target data 1: Device/label data only 2: All the target data except for the device/label data	U													
SD955		Restoration function setting	Set the CPU module data restoration function using the following bit pattern. (Off: Disabled, On: Enabled) <div style="text-align: center;"> <table border="1" style="margin: auto;"> <tr> <td style="width: 20px;">b15</td><td style="width: 20px;">b14</td><td style="width: 20px;">b13</td><td style="width: 20px;">0</td><td style="width: 20px;">b2</td><td style="width: 20px;">b1</td><td style="width: 20px;">b0</td> </tr> <tr> <td style="text-align: center;"> </td><td style="text-align: center;"> </td><td style="text-align: center;"> </td><td style="text-align: center;"> </td><td style="text-align: center;"> </td><td style="text-align: center;"> </td><td style="text-align: center;"> </td> </tr> </table> </div> b0: Automatic restoration b1: Initialization at automatic restoration b13: Latest data b14: Special relay and special register b15: Continuous operation with the status at backup	b15	b14	b13	0	b2	b1	b0							
b15	b14	b13	0	b2	b1	b0											
SD956	Restoration target date folder setting	Restoration target date folder setting	Store the target folder (date folder) of the CPU module data restoration using BCD code. <div style="text-align: center;"> <table border="1" style="margin: auto;"> <tr> <td style="width: 40px;">SD957</td><td style="width: 40px;">SD956</td> </tr> <tr> <td style="text-align: center;">b31 b24 b23</td><td style="text-align: center;">b16 b15 b8 b7 b0</td> </tr> <tr> <td style="text-align: center;">(4)</td><td style="text-align: center;">(3) (2) (1)</td> </tr> </table> </div> (1) Day (1 to 31) (2) Month (1 to 12) (3) Year (last two digits) (0 to 99) (4) Year (first two digits) (0 to 99) [Example] To specify the date folder of June 15 2015, store "H20150615".	SD957	SD956	b31 b24 b23	b16 b15 b8 b7 b0	(4)	(3) (2) (1)	U							
SD957				SD956

(4)	(3) (2) (1)																
SD957				U													
SD958	Restoration target number folder setting	Restoration target number folder setting	Specify the target folder of the CPU module data restoration. 1 to 32767: Serial number of the backup folder (****) in a date folder (00001 to 32767)	U													
SD959	Restoration error cause	Restoration error cause	<ul style="list-style-type: none"> The cause of an error that occurred during the CPU module data restoration is stored. 0H: No error Other than 0: For details on the values stored when an error occurs, refer to the list of error codes. (Page 504 List of Error Codes) <ul style="list-style-type: none"> "0" is set at the start of the CPU module data backup. 	S (Error)													
SD960	Backup function of the CPU module data backup/ restoration function	Upper limit status for the number of CPU module backup data	This register indicates the set value of the upper limit for the number of backup data in accordance with bit 5 of SD944. Bit 5 of SD944 is off: 0 Bit 5 of SD944 is on: 1 to 100	S (Status change)													

Data logging function

The following is the list of special register areas relating to the data logging function. (The R00CPU does not support the use of these functions.)

No.	Name	Data stored	Details	Set by (setting timing)
SD1200	Data logging Function memory use condition	Data logging Function memory use condition	<ul style="list-style-type: none"> The status of the data logging when the function memory is set for the storage location of data logging files are stored in the following bit patterns. <div style="text-align: center;">  <p>b9b8b7b6b5b4b3b2b1b0</p> </div> <ul style="list-style-type: none"> b0: Setting No.1 b1: Setting No.2 ⋮ b9: Setting No.10 <ul style="list-style-type: none"> Each bit turns on when a relevant data logging starts and turns off when the data logging stops. 	S (Status change)
SD1203	Data logging file transfer stop information	Data logging file transfer stop information	<ul style="list-style-type: none"> To stop data transfer of each data logging setting number, set the relevant setting number with the following bit pattern. (Off: Disabled, On: Enabled) <div style="text-align: center;">  <p>b9b8b7b6b5b4b3b2b1b0</p> </div> <ul style="list-style-type: none"> b0: Setting No.1 b1: Setting No.2 ⋮ b9: Setting No.10 <ul style="list-style-type: none"> This setting is activated when SM1203 is turned on. 	U
SD1210	Data logging setting No.1 Latest storage file number	Latest storage file number	<ul style="list-style-type: none"> The latest storage file number This register is cleared to 0 by the stop command from CPU Module Logging Configuration Tool. 	S (Status change)
SD1212	Data logging setting No.1 Oldest storage file number	Oldest storage file number	<ul style="list-style-type: none"> The oldest storage file number This register is cleared to 0 by the stop command from CPU Module Logging Configuration Tool. 	S (Status change)
SD1214	Data logging setting No.1 Internal buffer free space	Free space size of the internal buffer (K bytes)	<ul style="list-style-type: none"> The amount of free space of the internal buffer is stored in K bytes. The smaller the value, the higher the generating ratio of processing overflow. For the trigger logging, it refers to the total capacity of internal buffer until the data for the number of records is collected after a trigger occurred. This register is cleared to 0 by the stop command from CPU Module Logging Configuration Tool. 	S (Error)
SD1215	Data logging setting No.1 Number of processing overflow occurrences	Number of processing overflow occurrences	<ul style="list-style-type: none"> The number of data logging processing overflow occurrences When overflow occurs, data is lost. When the count exceeds 65535, it returns to 0 and starts a new cycle. With "Stop" set for the operation at the time when the number of save files exceeds the limit, a processing overflow may occur until the stop operation is completed after the collection of data corresponding to the specified number of storage files was completed. This register is cleared to 0 when the setting is registered or by the stop command from CPU Module Logging Configuration Tool. 	S (Error)
SD1216	Data logging setting No.1 Data logging error cause	Data logging error cause	<ul style="list-style-type: none"> Cause of the error generated during data logging operations is stored. 0: No error Other than 0: For details on the values stored when an error occurs, refer to the list of error codes. (Page 504 List of Error Codes) 	S (Error)
SD1217	Data logging setting No.1 Data logging file transfer error cause	Data logging file transfer error cause	<ul style="list-style-type: none"> An error cause that is detected last in the data logging file transfer function or a transferring of data logging files to the data memory is stored. 0: No error Other than 0: For details on the values stored when an error occurs, refer to the list of error codes. (Page 504 List of Error Codes) This register is cleared to 0 when data logging is started. 	S (Error)

No.	Name	Data stored	Details	Set by (setting timing)
SD1220 to SD1227	Data logging setting No.2	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SD1210 to SD1217).	Same configuration as the setting No.1
SD1230 to SD1237	Data logging setting No.3	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SD1210 to SD1217).	Same configuration as the setting No.1
SD1240 to SD1247	Data logging setting No.4	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SD1210 to SD1217).	Same configuration as the setting No.1
SD1250 to SD1257	Data logging setting No.5	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SD1210 to SD1217).	Same configuration as the setting No.1
SD1260 to SD1267	Data logging setting No.6	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SD1210 to SD1217).	Same configuration as the setting No.1
SD1270 to SD1277	Data logging setting No.7	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SD1210 to SD1217).	Same configuration as the setting No.1
SD1280 to SD1287	Data logging setting No.8	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SD1210 to SD1217).	Same configuration as the setting No.1
SD1290 to SD1297	Data logging setting No.9	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SD1210 to SD1217).	Same configuration as the setting No.1
SD1300 to SD1307	Data logging setting No.10	Same configuration as the setting No.1	Data configuration is the same as the setting No.1 (SD1210 to SD1217).	Same configuration as the setting No.1

CPU module data backup/restoration function

The following is the list of special register areas relating to the CPU module data backup/restoration function. (The R00CPU, R01CPU, and R02CPU do not support the use of these functions.)

No.	Name	Data stored	Details	Set by (setting timing)
SD1350	Number of uncompleted folders/files of CPU module data backup/restoration	Number of uncompleted folders/files of CPU module data backup/restoration	This register indicates the number of folders/files where the backup/restoration of the CPU module is not completed. When the backup/restoration processing is started, the total number of folders and files to be backed up or restored is stored. The number is reduced one each time one folder/file is backed up or restored, and 0 is stored when all the data is backed up or restored.	S (Status change)
SD1351	Progression status of CPU module data backup/restoration	Progression status of CPU module data backup/restoration	<ul style="list-style-type: none"> This register indicates the progression status of the backup or restoration in percentage.*1 Range of the value: 0 to 100 (%) "0" is set at the start of the CPU module data backup. 	S (Status change)
SD1353	Upper limit value setting for the number of CPU module backup data	Setting of the upper limit value for the number of CPU module backup data	Set the upper limit value for the number of the backup data for the CPU module data backup. (1 to 100)	U

*1 When program files are restored, the progress in SD1351 stops while data is being written (transferred) to the program memory in the restoration processing because the data is transferred from the program cache memory to the program memory. The progress of data transfer to the program memory can be checked in SD629.

Data backup/restoration function of iQ Sensor Solution

The following is the list of special register areas relating to the data backup/restoration function of iQ Sensor Solution. (The R00CPU does not support the use of these functions.)

No.	Name	Data stored	Details	Set by (setting timing)
SD1360	Right-to-use request number for iQ Sensor Solution data backup/restoration	Right-to-use request number for data backup/restoration	Set the request number (desired 4-digit number) to acquire/release the right to use. Use the request number as follows depending on the request source. 0000H: Right-to-use release request 1000H to 1FFFH: Request from the program D000H to DFFFH: Request from MELSOFT Navigator E000H to EFFFH: Request from GOT F000H to FFFFH: Request from GX Works3	U
SD1361	Right-to-use acquisition number for iQ Sensor Solution data backup/restoration	Right-to-use acquisition number for data backup/restoration	This register stores the request number of when the right to use for the iQ Sensor Solution data backup/restoration has been acquired. (0000H is stored when the right to use is not acquired or has been released)	S (Status change)
SD1362	Target module/execution unit setting for iQ Sensor Solution data backup/restoration	Target module/execution unit setting for data backup/restoration	Set the target module and execution unit of the iQ Sensor Solution data backup/restoration. <ul style="list-style-type: none"> Lower 8 bits (target module) <ul style="list-style-type: none"> 1H: AnyWireASLINK 2H: CC-Link 3H: Ethernet 4H: CC-Link IE Field Network Upper 8 bits (execution unit) <ul style="list-style-type: none"> <AnyWireASLINK> <ul style="list-style-type: none"> 1H: In module units 2H: In ID units <CC-Link and CC-Link IE Field Network> <ul style="list-style-type: none"> 1H: In module units 2H: In station units 3H: In station sub ID units <Ethernet> <ul style="list-style-type: none"> 1H: In module units 2H: In IP address units 	U

No.	Name	Data stored	Details	Set by (setting timing)
SD1363	Target folder number setting for iQ Sensor Solution data backup/restoration	Target folder number setting for data backup/restoration	Set a number of folder in which the backup data is to be stored or a folder in which the data to be restored is stored. 00 to 99: Target folder specification FFFEH: Automatic specification (Folder deletion supported) FFFFH (default): Automatic specification	U
SD1364	Target setting for iQ Sensor Solution data backup/restoration (target module)	Target setting for data backup/restoration (target module)	Set the target module of the iQ Sensor Solution data backup/restoration. I/O number. ^{*1} : Module 3FFH: Built-in Ethernet ^{*2}	U
SD1365	Target setting for iQ Sensor Solution data backup/restoration (target device 1)	Target setting for data backup/restoration (target device 1)	Set the target device of the iQ Sensor Solution data backup/restoration. <AnyWireASLINK> ID number <CC-Link and CC-Link IE Field Network> Station number <Ethernet> IP address (lower 16 bits) Example: When the IP address is 192.168.3.40 (expressed in dotted decimal notation ^{*3}), 3 = 3H and 40 = 28H. Therefore, the value of the lower 16 bits (0328H) is 808.	U
SD1366	Target setting for iQ Sensor Solution data backup/restoration (target device 2)	Target setting for data backup/restoration (target device 2)	Set the target device of the iQ Sensor Solution data backup/restoration. <AnyWireASLINK> 0 (Not used) <CC-Link and CC-Link IE Field Network> Station sub-ID number <Ethernet> IP address (upper 16 bits) Example: When the IP address is 192.168.3.40 (expressed in dotted decimal notation ^{*3}), 192 = C0H and 168 = A8H. Therefore, the value of the upper 16 bits (C0A8H) is 49320.	U
SD1367	Operation setting for iQ Sensor Solution data backup/restoration	Operation setting for data backup/restoration	Set the operation of the iQ Sensor Solution data backup/restoration.  b0 to b7: Operation setting at error occurrence (0: Continue, 1: Stop) b8 to b15: Fixed to 0	U
SD1368	Communication timeout time of iQ Sensor Solution data backup/restoration	Communication timeout time of data backup/restoration	Specify the communication timeout time of the iQ Sensor Solution data backup/restoration in increments of 100ms. 0: 600000ms (default) 1 to 65535 (×100ms): 100 to 6553500ms	U
SD1371	Execution status of iQ Sensor Solution data backup/restoration (total number of target devices)	Execution status of data backup/restoration (total number of target devices)	<ul style="list-style-type: none"> This register stores the total number of target devices of the data backup/restoration of iQ Sensor Solution for each execution unit. This register is cleared to 0 when the right to use is acquired or the backup/restoration is requested. 	S (Status change)
SD1372	Execution status of iQ Sensor Solution data backup/restoration (normal completion count)	Execution status of data backup/restoration (normal completion count)	<ul style="list-style-type: none"> This register indicates the execution status (the number of devices where the processing has been completed normally) of the iQ Sensor Solution data backup/restoration. Among the devices where the operation has been completed, the number of devices where the operation has been completed normally is stored. This register is cleared to 0 when the right to use is acquired or the backup/restoration is requested. 	S (Status change)
SD1373	Execution status of iQ Sensor Solution data backup/restoration (error completion count)	Execution status of data backup/restoration (error completion count)	<ul style="list-style-type: none"> This register indicates the execution status (the number of devices where the processing has been completed with an error) of the iQ Sensor Solution data backup/restoration. Among the devices where the operation has been completed, the number of devices where the operation has been completed with an error is stored. This register is cleared to 0 when the right to use is acquired or the backup/restoration is requested. 	S (Status change)

No.	Name	Data stored	Details	Set by (setting timing)
SD1374	Execution status of iQ Sensor Solution data backup/restoration (progress per device)	Execution status of data backup/restoration (progress per device)	<ul style="list-style-type: none"> This register indicates the progression status of the iQ Sensor Solution data backup/restoration of the device in progress in percentage (0 to 100%). Range of the value: 0 to 100 (%) This register is cleared to 0 when the right to use is acquired or the backup/restoration is requested. 	S (Status change)
SD1375	Folder number of iQ Sensor Solution data backup	Backup target folder number	<ul style="list-style-type: none"> This register stores a number of the target folder where the backup data of the device supporting iQSS is stored. 0 to 99: Folder number FFFFH: Backup data not saved This register stores FFFFH when the right to use is acquired or the backup/restoration is requested. 	S (Status change)
SD1376	Module error cause of iQ Sensor Solution data backup/restoration	Module error cause of data backup/restoration	<ul style="list-style-type: none"> This register stores the error cause that is detected in the module during the iQ Sensor Solution data backup/restoration. When errors are detected in multiple devices, the error detected first is stored. (For details on the error cause stored, refer to the manual for the CPU module used or the target device.) This register is cleared to 0 when the right to use is acquired or the backup/restoration is requested. 	S (Status change/Error)
SD1377	Target device error cause of iQ Sensor Solution data backup/restoration	Target device error cause of data backup/restoration	<ul style="list-style-type: none"> This register stores the error cause that is detected in the target device during the iQ Sensor Solution data backup/restoration. When errors are detected in multiple devices, the error detected first is stored. (For details on the error cause stored, refer to the manual for the target device.) This register is cleared to 0 when the right to use is acquired or the backup/restoration is requested. 	S (Status change/Error)
SD1378	Module information/execution unit information of iQ Sensor Solution data backup/restoration error	Module information/execution unit information of an error	<ul style="list-style-type: none"> At an occurrence of the iQ Sensor Solution data backup/restoration error, this register stores the information of the module where the error has been occurred and the execution unit information. When errors are detected in multiple devices, the information of a device where the error detected first is stored. Lower 8 bits (target module) 1H: AnyWireASLINK 2H: CC-Link 3H: Ethernet 4H: CC-Link IE Field Network Upper 8 bits (execution unit) <AnyWireASLINK> 1H: In module units 2H: In ID units <CC-Link and CC-Link IE Field Network> 1H: In module units 2H: In station units 3H: In station sub ID units <Ethernet> 1H: In module units 2H: In IP address units This register is cleared to 0 when the right to use is acquired or the backup/restoration is requested. 	S (Status change/Error)
SD1379	Folder number information of iQ Sensor Solution data backup/restoration error	Folder number information of an error	<ul style="list-style-type: none"> At an occurrence of the iQ Sensor Solution data backup/restoration error, this register stores the folder number (0 to 99) of the backup/restoration target. If the folder number cannot be specified or a backup error is detected before creating a backup folder (I/O number_station number), FFFFH is stored. This register is cleared to 0 when the right to use is acquired or the backup/restoration is requested. 	S (Status change/Error)
SD1380	Details on iQ Sensor Solution data backup/restoration error (module)	Information of the module where an error has occurred	<ul style="list-style-type: none"> This register stores the information of a module where an error of the iQ Sensor Solution data backup/restoration has been occurred. When errors are detected in multiple modules, the information of a module where the error detected first is stored. I/O number.^{*1}: Module 3FFH: Built-in Ethernet^{*2} This register is cleared to 0 when the right to use is acquired or the backup/restoration is requested. 	S (Status change/Error)

No.	Name	Data stored	Details	Set by (setting timing)
SD1381	Details on iQ Sensor Solution data backup/restoration error (device 1)	Information of the device (device 1) where an error has occurred	<ul style="list-style-type: none"> This register stores the information of a device (device 1) where an error of the iQ Sensor Solution data backup/restoration has been occurred. When errors are detected in multiple devices, the information of a device (device 1) where the error detected first is stored. <AnyWireASLINK> ID number <CC-Link and CC-Link IE Field Network> Station number <Ethernet> IP address (lower 16 bits) Example: When the IP address is 192.168.3.40 (expressed in dotted decimal notation ^{*3}), 3 = 3H and 40 = 28H. Therefore, the value of the lower 16 bits (0328H) is 808. <ul style="list-style-type: none"> This register is cleared to 0 when the right to use is acquired or the backup/restoration is requested. 	S (Status change/Error)
SD1382	Details on iQ Sensor Solution data backup/restoration error (device 2)	Information of the device (device 2) where an error has occurred	<ul style="list-style-type: none"> This register stores the information of a device (device 2) where an error of the iQ Sensor Solution data backup/restoration has been occurred. When errors are detected in multiple devices, the information of a device (device 2) where the error detected first is stored. <AnyWireASLINK> 0 (Not used) <CC-Link and CC-Link IE Field Network> Station sub-ID number <Ethernet> IP address (upper 16 bits) Example: When the IP address is 192.168.3.40 (expressed in dotted decimal notation ^{*3}), 192 = C0H and 168 = A8H. Therefore, the value of the upper 16 bits (C0A8H) is 49320. <ul style="list-style-type: none"> This register is cleared to 0 when the right to use is acquired or the backup/restoration is requested. 	S (Status change/Error)

*1 The start I/O number (first three digits in four-digit hexadecimal representation) of each module

*2 The built-in Ethernet port for the RnENCPU

*3 A 32-bit IP address is expressed by converting it into decimal numbers in units of eight bits and separating each with a dot.

Interrupt pointer mask pattern

The following is the list of special register areas relating to the mask pattern for interrupt pointers.

No.	Name	Data stored	Details	Set by (setting timing)																														
SD1400 to SD1463	Interrupt pointer mask pattern	Mask pattern	<p>The mask pattern for interrupt pointers is stored as shown in the following figure:</p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td></td> <td style="text-align: center;">b15</td> <td></td> <td style="text-align: center;">b1</td> <td style="text-align: center;">b0</td> </tr> <tr> <td>SD1400</td> <td style="border: 1px solid black;">I15</td> <td style="text-align: center;">to</td> <td style="border: 1px solid black;">I1</td> <td style="border: 1px solid black;">I0</td> </tr> <tr> <td>SD1401</td> <td style="border: 1px solid black;">I31</td> <td style="text-align: center;">to</td> <td style="border: 1px solid black;">I17</td> <td style="border: 1px solid black;">I16</td> </tr> <tr> <td></td> <td style="text-align: center;">▪</td> <td></td> <td></td> <td></td> </tr> <tr> <td></td> <td style="text-align: center;">▪</td> <td></td> <td></td> <td></td> </tr> <tr> <td>SD1463</td> <td style="border: 1px solid black;">I1023</td> <td style="text-align: center;">to</td> <td style="border: 1px solid black;">I1009</td> <td style="border: 1px solid black;">I1008</td> </tr> </table>		b15		b1	b0	SD1400	I15	to	I1	I0	SD1401	I31	to	I17	I16		▪					▪				SD1463	I1023	to	I1009	I1008	S (at execution)

Memory dump function

The following is the special register area relating to the memory dump function. (The R00CPU does not support the use of these functions.)

No.	Name	Data stored	Details	Set by (setting timing)
SD1472	Memory dump error cause	Memory dump error cause	The cause of the error occurred during the memory dump function is stored. 0: No error Other than 0: For details on the values stored when an error occurs, refer to the list of error codes. (☞ Page 504 List of Error Codes)	S (Error)

Real-time monitor function

The following is the special register area relating to the real-time monitor function.

(The CPU module where each function can be used supports these special register areas. ☞ Page 705 Added and Enhanced Functions)

No.	Name	Data stored	Details	Set by (setting timing)
SD1484	Real-time monitor internal buffer free space	Free space size of the internal buffer (K bytes)	The amount of free space of the internal buffer is stored in K bytes. The smaller the value, the higher the generating ratio of processing overflow.	S (Status change)

Debug function

The following is the special register area relating to the debug function.

No.	Name	Data stored	Details	Set by (setting timing)
SD1488	Debug function usage status	Debug function usage status	The usage status of the debug function is stored using the following bit pattern. <div style="text-align: center;">  </div> b0: External input/output forced on/off* ¹ Off: Not used On: In use b1: Program restoration information write status* ¹ Off: All written On: Not all written When SM386 is on (without LED flashing), this bit does not turn on. b2: Registration status of the device test with execution conditions* ¹ Off: Not registered On: Registered b3 to b15: Empty (fixed to 0)	S (Status change)

*¹ The CPU module where this function can be used supports these special register areas. (☞ Page 705 Added and Enhanced Functions)

CPU module database access function

The following is the special register area relating to the CPU module database access function. (The R00CPU, R01CPU, and R02CPU do not support the use of these functions.)

No.	Name	Data stored	Details	Set by (setting timing)
SD1498	Start-up status of CPU module database	Start-up status of CPU module database	When the CPU module database access function is enabled with the module parameter, the CPU module database start-up status is stored. 0:No error FFFFH: Starting-up Other than above: Start-up error For the stored value at the start-up error, refer to the list of error codes that occur when a database access instruction is executed. (📖 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks))	S (Status change)

Ethernet function

The following is the list of special register areas relating to the Ethernet function.

No.	Name	Data stored	Details	Set by (setting timing)
SD1504	Open completion signal	In this register, open completion status is stored.	<p>Open statuses of connection No.1 to 16 are stored. (0: Close/Open not completed, 1: Open completed).</p> <p>b0: Connection 1 b1: Connection 2 b2 to b15: Connection 3 to 16</p> <p>For details on the on/off timing, refer to the following. MELSEC iQ-R Ethernet User's Manual (Application)</p>	S (Status change)
SD1505	Open request signal	In this register, open request status is stored.	<p>Open processing statuses of connection No.1 to 16 are stored. (0: No open request, 1: Open request exists).</p> <p>b0: Connection 1 b1: Connection 2 b2 to b15: Connection 3 to 16</p> <p>For details on the on/off timing, refer to the following. MELSEC iQ-R Ethernet User's Manual (Application)</p>	S (Status change)
SD1506	Socket communications receive status signal	In this register, receive status is stored.	<p>Receiving statuses of connections No.1 to 16 are stored. (0: No data received, 1: Data receiving completed)</p> <p>b0: Connection 1 b1: Connection 2 b2 to b15: Connection 3 to 16</p> <p>For details on the on/off timing, refer to the following. MELSEC iQ-R Ethernet User's Manual (Application)</p>	S (Status change)
SD1512 ^{*2}	FTP server function file path name switching setting	The detailed of the file path name switching setting of the FTP server function is stored.	<p>The setting details of the file path name switching settings in the FTP server function by executing SM1512 is stored according to the following bit pattern.</p> <p>b0 (1): The directory delimiter of a file path name is set to "/". This delimiter is used for Linux computers. (0: Delimiter "/") b1 (2): The drive number in a file path name is omitted. (0: Not omitted, 1: Omitted) b2 to b3: Empty (fixed to 0) b4 to b7 (3): The target drive number is set when the drive number of the file path name is omitted. (2: SD memory card, 3: Device/label memory, 4: Data memory) When b1 sets to 1, settings in b4 to b7 are enabled. At omitted the drive number, when the CPU module receives a command which is specified the drive number to a file path name received from FTP client, the drive number specified by executing the command is prioritized. b8 to b15: Empty (fixed to 0)</p>	U
SD1513 ^{*2}	FTP server function file path name switching setting error cause	An error cause of the file path name switching setting of the FTP server function is stored.	<p>The error cause of the FTP server function file path name switching setting by executing SM1512 is stored.</p> <p>0H: No error 100H: SD1512 (FTP server function file path name switching setting) is out of the specified range</p> <p>When the FTP command (quote path-delimiter) switching setting is enabled or the switching setting is off, the value is 0H.</p>	S (Status change)

No.	Name	Data stored	Details	Set by (setting timing)																																
SD1514 *2	FTP server function file path name switching setting status	The current setting value of the file path name switching setting of the FTP server function is stored.	<p>The current setting value in SD1512 (FTP server function file path name switching setting) is stored. (This value is also stored when the switching setting is set with the FTP command (quote path-delimiter)).</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td>b15</td><td>b14</td><td>b13</td><td>b12</td><td>b11</td><td>b10</td><td>b9</td><td>b8</td><td>b7</td><td>b6</td><td>b5</td><td>b4</td><td>b3</td><td>b2</td><td>b1</td><td>b0</td> </tr> <tr> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td></td><td>(3)</td><td></td><td></td><td>0</td><td>0</td><td>(2)</td><td>(1)</td> </tr> </table> <p>b0 (1): The directory delimiter of the file path name (0: quote path-delimiter) b1 (2): the drive number of the file path name is omitted. (0: Not omitted, 1: Omitted) b4 to b7 (3): The target drive number is set when the drive number of the file path name is omitted. (2: SD memory card, 3: Device/label memory, 4: Data memory) When SM1512 is turned on and off or the switching setting is off by executing the FTP command (quote path-delimiter off), the value is 0H.</p>	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0	0	0	0	0	0	0	0	0		(3)			0	0	(2)	(1)	S (Status change)

*1 This status includes the case where a slave station has not responded to the first request from the master station due to a power-off of the slave station. (The slave station is not judged as a faulty station because the data link status is not determined.)

System monitoring information

The following is the list of special register areas relating to the system monitoring information.

(There are restrictions on the firmware version of the supported CPU module.  Page 705 Added and Enhanced Functions)

Point

These special register areas can be written only by the system.

The stored values, however, can be read by monitoring systems or SLMP-compatible devices. When reading a value using SLMP commands, use the following commands: 0401 (Read), 0403 (Read Random), and 0406 (Read Block). Do not use subcommands 008□ (Read by device extension specification).

Also, do not use the following to read the stored values (if used, "-1" is read):

- Programs, the circuit monitor function, or the watch function
- Index modification, indirect specification, or bit number specification

Appendix 6 Buffer Memory

The buffer memory is memory used with the following applications.

Module	Application
CPU module	Stores values such as Ethernet function setting values.

The buffer memory content returns to its default status (initial value) when the CPU module is powered off or is reset.

List of buffer memory addresses

CPU module

The following table lists the CPU module buffer memory addresses.

■Ethernet function

For a list of buffer memory addresses as well as details relating to the Ethernet function, refer to the following.

( MELSEC iQ-R Ethernet User's Manual (Application))

■CC-Link IE Field Network Basic function

The following table lists buffer memory addresses relating to the CC-Link IE Field Network Basic function. ( Page 645 Details on buffer memory addresses)

Address	Name	Data stored
Un\G1024	Total number of connected stations	The total number of connected stations set in parameter is stored.
Un\G1025	Reserved station specification status	The reserved station specification status of the slave station specified in parameter is stored.
Un\G1026 to Un\G1029	Reserved station specification status of each station	The reserved station specification status is stored.
Un\G1030 to Un\G1032, Un\G1034 to Un\G1036, Un\G1038 to Un\G1040, Un\G1042 to Un\G1044	Link scan information	The link scan time during cyclic transmission is stored.
Un\G1050	Diagnostic information display request	When a station number (1 to 16) to be diagnosed is specified in 'Diagnostic request information' (Un\G1051) and the bit 0 of 'Diagnostic information display request' (Un\G1050) is turned off and on, the diagnostic information of the specified slave station is stored in 'Diagnostic information 1' (Un\G1053 to Un\G1064) and 'Diagnostic information 2' (Un\G1068 to Un\G1077).
Un\G1051	Diagnostic request information	
Un\G1052	Diagnostic information status flag	
Un\G1053 to Un\G1064	Diagnostic information 1	
Un\G1068 to Un\G1077	Diagnostic information 2	

Details on buffer memory addresses

The following table lists items in the list.

Item	Description
Address	Buffer memory address of the CPU module
Name	Buffer memory name of the CPU module
Data stored	Data stored in the CPU module buffer memory and its meaning
Details	Detailed description of the data stored
Set by (setting timing)	Set side of data (system or user) and timing when data is set by the system <Set by> <ul style="list-style-type: none">• S: System• U: User (program, engineering tool, GOT, or other testing operations from external device)• U/S: User and system <Set timing> <ul style="list-style-type: none">• Every END: Data is set every time END processing is performed.• Initial: Data is set when initial processing is performed (e.g. powering on the system, changing the operating status from STOP to RUN).• Status change: Data is set when the status is changed.• Error: Data is set when an error occurs.• Instruction execution: Data is set when an instruction is executed.• Request: Data is set when requested by a user (using the special relay).• Switch change: Data is set when the switch of the CPU module is changed.• Card insertion/removal: Data is set when an SD memory card is inserted or removed.• Writing: Data is set when a user performs a writing operation.• During END: Data is set when END processing is performed.

Point

Do not change the data set by the system in a program or by a device test. Doing so may cause an unintended operation.

CC-Link IE Field Network Basic function

The following table lists buffer memory areas of the CPU module relating to the CC-Link IE Field Network Basic function.

Address	Name	Data stored	Details	Set by (setting timing)																																																																																					
Un\G1024	Total number of connected stations	Total number of connected stations	The total number of connected stations set in parameter is stored. Range: 1 to 16	S (Initial)																																																																																					
Un\G1025	Reserved station specification status	Reserved station specification status	The reserved station specification status of the slave station specified in parameter is stored. *1 Data is stored at END processing where the value is changed.

*2 When the count exceeds 65535, counting is continued from 1 again.

*3 A slave station specified is being disconnected, the information immediately before the disconnection is stored.

Appendix 7 Processing Time

The scan time of the CPU module is the sum of the instruction execution time, the program execution time, and the END processing time. Each of the processing time that constitutes the scan time is as follows.

Point

For the availability of functions depending on the CPU module, refer to the description of each function.

Instruction execution time

The instruction execution time is the total of each instruction processing time used for the program executed by the CPU module. For the processing time of each instruction, refer to the following.

 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

Program execution time

The program execution time is the processing time when multiple programs are executed. When the interrupt program is executed, the overhead time during the interrupt program being executed is also included.

Processing time when multiple programs are executed (program switching time)

When multiple programs are executed, the scan time becomes longer.

■When multiple programs run

The processing time [μs] with multiple programs run is given by: the number of program files \times 1.2.

Overhead time at execution of interrupt/fixed scan execution type program

This section describes each overhead time when each of the interrupt programs and fixed scan execution type programs is executed.

Point

The processing time for the interrupt program and fixed scan execution type program is as shown below.
Instruction processing time for each instruction + Overhead time + Each refresh processing time (when setting)

A

■ Overhead time when executing the interrupt program

The overhead time when executing the interrupt program includes the one before executing the interrupt program and the other when the interrupt program finished.

- Overhead time before executing the interrupt program

Interrupt factor	Condition	Overhead time
Internal timer interrupt (I28 to I31)	Saves/stores the file register (R) block number.	19.5 μ s
	Not save/store the file register (R) block number.	12.9 μ s
Inter-module synchronous interrupt (I44)	Saves/stores the file register (R) block number.	25.4 μ s
	Not save/store the file register (R) block number.	17.0 μ s
Multiple CPU synchronous interrupt (I45)	Saves/stores the file register (R) block number.	24.2 μ s
	Not save/store the file register (R) block number.	16.1 μ s
High-speed internal timer interrupt 2 (I48), high-speed internal timer interrupt 1 (I49)	Saves/stores the file register (R) block number.	25.8 μ s
	Not save/store the file register (R) block number.	18.1 μ s
Interrupt from module (I0 to I15, I50 to I1023)	Saves/stores the file register (R) block number.	19.1 μ s
	Not save/store the file register (R) block number.	12.8 μ s

- Overhead time when finishing the interrupt program

Interrupt factor	Condition	Overhead time
Internal timer interrupt (I28 to I31)	Saves/stores the file register (R) block number.	16.0 μ s
	Not save/store the file register (R) block number.	8.5 μ s
Inter-module synchronous interrupt (I44)	Saves/stores the file register (R) block number.	19.0 μ s
	Not save/store the file register (R) block number.	11.4 μ s
Multiple CPU synchronous interrupt (I45)	Saves/stores the file register (R) block number.	18.7 μ s
	Not save/store the file register (R) block number.	10.5 μ s
High-speed internal timer interrupt 2 (I48), high-speed internal timer interrupt 1 (I49)	Saves/stores the file register (R) block number.	19.4 μ s
	Not save/store the file register (R) block number.	10.3 μ s
Interrupt from module (I0 to I15, I50 to I1023)	Saves/stores the file register (R) block number.	15.7 μ s
	Not save/store the file register (R) block number.	8.5 μ s

■ Overhead time when executing the fixed scan execution type program

The following table lists the overhead times when executing the fixed scan execution type program.

Condition	Overhead time
Saves/stores the file register (R) block number.	37.9 μ s
Not save/store the file register (R) block number.	20.6 μ s

END processing time

The END processing time includes the following:

- Common processing time
- I/O refresh processing time
- Link refresh processing time for the network module
- Link refresh processing time for CC-Link IE Field Network Basic
- Intelligent function module refresh processing time
- Multiple CPU refresh processing time
- Prolonged time of END processing when executing each function
- Device/label access service processing time

Common processing time

The common processing time by the system is 85 μ s for one unit of CPU module (module is not mounted).

I/O refresh processing time

The I/O refresh processing time for module mounted on main base unit and extension base unit can be calculated by the following formula.

$$\text{I/O refresh processing time } [\mu\text{s}] = ((\text{Number of input refresh points}^{*1} \times \text{KM1}) + (\text{Number of unit having number of input points} \times \text{KM2}) + \text{KM3}^{*3}) + ((\text{Number of output refresh points}^{*2} \times \text{KM4}) + (\text{Number of unit having number of output points} \times \text{KM5}) + \text{KM6}^{*3})$$

*1 The value indicates the numeric value that is obtained through dividing the number of input points by 16.

*2 The value indicates the numeric value that is obtained through dividing the number of output points by 16.

*3 When the number of I/O points is 0, this value is handled as 0.

Condition			Constant value	
MELSEC iQ-R series module	Main base unit	Input	KM1	0.04
			KM2	0.56
			KM3	11.2
		Output	KM4	0.02
			KM5	0.94
			KM6	6.30
	Extension base unit	Input	KM1	0.04
			KM2	0.56
			KM3	11.2
		Output	KM4	0.02
			KM5	0.94
			KM6	6.30
Q series module	RQ extension base unit	Input	KM1	1.15
			KM2	1.33
			KM3	24.0
		Output	KM4	0.03
			KM5	1.20
			KM6	6.21
	Q series extension base unit	Input	KM1	1.85
			KM2	1.98
			KM3	39.4
		Output	KM4	0.02
			KM5	1.29
			KM6	6.01

Link refresh processing time for the network module

This section describes the link refresh processing time for the network module.

■Link refresh processing time for the CC-Link IE TSN master/local module

The link refresh processing time between the CPU module and the CC-Link IE TSN master/local module on the main base unit or the extension base unit is calculated by the following formulas.

$$\alpha T1, \alpha R1 [\text{ms}] = \text{KM1} + \text{KM2} \times ((\text{RX} + \text{RY} + \text{SB}) \div 16 + \text{RW}r + \text{RW}w + \text{SW}) + \alpha U$$

$$\alpha T2, \alpha R2 [\text{ms}] = \text{KM1} + \text{KM2} \times (\text{LB} \div 16 + \text{LW})$$

$$\alpha U [\text{ms}] = \text{KM3} \times (\text{SBU} \div 16 + \text{SWU})$$

- $\alpha T1$: RX/Ry/RWr/RWw/SB/SW link refresh time (sending side)
- $\alpha T2$: LB/LW link refresh time (sending side)
- $\alpha R1$: RX/Ry/RWr/RWw/SB/SW link refresh time (receiving side)
- $\alpha R2$: LB/LW link refresh time (receiving side)
- αU : Unit label (SB/SW) refresh time
- RX: Total number of points of remote input (RX) refreshed by the master station/local station^{*1}
- RY: Total number of points of remote output (RY) refreshed by the master station/local station^{*1}
- LB: Total number of points of link relay (LB) refreshed by the master station/local station station^{*1}
- RWw: Total number of points of remote register (RWw) refreshed by the master station/local station^{*1}
- RWr: Total number of points of remote register (RWr) refreshed by the master station/local station^{*1}
- LW: Total number of points of link register (LW) refreshed by the master station/local station station^{*1}
- SB: Number of points of link special relay (SB)^{*2}
- SW: Number of points of link special register (SW)^{*2}
- SBU: Number of points of link special relay (SB)^{*3}
- SWU: Number of points of link special register (SW)^{*3}

Condition		Constant value
KM1 ($\times 10^{-3}$)		40.00
KM2 ($\times 10^{-3}$)	Main base unit ^{*4}	0.01
	Extension base unit ^{*4}	0.12
KM3 ($\times 10^{-3}$)	Main base unit ^{*4}	0.03
	Extension base unit ^{*4}	0.15

*1 Total number of points here indicates the one of link devices that have been set in "Refresh Setting" and "Network Configuration Settings". The number of points that has been assigned in the reserved station is excluded in the link relay (LB) and the link register (LW).

*2 Number of points here indicates the one of when module label is not used. Calculation is executed while it is regarded as "0" when module label is used.

*3 Number of points here indicates the one of when module label is used. Calculation is executed while it is regarded as "0" when module label is not used.

*4 The base units here indicates the type of base unit where the network module targeted for refresh is mounted.

■Link refresh processing time for the CC-Link IE Controller Network module

The link refresh processing time between the CPU module and the CC-Link IE Controller Network module on the main base unit or the extension base unit is calculated by the following formulas.

$$\alpha T, \alpha R [\text{ms}] = \text{KM1} + \text{KM2} \times ((\text{LB} + \text{LX} + \text{LY} + \text{SB}) \div 16 + \text{LW} + \text{SW}) + \alpha U$$

$$\alpha U [\text{ms}] = \text{KM3} \times (\text{SBU} \div 16 + \text{SWU})$$

- αT : Link refresh time (sending side)
- αR : Link refresh time (receiving side)
- αU : Unit label (SB/SW) refresh time
- LB: Total number of points of link relay (LB) that is refreshed by the station ^{*1}
- LW: Total number of points of link register (LW) that is refreshed by the station ^{*1}
- LX: Total number of points of link input (LX) that is refreshed by the station ^{*1}
- LY: Total number of points of link output (LY) that is refreshed by the station ^{*1}
- SB: Number of points of link special relay (SB) ^{*2}
- SW: Number of points of link special register (SW) ^{*2}
- SBU: Number of points of link special relay (SB) ^{*3}
- SWU: Number of points of link special register (SW) ^{*3}

Condition		Constant value
KM1 ($\times 10^{-3}$)		40.00
KM2 ($\times 10^{-3}$)	Main base unit ^{*4}	0.01
	Extension base unit ^{*4}	0.12
KM3 ($\times 10^{-3}$)	Main base unit ^{*4}	0.03
	Extension base unit ^{*4}	0.15

*1 Total number of points here indicates the one of link devices that have been set in "Refresh Setting" and "Network Configuration Settings". Note that the number of points that has been assigned in the reserved station is excluded.

*2 Number of points here indicates the one of when module label is not used. Calculation is executed while it is regarded as "0" when module label is used.

*3 Number of points here indicates the one of when module label is used. Calculation is executed while it is regarded as "0" when module label is not used.

*4 The base units here indicates the type of base unit where the network module targeted for refresh is mounted.

■Link refresh processing time for the CC-Link IE Field Network module

The link refresh processing time between the CPU module and the CC-Link IE Field Network module on the main base unit or the extension base unit is calculated by the following formulas.

$$\alpha T, \alpha R [\text{ms}] = \text{KM1} + \text{KM2} \times ((\text{RX} + \text{RY} + \text{SB}) \div 16 + \text{RW}r + \text{RW}w + \text{SW}) + \alpha U$$

$$\alpha U [\text{ms}] = \text{KM3} \times (\text{SBU} \div 16 + \text{SWU})$$

- αT : Link refresh time (sending side)
- αR : Link refresh time (receiving side)
- αU : Unit label (SB/SW) refresh time
- RX: Total number of points of remote input (RX) refreshed by the master station/local station^{*1}
- RY: Total number of points of remote output (RY) refreshed by the master station/local station^{*1}
- RWw: Total number of points of remote register (RWw) refreshed by the master station/local station^{*1}
- RWr: Total number of points of remote register (RWr) refreshed by the master station/local station^{*1}
- SB: Number of points of link special relay (SB)^{*2}
- SW: Number of points of link special register (SW)^{*2}
- SBU: Number of points of link special relay (SB)^{*3}
- SWU: Number of points of link special register (SW)^{*3}

Condition		Constant value
KM1 ($\times 10^{-3}$)		40.00
KM2 ($\times 10^{-3}$)	Main base unit ^{*4}	0.01
	Extension base unit ^{*4}	0.12
KM3 ($\times 10^{-3}$)	Main base unit ^{*4}	0.03
	Extension base unit ^{*4}	0.15

*1 Total number of points here indicates the one of link devices that have been set in "Refresh Setting" and "Network Configuration Settings".

*2 Number of points here indicates the one of when module label is not used. Calculation is executed while it is regarded as "0" when module label is used.

*3 Number of points here indicates the one of when module label is used. Calculation is executed while it is regarded as "0" when module label is not used.

*4 The base units here indicates the type of base unit where the network module targeted for refresh is mounted.

■Link refresh processing time for the CC-Link module

The link refresh processing time between the CPU module and the CC-Link module on the main base unit or the extension base unit is calculated by the following formulas. (Remote net Ver.1 mode, Remote net Ver.2 mode)

$$\alpha T, \alpha R [\text{ms}] = \text{KM1} + \text{KM2} \times ((\text{RX} + \text{RY} + \text{SB}) \div 16 + \text{RW}r + \text{RW}w + \text{SW}) + \alpha U$$

$$\alpha U [\text{ms}] = \text{KM3} \times (\text{SBU} \div 16 + \text{SWU})$$

- αT : Link refresh time (sending side)
- αR : Link refresh time (receiving side)
- αU : Unit label (SB/SW) refresh time
- RX: Total number of points of remote input (RX) refreshed by the master station/local station^{*1}
- RY: Total number of points of remote output (RY) refreshed by the master station/local station^{*1}
- RWw: Total number of points of remote register (RWw) refreshed by the master station/local station^{*1}
- RWr: Total number of points of remote register (RWr) refreshed by the master station/local station^{*1}
- SB: Number of points of link special relay (SB)^{*2}
- SW: Number of points of link special register (SW)^{*2}
- SBU: Number of points of link special relay (SB)^{*3}
- SWU: Number of points of link special register (SW)^{*3}

Condition		Constant value
KM1 ($\times 10^{-3}$)		40.00
KM2 ($\times 10^{-3}$)	Main base unit ^{*4}	0.01
	Extension base unit ^{*4}	0.12
KM3 ($\times 10^{-3}$)	Main base unit ^{*4}	0.03
	Extension base unit ^{*4}	0.15

*1 Total number of points here indicates the one of link devices that have been set in "Refresh Setting" and "Network Configuration Settings".

*2 Number of points here indicates the one of when module label is not used. Calculation is executed while it is regarded as "0" when module label is used.

*3 Number of points here indicates the one of when module label is used. Calculation is executed while it is regarded as "0" when module label is not used.

*4 The base units here indicates the type of base unit where the network module targeted for refresh is mounted.

■Link refresh processing time for the MELSECNET/H network module

The link refresh processing time between the CPU module and the MELSEC iQ-R series MELSECNET/H network module on the main base unit or the extension base unit is calculated by the following formulas.

$$\alpha T, \alpha R [\text{ms}] = \text{KM1} + \text{KM2} \times ((\text{LB} + \text{LX} + \text{LY} + \text{SB}) \div 16 + \text{LW} + \text{SW}) + \alpha U$$

$$\alpha U [\text{ms}] = \text{KM3} \times (\text{SBU} \div 16 + \text{SWU})$$

- αT : Link refresh time (sending side)
- αR : Link refresh time (receiving side)
- αU : Unit label (SB/SW) refresh time
- LB: Total number of points of link relay (LB) that is refreshed by the station^{*1}
- LW: Total number of points of link register (LW) that is refreshed by the station^{*1}
- LX: Total number of points of link input (LX) that is refreshed by the station^{*1}
- LY: Total number of points of link output (LY) that is refreshed by the station^{*1}
- SB: Number of points of link special relay (SB)^{*2}
- SW: Number of points of link special register (SW)^{*2}
- SBU: Number of points of link special relay (SB)^{*3}
- SWU: Number of points of link special register (SW)^{*3}

Condition	Constant value	
KM1 ($\times 10^{-3}$)	40	
KM2 ($\times 10^{-3}$)	Main base unit ^{*4}	0.01
	Extension base unit ^{*4}	0.12
KM3 ($\times 10^{-3}$)	Main base unit ^{*4}	0.03
	Extension base unit ^{*4}	0.15

*1 Total number of points here indicates the one of link devices that have been set in "Refresh Setting" and "Network Configuration Settings". Note that the number of points that has been assigned in the reserved station is excluded.

*2 Number of points here indicates the one of when module label is not used. Calculation is executed while it is regarded as "0" when module label is used.

*3 Number of points here indicates the one of when module label is used. Calculation is executed while it is regarded as "0" when module label is not used.

*4 The base units here indicates the type of base unit where the network module targeted for refresh is mounted.

The link refresh processing time between the CPU module and the MELSEC-Q series MELSECNET/H network module on the RQ extension base unit or the Q series extension base unit is calculated by the following formulas.

$$\alpha T, \alpha R [\text{ms}] = \text{KM1} + \text{KM2} \times ((\text{LB} + \text{LX} + \text{LY} + \text{SB}) \div 16 + \text{LW} + \text{SW})$$

- αT : Link refresh time (sending side)
- αR : Link refresh time (receiving side)
- LB: Total number of points of link relay (LB) that is refreshed by the station^{*5}
- LW: Total number of points of link register (LW) that is refreshed by the station^{*5}
- LX: Total number of points of link input (LX) that is refreshed by the station^{*5}
- LY: Total number of points of link output (LY) that is refreshed by the station^{*5}
- SB: Number of points of link special relay (SB)
- SW: Number of points of link special register (SW)

Condition	Constant value	
KM1 ($\times 10^{-3}$)	65	
KM2 ($\times 10^{-3}$)	RQ extension base unit (RQ6□B) ^{*6}	0.41
	Q series extension base unit (Q5□B/Q6□B) ^{*6}	0.92

*5 Total number of points here indicates the one of link devices that have been set in "Refresh Setting" and "Network Configuration Settings". Note that the number of points that has been assigned in the reserved station is excluded.

*6 The base units here indicates the type of base unit where the network module targeted for refresh is mounted.

Link refresh processing time for CC-Link IE Field Network Basic

The link refresh processing time for CC-Link IE Field Network Basic (the increase in END processing time for the CPU module) can be calculated by the following formula.

$$\alpha T [\mu s] = KM1 + KM2 \times (((RX + RY) \div 16) + RWw + RWr) + \alpha E$$

$$\alpha E [\mu s] = KM3 + KM4 \times ((RX + RY) \div 16) + RWw + RWr$$

- αT : Link refresh time
- αE : Link refresh time when the file register (R, ZR) is used^{*1}
- RX: Total number of points of remote input (RX) refreshed by the master station^{*2}
- RY: Total number of points of remote output (RY) refreshed by the master station^{*2}
- RWw: Total number of points of remote register (RWw) refreshed by the master station^{*2}
- RWr: Total number of points of remote register (RWr) refreshed by the master station^{*2}

Condition		Constant value
KM1		12.5
KM2		0.02
KM3		14.5
KM4	When the extended SRAM cassette or battery-less option cassette is not used	0.04
	When the extended SRAM cassette or battery-less option cassette is used	0.11

*1 This is added when file register (R, ZR) is used.

*2 This value is determined according to the number of slave stations to be connected and the number of occupied stations.

Intelligent function module refresh processing time

The following calculation formula shows the refresh processing time for the intelligent function module mounted on the main base unit and the extension base unit.

Point

The refresh processing time described in this manual is for the case when the "Target" is set to "Device" in the refresh setting. For the refresh processing time of when the refreshing target is set to the module label or refresh data register (RD), refer to the manual for the module used.

Refresh processing time of one module [μs] = Read refresh time^{*1} + Write refresh time^{*1}

*1 When the number of settings of read refresh (Module → CPU module) or write refresh (CPU module → Module) is 0, each processing time is 0.

Read refresh time [μs]

Number of read refresh settings × KM1 + Refresh time for the first item (A) + Refresh time for the second item (A) + ... + Refresh time for the nth item (A) + KM2

Write refresh time [μs]

Number of write refresh settings × KM4 + Refresh time for the first item (B) + Refresh time for the second item (B) + ... + Refresh time for the nth item (B) + KM5

- A: KM3 × Number of refresh transfer (word) [μs]
- B: KM6 × Number of refresh transfer (word) [μs]
- n: Number of blocks for refresh settings^{*1}
- KM1 to KM6: Constant value as shown below

Condition			Constant value
MELSEC iQ-R series module	KM1	Module on the main base unit → CPU module	0.98
		Module on the extension base unit → CPU module	0.98
	KM2	Module on the main base unit → CPU module	11.6
		Module on the extension base unit → CPU module	11.6
	KM3	Module on the main base unit → CPU module	0.05
		Module on the extension base unit → CPU module	0.05
	KM4	CPU module → Main base unit	0.58
		CPU module → Extension base unit	0.58
	KM5	CPU module → Main base unit	9.10
		CPU module → Extension base unit	9.10
	KM6	CPU module → Main base unit	0.01
		CPU module → Extension base unit	0.01
Q series module	KM1	Module on the RQ extension base unit → CPU module	1.47
		Module on the Q series extension base unit → CPU module	2.92
	KM2	Module on the RQ extension base unit → CPU module	21.2
		Module on the Q series extension base unit → CPU module	20.2
	KM3	Module on the RQ extension base unit → CPU module	0.38
		Module on the Q series extension base unit → CPU module	0.91
	KM4	CPU module → Module on the RQ extension base unit	0.83
		CPU module → Module on the Q series extension base unit	1.20
	KM5	CPU module → Module on the RQ extension base unit	15.8
		CPU module → Module on the Q series extension base unit	15.0
	KM6	CPU module → Module on the RQ extension base unit	0.43
		CPU module → Module on the Q series extension base unit	0.97

*1 The number of blocks for refresh settings can be checked in "Auto Refresh Setting Total Counts" of "Module Parameter List" window. For details, refer to the manual for the module used.

Multiple CPU refresh processing time

This section describes the Multiple CPU refresh processing time.

Refresh processing time [μs] = Send refresh time + Receive refresh time

Send refresh time [μs] = $\text{KM1} + \text{KM2} \times \text{Number of points of send word}$

Receive refresh time [μs] = $\text{KM3} + \text{KM4} \times \text{Number of other CPU modules} + \text{KM5} \times \text{Number of points of receive word}$

■Refresh (when END)

The following table lists the constant values when refresh is executed in END processing at CPU buffer memory area.

Constant	Constant value
KM1	6
KM2	0.01
KM3	5
KM4	14
KM5	0.011

■Refresh (when I45 is executed)

The following table lists the constant values when refresh is executed in Multiple CPU synchronous interrupt (I45) at fixed scan communication area.

Constant	Constant value
KM1	20
KM2	0.007
KM3	20
KM4	4
KM5	0.007

Prolonged time of END processing when executing each function

This section describes the prolonged time of END processing when executing each function.

■Latch processing time

If the latch function is used and the range for the latch time setting is effective, the scan time becomes longer. Also when the time setting is configured for the latch time setting, the scan time may be prolonged in the next END processing after the specified time has passed. The increase in scan time when the latch range is set can be calculated by the following formula.
 Increase in scan time[μs] = (KM1 × Number of settings of latch range setting^{*1}) + (KM2 × (Number of points of bit device with latch specified ÷ 16 + Number of points of word device with latch specified + Number of points of double word device with latch specified × 2)) + KM3

*1 The latch range (1) and the latch range (2) are counted as different device types.

Condition	Constant value		
When set to "each scan"	KM1	1.00	
	KM2	When the battery-less option cassette is not used	0.09
		When the battery-less option cassette is used	0.1
	KM3	1.20	
When set to "hour"	KM1	1.0	
	KM2	0.004	
	KM3	17.5	

■Data logging function

When the data logging function is executed, the scan time becomes longer. The increase in scan time can be calculated by the following formula.

Increase in scan time [μs] = KM1 + (KM2 × Number of data logging settings) + (KM3 × Number of device points of internal device^{*1})

*1 This indicates the total number of points of data logging setting No.1 to No.10.

Condition	Constant value	
When all the columns are outputted under the condition of file format of Unicode text file	KM1	34
	KM2	34
	KM3	0.08

■Data logging file transfer function

In the data logging file transfer function, the scan time does not increase.

■Processing time when file register is used

When "Use File Register of Each Program" has been set through setting the file register, the scan time becomes longer. The increase in the scan time [ms] is given by: the number of program files × 0.016.

When "Use Common File Register in All Programs" has been set, the scan time may not become longer.

■Memory dump function

The execution of the memory dump function results in an increase in the scan time. The increase in scan time can be calculated by the following formula.

Increase in scan time [μs] = (KM1 × Number of points^{*1}) + KM2

Constant	Constant value	
	R00CPU, R01CPU, R02CPU, R04CPU	Other programmable controller CPUs
KM1	102.00	61.00
KM2	10.00	25.00

*1 This indicates the total number of points (total number of words) of devices that are set in the device area, file storage area, and refresh data register area. (unit: K words).

When the total number of points exceeds the value specified in the internal buffer capacity setting, change the total number to that value (unit: K words).

■Real-time monitor function

The execution of the real-time monitor function results in an increase in the scan time. The increase in scan time can be calculated by the following formula.

Increase in scan time [μ s] = $KM1 + (KM2 \times \text{Number of points of word device}) + (KM3 \times \text{Number of points of bit device})$

- In monitoring global devices (X, Y, M, L, B, F, SB, V, T, ST, C, LT, LST, LC, D, W, SW, FX, FY, SM, FD, SD, BLnS)/global labels

Constant	Constant value
KM1	149.00
KM2	3.20
KM3	0.80

- In monitoring file registers (R, ZR)

Constant	Constant value
KM1	149.00
KM2	3.50
KM3	1.10

- In monitoring module access devices (Un\G, U3En\G, U3En\HG)/link direct devices (Jn\W, Jn\X, Jn\SW, Jn\Y, Jn\SB, Jn\B)

Constant	Constant value	
	R00/R01/R02CPU	Other CPU modules
KM1	180.00	156.00
KM2	11.30	11.60
KM3	12.80	8.90

- In monitoring local devices (M, V, T, ST, C, LT, LST, LC, D)/local labels

Constant	Constant value	
	R00/R01/R02CPU	Other CPU modules
KM1	149.00	149.00
KM2	8.80	6.20
KM3	5.80	3.10

■Sequence scan synchronization sampling function

When the sequence scan synchronization sampling function is executed, the scan time becomes longer. The increase in scan time can be calculated by the following formula.

Increase in scan time [μ s] = $(KM1 \times \text{Number of processing times}^{*1}) + (KM2 \times \text{Total number of points of device that has been set}^{*2}) + (KM3 \times \text{Number of settings}^{*2}) + (KM4 \times \text{Number of modules}^{*3}) + KM5$

*1 The number of processing times indicates the number of times to perform the processing for 64 points of the device that can be processed at a time. The number of times is calculated by the total number of points of device that has been set $n \div 64$. (The decimal point is rounded up.)

*2 For the device types and number of settings that can be set, refer to the manual for the module used.

*3 The number of modules indicates the total number of modules which has executed this function.

Constant	Constant value
KM1	8.00
KM2	0.42
KM3	0.20
KM4	24.00
KM5	85.00

■File batch online change

When the file batch online change is executed, the scan time becomes longer. The increase in scan time [ms] can be calculated by the following formula.

Condition ^{*1}	Calculation formula	Constant value
When SM388 is off (Program file only)	$(KM1 \times \text{Number of program files}^{*2}) + (KM2 \times \text{Number of steps in the largest program}^{*3}) + KM3$	KM1: 0.018 KM2: 0.06×10^{-3} KM3: 0.9
When SM388 is on (Program file/FB file/global label setting file)	$(KM4 \times \text{Number of program files to be written}^{*4}) + (KM5 \times \text{Total number of steps in programs}^{*5})$	KM4: 2.34 KM5: 0.06×10^{-3}

*1 For R00CPU, R01CPU, R02CPU, calculate with calculation formula for "when SM388 is on" in the above table. For R00CPU, R01CPU, R02CPU, the operation setting status is set to "program file/FB file/global label setting file" regardless of the SM388 setting.

*2 This indicates the number of program files that are written to the CPU module.

*3 This indicates the number of steps in the largest program file among the program files to which the file batch online change is performed.

*4 This indicates the number of program files to which the file batch online change is performed.

*5 This indicates the total number of steps in the program files to which the file batch online change is performed.

Point

The number of steps for each program file can be checked [Confirm Memory Size (Offline)] in [Tool] of the engineering tool.

■Simple CPU communication function

The processing time of the simple CPU communication function (the increase in END processing time for the CPU module) can be calculated by the following formula.

Processing time of the simple CPU communication function [μs] = $KM1 + \alpha T_1 + \alpha T_2 + \dots + \alpha T_n$

• αT_n [μs] = $KM2 + KM6^{*2} + \alpha B_n + \alpha W_n$

• αB_n [μs] = $KM3 \times (\text{number of bit points to be communicated} \div 16)$

• αW_n^{*1} [μs] = $KM3 \times (\text{number of word points to be communicated})$

*1 αE_n in the following is used when the file register (R, ZR) is used.

αE_n [μs] = $KM4 + KM5 \times (\text{number of word points to be communicated})$

*2 The value is added only when the communication setting is set to "On Request".

• αT_n : Simple CPU communication processing time per setting

• αB_n : Simple CPU communication processing time per setting when using a bit device

• αW_n : Simple CPU communication processing time per setting when using a word device (except for the file register (R, ZR))

• αE_n : Simple CPU communication processing time when using the file register (R, ZR)

• n: Number of settings

Condition	Constant value		
	R00CPU, R01CPU, R02CPU	R04(EN)CPU	R08(EN)CPU, R16(EN)CPU, R32(EN)CPU, R120(EN)CPU
KM1	60.00	60.00	60.00
KM2	0.90	0.90	0.90
KM3	0.024	0.024	0.024
KM4	0.70	0.70	0.70
KM5	When the extended SRAM cassette or battery-less option cassette is not used	0.10	0.10
	When the extended SRAM cassette or battery-less option cassette is used	—	0.13
KM6	1.10	1.10	1.10

Device/label access service processing time

This section describes the device/label access service processing time when "Processing time = One time" in the device/label access service processing setting.

Condition			Device/label access service processing time
Connected via USB	Ladder block change during RUN (online program change)	100 steps are inserted into the head of program of 40K steps.	1.0ms maximum ^{*1}
	Monitor data registration	Data register (D) (Number of device points = 32 points) is registered to monitor.	0.07ms maximum
When connecting the Ethernet port (TCP)	Ladder block change during RUN (online program change)	100 steps are inserted into the head of program of 40K steps.	1.0ms maximum ^{*1}
	Monitor data registration	Data register (D) (Number of device points = 32 points) is registered to monitor.	0.07ms maximum
When connecting the Ethernet port (UDP)	Ladder block change during RUN (online program change)	100 steps are inserted into the head of program of 40K steps.	1.0ms maximum ^{*1}
	Monitor data registration	Data register (D) (Number of device points = 32 points) is registered to monitor.	0.07ms maximum

*1 When data are written to the program using a pointer (P) during RUN, the processing time is extended depending on the pointer number used. For example, when the data are written to the program using P8191 during RUN, the processing time is extended up to 3.0ms.

Data logging function processing time

This section describes the processing time taken to store the data when executing the data logging function. (The values shown in the tables below are the minimum time values that allow the CPU module to collect data without missing any data while the continuous logging is executed.)

When the file format is Unicode text file

■When a global device or global label is specified

The following table lists the collection intervals at which data can be collected under the following conditions.

- Scan time = 1.5ms (up to 3ms)
- Internal buffer capacity setting = 128K bytes per setting (default setting)
- Collection setting = Time specification (data collection at time interval)
- Data setting = Data register (D) (Data-type: word-signed (decimal number type))
- Output setting = Day/time column (output format is default) and index column are outputted.
- Save setting = file switching timing: 1024K bytes (when the data storage destination memory is the function memory) or 10000 records (when the data storage destination memory is the SD memory card), operation when the number of saved files exceeded: overwriting
- When the data storage destination memory is the SD memory card, functions that require access to files in the SD memory card except for the data logging function are not active.
- The default setting value is used for the file transfer server setting of the CPU Module Logging Configuration Tool (however, the IP address, login user name, and password can be customized).
- Parameters are used only for required settings that can be connected to the FTP server (IP address settings of the module parameter only) and default setting values are used for other settings.

Number of points		File transfer		Collection interval at which data can be collected		
				When the function memory is used	When the SD memory card is used	
					NZ1MEM-2GBSD	NZ1MEM-4/8/16GBSD
8 points	(8 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	1.0ms
16 points	(16 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	1.0ms
64 points	(64 points × 1 setting)	Not performed		—	1.0ms	2.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	2.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	3.0ms
128 points	(128 points × 1 setting)	Not performed		—	1.0ms	4.0ms
		Performed	No file deletion specification at transfer completion	—	2.0ms	5.0ms
			File deletion specification at transfer completion	1.0ms	2.0ms	6.0ms
256 points	(128 points × 2 setting)	Not performed		—	4.0ms	7.0ms (For the R04(EN)CPU: 5.0ms)
		Performed	No file deletion specification at transfer completion	—	4.0ms	8.0ms
			File deletion specification at transfer completion	1.0ms	4.0ms	8.0ms

Number of points		File transfer		Collection interval at which data can be collected		
				When the function memory is used	When the SD memory card is used	
					NZ1MEM-2GBSD	NZ1MEM-4/8/16GBSD
1280 points	(128 points × 10 setting)	Not performed		—	18.0ms	20.0ms
		Performed	No file deletion specification at transfer completion	—	19.0ms	23.0ms
			File deletion specification at transfer completion	6.0ms	19.0ms	24.0ms (For the R04(EN)CPU: 23.0ms)

■When a local device or local label is specified

The following table lists the collection intervals at which data can be collected under the following conditions.

- Scan time = 1.5ms (up to 5ms)
- Internal buffer capacity setting = 128K bytes per setting (default setting)
- Collection setting = Time specification (data collection at time interval)
- Data setting = Data register (#D) (Data-type: word-signed (decimal number type))
- Output setting = Day/time column (output format is default) and index column are outputted.
- Save setting = file switching timing: 1024K bytes (when the data storage destination memory is the function memory) or 10000 records (when the data storage destination memory is the SD memory card), operation when the number of saved files exceeded: overwriting
- When the data storage destination memory is the SD memory card, functions that require access to files in the SD memory card except for the data logging function are not active.
- The default setting value is used for the file transfer server setting of the CPU Module Logging Configuration Tool (however, the IP address, login user name, and password can be customized).
- Parameters are used only for required settings that can be connected to the FTP server (IP address settings of the module parameter only) and default setting values are used for other settings.

Number of points		File transfer		Collection interval at which data can be collected		
				When the function memory is used	When the SD memory card is used	
					NZ1MEM-2GBSD	NZ1MEM-4/8/16GBSD
8 points	(8 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	1.0ms
16 points	(16 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	1.0ms
64 points	(64 points × 1 setting)	Not performed		—	1.0ms	2.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	3.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	3.0ms
128 points	(128 points × 1 setting)	Not performed		—	3.0ms	5.0ms
		Performed	No file deletion specification at transfer completion	—	4.0ms	6.0ms
			File deletion specification at transfer completion	1.0ms	4.0ms	6.0ms
256 points	(128 points × 2 setting)	Not performed		—	6.0ms	6.0ms
		Performed	No file deletion specification at transfer completion	—	7.0ms	7.0ms
			File deletion specification at transfer completion	1.0ms	7.0ms	7.0ms
1280 points	(128 points × 10 setting)	Not performed		—	25.0ms	30.0ms
		Performed	No file deletion specification at transfer completion	—	30.0ms	35.0ms
			File deletion specification at transfer completion	6.0ms	30.0ms	35.0ms

When the file format is CSV

■When a global device or global label is specified

The following table lists the collection intervals at which data can be collected under the following conditions.

- Scan time = 1.5ms (up to 3ms)
- Internal buffer capacity setting = 128K bytes per setting (default setting)
- Collection setting = Time specification (data collection at time interval)
- Data setting = Data register (D) (Data-type: word-signed (decimal number type))
- Output setting = Day/time column (output format is default) and index column are outputted.
- Save setting = file switching timing: 1024K bytes (when the data storage destination memory is the function memory) or 10000 records (when the data storage destination memory is the SD memory card), operation when the number of saved files exceeded: overwriting
- When the data storage destination memory is the SD memory card, functions that require access to files in the SD memory card except for the data logging function are not active.
- The default setting value is used for the file transfer server setting of the CPU Module Logging Configuration Tool (however, the IP address, login user name, and password can be customized).
- Parameters are used only for required settings that can be connected to the FTP server (IP address settings of the module parameter only) and default setting values are used for other settings.

Number of points		File transfer		Collection interval at which data can be collected		
				When the function memory is used	When the SD memory card is used	
					NZ1MEM-2GBSD	NZ1MEM-4/8/16GBSD
8 points	(8 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	1.0ms
16 points	(16 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	1.0ms
64 points	(64 points × 1 setting)	Not performed		—	1.0ms	2.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	2.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	3.0ms
128 points	(128 points × 1 setting)	Not performed		—	1.0ms	4.0ms
		Performed	No file deletion specification at transfer completion	—	2.0ms	5.0ms
			File deletion specification at transfer completion	1.0ms	2.0ms	6.0ms
256 points	(128 points × 2 setting)	Not performed		—	4.0ms	7.0ms (For the R04(EN)CPU: 5.0ms)
		Performed	No file deletion specification at transfer completion	—	4.0ms	8.0ms
			File deletion specification at transfer completion	1.0ms	4.0ms	8.0ms
1280 points	(128 points × 10 setting)	Not performed		—	18.0ms	20.0ms
		Performed	No file deletion specification at transfer completion	—	19.0ms	23.0ms
			File deletion specification at transfer completion	6.0ms	19.0ms	24.0ms (For the R04(EN)CPU: 23.0ms)

■When a local device or local label is specified

The following table lists the collection intervals at which data can be collected under the following conditions.

- Scan time = 1.5ms (up to 5ms)
- Internal buffer capacity setting = 128K bytes per setting (default setting)
- Collection setting = Time specification (data collection at time interval)
- Data setting = Data register (#D) (Data-type: word-signed (decimal number type))
- Output setting = Day/time column (output format is default) and index column are outputted.
- Save setting = file switching timing: 1024K bytes (when the data storage destination memory is the function memory) or 10000 records (when the data storage destination memory is the SD memory card), operation when the number of saved files exceeded: overwriting
- When the data storage destination memory is the SD memory card, functions that require access to files in the SD memory card except for the data logging function are not active.
- The default setting value is used for the file transfer server setting of the CPU Module Logging Configuration Tool (however, the IP address, login user name, and password can be customized).
- Parameters are used only for required settings that can be connected to the FTP server (IP address settings of the module parameter only) and default setting values are used for other settings.

Number of points		File transfer		Collection interval at which data can be collected		
				When the function memory is used	When the SD memory card is used	
					NZ1MEM-2GBSD	NZ1MEM-4/8/16GBSD
8 points	(8 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	1.0ms
16 points	(16 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	1.0ms
64 points	(64 points × 1 setting)	Not performed		—	1.0ms	2.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	3.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	3.0ms
128 points	(128 points × 1 setting)	Not performed		—	3.0ms	5.0ms
		Performed	No file deletion specification at transfer completion	—	4.0ms	6.0ms
			File deletion specification at transfer completion	1.0ms	4.0ms	6.0ms
256 points	(128 points × 2 setting)	Not performed		—	6.0ms	6.0ms
		Performed	No file deletion specification at transfer completion	—	7.0ms	7.0ms
			File deletion specification at transfer completion	1.0ms	7.0ms	7.0ms
1280 points	(128 points × 10 setting)	Not performed		—	25.0ms	30.0ms
		Performed	No file deletion specification at transfer completion	—	30.0ms	35.0ms
			File deletion specification at transfer completion	6.0ms	30.0ms	35.0ms

When the file format is binary file

■When a global device or global label is specified

The following table lists the collection intervals at which data can be collected under the following conditions.

- Scan time = 1.5ms (up to 3ms)
- Internal buffer capacity setting = 128K bytes per setting (default setting)
- Collection setting = Time specification (data collection at time interval)
- Data setting = Data register (D) (Data-type: word-signed (decimal number type))
- Output setting = Day/time column (output format is default) and index column are outputted.
- Save setting = file switching timing: 1024K bytes (when the data storage destination memory is the function memory) or 10000 records (when the data storage destination memory is the SD memory card), operation when the number of saved files exceeded: overwriting
- When the data storage destination memory is the SD memory card, functions that require access to files in the SD memory card except for the data logging function are not active.
- The default setting value is used for the file transfer server setting of the CPU Module Logging Configuration Tool (however, the IP address, login user name, and password can be customized).
- Parameters are used only for required settings that can be connected to the FTP server (IP address settings of the module parameter only) and default setting values are used for other settings.

Number of points		File transfer		Collection interval at which data can be collected		
				When the function memory is used	When the SD memory card is used	
					NZ1MEM-2GBSD	NZ1MEM-4/8/16GBSD
8 points	(8 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	1.0ms
16 points	(16 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	1.0ms
64 points	(64 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	2.0ms (For the R04(EN)CPU: 1.0ms)
128 points	(128 points × 1 setting)	Not performed		—	1.0ms	3.0ms
		Performed	No file deletion specification at transfer completion	—	2.0ms	4.0ms (For the R04(EN)CPU: 3.0ms)
			File deletion specification at transfer completion	1.0ms	2.0ms	4.0ms (For the R04(EN)CPU: 3.0ms)
256 points	(128 points × 2 setting)	Not performed		—	4.0ms	5.0ms
		Performed	No file deletion specification at transfer completion	—	4.0ms	6.0ms
			File deletion specification at transfer completion	1.0ms	4.0ms	7.0ms (For the R04(EN)CPU: 6.0ms)
1280 points	(128 points × 10 setting)	Not performed		—	13.0ms	18.0ms
		Performed	No file deletion specification at transfer completion	—	17.0ms	20.0ms (For the R04(EN)CPU: 18.0ms)
			File deletion specification at transfer completion	5.0ms	17.0ms	21.0ms (For the R04(EN)CPU: 18.0ms)

■When a local device or local label is specified

The following table lists the collection intervals at which data can be collected under the following conditions.

- Scan time = 1.5ms (up to 5ms)
- Internal buffer capacity setting = 128K bytes per setting (default setting)
- Collection setting = Time specification (data collection at time interval)
- Data setting = Data register (#D) (Data-type: word-signed (decimal number type))
- Output setting = Day/time column (output format is default) and index column are outputted.
- Save setting = file switching timing: 1024K bytes (when the data storage destination memory is the function memory) or 10000 records (when the data storage destination memory is the SD memory card), operation when the number of saved files exceeded: overwriting
- When the data storage destination memory is the SD memory card, functions that require access to files in the SD memory card except for the data logging function are not active.
- The default setting value is used for the file transfer server setting of the CPU Module Logging Configuration Tool (however, the IP address, login user name, and password can be customized).
- Parameters are used only for required settings that can be connected to the FTP server (IP address settings of the module parameter only) and default setting values are used for other settings.

Number of points		File transfer		Collection interval at which data can be collected		
				When the function memory is used	When the SD memory card is used	
					NZ1MEM-2GBSD	NZ1MEM-4/8/16GBSD
8 points	(8 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	1.0ms
16 points	(16 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	1.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	1.0ms
64 points	(64 points × 1 setting)	Not performed		—	1.0ms	1.0ms
		Performed	No file deletion specification at transfer completion	—	1.0ms	2.0ms
			File deletion specification at transfer completion	1.0ms	1.0ms	2.0ms
128 points	(128 points × 1 setting)	Not performed		—	2.0ms	5.0ms
		Performed	No file deletion specification at transfer completion	—	3.0ms	6.0ms
			File deletion specification at transfer completion	1.0ms	3.0ms	6.0ms
256 points	(128 points × 2 setting)	Not performed		—	4.0ms	6.0ms
		Performed	No file deletion specification at transfer completion	—	5.0ms	7.0ms
			File deletion specification at transfer completion	1.0ms	5.0ms	7.0ms
1280 points	(128 points × 10 setting)	Not performed		—	25.0ms	30.0ms
		Performed	No file deletion specification at transfer completion	—	25.0ms	35.0ms
			File deletion specification at transfer completion	5.0ms	25.0ms	35.0ms

Memory dump function processing time

This section describes the time (unit: seconds) taken to save all of the data when the memory dump function is in execution. The following table shows the time taken for data save under the following conditions:

- Scan time = 1.5ms (up to 3ms)
- Internal buffer capacity setting = 256K bytes (by default)
- SD memory card: NZ1MEM-2/4/8/16GBSD used

Number of points ^{*1}	Time taken for data save when the memory dump function is in execution	
	NZ1MEM-2GBSD	NZ1MEM-4/8/16GBSD
550.4K points ^{*2}	17.00 seconds	25.00 seconds
1224K points ^{*3}	35.00 seconds	56.00 seconds
5320K points ^{*4}	145.00 seconds	240.00 seconds
9416K points ^{*5}	244.00 seconds	404.00 seconds

- *1 This indicates the total number of points (total number of words) of devices that are set in the device area, file storage area, and refresh data register area.
- *2 This indicates the number of device points (user device: 38.4K points (words), refresh data register: 512K points (words)) with the CPU parameters set to default values.
- *3 Settings for this number of points (with no extended SRAM cassette inserted) are as follows.
- User device: 40K points (words), file register: 160K points (words), and refresh data register: 1024K points (words)
 - "Use Common File Register in All Programs" is selected in the file register setting.
- *4 Settings for this number of points (with an 8M extended SRAM cassette inserted) are as follows.
- Total number of points (total number of words) of user devices, local devices, and file registers: 4296K points (words), and refresh data register: 1024K points (words)
 - "Use File Register of Each Program" is selected in the file register setting.
 - The number of program files is 10.
- *5 Settings for this number of points (with a 16M extended SRAM cassette inserted) are as follows.
- Total number of points (total number of words) of user devices, local devices, and file registers: 8392K points (words), and refresh data register: 1024K points (words)
 - "Use File Register of Each Program" is selected in the file register setting.
 - The number of program files is 10.

Real-time monitor function processing time

This section shows the minimum value (unit: ms) of monitor interval that allows monitoring under the following conditions without data loss during execution of the real-time monitor function.

- CPU module: The firmware version of the CPU module is "71" or later (except for the R00CPU, R01CPU, and R02CPU)
- Scan time = 1.5ms (up to 3ms)
- Monitor target data = "Number of points" column in the table below (The value of monitor interval does not change when a local device or label is specified.)
- Timing setting in the monitor condition setting = Time specification (deselect "Sample data at the next END processing after the specified time has elapsed")
- Internal buffer capacity = 256K bytes (default settings)
- Performance of the system of personal computer = CPU: Intel® Core™ i9-10900K (3.7GHz), Memory: 32GB, OS: Windows® 10 Enterprise 22H2 64 bits

Condition	Number of points (in word conversion)	Value of monitor interval
Connected via USB	1 point	1.0ms
	8 points	1.0ms
	16 points	1.0ms
	32 points	2.0ms
When connecting the Ethernet port (TCP)	1 point	1.0ms
	8 points	1.0ms
	16 points	1.0ms
	32 points	2.0ms
When connecting the Ethernet port (UDP)	1 point	1.0ms
	8 points	1.0ms
	16 points	1.0ms
	32 points	2.0ms

Database function processing time

Database operation by database access instruction

The table below lists the processing time under the following conditions:

Condition 1	Condition 2
<ul style="list-style-type: none"> Number of records: 10000 Number of fields: 16 The data type of the field is WORD (6 fields), LREAL (6 fields), WSTRING (124 characters) (3 fields), and BOOL (1 field). Main key: Provided Functions that require access to files in the SD memory card except for the database function are not active. 	<ul style="list-style-type: none"> Number of records: 10000 Number of fields: 64 The data type of the field is WORD (20 fields), LREAL (20 fields), WSTRING (124 characters) (6 fields), and BOOL (18 fields). Main key: Provided Functions that require access to files in the SD memory card except for the database function are not active.

This section shows the time taken for the completion signal of the completion device to turn on from the execution of each instruction of the database access instructions.

Instruction		Time taken to complete the execution of instruction	
		Condition 1	Condition 2
Database import	DBIMPORT	155s	255s
Database export	DBEXPORT	75s	195s
Database connection	DBOPEN	First time ^{*1}	150ms
		Second time or later	105ms
Database disconnection	DBCLOSE	30ms	30ms
Database record search	DBSELECT	700ms	750ms
Database record addition	DBINSERT	700ms	800ms
Database record update	DBUPDATE	550ms	600ms
Database record deletion	DBDELETE	700ms	1000ms

*1 After power-on, initial database access involves the diagnostics to check whether the database is corrupted, and thus it takes time to execute the DBOPEN instruction.

■For the programmable controller CPU with firmware version earlier than "28"

The table below lists the processing time under the following conditions:

Condition
<ul style="list-style-type: none"> Number of tables: 1 Number of records: 10000 Number of fields: 4 The data type of the field is specified as WORD, DWORD, WSTRING (16 characters), and WSTRING (32 characters). Index: specified Transaction: Provided (The DBINSERT/DBUPDATE/DBSELECT/DBDELETE instructions only are subject to this condition.) Functions that require access files in to the SD memory card except for the database access instruction are not active.

This section shows the time taken for the completion signal of the completion device to turn on from the execution of each instruction of the database access instructions.

Instruction		Time taken to complete the execution of instruction	
Database import	DBIMPORT	320s	
Database export	DBEXPORT	220s	
Database connection	DBOPEN	First time ^{*1}	590ms
		Second time or later	140ms
Database disconnection	DBCLOSE	3ms	
Database record search	DBSELECT	180ms	
Database record addition	DBINSERT	210ms	
Database record update	DBUPDATE	260ms	
Database record deletion	DBDELETE	300ms	

*1 After power-on, initial database access involves the diagnostics to check whether the database is corrupted, and thus it takes time to execute the DBOPEN instruction.

Processing time of the CPU module database access (from external device) function

The table below lists the processing time under the following conditions:

Condition 1	Condition 2
<ul style="list-style-type: none"> Number of records: 10000 Number of fields: 16 The data type of the field is specified as WORD (6 fields), DOUBLE PRECISION (6 fields), NLSCHAR(UNICODE) [124 characters] (3 fields), and BOOLEAN (1 field). Main key: Provided Functions that require access to files in the SD memory card except for the CPU module database access function are not active. 	<ul style="list-style-type: none"> Number of records: 10000 Number of fields: 64 The data type of the field is specified as WORD (20 fields), DOUBLE PRECISION (20 fields), NLSCHAR(UNICODE) [124 characters] (6 fields), and BOOLEAN (18 fields). Main key: Provided Functions that require access to files in the SD memory card except for the CPU module database access function are not active.

The following table lists the processing time until the database operation is completed with the CPU module database access function.

Item	Time until the operation is completed	
	Condition 1	Condition 2
Connect to the database of the CPU module from the application (Microsoft Access).	5s	
Select a record in the database of the CPU module from the application (Excel). (SELECT)	3s	3s
Insert 1000 records in the database of the CPU module from the application (Microsoft Access). (INSERT)	230s	330s
Update a record in the database of the CPU module from the application (Microsoft Access). (UPDATE)	1s	1s
Delete a record in the database of the CPU module from the application (Microsoft Access). (DELETE)	1s	1s

SFC program processing time

This section describes the time required for SFC program processing.

Point

For details on the SFC program, refer to the following.

📖 MELSEC iQ-R Programming Manual (Program Design)

SFC program processing performance

The SFC program execution time can be calculated with the following formula.

- SFC program execution time = (A) + (B) + (C)

Item	Description
(A)	SFC processing time This is the total time shown in the following table.
(B)	Operation output processing time for all steps This is the total processing time for each instruction used for operation output for all steps in the active status.
(C)	Processing time for all transition conditions This is the total processing time for each instruction used for transition conditions associated with each step in the active status.

*1 For the processing time for each instruction, refer to the following.

📖 MELSEC iQ-R Programming Manual (CPU Module Instructions, Standard Functions/Function Blocks)

The following table lists the types of the SFC processing time (A).

- SFC processing time (A) = (a) + (b) + (c) + (d) + (e) + (f) + (g) + (h)

Item	Processing time calculation (unit: μ s)	Description
(a)	Active block processing time Active block processing time coefficient \times Number of active blocks	This is the system processing time required to execute active blocks.
(b)	Inactive block processing time Inactive block processing time coefficient \times Number of inactive blocks	This is the processing time required to execute inactive blocks.
(c)	Nonexistent block processing time Nonexistent block processing time coefficient \times Number of nonexistent blocks	This is the system processing time required to execute blocks that have not been created.
(d)	Active step processing time Active step processing time coefficient \times Number of active steps	This is the time required to execute active steps.
(e)	Active transition processing time Active transition processing time coefficient \times Number of active transitions	This is the system processing time required to execute active transitions.
(f)	Transition establishment step processing time Transition establishment step processing time coefficient \times Number of transitions	This is the time required to turn off active steps when transitions are established.
(g)	SFC END processing time SFC END processing time = SFC END processing time	This is the system processing time required for SFC END processing.
(h)	Operation output processing time Action processing time coefficient \times Number of actions	This is the system processing time required to process operation outputs.

The following table lists the coefficient values for each processing time.

Item	Coefficient value	
	R00CPU, R01CPU, R02CPU	Other CPU modules
Active block processing time coefficient	3.35	4.4
Inactive block processing time coefficient	2.8	2.7
Nonexistent block processing time coefficient	0.25	0.23
Active step processing time coefficient	12.6	6.8
Active transition processing time coefficient	0.21	0.12
Transition establishment step processing time coefficient	Hold step	30.0
	Normal step	45.0
SFC END processing time	45.0	56.5
Operation output processing time coefficient	2.5	0.94

SFC program switching

This section describes the processing time required to switch the SFC program from the standby status to the scan execution type.

- Switching processing time [μs] = (Number of blocks created \times Km) + (Number of steps created \times Kn) + (SFC program capacity \times Kp) + Kq

Constant	Constant value	
	R00CPU, R01CPU, R02CPU	Other CPU modules
Km	7.90	7.90 ^{*1}
Kn	1.85	1.55 ^{*1}
Kp	0.21	0.21 ^{*1}
Kq	2550	2500

*1 For the firmware version "30" or earlier, the values are as follows.

- R04CPU, R04ENCPU, R08CPU, R08ENCPU, R16CPU, R16ENCPU, R32CPU, R32ENCPU: Km = 3.97, Kn = 0.41, Kp = 0.39
- R120CPU, R120ENCPU: Km = 3.97, Kn = 0.41, Kp = 0.32

When the SFC program capacity is the following models or conditions, the processing time required to switch the SFC program from the standby status to the scan execution type will be fixed.

Model	Condition	Processing time (constant value)
The R04CPU, R04ENCPU, R08CPU, R08ENCPU, R16CPU, R16ENCPU, R32CPU, and R32ENCPU with firmware version "30" or earlier	28K steps or less	14ms
The R120CPU and R120ENCPU with firmware version "30" or earlier	48K steps or less	18ms

When the SFC information device is set, the processing time required to switch the SFC program from the standby status to the scan execution type will become longer.

Processing time until the file operation is completed

This section describes the processing time from the start of the file operation instruction until the completion of the file operation.

Changes in the processing time according to the number of files

The processing time changes according to the number of files stored in folders. The table below lists the processing time under the following conditions:

[Condition]

- Folder/file structure (drive 2: SD memory card)
- SD memory card: NZ1MEM-2/4/8/16GBSD used
- Size of each file to be operated: 1K byte
- The following table lists the instruction arguments of each file operation instruction.

Instruction name	First argument	Second argument	Third argument	Fourth argument	Fifth argument	Sixth argument	Seventh argument
SP.FDELETE	U0	K2	D0	"D001"	M0	—	—
SP.FCOPY	U0	D0	K2	"D001"	K2	"D002"	M0
SP.FMOVE	U0	D0	K2	"D001"	K2	"D002"	M0
SP.FRENAME	U0	K2	D0	"D001"	"D003"	M0	—
SP.FSTATUS	U0	K2	D0	"D001"	D10	M0	—

- File/folder structures except those shown below do not exist.

- Overwriting setting: Not overwrite (SP.FCOPY, SP.FMOVE only)
- Target type setting: Folder specification
- Empty folder deletion setting: Delete folders even when they are not empty (SP.FDELETE only)

■ Processing time

Instruction name	Number of operated files in the folder (D001)			
	1	10	100	1000
SP.FDELETE	38ms	173ms	1417ms	16768ms
SP.FCOPY	694ms	1169ms	6045ms	80977ms
SP.FMOVE	53ms	53ms	53ms	53ms
SP.FRENAME	32ms	32ms	32ms	32ms
SP.FSTATUS	9ms	9ms	9ms	9ms

Changes in the processing time according to the file size

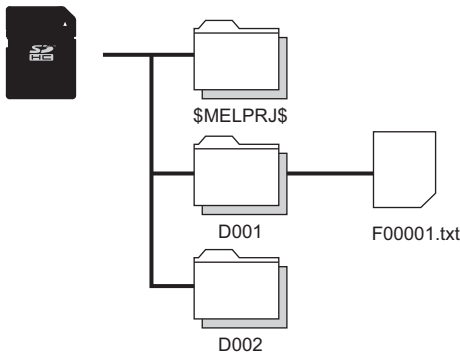

The processing time changes according to the size of the files stored in the folder. The table below lists the processing time under the following conditions:

[Condition]

- Folder/file structure (drive 2: SD memory card)
- SD memory card: NZ1MEM-2/4/8/16GBSD used
- Number of files in the folder: 1
- The following table lists the instruction argument of each file operation instruction.

Instruction name	First argument	Second argument	Third argument	Fourth argument	Fifth argument	Sixth argument	Seventh argument
SP.FDELETE	U0	K2	D0	"D001\F00001.txt"	M0	—	—
SP.FCOPY	U0	D0	K2	"D001\F00001.txt"	K2	"D002"	M0
SP.FMOVE	U0	D0	K2	"D001\F00001.txt"	K2	"D002"	M0
SP.FRENAME	U0	K2	D0	"D001\F00001.txt"	"F00002.txt"	M0	—
SP.FSTATUS	U0	K2	D0	"D001\F00001.txt"	D10	M0	—

- File/folder structures except those shown below do not exist.

- Overwriting setting: Not overwrite (SP.FCOPY, SP.FMOVE only)
- Target type setting: File specification

■ Processing time

Instruction name	Size of operated files in the folder (D001)			
	1MB	16MB	64MB	256MB
SP.FDELETE	40ms	40ms	130ms	270ms
SP.FCOPY	450ms	5450ms	21450ms	85400ms
SP.FMOVE	60ms	60ms	60ms	60ms
SP.FRENAME	50ms	50ms	50ms	50ms
SP.FSTATUS	10ms	10ms	10ms	10ms

Appendix 8 Parameter List

This section lists the items of the parameters and parameter numbers.

System parameters

The following is the list of the items and parameter numbers of the system parameters.

Item			Parameter No.	
I/O Assignment	Base/Power/Extension Cable Setting	Slot	0201H	
		Base, Power Supply Module, Extension Cable	0203H	
	I/O Assignment Setting	Points, Start XY, Module Status Setting	0200H	
		Control PLC Settings	0202H	
		Module Name (number of CPU modules, Host station)	0203H, 0301H, 3900H ^{*1}	
		CPU Module Operation Setting at Error Detection	3600H ^{*1}	
Points Occupied by Empty Slot Batch Setting			0100H	
Multiple CPU Setting	Communication Setting between CPUs	CPU Buffer Memory Setting	CPU Buffer Memory Setting	0303H
			Refresh Setting (At the END)	0304H
			Refresh Setting (At I45 Exe.)	0308H
		PLC Unit Data		0309H
		Fixed Scan Communication Area Setting	0307H	
	Fixed Scan Communication Setting	Fixed Scan Interval Setting of Fixed Scan Communication		0306H
		Fixed Scan Communication Function and Inter-module Synchronization Function		
	Operation Mode Setting	Stop Setting		0302H
		Synchronous Startup Setting		030AH
	Other PLC Control Module Setting	I/O Setting Outside Group		0305H
Inter-module Synchronization Setting	Select Inter-module Synchronization Target Module		0101H	
	Fixed Scan Interval Setting of Inter-module Synchronization			
	Inter-module Synchronous Master Setting		0102H	

*1 The number is stored in the CPU parameter file.

CPU Parameters

The following is the list of the items and parameter numbers of the CPU parameters.

Item		Parameter No.		
Name Setting	Title Setting	3100H		
	Comment Setting	3101H		
Operation Related Setting	Timer Limit Setting	3200H		
	RUN-PAUSE Contact Setting	3201H		
	Remote Reset Setting	3202H		
	Output Mode Setting of STOP to RUN	3203H		
	Module Synchronous Setting	3207H		
	Clock Related Setting	3209H		
	Co-recording Setting	320DH		
	Interrupt Settings	Fixed Scan Interval Setting	3A00H	
Fixed Scan Execution Mode Setting				
Interrupt Enable Setting in Executing Instruction				
Block No. Save/Recovery Setting				
Interrupt Priority Setting from Module		3A01H		
Service Processing Setting	Device/Label Access Service Processing Setting	3B00H		
File Setting	File Register Setting	3300H		
	Initial Value Setting	3301H		
	File Setting for Device Data Storage	3303H		
Memory/Device Setting	Cassette Setting	Extended SRAM Cassette	3404H	
		Battery-less Option Cassette Setting	340CH	
	Device/Label Memory Area Setting	Device/Label Memory Area Capacity Setting		3400H, 3409H
		Device/Label Memory Area Detailed Setting	Device Points	3401H
			Local Device	3405H
			Latch Range Setting	3407H
			Device write-protect setting	340FH
	Latch Type Setting of Latch Type Label		3408H	
	Index Register Setting		3402H	
	Refresh Memory Setting		3403H	
	Device Latch Interval Setting		3406H	
	Pointer Setting		340BH	
	Internal Buffer Capacity Setting		340AH	
	Link Direct Device Setting		340DH	
	Buffer Area Setting for Data Sampling		340EH	
	RAS Setting	Scan Time Monitoring Time (WDT) Setting		3500H
Constant Scan Setting		3503H		
Error Detections Setting		3501H		
CPU Module Operation Setting at Error Detected				
LED Display Setting		3502H		
Event History Setting		Save Destination	3504H ^{*1} , 3507H ^{*1}	
		Storage Capacity Setting per File		
	Save Device/Label Operations	3507H		
Program Setting	Program Setting	Program Name	3700H	
		Execution Type		
		Type	3700H, 3701H	
		Refresh Group Setting	3700H	
		Device/File Use or not		
	FB/FUN File Setting	3702H		
Refresh Setting between Multiple CPU	Refresh Setting (At the END)		3901H	
	Refresh Setting (At I45 Exe.)		3902H	

Item		Parameter No.
Routing Setting	Routing Setting	3800H
SFC Setting	SFC Program Start Mode Setting	3C00H
	Start Condition Setting	
	Output Mode at Block Stop Setting	
User-defined Setting	User-defined Setting	6F00H

*1 When the device/label operation save setting is set to "Not to Save", the value is 3504H. When the device/label operation save setting is set to "Save", the value is 3507H.

Memory card parameters

The following is the list of the items and parameter numbers of the memory card parameters.

Item		Parameter No.
Boot Setting	Operation Setting at CPU Built-in Memory Boot	2000H
	Boot File Setting	
Setting of File/Data Use or Not in Memory Card	Data for Label Communication	2010H
	Module Extended Parameter	
	Device Station Parameter	

Module parameters

This section lists the items and parameter numbers of the module parameters.

Built-in Ethernet function

The following is the list of the items and parameter numbers of the module parameters relating to the built-in Ethernet function.

Item			Parameter No.	
Basic Settings	Own Node Settings	Parameter Setting Method	7100H	
		IP Address Setting	IP Address	A012H
			Subnet Mask	
			Default Gateway	A013H
		Communications by Network No./Station No.		7A20H
		Enable/Disable Online Change		A030H
		Communication Data Code		
	Opening Method		A031H	
	CC-Link IEF Basic Setting	Network Configuration Settings	Network Configuration Settings	7A00H
			Link Scan Setting	7A02H
		Refresh Settings		7420H
	External Device Configuration			A031H, A032H
	Transmission Port Settings	MELSOFT Transmission Port UDP/IP		7A30H
		MELSOFT Transmission Port TCP/IP		
		Auto-open UDP Port		
Application Settings	FTP Server Settings		A037H	
	FTP Client Settings		A03DH	
	DNS Settings		A035H	
	Web Server Settings			
	Simple CPU Communication Setting		7A10H	
	Time Setting		A039H	
	Timer Settings for Data Communication		A038H	
	Security	IP Filter		A03AH
		Disable Direct Connection with MELSOFT		A034H
		Do Not Respond to CPU Module Search		
	Gateway Parameter Settings			A013H
	Network/Station No. <-> IP information setting			A033H
	IP Packet Transfer Setting			A030H
	Built-in Database Access Setting			A0E0H
	iQ Sensor Solution Settings			7A31H
SLMPSND Instruction Settings				

I/O module, intelligent function module, and network module

The following is the list of the items and parameter numbers of the module parameters relating to the I/O module, intelligent function module, and network module.

For details on the items and parameter numbers relating to the intelligent function module and network module, refer to the manual for the corresponding module.

Item		Parameter No.	
Module Information (common)	Module Name	7000H	
	Start I/O No.	7002H	
	Mounting Base, Mounting Slot No.	7002H	
	Comment	7001H	
I/O module	input response time setting	7102H	
	Interrupt setting	7800H	
	Setting of error-time output mode	7101H	
	Refresh Setting	7400H	
Intelligent function module	Basic Setting	7100H	
	Application Setting	7200H	
	Interrupt Setting	7800H	
	Refresh Setting	7400H	
Network module	Required Settings	Required Settings	7100H
		Station Type	7700H
	Basic Settings	Basic Settings	7300H, 7301H, 7302H, 7303H
		Refresh Settings	7401H
	Application Settings	Application Settings	7300H, 7301H, 7302H, 7303H
		Interrupt Settings	7800H

Appendix 9 Target List and Operation Details of the Device/Label Access Service Processing Setting

Target list

This section describes the targets of the device/label access service processing setting.

Applicable function	Description
Functions to perform read/write to files accessed by programs	When read/write is performed to the relevant files during execution of a program, file inconsistency may occur. Therefore, such operation is performed during the END processing.
Functions to perform write to devices/labels	When write is performed to devices/labels during execution of a program, the result of operation processing may become inconsistent. Therefore, such operation is performed during the END processing.

Communication functions via the SLMP/MC protocol

Among communication functions using the SLMP/MC protocol, those to which the device/label access service processing setting can be applied are as follows.

Function	Command		
Device memory	Multiple blocks batch read	0406 (00□0)	
	Multiple blocks batch write	1406 (00□0)	
	Batch read	In units of bits	0401 (00□1)
		In units of words	0401 (00□0)
	Batch write	In units of bits	1401 (00□1)
		In units of words	1401 (00□0)
	Random read	0403 (00□0)	
	Test (Random write)	In units of bits	1402 (00□1)
		In units of words	1402 (00□0)
Monitor	0802 (00□0)		
Files	New file creation ^{*1}	1820 (0000)	
	File copy ^{*1}	File password function incompatible	1824 (0000)
		File password function compatible	1824 (0004)
	File open ^{*1}	File password function incompatible	1827 (0000)
		File password function compatible	1827 (0004)
	File read ^{*1}	1828 (0000)	
	File write ^{*1}	1829 (0000)	
File close ^{*1}	182A (0000)		
Programmable controller CPU monitoring	Registration ^{*2}	0630 (0000)	
	Clear ^{*2}	0631 (0000)	

*1 Only the file register file can support it. (Other file access is always executed asynchronously from the program.)

*2 When registration/clear command is executed, it does not affect the scan time. However, since the serial communication module will periodically access into the device memory of the CPU module when Function is enabled, it becomes the target for Device/Label access service processing setting.

Communication function using an engineering tool

Of the communication functions using an engineering tool, the functions targeted for the setting of the Device/Label access service processing are indicated.

Function	
Writing data to the programmable controller	File register file
	Device data (Local device also included)
	Global label and local label data
Reading data from the programmable controller	File register file
	Device data (Local device also included)
	Global label and local label data
	Device data storage file
Monitor function	Circuit monitor
	Device/buffer memory batch monitor
	Label batch monitor (local label included)
	Buffer memory monitor
Ethernet function	File transfer (FTP server) ^{*1}
	File transfer (FTP client) ^{*1}

*1 Only the file register file can support it. (Other file access is always executed asynchronously from the program.)

Operation details

Operations enabled by setting details of the device/label access service processing setting are as follows.

Execute the process as scan time proceeds

This setting is useful to execute the device/label access service processing in a way commensurate with the system size. It allows the system to be designed without considering the device/label access service processing time because it is determined as a function of the scan time.

Ex.

When "Scan time ratio = 10%" is set

- (1) Synchronization with program is unnecessary.
- (2) Multiple requests are processed until the specified device/label access service processing ratio (10%) is exceeded. When the specified device/label access service processing ratio is exceeded, the remaining requests are processed in the END processing of the next scan. Also, for scan which has the device/label access service processing time shorter than 0.1ms, it is assumed as "The device/label access service processing time per scan = 0.1ms".
- (3) Operations such as access to device, which are synchronized with the program, are processed in the END processing.
- (4) The maximum device/label access service processing time available varies because the scan time (program execution time) varies.

A

Point

For operations such as access to devices, which are synchronized with the program, adjust the time by this setting because they are processed during the END processing. If no request data for the device/label access service processing exists, the scan time is shortened by the specified ratio as the CPU module proceeds to the next scan without waiting for requests.

However, when the device/label access service processing constant wait function^{*1} is enabled, until the ratio set for the device/label access service processing setting of the CPU parameters is reached, the CPU module waits for requests even if requests for service processing do not exist.

*1 For details on the compatible CPU modules, refer to the following.

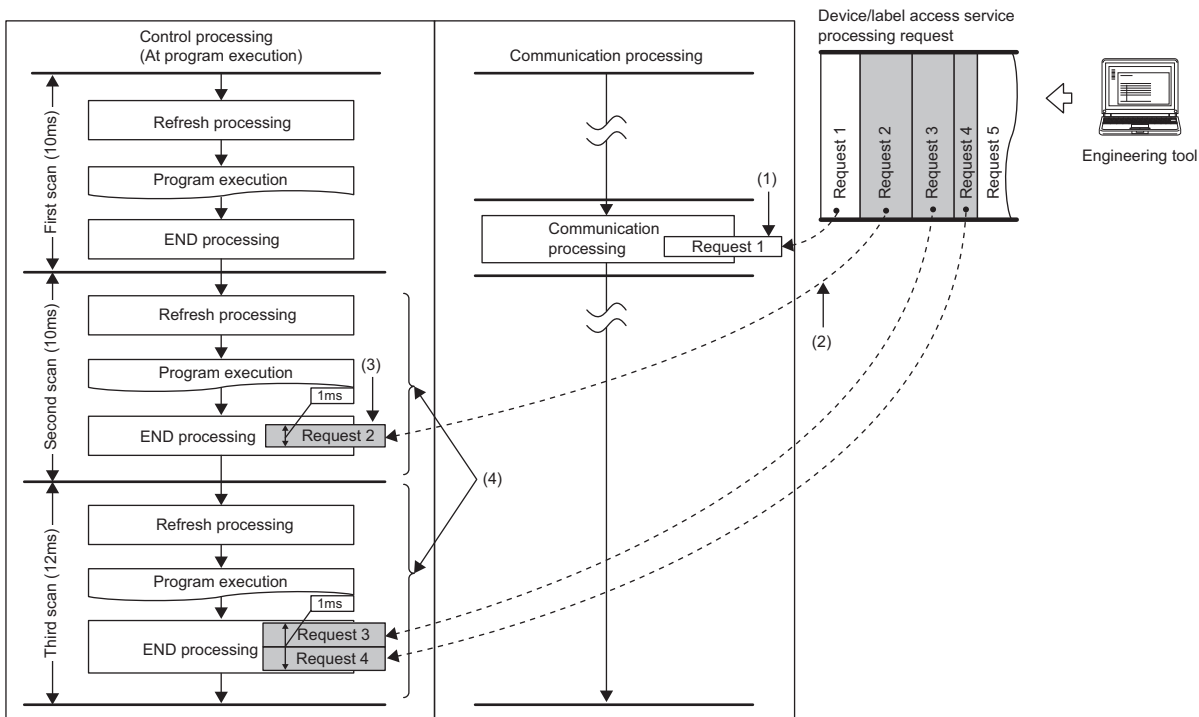

📖 Page 705 Added and Enhanced Functions

Set Processing Time

This setting is useful to give priority to the device/label access service processing. It allows for stable communication because the CPU module can always process a constant amount of the device/label access service processing without affecting the scan time.

Ex.

When "Processing time = 1ms" is set

- (1) Synchronization with program is unnecessary.
- (2) Multiple requests are processed until the specified processing time (1ms) is exceeded. If the specified processing time is exceeded, the remaining requests are processed in the END processing of the next scan.
- (3) Operations such as access to device, which are synchronized with the program, are processed in the END processing.
- (4) The maximum device/label access service processing time available is the same even when the scan time (program execution time) varies.

Point

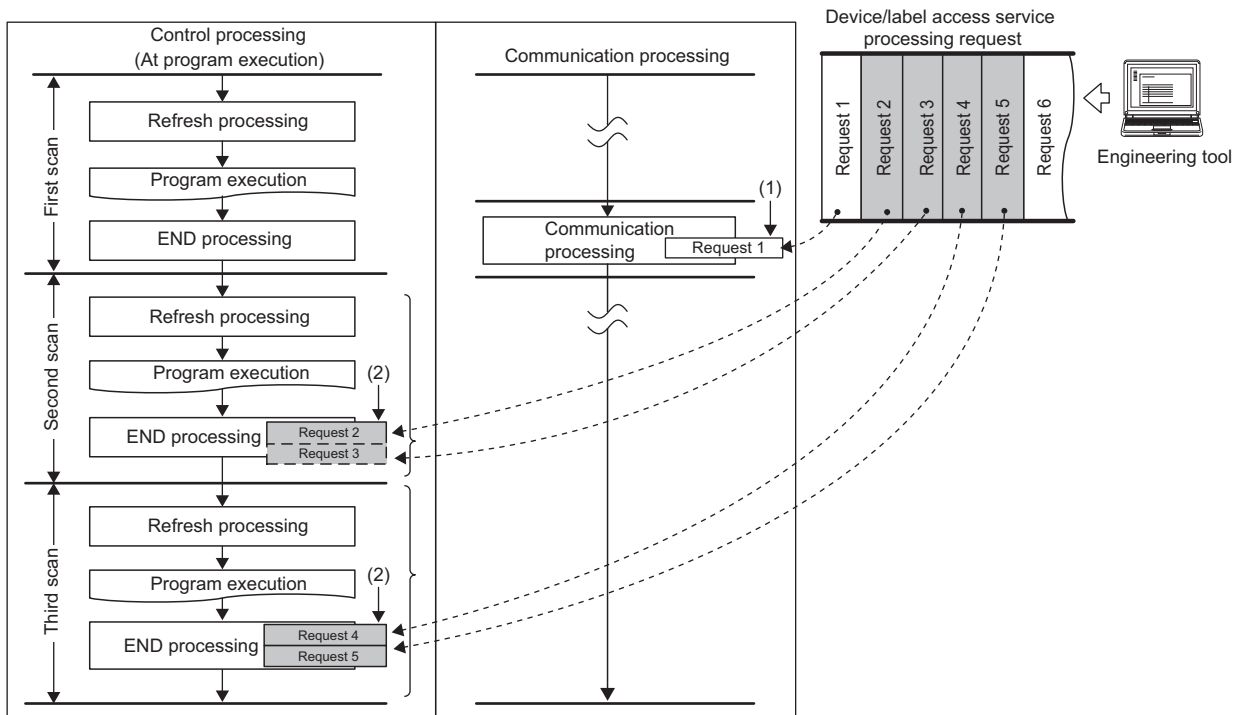

For operations such as access to devices, which are synchronized with the program, adjust the time by this setting because they are processed during the END processing. If no request data for the device/label access service processing exists, the scan time is shortened by the specified ratio as the CPU module proceeds to the next scan without waiting for requests.

Set Processing Counts

This setting is useful to stably execute the device/label access service processing in a system where requests come from multiple peripherals. It provides stable communication in a system where multiple peripherals exist because the CPU module can execute the device/label access service processing based on the number of request sources.

Ex.

When "Processing counts = 2" is set

(1) Synchronization with program is unnecessary.

(2) Two requests are processed in one END processing independently of the requested processing time.

Point

For operations such as access to devices, which are synchronized with the program, adjust the number of executions by this setting because they are processed during the END processing. If no request data for the device/label access service processing exists, the CPU module proceeds to the next scan without waiting for requests.

A

Execute END Processing between Programs

This setting is useful to give priority to the device/label access service processing in a system with a large number of programs. Because operations such as access to devices are performed between program executions and during the END processing, requests as many as the number of programs can be processed during a single scan. As a result, it can reduce the response for the device/label access service processing.

Ex.

When "Execute END Processing between Programs" is enabled

(1) Synchronization with program is unnecessary.

(2) Requests for operations such as access to devices are processed between program executions and during the END processing.

Appendix 10 Program Restoration Information Write Selection

Program restoration information includes the information required to read a program from the programmable controller with the engineering tool. (☞ Page 125 Data allocation and procedure of read/write operations)

Generally, use the CPU module with program restoration information written. However, the method that the program restoration information is not written during writing to the programmable controller and online change*¹ can be selected. Disabling the writing of program restoration information can shorten the time required for writing. This setting is useful to change and write programs repeatedly in the short term such as system start-up and program debugging.

*¹ Even if the program restoration information writing is disabled, an empty file of the same size as the program restoration information is created in the data memory.

For the setting method and operating procedure, refer to the following.

📖 GX Works3 Operating Manual

Restriction

- To use the program restoration information write selection, check the versions of the CPU module and engineering tool used. (☞ Page 705 Added and Enhanced Functions)
- When the program restoration information is not written, data cannot be read from the programmable controller or the detailed verification result window cannot be displayed for verifying data with the programmable controller. Therefore, always write program restoration information after the completion of work such as system start-up and program debugging.

Before writing the program restoration information to a CPU module with no program restoration information by using the online change, select "Write in Background" in the following option.

🔗 [Tool] ⇒ [Options] ⇒ "Convert" ⇒ "Online Program Change" ⇒ "Operational Setting" ⇒ "Write Program Restore Information"

Checking the program restoration information write status

The write status of the program restoration information can be checked in the following ways.

Item	Description	Reference
SM387 (Program restoration information write status)	Off: All written* ¹ On: Not all written* ²	Page 584 System information
SD1488 (Debug function usage status)	b1: Program restoration information write status Off: All written* ¹ On: Not all written* ²	Page 635 Debug function
FUNCTION LED	Off: All written* ¹ Flashing: Not all written* ²	—
Monitor status of GX Works3	 All written* ¹ (Data can be read from the programmable controller.)	GX Works3 Operating Manual
	 Not all written* ² (Data cannot be read from the programmable controller.)	

*¹ Program restoration information of all programs is written.

*² There are one or more programs whose restoration information is not written.

Point

The records of the program restoration information write status are not retained in the event history. Check the write status using the items described above.

FUNCTION LED

The FUNCTION LED indication follows the priority order shown below.

Priority	Description	Remarks
High	When program restoration information is not written, when the external input/output forced on/off function is executed (in registration), when the device tests with execution conditions are registered	Same priority
Low	Functions set in "Function to use FUNCTION LED" of "LED Display Setting" (such as the data logging function)	☞ Page 172 LED display setting

When program restoration information is not written, the operating status of other functions cannot be checked with the FUNCTION LED indication only. However, the operating status of the above functions can be checked with the FUNCTION LED by changing the LED control setting for program restoration information write status.

■ Procedures for disabling the FUNCTION LED flashing

The following describes the procedures for disabling the FUNCTION LED flashing when program restoration information is not written.

1. Check that SM386 (Program restoration information write status LED control setting mode) is off (LED flashing).
2. Set "AFAFH" to SD384 (System operation setting).
3. Turn on SM384 (System operation setting request). SM384 is automatically turned off. If writing has failed, SM385 (System operation setting error) is turned on and an error is stored in SD385 (System operation setting error cause).
4. Check that SM385 is off, and turn off or reset the CPU module.
5. The FUNCTION LED turns off and SM386 turns on (without LED flashing). b1 of SD1488 (Debug function usage status) is turned off.

When other functions relating to the FUNCTION LED indication are used, the LED indication follows the execution status.

■ Procedures for returning the FUNCTION LED to the flashing state

The following describes the procedures for returning the FUNCTION LED to the flashing state when program restoration information is not written.

1. Check that SM386 (Program restoration information write status LED control setting mode) is turned on (without LED flashing).
2. Set "AFA0H" to SD384 (System operation setting).
3. Turn on SM384 (System operation setting request). SM384 is automatically turned off. If writing has failed, SM385 (System operation setting error) is turned on and an error is stored in SD385 (System operation setting error cause).
4. Check that SM385 is off, and turn off or reset the CPU module.
5. The FUNCTION LED flashes and SM386 turns off (LED flashing). b1 of SD1488 (Debug function usage status) is turned on.

Precautions

The following describes the precautions for the program restoration information write selection.

Precautions when using the boot operation

- When using the boot operation, always write program restoration information. When "No" is selected in "Program Restore Information", the SD memory card cannot be specified for the write destination.
- If online change is executed during boot operation with "No" being selected in "Program Restore Information", the change is not reflected in a program in the transfer source SD memory card.

Precautions when writing only program restoration information

The initial global label value file and initial local label value file are also written at writing only program restoration information.

Appendix 11 List of Available SQL Commands for CPU Module Database Access Function

This section describes the available SQL commands for the CPU module database access function.

Data definition

CREATE TABLE

This command creates a table in the database.

Syntax

```
CREATE TABLE [table name] ([field name] [data type] [option], [field name] [data type] [option], ..., [field name] [data type] [option]);
```

Option

Item	Description	Syntax
Primary key constraint	Maintains the uniqueness of a value stored in the field. (NULL is not available.) Only one primary key constraint can be set per table. Key names must be up to 16 single-byte alphabetical characters and are case sensitive.	PRIMARY KEY [key name]
Foreign key constraint	Refers to the value of a field of another table. Only the field with the name where the primary key constraint of another table is set can be set as the reference field. (Always set the same field name to the reference field and own field.) Key names must be up to 16 single-byte alphabetical characters and are case sensitive.	FOREIGN KEY [key name] REFERENCES [reference table name] ([reference field name])
NOT NULL constraint	Disables storing NULL values. (Always store a value other than NULL.)	NOT NULL

Application example

- To create table1 (fld1 (integer type, primary key (key name: pk1)), fld2 (integer type), fld3 (character string type (120 characters, NOT NULL)))

```
CREATE TABLE "table1" ("fld1" INT PRIMARY KEY "pk1", "fld2" INT, "fld3" NLSCHAR (120) NOT NULL);
```

- To create table2 (fld1 (integer type, foreign key (key name: fk1, reference: table1 fld1)), fld2 (BOOLEAN type), fld3 (single-precision real number type))

```
CREATE TABLE "table2" ("fld1" INT FOREIGN KEY "fk1" REFERENCES "table1" ("fld1"), "fld2" BOOLEAN, "fld3" REAL);
```

Precautions

- To define the NLSCHAR field, check the data size of the field.
- Define the NLSCHAR type with the size specified in $NLSCHAR = (n+1) \times 3^{*1}$ since it needs to be defined with the data size. For example, the definition is 39 characters for "fld3" NLSCHAR (120) of table1 in the application example.

*1 n indicates the number of characters.

DROP TABLE

This command deletes the specified table in the database.

Syntax

```
DROP TABLE [table name];
```

Application example

- To delete table 1

```
DROP TABLE "table1";
```

CREATE INDEX

This command creates an index in the specified field of the specified table in the database. Index names must be up to 16 single-byte alphabetical characters and are case sensitive.

Syntax

```
CREATE INDEX [index name] ON [table name] (field name);
```

■Application example

- To set the index "idx1" to fld2 of table1

```
CREATE INDEX "idx1" ON "table1" ("fld2");
```

DROP INDEX

This command deletes the specified index in the database.

Syntax

```
DROP INDEX [index name] ON [table name];
```

■Application example

- To delete the "idx1" index in table1

```
DROP INDEX "idx1" ON "table1";
```

EMPTY TABLE

This command deletes all records of the specified table in the database.

Syntax

```
EMPTY [table name];
```

■Application example

- To delete all records in table1

```
EMPTY "table1";
```

Data operation

INSERT

This command adds a record to the specified table in the database.

Syntax^{*1*2}

- To add records to all fields
INSERT INTO [table name] VALUES (field 1 value, field 2 value, ..., field X value);
- To add records to the specified fields
INSERT INTO [table name] (field specification 1, field specification 2, ..., field specification X) VALUES (field 1 value, field 2 value, ..., field X value);

*1 Input null not to store the field value.

*2 When the field value is a character string, enclose it in single quotation marks (').

Application example

- To add records to all fields

```
INSERT INTO "table1" VALUES (11, null, 'abc');
```

- To add records to the specified fields

```
INSERT INTO "table1" ("fld1", "fld3") VALUES (12, 'efg');
```

SELECT

This command outputs a value of the specified record from the specified table in the database.

Syntax

- To output all values
SELECT [output target field or numeric expression] FROM [table name] [option];
- To output a value excluding overlapped values
SELECT DISTINCT [output target field or numeric expression] FROM [table name] [option 1] [option 2];

Option 1

Item	Description	Syntax
INNER JOIN	Performs inner join. (Records that exist in the specified both tables are output.)	SELECT [output target field or numeric expression] FROM [table name 1] INNER JOIN [table name 2] ON [combining condition];
LEFT JOIN	Performs outer join. (All records that exist in [table name 1] are output.)	SELECT [output target field or numeric expression] FROM [table name 1] LEFT JOIN [table name 2] ON [combining condition];
RIGHT JOIN	Performs outer join. (All records that exist in [table name 2] are output.)	SELECT [output target field or numeric expression] FROM [table name 1] RIGHT JOIN [table name 2] ON [combining condition];
FULL JOIN	Performs outer join. (All records that exist in both of specified tables are output.)	SELECT [output target field or numeric expression] FROM [table name 1] FULL JOIN [table name 2] ON [combining condition];

Option 2^{*1}

Item	Description
WHERE	Specifies the condition to obtain a specific record. (☞ Page 698 WHERE).
GROUP BY	Specifies the grouping condition of the record to be obtained. (☞ Page 698 GROUP BY).
HAVING	Specifies the condition to narrow down a search using the result of the aggregate function. (☞ Page 698 HAVING).
ORDER BY	Specifies the sorting condition of the record to be obtained. (☞ Page 699 ORDER BY).

*1 Multiple options can be used.

Application example

- To output all record values in table1 (all fields of table1)

```
SELECT * FROM table1;
```

- To output all record values in table1 (fld1 and fld2 in table1)

```
SELECT "fld1", "fld2" FROM table1;
```

- To output all records excluding the overlapped records in fld1 of table1

```
SELECT DISTINCT "fld1" FROM table1;
```

UPDATE

This command updates the value of the specified record of the specified table in the database.

Syntax^{*1}

```
UPDATE [table name] SET [field name = assigned value], [field name = assigned value], ..., [field name = assigned value] [option];
```

*1 When the field value is a character string, enclose it in single quotation marks (').

Option

Item	Description	Syntax
WHERE	Specifies the condition to obtain (process) a specific record (☞ Page 698 WHERE).	WHERE

Application example

- To store a value in "fld1" and "fld3" of the record of "fld2" field value = 935 of table1 (storing fld1 = 20, fld3 = abc)

```
UPDATE table1 SET "fld1" = 20, "fld3" = 'abc' WHERE "fld2" = 935;
```

DELETE

This command deletes a record of the specified table in the database.

Syntax^{*1}

```
DELETE [table name] [option];
```

*1 When the field value is a character string, enclose it in single quotation marks (').

Option

Item	Description	Syntax
WHERE	Specifies the condition to obtain (process) a specific record (☞ Page 698 WHERE).	WHERE

Application example

- To delete all records in table1

```
DELETE "table1";
```

- To delete the record of the fld3 value = abc in table1

```
DELETE "table1" WHERE "fld3" = 'abc';
```

Clause

WHERE

This command conducts search with conditions.

Syntax

- To specify a condition
WHERE [condition]
- To specify an exception
WHERE NOT [condition];
- To specify two conditions with AND
WHERE [condition 1] AND [condition 2];
- To specify two conditions with OR
WHERE [condition 1] OR [condition 2];

■Operators that can be used in [condition]

Item	Description	Syntax
=	Equals	[numeric expression 1] = [numeric expression 2]
!=	Not equal to	[numeric expression 1] != [numeric expression 2]
<>	Not equal to	[numeric expression 1] <> [numeric expression 2]
>	Greater than	[numeric expression 1] > [numeric expression 2]
>=	Greater than or equal to	[numeric expression 1] >= [numeric expression 2]
<	Less than	[numeric expression 1] < [numeric expression 2]
<=	Less than or equal to	[numeric expression 1] <= [numeric expression 2]
IN	Brings the conditions to be set together.	IN ([numeric expression 1], [numeric expression 2], ..., [numeric expression 3])
BETWEEN	Specifies the range to be output.	[numeric expression 1] BETWEEN [numeric expression 2] AND [numeric expression 3]

■Application example

- To output a record with the fld1 value of 1 to 100 of table1
SELECT * FROM "table1" WHERE "fld1" BETWEEN 1 AND 100;
- To output fld1 and fld3 of the record with the fld3 value other than abc of table1
SELECT "fld1", "fld3" FROM "table1" WHERE NOT "fld3" = 'abc';

GROUP BY

This command groups elements.

Syntax

GROUP BY [numeric expression]

■Application example

- To group Table1 according to the value of fld1 and aggregate the number of records
SELECT COUNT(*) FROM "table1" GROUP BY "fld1";

HAVING

This command narrows down a search using the result of the aggregate function.

Syntax

HAVING [numeric expression]

■Application example

- To output only the groups whose total value is 50 or less
SELECT SUM ("fld2") FROM "table1" GROUP BY "fld1" HAVING SUM ("fld2") < 50;

ORDER BY

This command sorts output.

Syntax

- Ascending
ORDER BY [numeric expression] ASC
- Descending
ORDER BY [numeric expression] DESC

■Application example

- To sort and output fld1 and fld2 of all records in ascending order of the fld1 value from table1
SELECT "fld1", "fld2" FROM "table1" ORDER BY "fld1" ASC;

Aggregate function

AVG

This command obtains a mean value.

Syntax

```
AVG ([numeric expression])
```

■Application example

- To obtain the mean value of fld1 from table1 (including overlapped values)
SELECT AVG ("fld1") FROM "table1";
- To obtain the mean value of fld1 from table1 (excluding overlapped values)
SELECT AVG (DISTINCT "fld1") FROM "table1";

COUNT

This command aggregates the number of records.

Syntax

```
COUNT [target]
```

■Application example

- To obtain the number of records of fld1 from table1 (including overlapped values)
SELECT COUNT ("fld1") FROM "table1";
- To obtain the number of records of fld1 from table1 (excluding overlapped values)
SELECT COUNT (DISTINCT "fld1") FROM "table1";

MAX

This command obtains a maximum value.

Syntax

```
MAX ([numeric expression])
```

■Application example

- To obtain the maximum value of fld1 from table1
SELECT MAX ("fld1") FROM "table1";

MIN

This command obtains a minimum value.

Syntax

```
MIN ([numeric expression])
```

■Application example

- To obtain the minimum value of fld1 from table1
SELECT MIN ("fld1") FROM "table1";

SUM

This command obtains the total.

Syntax

```
SUM ([numeric expression])
```

■Application example

- To obtain the total of fld1 from table1 (including overlapped values)
SELECT SUM ("fld1") FROM "table1";
- To obtain the total of fld1 from table1 (excluding overlapped values)
SELECT SUM (DISTINCT "fld1") FROM "table1";

Arithmetic function

ABS

This command obtains an absolute value.

Syntax

ABS ([numeric expression])

■Application example

- To obtain the absolute value of fld1 from table1

```
SELECT ABS ("fld1") FROM "table1";
```

ACOS

This command obtains an arc cosine.

Syntax

ACOS ([numeric expression])

■Application example

- To obtain the arc cosine of fld1 from table1

```
SELECT ACOS ("fld1") FROM "table1";
```

ASIN

This command obtains an arc sine.

Syntax

ASIN ([numeric expression])

■Application example

- To obtain the arc sine of fld1 from table1

```
SELECT ASIN ("fld1") FROM "table1";
```

ATAN

This command obtains an arc tangent.

Syntax

ATAN ([numeric expression])

■Application example

- To obtain the arc tangent of fld1 from table1

```
SELECT ATAN ("fld1") FROM "table1";
```

ATAN2

This command obtains an arc tangent.

Syntax

ATAN2 ([numeric expression 1], [numeric expression 2])^{*1}

*1 This syntax is ATAN2 (y, x).

■Application example

- To obtain an arc tangent of fld1/fld2 from table1

```
SELECT ATAN2 ("fld1", "fld2") FROM "table1";
```

CEILING

This command obtains the smallest integer greater than or equal to the specified numeric expression.

Syntax

```
CEILING ([numeric expression])
```

■Application example

- To obtain the smallest integer greater than or equal to the fld1 value from table1

```
SELECT CEILING ("fld1") FROM "table1";
```

COS

This command obtains a cosine.

Syntax

```
COS ([numeric expression])
```

■Application example

- To obtain the cosine of fld1 from table1

```
SELECT COS ("fld1") FROM "table1";
```

COT

This command obtains a cotangent.

Syntax

```
COT ([numeric expression])
```

■Application example

- To obtain the cotangent of fld1 from table1

```
SELECT COT ("fld1") FROM "table1";
```

DEGREES

This command obtains degrees from radians.

Syntax

```
DEGREES ([numeric expression])
```

■Application example

- To obtain degrees of fld1 from table1

```
SELECT DEGREES ("fld1") FROM "table1";
```

EXP

This command obtains an exponent value. (It calculates e raised to the power of [numeric expression].)

Syntax

```
EXP ([numeric expression])
```

■Application example

- To obtain e raised to the power of fld1 from table1

```
SELECT EXP ("fld1") FROM "table1";
```

FLOOR

This command obtains the largest integer less than or equal to the specified numeric expression.

Syntax

FLOOR ([numeric expression])

■Application example

- To obtain the largest integer less than or equal to the fld1 value from table1

```
SELECT FLOOR ("fld1") FROM "table1";
```

LOG

This command obtains a natural logarithm.

Syntax

- To obtain a natural logarithm

LOG ([numeric expression])

- To obtain a decadic logarithm

LOG10 ([numeric expression])

■Application example

- To obtain the natural logarithm of fld1 from table1

```
SELECT LOG ("fld1") FROM "table1";
```

- To obtain the decadic logarithm of fld1 from table1

```
SELECT LOG10 ("fld1") FROM "table1";
```

POW

This command raises a value. (It raises [numeric expression 1] to the power of [numeric expression 2].)

Syntax

POW ([numeric expression 1], [numeric expression 2])

When [numeric expression 1] = 0, [numeric expression 2] must be greater than 0.

When [numeric expression 1] is less than 0, [numeric expression 2] must be an integer.

■Application example

- To obtain fld1 raised to the power of fld2 from table1

```
SELECT POW ("fld1", "fld2") FROM "table1";
```

RADIANS

This command obtains radians from degrees.

Syntax

RADIANS ([numeric expression])

■Application example

- To obtain radians of fld1 from table1

```
SELECT RADIANS ("fld1") FROM "table1";
```

ROUND

This command rounds a value. (The value of [numeric expression 1] is rounded off to the nth decimal place.)*¹

Syntax

ROUND ([numeric expression 1], [numeric expression 2])

*1 Add one to the value specified in n = [numeric expression 2].

■Application example

- To obtain the value of fld1 rounded off to the third decimal place from table1.

```
SELECT ROUND ("fld1", 2) FROM "table1";
```

SIGN

This command obtains a sign.

Syntax

```
SIGN ([numeric expression])
```

■Application example

- To obtain the sign of fld1 from table1

```
SELECT SIGN ("fld1") FROM "table1";
```

SIN

This command obtains a sine.

Syntax

```
SIN ([numeric expression])
```

■Application example

- To obtain the sine of fld1 from table1

```
SELECT SIN ("fld1") FROM "table1";
```

SQRT

This command obtains a square root.

Syntax

```
SQRT ([numeric expression])
```

■Application example

- To obtain the square root of fld1 from table1

```
SELECT SQRT ("fld1") FROM "table1";
```

TAN

This command obtains a tangent.

Syntax

```
TAN ([numeric expression])
```

■Application example

- To obtain the tangent of fld1 from table1

```
SELECT TAN ("fld1") FROM "table1";
```

Appendix 12 Added and Enhanced Functions

This section describes added and enhanced functions of the CPU module and the engineering tool, as well as the firmware versions of the CPU module and software versions of the engineering tool corresponding to the functions.

Point

The firmware update function enables users to update the firmware versions of the CPU module. For the target CPU modules and how to update the firmware version, refer to the following.

 MELSEC iQ-R Module Configuration Manual

○: Supported from the first released product, ×: Not supported, —: Function usable regardless of the software version

Added or enhanced function	F: Firmware version of the CPU module S: Software version of the engineering tool O: Version of the other tools		Reference

Japanese manual number: SH-082487-E

This manual confers no industrial property rights or any rights of any other kind, nor does it confer any patent licenses. Mitsubishi Electric Corporation cannot be held responsible for any problems involving industrial property rights which may occur as a result of using the contents noted in this manual.

© 2022 MITSUBISHI ELECTRIC CORPORATION

CONDITIONS OF USE FOR THE PRODUCT

- (1) MELSEC programmable controller ("the PRODUCT") shall be used in conditions;
- i) where any problem, fault or failure occurring in the PRODUCT, if any, shall not lead to any major or serious accident; and
 - ii) where the backup and fail-safe function are systematically or automatically provided outside of the PRODUCT for the case of any problem, fault or failure occurring in the PRODUCT.
- (2) The PRODUCT has been designed and manufactured for the purpose of being used in general industries. MITSUBISHI ELECTRIC SHALL HAVE NO RESPONSIBILITY OR LIABILITY (INCLUDING, BUT NOT LIMITED TO ANY AND ALL RESPONSIBILITY OR LIABILITY BASED ON CONTRACT, WARRANTY, TORT, PRODUCT LIABILITY) FOR ANY INJURY OR DEATH TO PERSONS OR LOSS OR DAMAGE TO PROPERTY CAUSED BY the PRODUCT THAT ARE OPERATED OR USED IN APPLICATION NOT INTENDED OR EXCLUDED BY INSTRUCTIONS, PRECAUTIONS, OR WARNING CONTAINED IN MITSUBISHI ELECTRIC USER'S, INSTRUCTION AND/OR SAFETY MANUALS, TECHNICAL BULLETINS AND GUIDELINES FOR the PRODUCT.
- ("Prohibited Application")
- Prohibited Applications include, but not limited to, the use of the PRODUCT in;
- Nuclear Power Plants and any other power plants operated by Power companies, and/or any other cases in which the public could be affected if any problem or fault occurs in the PRODUCT.
 - Railway companies or Public service purposes, and/or any other cases in which establishment of a special quality assurance system is required by the Purchaser or End User.
 - Aircraft or Aerospace, Medical applications, Train equipment, transport equipment such as Elevator and Escalator, Incineration and Fuel devices, Vehicles, Manned transportation, Equipment for Recreation and Amusement, and Safety devices, handling of Nuclear or Hazardous Materials or Chemicals, Mining and Drilling, and/or other applications where there is a significant risk of injury to the public or property.
- Notwithstanding the above restrictions, Mitsubishi Electric may in its sole discretion, authorize use of the PRODUCT in one or more of the Prohibited Applications, provided that the usage of the PRODUCT is limited only for the specific applications agreed to by Mitsubishi Electric and provided further that no special quality assurance or fail-safe, redundant or other safety features which exceed the general specifications of the PRODUCTS are required. For details, please contact the Mitsubishi Electric representative in your region.
- (3) Mitsubishi Electric shall have no responsibility or liability for any problems involving programmable controller trouble and system trouble caused by DoS attacks, unauthorized access, computer viruses, and other cyberattacks.

WARRANTY

Please confirm the following product warranty details before using this product.

1. Gratis Warranty Term and Gratis Warranty Range

If any faults or defects (hereinafter "Failure") found to be the responsibility of Mitsubishi occurs during use of the product within the gratis warranty term, the product shall be repaired at no cost via the sales representative or Mitsubishi Service Company.

However, if repairs are required onsite at domestic or overseas location, expenses to send an engineer will be solely at the customer's discretion. Mitsubishi shall not be held responsible for any re-commissioning, maintenance, or testing on-site that involves replacement of the failed module.

[Gratis Warranty Term]

The gratis warranty term of the product shall be for one year after the date of purchase or delivery to a designated place. Note that after manufacture and shipment from Mitsubishi, the maximum distribution period shall be six (6) months, and the longest gratis warranty term after manufacturing shall be eighteen (18) months. The gratis warranty term of repair parts shall not exceed the gratis warranty term before repairs.

[Gratis Warranty Range]

- (1) The range shall be limited to normal use within the usage state, usage methods and usage environment, etc., which follow the conditions and precautions, etc., given in the instruction manual, user's manual and caution labels on the product.
- (2) Even within the gratis warranty term, repairs shall be charged for in the following cases.
 1. Failure occurring from inappropriate storage or handling, carelessness or negligence by the user. Failure caused by the user's hardware or software design.
 2. Failure caused by unapproved modifications, etc., to the product by the user.
 3. When the Mitsubishi product is assembled into a user's device, Failure that could have been avoided if functions or structures, judged as necessary in the legal safety measures the user's device is subject to or as necessary by industry standards, had been provided.
 4. Failure that could have been avoided if consumable parts (battery, backlight, fuse, etc.) designated in the instruction manual had been correctly serviced or replaced.
 5. Failure caused by external irresistible forces such as fires or abnormal voltages, and Failure caused by force majeure such as earthquakes, lightning, wind and water damage.
 6. Failure caused by reasons unpredictable by scientific technology standards at time of shipment from Mitsubishi.
 7. Any other failure found not to be the responsibility of Mitsubishi or that admitted not to be so by the user.

2. Onerous repair term after discontinuation of production

- (1) Mitsubishi shall accept onerous product repairs for seven (7) years after production of the product is discontinued. Discontinuation of production shall be notified with Mitsubishi Technical Bulletins, etc.
- (2) Product supply (including repair parts) is not available after production is discontinued.

3. Overseas service

Overseas, repairs shall be accepted by Mitsubishi's local overseas FA Center. Note that the repair conditions at each FA Center may differ.

4. Exclusion of loss in opportunity and secondary loss from warranty liability

Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to:

- (1) Damages caused by any cause found not to be the responsibility of Mitsubishi.
- (2) Loss in opportunity, lost profits incurred to the user by Failures of Mitsubishi products.
- (3) Special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than Mitsubishi products.
- (4) Replacement by the user, maintenance of on-site equipment, start-up test run and other tasks.

5. Changes in product specifications

The specifications given in the catalogs, manuals or technical documents are subject to change without prior notice.

TRADEMARKS

Microsoft, Microsoft Access, Excel, SQL Server, Visual Basic, Visual C++, Visual Studio, Windows, Windows NT, Windows Server, Windows Vista, and Windows XP are trademarks of the Microsoft group of companies.

The company names, system names and product names mentioned in this manual are either registered trademarks or trademarks of their respective companies.

In some cases, trademark symbols such as [™] or [®] are not specified in this manual.

COPYRIGHTS
