

Numerical Protection Relay

INSTRUCTION MANUAL

Request

Ensure that this Instruction Manual is delivered to the end users and the maintenance manager.

Safety precautions —

Before installation, operation, maintenance, and inspection, please be sure to read this instruction manual and all other attached documents thoroughly in order to work safely with the equipment. Please ensure that you fully understand the equipment, safety information, and precautions that need to be taken before working with the equipment. Safety precautions are classified as "Caution."

The case where a dangerous situation can arise and there is the possibility that moderate or minor injuries can occur, or property damage can take place if the equipment is handled incorrectly.

Furthermore, even with items described as A Caution, there is the possibility of serious consequences depending on the situation. All of the described contents are important. Therefore, be sure to comply with them.

Caution

1. Installation and Wiring work

* Ensure that the equipment is mounted and connected correctly. Otherwise, there are risks of failure, burning, or maloperation.

* Securely tighten the terminal connection screws. Otherwise, there are risks of failure and burning. For tightening torque of screws, refer to the following Table. Nominal Standard value of Material Allowable range Place of use dia. torque 1.10N•m 0.932~1.27N·m Steel M3.5 Terminal block (11.2kgf · cm) (9.5~12.9kgf·cm) 1.65N•m 1.39~1.89N·m Drawer fixing screw of unit-drawer type Steel M4 (14.2~19.3kgf·cm) (16.8kgf.cm) (RD type) 5.49N•m 4.71~6.37N·m Steel M6 Fixing screw for mounting (56kgf·cm) $(48 \sim 65 \text{kgf} \cdot \text{cm})$ 26.5N•m 22.6~30.4N·m Steel M10 MPD-3C bottom screw (230~310kgf·cm) Ŵ (270kgf•cm) 0.961N•m 0.824~1.11N·m MZT primary terminal (k, l) Caution Brass M4 MPD-3T terminal (9.8kgf.cm) (8.4~11.3kgf·cm)

* The equipment must be correctly grounded using the designated grounding terminals where they exist. Failure to do so

- may lead to the risk of electric shock, equipment failure, malfunction or failure to operate. * Ensure that the equipment is connected correctly in accordance with the details (e.g.: polarity or phase sequence) shown
- on the connection terminals. Otherwise, there is the risk of failure, burning, malfunction, or maloperation. * All power supplies and transformers to the equipment must be of suitable capacity and rated load to avoid the risk of malfunction and maloperation.
- * Be sure to return all terminal covers, protection covers to their original positions once any work is complete. If they remain uncovered there is a risk of electrical shock.
- * The appropriate connectors must be used to ensure compatibility with the connector terminals to avoid the risks of failure or fire.
- * When inserting subunit into the case, please ensure that there is no gap between front side of the subunit and the case. In addition, tighten lower screw surely. If the subunit is inserted inadequately, there are risks of malfunction or generation of heat.

2. Operating and Setting

The equipment must be used within the following range limits. Otherwise, there is a risk of reducing the performance and life of the product.

 Variation range of auxiliary power supply voltage 	Within –15 to +10% of the rated voltage
 Frequency variation 	Within ±5% of the rated frequency
Ambient temperature	–20 to +60°C
	(under the state where dew condensation or freezing does not occur)
Relative humidity	30 to 80% on daily average
Altitude	2000m or lower
The state where charmed vibration, check inclined	tion magnetic field (X) are not explicit

- The state where abnormal vibration, shock, inclination, magnetic field(X) are not applied
- The state where it is not exposed to harmful smoke/gas, saline gas, water droplet or vapor, excessive dust or fine powder, explosive gas or fine powder, wind & rain
- (※) If there is a large amount of current on main circuit surrounding the relay, the operation indicator may be magnetized and turned from black to orange color. In that case, please shield back of the relay by iron plate.

	* The equipment must only be operated and handled by qualified personnel. Otherwise, there are risks of electric shock, injury, failure, malfunction, and maloperation.
A Caution	 * Handling and maintenance of the equipment must only be carried out after gaining a thorough understanding of the instruction manual. Otherwise, there is the risk of electric shock, injury, failure, malfunction, or maloperation. * While energized, do not remove any components other than those which have been designated. Otherwise, there is a risk of failure, malfunction, or maloperation. * While energized, do not draw out the internal unit (subunit). Otherwise, there is a risk of electric shock, injury, failure, malfunction, or maloperation. * While energized, do not draw out the internal unit (subunit). Otherwise, there is a risk of electric shock, injury, failure, malfunction, or maloperation. * When changing the setting value during the energized state, ensure that all trip circuits are locked in order not to operate. Otherwise, there is a risk of malfunction.

* Use in rated range. Otherwise, there is a risk of malfunction.

3. Maintenance and Inspection

We recommend that any tests or inspections are carried out under the following conditions, as well as any additional conditions described in the instruction manual.

20±10°C	
90% or less	
80A/m or less	
86~106×10³ Pa	
Regular direction ±2°	
Rated frequency ±1%	
Distortion factor: 2% or less	
Effective value of higher harmonics only	
Distortion factor=	– ×100(%)
Effective value of fundamental wave	
Ripple factor: 3% or less	
Max. value – Min. value	
Ripple factor= ×100(%)	
Average value of DC	
Rated voltage ±2%	
	90% or less 80A/m or less 86~106×10 ³ Pa Regular direction $\pm 2^{\circ}$ Rated frequency $\pm 1\%$ Distortion factor: 2% or less Effective value of higher harmonics only Distortion factor= Effective value of fundamental wave Ripple factor: 3% or less Max. value – Min. value Ripple factor= X100(%)

* The equipment must only be operated and handled by qualified personnel. Otherwise, there are risks of electric shock, injury, failure, malfunction, and maloperation.
 * Handling and maintenance of the equipment must only be carried out after gaining a thorough understanding of the instruction manual. Otherwise, there is the risk of electric shock, injury, failure, malfunction, or maloperation.
 * When replacing the equipment, use a product of same model, rating, and specifications. Otherwise, there is the risk of failure or fire. If any other product is to be used, the manufacturer must be consulted.
 * Do not exceed the overload capacity for voltage and current. Otherwise, equipment failure or fire could occur.
 * Do not touch any live parts, such as terminals, etc. Otherwise, there is a risk of electric shock.
 * Do not clean the equipment while energised. When the cover needs to be cleaned, make use of a damp cloth.

4. Transportation

* Transport the equipment in the correct orientation.

* Do not apply excessive shock and/or vibration as this could affect the performance and life of the product.

5. Storage

The storage environment shall comply with the following conditions. Otherwise, there is a risk of reducing the performance and life of the product.

 Ambient temperature 	−20 to +60°C
	(under the state where dew condensation or freezing does not occur)
 Relative humidity 	30 to 80% on daily average
Altitude	2000m or lower
The equipment must not be expected to a	heremal vibration, chaola inclination, or magnetic fields

- The equipment must not be exposed to abnormal vibration, shock, inclination, or magnetic fields.
- The equipment must not be exposed to harmful smoke/gas, saline gas, water droplets or vapor, excessive dust or fine powder, explosive gas or fine powder, wind & rain.

6. Repair and Modification

* When carrying out repair and/or modification, please consult with the manufacturer in advance. We will not take any responsibility for any repair and/or modification (including software) which has been carried out without prior consent.

7. Disposal

Disposal must take place in accordance with the applicable legislation

Guarantee

1. Guarantee period

The guarantee period of this product should be one year after delivery, unless otherwise specified by both parties.

2. Scope of guarantee

When any fault or defect is detected during the period of guarantee and such fault or defect is proved to be caused apparently at the responsibility of MITSUBISHI ELECTRIC CORPORATION, the defective unit concerned will be repaired or replaced with substitute with free of charge. However, the fee for our engineer dispatching to site has to be covered by the user. Also, site retesting or trial operation caused along with replacing the defect units should be out of scope of our responsibilities.

It is to be acknowledged that the following faults and defects should be out of this guarantee.

- (1) When the faults or defects are resulted from the use of the equipment at the range exceeding the condition/environment requirements stated in the catalogue and manual.
- (2) When the faults or defects are resulted from the reason concerning without our products.
- (3) When the faults or defects are resulted from the modification or repair carried out by any other entity than MITSUBISHI ELECTRIC CORPORATION.
- (4) When the faults or defects are resulted from a phenomenon which cannot be predicted with the science and technology put into practical use at the time of purchase or contract
- (5) In case of integrating our products into your equipment, when damages can be hedged by the proper function or structure in the possession of your equipment which should be completed according to the concept of the de fact standard of industry.
- (6) In case of that the faults or defects are resulted from un-proper application being out of instruction of MITSUBISHI ELECTRIC CORPORATION.
- (7) In case that the faults or defects are resulted from force majeure such a fire or abnormal voltage and as an act of God such as natural calamity or disaster.

3. Exclusion of loss in opportunity and secondary loss from warranty liability

Regardless of whether in guarantee period or not, MITSUBISHI ELECTRIC CORPORATION shall not be liable for compensation of damages caused by any cause found not be the responsibility of MITSUBISHI ELECTRIC CORPORATION, loss in opportunity, lost profits incurred to the user by failures of MITSUBISHI ELECTRIC CORPORATION products, special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than MITSUBISHI ELECTRIC CORPORATION products and other tasks.

4. Applications of products

- (1) The user is requested to confirm the standards, the regulations and the restrictions which should be applied, in case of utilizing this product and another one in combination. Also, the user is requested to confirm the suitability of our products to your applied system or equipment or apparatus by yourself. MITSUBISHI ELECTRIC CORPORATION shall not be liable for any suitability of our products to your utilization.
- (2) This product has been designed and manufactured for application in general industries, etc. Thus, application in which the life or an asset could be affected by special application such as medical system for life-sustaining, in nuclear power plants, power plants, aerospace, transportation devices (automobile, train, ship, etc.) shall be excluded from the application. In addition to above, application in which the life or an asset could be affected by potentially chemical contamination or electrical interference and also in which the circumstances and condition are not mentioned in this manual shall be excluded from the application. Note even if the user wants to use for these applications with user's responsibility, the user to be requested to approve the specification of MITSUBISHI ELECTRIC CORPORATION products and to contact to the technical section of MITSUBISHI ELECTRIC CORPORATION prior to such applications. If the user applies MITSUBISHI ELECTRIC CORPORATION products to such applications without any contact to our technical section, MITSUBISHI ELECTRIC CORPORATION shall not be liable for any items and not be insured, independently from mentioned in this clause.
- (3) In using this product, the working conditions shall be that the application will not lead to a major accident even if any problem or fault occur, and that backup or duplicate system built in externally which should be decided based on the importance of facility, is recommended.
- (4) The application examples given in this manual are reference only and you are requested to confirm function and precaution for equipment and apparatus and then, use our products.
- (5) The user is requested to understand and to respect completely all warning and caution items so that unexpected damages of the user or the third party arising out of incorrect application of our products would not be resulted.

5. Onerous repair term after discontinuation of product

- (1) MITSUBISHI ELECTRIC CORPORATION shall accept onerous product repairs for 7 years after production is discontinued. (However, the product which was made over 15 years is recommended to replace.)
 (2) Product cumply (including repair parts) is not evaluable after production is discontinued.
- (2) Product supply (including repair parts) is not available after production is discontinued.

6. Changes in product specification

The specification given in the catalogue, manuals or technical documents are subject to change without prior notice.

7. Scope of service

The technical service fee such as engineer dispatching fee is excluded in the price of our products. Please contact to our agents if you have such a requirement.

Features

- 1. Earth fault overvoltage relay for MPD-3 type ZVT correspondence.
- 2. Wide setting range enables flexible protection coordination.
- 3. The number of connectable relay units to MPD-3 type ZVT is increased to 20.

<u>Caution</u> However, this increase is limited only when all of the relays are composed of New MELPRO-A series. If another series are combined, the number of connectable units is limited to 5.

- 4. Reset method of output contacts can be switchable between auto-reset and self-hold.
- 5. The fault value record function is installed.
- Good operability and visibility design is adopted. The numerical display turns on for 3 seconds when the setting value is changed, which enables to check setting values easily.
- 7. Panel cutout is the same as previous MELPRO-A series and E series.

Ratings and Specifications

(*) shows factory setting.

Application to 3.3kV system voltage:

The MPD-3 type ZVT is intended for use at 6.6kV system voltage.

When applied to a system voltage of 3.3 kV, ZVT secondary output voltage at single-phase fault is 3.5V.

(Half of the rating voltage (7V) at 6.6kV system.)

Therefore, setting and measurement display are as follows:

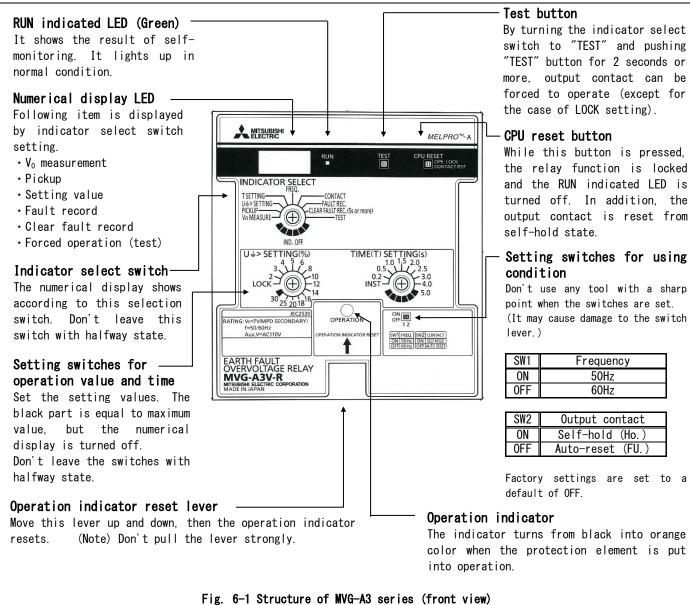

- Example 1) In the case of 10% setting for 3.3kV system, the actual setting value should be 5%, which is half of 10%.
- Example 2) When the V₀ measurement display is 5%, the actual value in 3.3kV system is 10% of the single-phase fault, which is twice the displayed value.

Characteristics (MVG-A3V type relay + MPD-3 type ZVT combination)

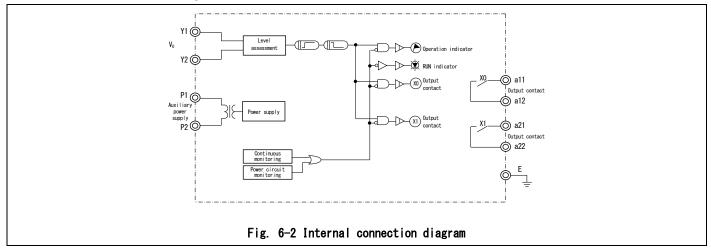

Item	Characteristics									
1.000	Ambient temperature: -20 to +60°C (Under the state where dew condensation or freezing does not occur)

Note) For details, refer to JEC 2520 (2018).

Internal connection diagram

Operating Description

1. Protection function

 $\textcircled{\sc 1}$ The power supply can be derived from VT secondary.

- ②Set using condition switches according to your using condition (frequency and output contact).
- ③ Zero-sequence voltage input is supplied from secondary output of MPD-3 type ZVT combined with the relay.
- ④If input zero-sequence voltage is greater than or equal to the setting value, the operation timer starts. The relay actuates the output contact and operation indicator after a preset time of the operation timer.
- (5)After the relay operation, if input zero-sequence voltage falls below the setting value, the output contact will be in the state set by the using condition setting switch (auto-reset or self-hold). The operation indicator keeps the operation status (orange color). To reset the indicator, move the reset lever up and down.

2. RUN display (Self-monitoring function)

This relay monitors control voltage, electric circuit, and program data at all time. The RUN LED (green) lights up in the normal condition.

In the abnormal condition, the RUN LED goes out and the error message $\boxed{\text{E r r}}$ is displayed on the numerical display LED, with the output contact locked.

3. Numerical display function

By switching the position of the indicator select switch, following items can be displayed on the numerical display LED.

$\mathbf{O}V_0$ voltage measurement

The display shows the value of zero-sequence voltage. The display range is from 1.0% to 40%.

(If input voltage is less than 1.0%, the display goes out. If input voltage is more than 40%, the error message $\boxed{O. F.}$ is displayed.)

Here, "100%" denotes complete single-phase fault in 6.6kV power systems: V_0 primary = 3810V, ZVT secondary = 7V.

This function makes it possible to measure the residual V_0 voltage in sound condition.

②Pickup

When input zero-sequence voltage is greater than or equal to the setting value, U. is displayed.

This function can be used for operation value tests.

③Setting value

It displays the setting condition of the relay including V_0 value and operating time setting.

④Frequency setting

It displays the setting condition of frequency in accordance with the setting switch of SW1.

(5)Output contact setting

It displays the setting condition of output contact in accordance with the setting switch of SW2.

The setting is self-hold, the display shows $[H \circ .]$.

The setting is auto-reset, the display shows FU.

4. Fault record function ①Display of fault records

When a fault occurs, the relay outputs the operating signal, and at the same time the input value of zero-sequence voltage is recorded. When the indicator select switch is set to the position of fault record, the records are displayed starting from the latest record to the oldest one at approximately 2 second intervals. The relay can save the newest five phenomena.

The records are saved in the non-volatile memory, therefore the records can be read again after shutting the power off.

Note that the fault record may not be saved if the auxiliary power supply is turned off soon after the relay operation.

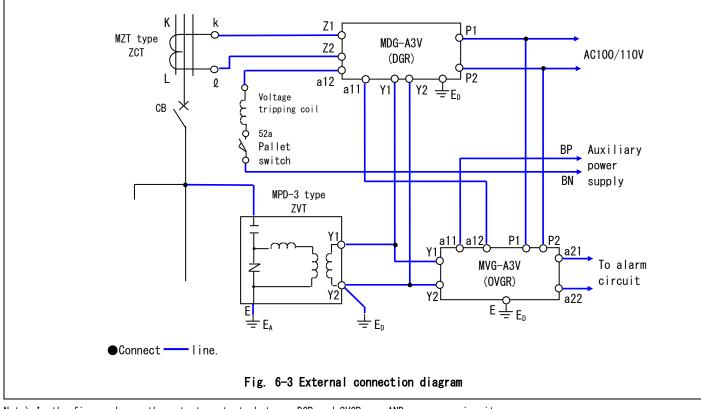

②Clearing of fault records

Set indicator select switch to "CLEAR FAULT REC." and hold for 5s or more, then \bigcirc . K. is displayed and all of the fault record are cleared.

5. Display function of setting change

When a setting is changed, the setting value after changing is displayed for approx. 3s preferentially.

External connection diagram (Example)

It is also possible to use each relay individually.

Handling precautions

1. Panel mounting

- ①Be sure to connect the "E" terminal of the relay to Dclass grounding.
- ②The relay of unit-drawer type (RD type) can be drawn out from the case.

2. Use and operation

- ①About the setting switches for using condition, factory settings are set to a default of OFF. So it is necessary to set the switches according to the conditions.
- ②Please refrain from changing the setting value during operation, since unwanted operation may occur. However, if the setting change is unavoidable, please press the CPU reset button in order to lock the relay function.
- ③Don't leave rotary switches with halfway (indefinite) state.

(4) The RUN LED lights up in the normal condition when the

rated auxiliary power supply is input. If it still turns off when the auxiliary power supply voltage exceeds 85V, please contact our local agent and branch office since the relay may fail.

3. Wiring

For wiring materials from ZVT, please use 2-core shielded cables with a diameter of 0.75mm² or more and connect the shield to E terminal of the relay or D-class grounding. The cable burden shall be 5Ω or less for both ways. (In the case of 0.75mm², one way is about 100 meters.)

4. Connection of V_0 input terminal

()Be sure to connect the V_0 input terminal (Y1-Y2) to the MPD-3 type ZVT or the MDG relay supplying V_0 when turning on the relay power supply.

Test

A relay test is carried out sufficiently before shipment, but at the following cases, it is recommended the test should be carried out again.

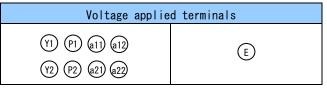

- a. When the products are delivered and unpacked
- b. At the time of starting operation of equipment
- c. At the time of periodic inspection (Usually once a year)

1. At the time of testing

- (1) The input waveform should be a sine wave with little distortion.
- (2)During the test, set the position of the indicator select switch to " V_0 MEASURE". Set the other setting switches according to the test conditions of the operating characteristic control point.
- ③ If user-defined control point is specified (e.g. accuracy of relay characteristic is controlled at service conditions), execute the test at the manufacturer-defined characteristic control point before in-service operation and then check accuracy of the relay. After that, execute the test at the user-defined control point, and use this data as a later reference.

2. Withstand voltage test

- Please disconnect the relay from ZVT. If a voltage higher than the rated value is applied, it may burn out.
- b. Apply 2000V AC (commercial frequency) between all circuits and earth (E terminal) for one minute, and make sure that there is no problem.

c. Apply 2000V AC (commercial frequency) between separate circuits for one minute, and make sure that there is no problem.

Voltage applied terminals				
P1 P2	a11 a12 a21 a22			
(1) (12)	a11 a12 a21 a22			
(P1) (P2)	(Y1) (Y2)			

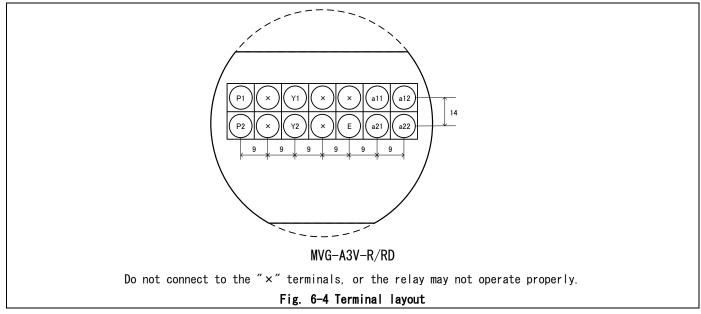

- Operation characteristics test [ZVT combination]
 (1)When the rated power supply voltage is applied, the RUN display LED (green) lights up. This indicates that the relay works properly.
- (2)When adjusting the test voltage during the operating time test, it is recommended to press the CPU reset button to lock the operation of this relay. If the operation is locked and the test voltage is adjusted, an accurate test is possible.
- ③By turning the indicator select switch to "TEST" and pushing "TEST" button for 2 seconds or more, output contact can be forced to operate (except for the case of LOCK setting).

4. Operation characteristic control point

Perform the test periodically according to the following test conditions and criteria.

		Test condi		
Test item	Innut	Operation	Operating	Criteria
Input		value	time	
Operation		Each	Instantaneous	$\pm 25\%$ of
value	Ι	setting	Instantaneous	setting value
	٥V	Minimum	Instantonous	60ma an 1000
Operating	Ļ	setting	Instantaneous	60ms or less
time	150% of	Minimum	0.00 00 000	±10% of
	setting	setting	0.2s or more	setting time

Terminal layout

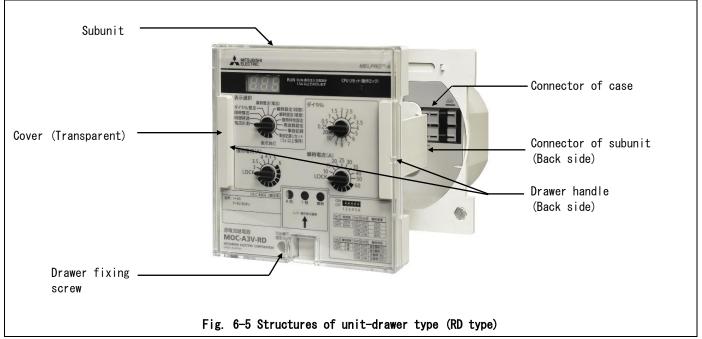

Drawing out and housing operation of subunit (Unit-drawer type)

For unit-drawer type (RD type), it is possible to draw out the subunit from the case without removing external wiring, which makes easier to carry out inspection and testing.

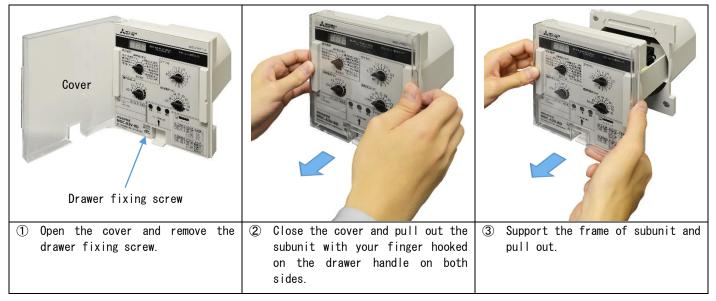

When drawing out and housing, be careful not to touch the electrical circuit (e.g. substrate, capacitor, and transformer) and be sure to hold the drawer handle or the frame part when transporting. (Touching the electrical circuit may cause electric shock or damage to the circuit.) Before the subunit is to be drawn out, ensure that the following items are checked in order not to carry out the work in hot-line condition.

- Lock of the tripping circuit
- Turning off the main circuit
- Disconnect CT/VT circuit
- Turning off the auxiliary power supply

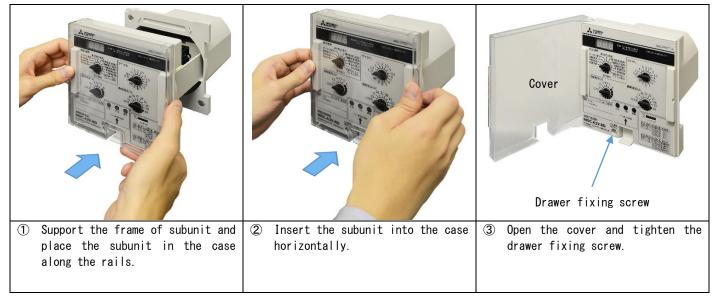

The CT circuit is equipped with an automatic short circuit piece so that the CT secondary circuit won't be opened even if the relay subunit is drawn out without disconnecting the CT circuit.

1. Procedure of drawing out

2. Procedure of housing

1. Opening and closing

Please open the cover by placing your fingertip on the convex part in the right side of the cover as shown in Fig. 6-6.

Fig. 6-6

2. How to replace the cover

•Removing the cover

Open the cover, and lightly push up the upper side of the cover from the inner surface. Then, remove from the protrusion of the body.

·Installing the cover

As shown in Fig. 6-7, mount the holes on the upper side of the cover to the protrusion of the body. Then, press down lightly on the lower side of the cover and mount to the protrusion of the body in the same way as above.

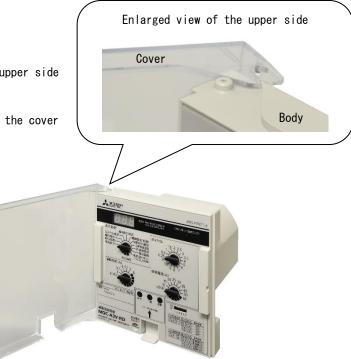

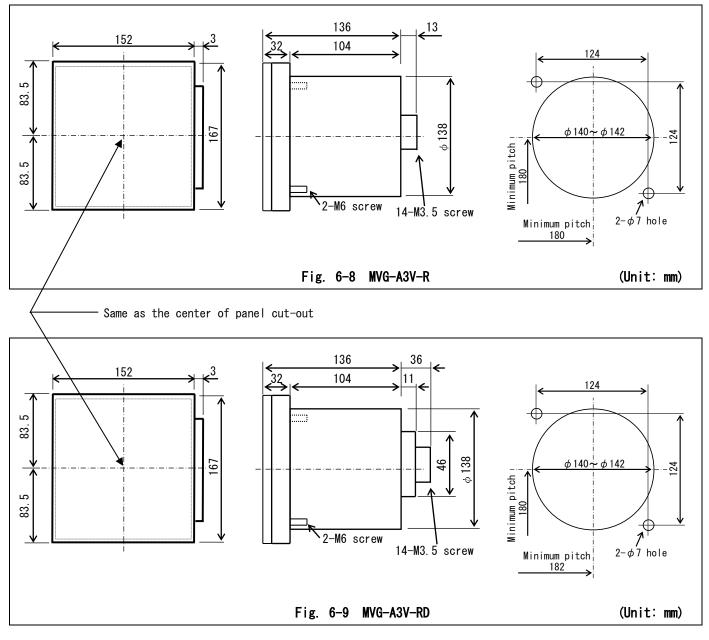

Fig. 6-7

• When replacing the cover during operation, <u>be careful not to touch the switches.</u>

Improvement on the reliability of protection function

Any parts and materials applied to the protection relay have limited lifetime which will bring the degradation to the relay. The degree of degradation will be variable depending on the purpose, aging, usage environment, and unevenness on the performance of each part.

Our company designs its products so that the recommended renewal period is 15 years or more.

However, there may be some possibilities to occur any failures before reaching 15 years due to above reasons.

To prevent unwanted operation or no operation of relay, it is recommended to apply the relay with self-diagnosis function and/or multiplexing relay system such as dual or duplex scheme.
