

General-Purpose AC Servo

$\underset{\textbf{MELSERVO-J4}}{\texttt{MELSERVO-J4}}$

CC-Link IE Field Network Interface Servo Amplifier Instruction Manual (Motion Mode)

-MR-J4-_GF_ -MR-J4-_GF_-RJ

SAFETY PRECAUTIONS

Please read the instructions carefully before using the equipment.

To use the equipment correctly, do not attempt to install, operate, maintain, or inspect the equipment until you have read through this Instruction Manual, Installation guide, and appended documents carefully. Do not use the equipment until you have a full knowledge of the equipment, safety information and instructions.

In this Instruction Manual, the safety instruction levels are classified into "WARNING" and "CAUTION".

WARNING Indicates that incorrect handling may cause hazardous conditions, resulting death or severe injury.	
	Indicates that incorrect handling may cause hazardous conditions, resulting in minor or moderate injury or property damage.
Please follow the instructions o	hay lead to a serious consequence according to conditions. f both levels because they are important to personnel safety. at must be done are indicated by the following diagrammatic symbols.
Indicates what must	not be done. For example, "No Fire" is indicated by 🛞 .
Indicates what must	be done. For example, grounding is indicated by

In this Instruction Manual, instructions at a lower level than the above, instructions for other functions, and so on are classified into "POINT".

After reading this Instruction Manual, keep it accessible to the operator.

[To prevent electric shock, note the following]

- Before wiring and inspections, turn off the power and wait for 15 minutes or more until the charge lamp turns off. Then, confirm that the voltage between P+ and N- is safe with a voltage tester and others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, always confirm it from the front of the servo amplifier.
- Ground the servo amplifier and servo motor securely.
- Any person who is involved in wiring and inspection should be fully competent to do the work.
- Do not attempt to wire the servo amplifier and servo motor until they have been installed. Otherwise, it may cause an electric shock.
- Do not operate switches with wet hands. Otherwise, it may cause an electric shock.
- The cables should not be damaged, stressed, loaded, or pinched. Otherwise, it may cause an electric shock.
- During power-on or operation, do not open the front cover of the servo amplifier. Otherwise, it may cause an electric shock.
- Do not operate the servo amplifier with the front cover removed. High-voltage terminals and charging area are exposed and you may get an electric shock.
- Except for wiring and periodic inspection, do not remove the front cover of the servo amplifier even if the power is off. The servo amplifier is charged and you may get an electric shock.
- To prevent an electric shock, always connect the protective earth (PE) terminal (marked 🕀) of the servo amplifier to the protective earth (PE) of the cabinet.
- To avoid an electric shock, insulate the connections of the power supply terminals.

[To prevent fire, note the following]

- Install the servo amplifier, servo motor, and regenerative resistor on incombustible material. Installing them directly or close to combustibles will lead to smoke or a fire.
- Always connect a magnetic contactor between the power supply and the main circuit power supply (L1/L2/L3) of the servo amplifier, in order to configure a circuit that shuts down the power supply on the side of the servo amplifier's power supply. If a magnetic contactor is not connected, continuous flow of a large current may cause smoke or a fire when the servo amplifier malfunctions.
- Always connect a molded-case circuit breaker, or a fuse to each servo amplifier between the power supply and the main circuit power supply (L1/L2/L3) of the servo amplifier, in order to configure a circuit that shuts down the power supply on the side of the servo amplifier's power supply. If a moldedcase circuit breaker or fuse is not connected, continuous flow of a large current may cause smoke or a fire when the servo amplifier malfunctions.
- When using the regenerative resistor, switch power off with the alarm signal. Otherwise, a
 regenerative transistor malfunction or the like may overheat the regenerative resistor, causing smoke
 or a fire.
- Provide adequate protection to prevent screws and other conductive matter, oil and other combustible matter from entering the servo amplifier and servo motor.

[To prevent injury, note the following]

- Only the power/signal specified in the Instruction Manual should be applied to each terminal. Otherwise, it may cause an electric shock, fire, injury, etc.
- Connect cables to the correct terminals. Otherwise, a burst, damage, etc., may occur.
- Ensure that polarity (+/-) is correct. Otherwise, a burst, damage, etc., may occur.
- The servo amplifier heat sink, regenerative resistor, servo motor, etc., may be hot while the power is on and for some time after power-off. Take safety measures such as providing covers to avoid accidentally touching them by hands and parts such as cables.

[Additional instructions]

The following instructions should also be fully noted. Incorrect handling may cause a malfunction, injury, electric shock, fire, etc.

[Transportation and installation]

- Transport the products correctly according to their mass.
- Stacking in excess of the specified number of product packages is not allowed.
- Do not hold the front cover, cables, or connectors when carrying the servo amplifier. Otherwise, it may drop.
- Install the servo amplifier and the servo motor in a load-bearing place in accordance with the Instruction Manual.
- Do not get on or put heavy load on the equipment. Otherwise, it may cause injury.
- The equipment must be installed in the specified direction.
- Maintain specified clearances between the servo amplifier and the inner surfaces of a control cabinet or other equipment.
- Do not install or operate the servo amplifier and servo motor which have been damaged or have any parts missing.
- Do not block the intake and exhaust areas of the servo amplifier. Otherwise, it may cause a malfunction.
- Do not drop or apply heavy impact on the servo amplifiers and the servo motors. Otherwise, it may cause injury, malfunction, etc.
- Do not strike the connector. Otherwise, it may cause a connection failure, malfunction, etc.
- When you keep or use the equipment, please fulfill the following environment.

Item		Environment
Ambient	Operation	0 °C to 55 °C (non-freezing)
temperature	Storage	-20 °C to 65 °C (non-freezing)
Ambient	Operation	5 %RH to 90 %RH (non-condensing)
humidity	Storage	5 %RT to 90 %RT (non-condensing)
Ambience Altitude Vibration resistance		Indoors (no direct sunlight), free from corrosive gas, flammable gas, oil mist, dust, and dirt
		2000 m or less above sea level (Contact your local sales office for the altitude for options.)
		5.9 m/s², at 10 Hz to 55 Hz (X, Y, Z axes)

- When the product has been stored for an extended period of time, contact your local sales office.
- When handling the servo motor, be careful with the sharp edges of the servo motor.
- The servo amplifier must be installed in a metal cabinet.
- When fumigants that contain halogen materials, such as fluorine, chlorine, bromine, and iodine, are used for disinfecting and protecting wooden packaging from insects, they cause a malfunction when entering our products. Please take necessary precautions to ensure that remaining materials from fumigant do not enter our products, or treat packaging with methods other than fumigation, such as heat treatment. Additionally, disinfect and protect wood from insects before packing the products.
- To prevent a fire or injury in case of an earthquake or other natural disasters, securely install, mount, and wire the servo motor in accordance with the Instruction Manual.

[Wiring]

- Wire the equipment correctly and securely. Otherwise, the servo motor may operate unexpectedly.
- Make sure to connect the cables and connectors by using the fixing screws and the locking mechanism. Otherwise, the cables and connectors may be disconnected during operation.
- Do not install a power capacitor, surge killer, or radio noise filter (optional FR-BIF(-H)) on the servo amplifier output side.
- To avoid a malfunction, connect the wires to the correct phase terminals (U/V/W) of the servo amplifier and servo motor.
- Connect the servo amplifier power output (U/V/W) to the servo motor power input (U/V/W) directly. Do not connect a magnetic contactor and others between them. Otherwise, it may cause a malfunction.

- The connection diagrams in this Instruction Manual are shown for sink interfaces, unless stated otherwise.
- The surge absorbing diode installed to the DC relay for control output should be fitted in the specified direction. Otherwise, the converter unit and the drive unit will malfunction and will not output signals, disabling the emergency stop and other protective circuits.

- When the wires are not tightened enough to the terminal block, the wires or terminal block may generate heat because of the poor contact. Be sure to tighten the wires with specified torque.
- Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- Configure a circuit to turn off EM2 or EM1 when the main circuit power supply is turned off to prevent an unexpected restart of the servo amplifier.
- To prevent malfunction, avoid bundling power lines (input/output) and signal cables together or running them in parallel to each other. Separate the power lines from the signal cables.

- When executing a test run, follow the notice and procedures in this instruction manual. Otherwise, it
 may cause a malfunction, damage to the machine, or injury.
- Before operation, check and adjust the parameter settings. Improper settings may cause some machines to operate unexpectedly.
- Never make a drastic adjustment or change to the parameter values as doing so will make the operation unstable.
- Do not get close to moving parts during the servo-on status.

[Usage]

- Provide an external emergency stop circuit to stop the operation and shut the power off immediately.
- For equipment in which the moving part of the machine may collide against the load side, install a limit switch or stopper to the end of the moving part. The machine may be damaged due to a collision.
- Do not disassemble, repair, or modify the product. Otherwise, it may cause an electric shock, fire, injury, etc. Disassembled, repaired, and/or modified products are not covered under warranty.
- Before resetting an alarm, make sure that the run signal of the servo amplifier is off in order to prevent a sudden restart. Otherwise, it may cause an accident.
- Use a noise filter, etc., to minimize the influence of electromagnetic interference. Electromagnetic interference may affect the electronic equipment used near the servo amplifier.
- Do not burn or destroy the servo amplifier. Doing so may generate a toxic gas.
- Use the servo amplifier with the specified servo motor.
- Wire options and peripheral equipment, etc. correctly in the specified combination. Otherwise, it may cause an electric shock, fire, injury, etc.
- The electromagnetic brake on the servo motor is designed to hold the motor shaft and should not be used for ordinary braking.
- For such reasons as incorrect wiring, service life, and mechanical structure (e.g. where a ball screw and the servo motor are coupled via a timing belt), the electromagnetic brake may not hold the motor shaft. To ensure safety, install a stopper on the machine side.
- If the dynamic brake is activated at power-off, alarm occurrence, etc., do not rotate the servo motor by an external force. Otherwise, it may cause a malfunction of the dynamic brake or a fire.

[Corrective actions]

- Ensure safety by confirming the power off, etc. before performing corrective actions. Otherwise, it may cause an accident.
- If it is assumed that a power failure, machine stoppage, or product malfunction may result in a hazardous situation, use a servo motor with an electromagnetic brake or provide an external brake system for holding purpose to prevent such hazard.
- Configure an electromagnetic brake circuit which is interlocked with an external emergency stop switch.

- When an alarm occurs, eliminate its cause, ensure safety, and deactivate the alarm to restart operation.
- If the molded-case circuit breaker or fuse is activated, be sure to remove the cause and secure safety before switching the power on. If necessary, replace the servo amplifier and recheck the wiring. Otherwise, it may cause smoke, fire, or an electric shock.
- Provide an adequate protection to prevent unexpected restart after an instantaneous power failure.
- After an earthquake or other natural disasters, ensure safety by checking the conditions of the installation, mounting, wiring, and equipment before switching the power on to prevent an electric shock, injury, or fire.

[Maintenance, inspection and parts replacement]

- Make sure that the emergency stop circuit operates properly such that an operation can be stopped immediately and a power is shut off by the emergency stop switch.
- It is recommended that the servo amplifier be replaced every 10 years when it is used in general environment.
- When using the servo amplifier that has not been energized for an extended period of time, contact your local sales office.

[General instruction]

To illustrate details, the equipment in the diagrams of this Instruction Manual may have been drawn without covers and safety guards. When the equipment is operated, the covers and safety guards must be installed as specified. Operation must be performed in accordance with this Instruction Manual.

DISPOSAL OF WASTE

Please dispose a servo amplifier, battery (primary battery) and other options according to your local laws and regulations.

EEP-ROM LIFE

The number of write times to the EEP-ROM, which stores parameter settings, etc., is limited to 100,000. If the total number of the following operations exceeds 100,000, the servo amplifier may malfunction when the EEP-ROM reaches the end of its useful life.

- Write to the EEP-ROM due to parameter setting changes
- Write to the EEP-ROM due to device changes

STO FUNCTION OF THE SERVO AMPLIFIER

When using the STO function of the servo amplifier, refer to the following.

Improvement Page 469 USING STO FUNCTION

For the MR-J3-D05 safety logic unit, refer to the following.

Image 609 MR-J3-D05 Safety logic unit

COMPLIANCE WITH GLOBAL STANDARDS

For the compliance with global standards, refer to the following.

Page 595 Compliance with global standards

ABOUT THE MANUALS

You must have this Instruction Manual and the following manuals to use this servo. Ensure to prepare them to use the servo safely.

Relevant manuals

Manual No.

*1 It is necessary for using an MR-D30 functional safety unit.

*2 It is necessary for using a rotary servo motor.

- *3 It is necessary for using a linear servo motor.
- *4 It is necessary for using a direct drive motor.
- *5 It is necessary for using a fully closed loop system.

WIRING

Wires mentioned in this Instruction Manual are selected based on the ambient temperature of 40 °C.

U.S. CUSTOMARY UNITS

U.S. customary units are not shown in this manual. Convert the values if necessary according to the following table.

Quantity	SI (metric) unit	U.S. customary unit
Mass	1 [kg]	2.2046 [lb]
Length	1 [mm]	0.03937 [inch]
Torque	1 [N.m]	141.6 [oz.inch]
Moment of inertia	1 [(× 10 ⁻⁴ kg.m ²)]	5.4675 [oz.inch ²]
Load (thrust load/axial load)	1 [N]	0.2248 [lbf]
Temperature	N [°C] × 9/5 + 32	N [°F]

1 FUNCTIONS AND CONFIGURATION

1.1 Summary

The Mitsubishi Electric general-purpose AC servo MELSERVO-J4 series have further higher performance and higher functions compared to the previous MELSERVO-J3 series.

MR-J4-_GF_ servo amplifier can be connected to controllers, such as a simple motion module on CC-Link IE Field Network. CC-Link IE Field Network is an open network using Ethernet (1000BASE-T), allowing high-speed and large-capacity communication. A communication speed of 1 Gbps achieves high-speed control of field devices and high-speed communication between facilities, thus shortening operating cycle.

MELSERVO-J4 series compatible rotary servo motor is equipped with 22-bit (4194304 pulses/rev) high-resolution absolute encoder. In addition, speed frequency response is increased to 2.5 kHz. Thus, faster and more accurate control is enabled as compared to MELSERVO-J3 series.

MR-J4-_GF_ servo amplifier operates MELSERVO-J4 series compatible rotary servo motors, linear servo motors, and direct drive motors as standard.

With one-touch tuning and real-time auto tuning, you can easily adjust the servo gains according to the machine. The tough drive function and the drive recorder function, which are well-received in the MELSERVO-JN series, have been improved. The MR-J4 servo amplifier supports the improved functions. Additionally, the preventive maintenance support function detects an error in the machine parts. This function provides strong support for the machine maintenance and inspection.

MR-J4-_GF_ servo amplifier supports the Safe Torque Off (STO) function. By combining with optional MR-J3-D05, the servo amplifier supports Safe stop 1 (SS1) function.

The servo amplifier has a USB communication interface. Therefore, you can connect the servo amplifier to the personal computer with MR Configurator2 installed to perform the parameter setting, test operation, gain adjustment, and others. In the MELSERVO-J4 series, servo amplifiers with the CN2L connector are also available as MR-J4- GF -RJ.

By using the CN2L connector, an A/B/Z-phase differential output type external encoder can be connected to the servo amplifier. In a fully closed loop system, a four-wire type external encoder is connectable as well. The following table indicates the communication method of the external encoder compatible with MR-J4-_GF_ and MR-J4-_GF_-RJ servo amplifiers.

Operation mode	External encoder	Connector					
	communication method	MR-J4GF_	MR-J4GFRJ				
Linear servo system ^{*5}	Two-wire type	CN2 ^{*1}	CN2 ^{*1}				
	Four-wire type						
	A/B/Z-phase differential output method	-	CN2L ^{*4}				
Fully closed loop system ^{*5}	Two-wire type	CN2 ^{*2*3}	CN2L				
	Four-wire type	-					
	A/B/Z-phase differential output method						
Scale measurement function*5	Two-wire type	CN2*2*3	CN2L				
	Four-wire type	-					
	A/B/Z-phase differential output method						

*1 The MR-J4THCBL03M branch cable is necessary.

*2 The MR-J4FCCBL03M branch cable is necessary.

- *3 When the communication method of the servo motor encoder is four-wire type, MR-J4-_GF_ cannot be used. Use an MR-J4-_GF_-RJ.
- *4 Connect a thermistor to CN2.
- *5 This is used with servo amplifiers with software version A1 or later.

1.2 Function block diagram

The function block diagram of this servo is shown below.

The diagram shows for MR-J4-_GF_-RJ as an example. MR-J4-_GF_ servo amplifier does not have CN2L connector.

200 V class

- *1 The built-in regenerative resistor is not provided for MR-J4-10GF(-RJ).
- *2 For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. Refer to the following for the power supply specifications.
 - Page 30 Servo amplifier standard specifications
- *3 Servo amplifiers MR-J4-70GF(-RJ) or more have a cooling fan.
- *4 MR-J4 servo amplifier has P3 and P4 in the upstream of the inrush current suppression circuit. They are different from P1 and P2 of MR-J3 servo amplifiers.
- *5 This is for MR-J4-_GF-RJ servo amplifier. MR-J4-_GF servo amplifier does not have CN2L connector.
- *6 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.

■MR-J4-700GF(-RJ)

*1 Refer to the following for the power supply specifications.

- *2 MR-J4 servo amplifier has P3 and P4 in the upstream of the inrush current suppression circuit. They are different from P1 and P2 of MR-J3 servo amplifiers.
- *3 This is for MR-J4-_GF-RJ servo amplifier. MR-J4-_GF servo amplifier does not have CN2L connector.
- *4 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.

MR-J4-11KGF(-RJ)/MR-J4-15KGF(-RJ)/MR-J4-22KGF(-RJ)

- *1 Refer to the following for the power supply specifications.
- Page 30 Servo amplifier standard specifications
- *2 MR-J4 servo amplifier has P3 and P4 in the upstream of the inrush current suppression circuit. They are different from P1 and P2 of MR-J3 servo amplifiers.
- *3 This is for MR-J4-_GF-RJ servo amplifier. MR-J4-_GF servo amplifier does not have CN2L connector.
- *4 Use an external dynamic brake for this servo amplifier. Failure to do so will cause an accident because the servo motor does not stop immediately but coasts at an alarm occurrence for which the servo motor does not decelerate to stop. Ensure the safety in the entire equipment. For alarms for which the servo motor does not decelerate to stop, refer to the following.
- *5 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- *6 The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.

400 V class

■MR-J4-350GF4(-RJ) or less

- *1 Refer to the following for the power supply specifications.
- *2 Servo amplifiers MR-J4-200GF4(-RJ) or more have a cooling fan.
- *3 MR-J4 servo amplifier has P3 and P4 in the upstream of the inrush current suppression circuit. They are different from P1 and P2 of MR-J3 servo amplifiers.
- *4 This is for MR-J4-_GF4-RJ servo amplifier. MR-J4-_GF4 servo amplifier does not have CN2L connector.
- *5 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.

MR-J4-500GF4(-RJ)/MR-J4-700GF4(-RJ)

*1 Refer to the following for the power supply specifications.

- *2 MR-J4 servo amplifier has P3 and P4 in the upstream of the inrush current suppression circuit. They are different from P1 and P2 of MR-J3 servo amplifiers.
- *3 This is for MR-J4-_GF4-RJ servo amplifier. MR-J4-_GF4 servo amplifier does not have CN2L connector.
- *4 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.

MR-J4-11KGF4(-RJ)/MR-J4-15KGF4(-RJ)/MR-J4-22KGF4(-RJ)

- *1 Refer to the following for the power supply specifications.
- Page 30 Servo amplifier standard specifications
- *2 MR-J4 servo amplifier has P3 and P4 in the upstream of the inrush current suppression circuit. They are different from P1 and P2 of MR-J3 servo amplifiers.
- *3 This is for MR-J4-_GF4-RJ servo amplifier. MR-J4-_GF4 servo amplifier does not have CN2L connector.
- *4 Use an external dynamic brake for this servo amplifier. Failure to do so will cause an accident because the servo motor does not stop immediately but coasts at an alarm occurrence for which the servo motor does not decelerate to stop. Ensure the safety in the entire equipment. For alarms for which the servo motor does not decelerate to stop, refer to the following.
- *5 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.

*1 0.3 A is the value applicable when all I/O signals are used. The current capacity can be decreased by reducing the number of I/O points.

*2 When closely mounting the servo amplifier, operate it at an ambient temperature of 0 °C to 45 °C or at 75% or smaller effective load ratio.

*3 Test pulse is a signal which instantaneously turns off a signal to the servo amplifier at a constant period for external circuit to selfdiagnose.

- *4 Except for the terminal block.
- *5 This value is applicable when a 3-phase power supply is used.
- *6 The rated current is 2.9 A when the servo amplifier is used with a UL or CSA compliant servo motor.
- *7 When using 1-phase 200 V AC to 240 V AC power supply, operate the servo amplifier at 75% or smaller effective load ratio.

*8 The DC power supply input is available only with MR-J4-_GF-RJ servo amplifiers. For the connection example of the power circuit when a DC input is used, refer to the following.

- $\ensuremath{\mathbb{I}}\xspace$ Page 586 When using the servo amplifier with the DC power supply input
- *9 Follow the restrictions below when using the servo amplifiers at altitude exceeding 1000 m and up to 2000 m above sea level.
- *10 The safety level depends on the setting value of [Pr. PF18 STO diagnosis error detection time] and whether STO input diagnosis by TOFB output is performed or not. For details, refer to the Function column of [Pr. PF18] below.
- *11 The MR-J4-_GF servo amplifier is compatible only with the two-wire type. The MR-J4-_GF-RJ servo amplifier is compatible with the twowire type, four-wire type, and A/B/Z-phase differential output method.
- *12 The communication cycle depends on the controller specifications and the number of axes connected.
- *13 Use an external dynamic brake for this servo amplifier. Failure to do so will cause an accident because the servo motor does not stop immediately but coasts at emergency stop. Ensure the safety in the entire equipment.
- *14 The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.
- $^{\ast}15\,$ This is used with servo amplifiers with software version A1 or later.

- *4 Follow the restrictions below when using the servo amplifiers at altitude exceeding 1000 m and up to 2000 m above sea level. 🖙 Page 81 Restrictions when using the servo amplifiers at altitude exceeding 1000 m and up to 2000 m above sea level
- *5 The safety level depends on the setting value of [Pr. PF18 STO diagnosis error detection time] and whether STO input diagnosis by TOFB output is performed or not. For details, refer to the Function column of [Pr. PF18] below. Page 217 Extension setting 3 parameters ([Pr. PF__])
- *6 The MR-J4-_GF1 servo amplifier is compatible only with the two-wire type. The MR-J4-_GF1-RJ servo amplifier is compatible with the two-wire type, four-wire type, and A/B/Z-phase differential output method. Page 18 Summary

*7 The communication cycle depends on the controller specifications and the number of axes connected.

1.4 Combinations of servo amplifiers and servo motors

Point P

~~~ ``

- When a 1-phase 200 V AC input is used, the maximum torque of 400% cannot be achieved with HG-JR series servo motor.
- When you use the MR-J4-100GF(-RJ) or MR-J4-200GF(-RJ) with the 1-phase 200 V AC input, contact your local sales office for the torque characteristics of the HG-UR series and HG-RR series servo motors.

| Servo amplifier  | Rotary servo motor |           |                          |            |            |                                                     | Linear servo motor                                                                                                        | Direct drive motor*1                                                                                                                     |  |

\*1 This is used with servo amplifiers with software version A1 or later.

 $^{\ast}2$   $\,$  This is used with servo amplifiers with software version A5 or later.

 $^{\ast}3$   $\,$  This combination increases the maximum torque of the servo motor to 400%.

\*4 The combination increases the rated torque and the maximum torque.

\*1 The combination increases the rated torque and the maximum torque.

# **1.5** Function list

The following table lists the functions of this servo. For details of the functions, refer to each section of the detailed explanation field.

| Function                                     | Description                                                                                                                                                                                                                                                                                                                                                                          | Detailed explanation                                                |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|
| Model adaptive control                       | This realizes a high response and stable control following the ideal model. The two-degrees-of-<br>freedom-model model adaptive control enables you to set a response to the command and<br>response to the disturbance separately.<br>Additionally, this function can be disabled. Refer to the following for disabling this function.<br>Image 278 Model adaptive control disabled | -                                                                   |
| Cyclic synchronous position mode (CSP)       | Operation is performed in the cyclic synchronous position mode.                                                                                                                                                                                                                                                                                                                      | -                                                                   |
| Cyclic synchronous velocity mode<br>(CSV)    | Operation is performed in the cyclic synchronous velocity mode.                                                                                                                                                                                                                                                                                                                      | —                                                                   |
| Cyclic synchronous torque mode<br>(CST)      | Operation is performed in the cyclic synchronous torque mode.                                                                                                                                                                                                                                                                                                                        | —                                                                   |
| Touch probe                                  | When the touch probe signal is turned on, the current position is latched. This is used with servo amplifiers with software version A1 or later.                                                                                                                                                                                                                                     | ≌ Page 568<br>Touch probe                                           |
| High-resolution encoder                      | High-resolution encoder of 4194304 pulses/rev is used as the encoder of the rotary servo motor compatible with the MELSERVO-J4 series.                                                                                                                                                                                                                                               | —                                                                   |
| Absolute position detection system           | Merely setting a home position once makes home position return unnecessary at every power-on.                                                                                                                                                                                                                                                                                        | CP Page 462<br>ABSOLUTE<br>POSITION<br>DETECTION<br>SYSTEM          |
| Gain switching function                      | You can switch gains during rotation and during stop, and can use an input device to switch gains during operation.                                                                                                                                                                                                                                                                  | SP Page 262<br>Gain switching<br>function                           |
| Advanced vibration suppression<br>control II | This function suppresses vibration at the arm end or residual vibration.                                                                                                                                                                                                                                                                                                             | CP Page 257<br>Advanced<br>vibration<br>suppression<br>control II   |
| Machine resonance suppression<br>filter      | This is a filter function (notch filter) which decreases the gain of the specific frequency to suppress the resonance of the mechanical system.                                                                                                                                                                                                                                      | েঁ Page 250<br>Machine<br>resonance<br>suppression filte            |
| Shaft resonance suppression filter           | When a load is mounted to the servo motor shaft, resonance by shaft torsion during driving may generate a mechanical vibration at high frequency. The shaft resonance suppression filter suppresses the vibration.                                                                                                                                                                   | Shaft resonance suppression filter                                  |
| Adaptive filter II                           | Servo amplifier detects mechanical resonance and sets filter characteristics automatically to suppress mechanical vibration.                                                                                                                                                                                                                                                         | Page 253<br>Adaptive filter II                                      |
| Low-pass filter                              | Suppresses high-frequency resonance which occurs as servo system response is increased.                                                                                                                                                                                                                                                                                              | Page 256 Low-pass filter                                            |
| Machine analyzer function                    | Analyzes the frequency characteristic of the mechanical system by simply connecting a MR<br>Configurator2 installed personal computer and servo amplifier.<br>MR Configurator2 is necessary for this function.                                                                                                                                                                       | -                                                                   |
| Robust filter                                | This function provides better disturbance response in case low response level that load to motor inertia ratio is high for such as roll send axes.                                                                                                                                                                                                                                   | [Pr. PE41]                                                          |
| Slight vibration suppression control         | Suppresses vibration of ±1 pulse produced at a servo motor stop.                                                                                                                                                                                                                                                                                                                     | [Pr. PB24]                                                          |
| Auto tuning                                  | Automatically adjusts the gain to optimum value if load applied to the servo motor shaft varies.                                                                                                                                                                                                                                                                                     | Service Page 240 Auto tuning                                        |

| Power monitoring function                  | This function calculates the power running energy and the regenerative power from the data in the servo amplifier such as speed and current. Power consumption and others are displayed on MR Configurator2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | _                                                   |
| Machine diagnosis function                 | From the data in the servo amplifier, this function estimates the friction and vibrational component<br>of the drive system in the equipment and recognizes an error in the machine parts, including a ball<br>screw and bearing.<br>This function automatically sets the threshold used for detecting the error of machine parts such as<br>ball screws and bearings based on the estimated friction, vibrational component, and servo motor<br>total travel distance. It outputs the warning when the friction, vibrational component, and servo<br>motor total travel distance are out of the set threshold. The error in the machine parts such as ball<br>screws and bearings can be detected automatically with this function.<br>MR Configurator2 is necessary for this function.<br>Also, the machine diagnosis function can be used through network.<br>Corr Page 651 List of registration objects | CP Page 575<br>Machine<br>diagnosis<br>function     |
| Limit switch                               | External limit switches can be used to limit travel intervals of the servo motor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | —                                                   |
| Software limit                             | Limits travel intervals by address using parameters.<br>Enables the same function with the limit switch by setting parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Software limit                                      |
| Scale measurement function                 | The function transmits position information of a scale measurement encoder to the controller by connecting the scale measurement encoder in semi closed loop control. This is used with servo amplifiers with software version A1 or later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Page 559<br>Scale<br>measurement<br>function        |
| Home position return mode                  | The servo amplifier operates in the home position return mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Page 146<br>Home position<br>return mode            |
| Lost motion compensation function          | This function improves the response delay occurred when the machine moving direction is reversed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Page 279<br>Lost motion<br>compensation<br>function |
| Super trace control                        | This function sets constant and uniform acceleration/deceleration droop pulses to almost 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Super trace                                         |
| SLMP                                       | SLMP (SeamLess Message Protocol) is a protocol to access SLMP-compatible devices from external devices (such as a personal computer and an HMI) or programmable controller CPU via Ethernet. The parameters of servo amplifiers can be set (read or written) and monitored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | _                                                   |
| Backup/restoration function                | This function is to back up and restore all parameter data and point table data in the servo amplifier to GOT using SLMP. This is used with servo amplifiers with software version A1 or later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | SP Page 572<br>Backup/<br>restoration<br>function   |
| Functional safety unit                     | MR-D30 can be used to expand the safety observation function. This is available with servo amplifiers with software version A3 or later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | —                                                   |
| CC-Link IE Field diagnosis                 | "Selected Station Communication Status Monitor" is available. This is available with servo amplifiers with software version A3 or later. "Operation Test", "Information Confirmation/Set", and "Selected Station Operation" are not available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | _                                                   |

# **1.6** Model designation

#### Rating plate

The following shows an example of rating plate for explanation of each item.

#### Model

The following describes what each block of a model name indicates. Not all combinations of the symbols are available.

\*1 Indicates a servo amplifier of 11 kW to 22 kW that does not use a regenerative resistor as standard accessory.

\*2 Dynamic brake which is built in 7 kW or smaller servo amplifiers is removed. Served Page 645 Amplifiers without dynamic brake

\*3 Type with a specially-coated servo amplifier board (IEC 60721-3-3 Class 3C2). Server Page 647 Special coating-specification product (IEC 60721-3-3 Class 3C2)

# 1.7 Structure

### Parts identification

# 

- When the servo amplifier is used for CC-Link IE Field Network, use the CN1A connector and CN1B connector. Do not connect these connectors to other than CC-Link IE Field Network. Otherwise, a malfunction may occur.
- When the servo amplifier is used for CC-Link IE Field Network Basic, use the CN1A connector only. Do not connect this connector to other than CC-Link IE Field Network Basic. Otherwise, a malfunction may occur.

#### 200 V class

#### ■MR-J4-200GF(-RJ) or less

The diagram shows MR-J4-10GF-RJ.

| (17)                 | Charge lamp<br>When the main circuit is charged, this will light up. While this lamp is lit, do not reconnect the cables.                          | -                                                                                  |
| (18) <sup>*1*2</sup> | External encoder connector (CN2L)<br>Used to connect the external encoder. Refer to the following for the compatible external encoders.            | ি Page 103 Connectors and pin<br>assignment<br>"Linear Encoder Instruction Manual" |
| (19)                 | Optional unit connector 1 (CN7)<br>This connector is used for connection with an optional unit. The connector is attached only on MR-J4-<br>_GFRJ. | _                                                                                  |
| (20)                 | Optional unit connector 2 (CN9)<br>This connector is used for connection with an optional unit. The connector is attached only on MR-J4-<br>_GFRJ. | _                                                                                  |

\*1 This is for MR-J4-\_GF-RJ servo amplifier. MR-J4-\_GF servo amplifier does not have CN2L connector.

\*2 "External encoder" is a term for linear encoder used in the linear servo system, load-side encoder used in the fully closed loop system, and scale measurement encoder used with the scale measurement function in this manual.

#### ■MR-J4-350GF(-RJ)

The diagram shows MR-J4-350GF-RJ.

| No. | Name/Application                                                                                                             | Detailed explanation                                                                      |

\*1 This is for MR-J4-\_GF4-RJ servo amplifier. MR-J4-\_GF4 servo amplifier does not have CN2L connector.

\*2 "External encoder" is a term for linear encoder used in the linear servo system, load-side encoder used in the fully closed loop system, and scale measurement encoder used with the scale measurement function in this manual.

#### ■MR-J4-350GF4(-RJ)

The diagram shows MR-J4-350GF4-RJ.

\*1 Lines for slots around the battery holder are omitted from the illustration.

| (19)                 | Optional unit connector 1 (CN7)<br>This connector is used for connection with an optional unit. The connector is attached only on<br>MR-J4GF1RJ.                | _                                                                                    |
| (20)                 | Optional unit connector 2 (CN9)<br>This connector is used for connection with an optional unit. The connector is attached only on<br>MR-J4GF1RJ.                | _                                                                                    |

\*1 This is for MR-J4-\_GF1-RJ servo amplifier. MR-J4-\_GF1 servo amplifier does not have CN2L connector.

\*2 "External encoder" is a term for linear encoder used in the linear servo system, load-side encoder used in the fully closed loop system, and scale measurement encoder used with the scale measurement function in this manual.

### 

• Before removing or installing the front cover, turn off the power and wait for 15 minutes or more until the charge lamp turns off. Then, confirm that the voltage between P+ and N- is safe with a voltage tester and others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, be sure to look at the lamp from the front of the servo amplifier.

The following shows how to remove and reinstall the front cover of MR-J4-700GF(-RJ) to MR-J4-22KGF(-RJ) and MR-J4-500GF4(-RJ) to MR-J4-22KGF4(-RJ).

The diagram shows MR-J4-700GF-RJ.

#### Removal of the front cover

1) Hold the ends of lower side of the front cover with both hands.

2) Pull up the cover, supporting at point A).

3) Pull out the front cover to remove.

#### Reinstallation of the front cover

1) Insert the front cover setting tabs into the sockets of servo amplifier (2 places).

2) Push down the cover, supporting at point A).

Setting tab

3) Press the cover against the terminal box until the installing knobs click.

# **1.8** Configuration including peripheral equipment

## 

• Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.

• The CN1A and CN1B connectors are designed for CC-Link IE Field Network only. Do not connect these connectors to other than CC-Link IE Field Network. Otherwise, a malfunction may occur.

### Point P

· Equipment other than the servo amplifier and servo motor are optional or recommended products.

- When using the MR-J4-\_GF-RJ servo amplifier with the DC power supply input, refer to the following.
  - $\ensuremath{\mathbb{I}}\xspace^{-1}$  Page 586 When using the servo amplifier with the DC power supply input

#### 200 V class

#### ■MR-J4-200GF(-RJ) or less

The diagram shows MR-J4-20GF-RJ.

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. Refer to the following for the power supply specifications.

Page 30 Servo amplifier standard specifications

- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 This is for MR-J4-\_GF-RJ servo amplifier. MR-J4-\_GF servo amplifier does not have CN2L connector. When using MR-J4-\_GF-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
- \*5 Always connect between P+ and D terminals. When using the regenerative option, refer to the following.

#### ■MR-J4-350GF(-RJ)

The diagram shows MR-J4-350GF-RJ.

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 This is for MR-J4-\_GF-RJ servo amplifier. MR-J4-\_GF servo amplifier does not have CN2L connector. When using MR-J4-\_GF-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
- \*5 Always connect between P+ and D terminals. When using the regenerative option, refer to the following.

#### ■MR-J4-500GF(-RJ)

The diagram shows MR-J4-500GF-RJ.

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 This is for MR-J4-\_GF-RJ servo amplifier. MR-J4-\_GF servo amplifier does not have CN2L connector. When using MR-J4-\_GF-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
- \*5 Always connect between P+ and D terminals. When using the regenerative option, refer to the following.

#### ■MR-J4-700GF(-RJ)

The diagram shows MR-J4-700GF-RJ.

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 This is for MR-J4-\_GF-RJ servo amplifier. MR-J4-\_GF servo amplifier does not have CN2L connector. When using MR-J4-\_GF-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
- \*5 When using the regenerative option, refer to the following.

#### ■MR-J4-11KGF(-RJ)/MR-J4-15KGF(-RJ)

The diagram is for MR-J4-11KGF-RJ and MR-J4-15KGF-RJ.

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 This is for MR-J4-\_GF-RJ servo amplifier. MR-J4-\_GF servo amplifier does not have CN2L connector. When using MR-J4-\_GF-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
- \*5 When using the regenerative option, refer to the following.

#### ■MR-J4-22KGF(-RJ)

The diagram shows MR-J4-22KGF-RJ.

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 This is for MR-J4-\_GF-RJ servo amplifier. MR-J4-\_GF servo amplifier does not have CN2L connector. When using MR-J4-\_GF-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
- \*5 When using the regenerative option, refer to the following.

#### 400 V class

#### ■MR-J4-200GF4(-RJ) or less

The diagram is for MR-J4-60GF4-RJ and MR-J4-100GF4-RJ.

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 This is for MR-J4-\_GF4-RJ servo amplifier. MR-J4-\_GF4 servo amplifier does not have CN2L connector. When using MR-J4-\_GF4-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
- \*5 Always connect between P+ and D terminals. When using the regenerative option, refer to the following.

#### ■MR-J4-350GF4(-RJ)

The diagram shows MR-J4-350GF4-RJ.

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 This is for MR-J4-\_GF4-RJ servo amplifier. MR-J4-\_GF4 servo amplifier does not have CN2L connector. When using MR-J4-\_GF4-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
- \*5 Always connect between P+ and D terminals. When using the regenerative option, refer to the following.

#### ■MR-J4-500GF4(-RJ)

The diagram shows MR-J4-500GF4-RJ.

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 This is for MR-J4-\_GF4-RJ servo amplifier. MR-J4-\_GF4 servo amplifier does not have CN2L connector. When using MR-J4-\_GF4-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
- \*5 When using the regenerative option, refer to the following.  $\square$  Page 338 Regenerative options

#### ■MR-J4-700GF4(-RJ)

The diagram shows MR-J4-700GF4-RJ.

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 This is for MR-J4-\_GF4-RJ servo amplifier. MR-J4-\_GF4 servo amplifier does not have CN2L connector. When using MR-J4-\_GF4-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
- \*5 When using the regenerative option, refer to the following.

#### ■MR-J4-11KGF4(-RJ)/MR-J4-15KGF4(-RJ)

The diagram is for MR-J4-11KGF-RJ and MR-J4-15KGF-RJ.

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 This is for MR-J4-\_GF4-RJ servo amplifier. MR-J4-\_GF4 servo amplifier does not have CN2L connector. When using MR-J4-\_GF4-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
- \*5 When using the regenerative option, refer to the following.

#### ■MR-J4-22KGF4(-RJ)

The diagram shows MR-J4-22KGF4-RJ.

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 This is for MR-J4-\_GF4-RJ servo amplifier. MR-J4-\_GF4 servo amplifier does not have CN2L connector. When using MR-J4-\_GF4-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
- \*5 When using the regenerative option, refer to the following.

1.8 Configuration including peripheral equipment

#### 100 V class

The diagram shows MR-J4-20GF1-RJ.

- \*1 The power factor improving DC reactor cannot be used.
- \*2 Refer to the following for the power supply specifications.
- Page 30 Servo amplifier standard specifications
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 When this is used as a fully closed loop system, the external encoder status is returned. Refer to the following and "Linear Encoder Instruction Manual" for the compatible external encoders.
  Image 18 Summary
- \*5 Always connect between P+ and D terminals. When using the regenerative option, refer to the following.

# 

• To prevent electric shock, ground each equipment securely.

# 

- · Stacking in excess of the specified number of product packages is not allowed.
- Do not hold the front cover, cables, or connectors when carrying the servo amplifier. Otherwise, it may drop.
- Install the equipment on incombustible material. Installing it directly or close to combustibles will lead to a fire.
- Install the servo amplifier and the servo motor in a load-bearing place in accordance with the Instruction Manual.
- Do not get on or put heavy load on the equipment. Otherwise, it may cause injury.
- Use the equipment within the specified environment. For the environment, refer to the following. 🖙 Page 30 Servo amplifier standard specifications
- Provide an adequate protection to prevent screws and other conductive matter, oil and other combustible matter from entering the servo amplifier.
- · Do not block the intake and exhaust areas of the servo amplifier. Otherwise, it may cause a malfunction.
- Do not drop or apply heavy impact on the servo amplifiers and the servo motors. Otherwise, it may cause injury, malfunction, etc.
- Do not drop or strike the servo amplifier. Isolate it from all impact loads.
- Do not install or operate the servo amplifier which have been damaged or have any parts missing.
- When the product has been stored for an extended period of time, contact your local sales office.
- When handling the servo motor, be careful with the sharp edges of the servo motor.
- The servo amplifier must be installed in a metal cabinet.
- When fumigants that contain halogen materials, such as fluorine, chlorine, bromine, and iodine, are used for disinfecting and protecting wooden packaging from insects, they cause a malfunction when entering our products. Please take necessary precautions to ensure that remaining materials from fumigant do not enter our products, or treat packaging with methods other than fumigation, such as heat treatment. Additionally, disinfect and protect wood from insects before packing the products.

## 

• The equipment must be installed in the specified direction. Otherwise, it may cause a malfunction.

• Leave specified clearances between the servo amplifier and the cabinet walls or other equipment. Otherwise, it may cause a malfunction.

#### Installation clearances of the servo amplifier

#### Installation of one servo amplifier

\*1 For 11 kW to 22 kW servo amplifiers, the clearance between the bottom and ground will be 120 mm or more.

\*2 When mounting MR-J4-500GF(-RJ), maintain a minimum clearance of 25 mm on the left side.

#### Installation of two or more servo amplifiers

#### Point P

- Close mounting is possible depending on the capacity of the servo amplifier. Refer to the following for availability of close mounting. 🖙 Page 30 Servo amplifier standard specifications
- When closely mounting multiple servo amplifiers, the servo amplifier on the right must have a larger depth than that on the left. Otherwise, the CNP1, CNP2, and CNP3 connectors cannot be removed.

Leave a large clearance between the top of the servo amplifier and the cabinet walls, and install a cooling fan to prevent the internal temperature of the cabinet from exceeding the environment.

When mounting the servo amplifiers closely, leave a clearance of 1 mm between the adjacent servo amplifiers in consideration of mounting tolerances. In this case, keep the ambient temperature within 0  $^{\circ}$ C to 45  $^{\circ}$ C or use the servo amplifier with 75% or less of the effective load ratio.

- \*1 For 11 kW to 22 kW servo amplifiers, the clearance between the bottom and ground will be 120 mm or more.
- \*2 When mounting MR-J4-500GF(-RJ), maintain a minimum clearance of 25 mm between the MR-J4-500GF(-RJ) and a servo amplifier mounted on the left side.

#### Others

When using heat generating equipment such as the regenerative option, install them with full consideration of heat generation so that the servo amplifier is not affected.

Install the servo amplifier on a perpendicular wall in the correct vertical direction.

# 2.2 Keeping out of foreign materials

- When drilling in the cabinet, prevent drill chips and wire fragments from entering the servo amplifier.
- Prevent oil, water, metallic dust, etc. from entering the servo amplifier through openings in the cabinet or a cooling fan installed on the ceiling.
- When installing the cabinet in a place where toxic gas, dirt and dust exist, conduct an air purge (force clean air into the cabinet from outside to make the internal pressure higher than the external pressure) to prevent such materials from entering the cabinet.

# 2.3 Encoder cable stress

- The way of clamping the cable must be fully examined so that bending stress and cable's own weight stress are not applied to the cable connection.
- For use in any application where the servo motor moves, fix the cables (encoder, power supply, and brake) with having some slack from the connector connection part of the servo motor to avoid putting stress on the connector connection part. Use the optional encoder cable within the bending life range. Use the power supply and brake wiring cables within the bending life of the cables.
- Avoid any probability that the cable insulator might be cut by sharp chips, rubbed by a machine corner, or stamped by workers or vehicles.
- For installation on a machine where the servo motor moves, the bending radius should be made as large as possible. Refer to the following for the bending life. 🖙 Page 327 Cable bending life

# 2.4 Inspection items

# 

- Before starting maintenance and/or inspection, turn off the power and wait for 15 minutes or more until the charge lamp turns off. Then, confirm that the voltage between P+ and N- is safe with a voltage tester and others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, always confirm it from the front of the servo amplifier.
- To avoid an electric shock, only qualified personnel should attempt inspections. For repair and parts replacement, contact your local sales office.

# 

- Do not perform insulation resistance test on the servo amplifier. Otherwise, it may cause a malfunction.
- Do not disassemble and/or repair the equipment on customer side.

It is recommended that the following points periodically be checked.

- · Check for loose terminal block screws. Retighten any loose screws.
- Check the cables and the like for scratches or cracks. Inspect them periodically according to operating conditions especially when the servo motor is movable.
- · Check that the connector is securely connected to the servo amplifier.
- · Check that the wires are not coming out from the connector.
- · Check for dust accumulation on the servo amplifier.
- Check for unusual noise generated from the servo amplifier.
- Make sure that the emergency stop circuit operates properly such that an operation can be stopped immediately and a
  power is shut off by the emergency stop switch.

# 2.5 Parts having service life

Service life of the following parts is listed below. However, the service life varies depending on operation and environment. If any fault is found in the parts, they must be replaced immediately regardless of their service life. For parts replacement, please contact your local sales office.

| Part name                 | Life guideline                                                                                                                                                  |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Smoothing capacitor       | 10 years                                                                                                                                                        |
| Relay                     | Number of power-on, forced stop by EM1 (Forced stop 1), and sudden stop command from controller: 100,000 times<br>Number of on and off for STO: 1,000,000 times |
| Cooling fan               | 10,000 hours to 30,000 hours (2 years to 3 years)                                                                                                               |
| Absolute position battery | Ser Page 466 Battery                                                                                                                                            |

#### Smoothing capacitor

The characteristic of smoothing capacitor is deteriorated due to ripple currents, etc. The life of the capacitor greatly depends on ambient temperature and operating conditions. The capacitor will be the end of its life in 10 years of continuous operation in air-conditioned environment (ambient temperature of 40  $^{\circ}$ C or less for use at the maximum 1000 m above sea level, 30  $^{\circ}$ C or less for over 1000 m to 2000 m).

#### Relays

Contact faults will occur due to contact wear arisen from switching currents. Relays reach the end of their lives when the power has been turned on, forced stop by EM1 (Forced stop 1) has occurred, and sudden stop command from controller has been executed 100,000 times in total, or when the STO has been turned on and off 1,000,000 times while the servo motor is stopped under servo-off state. However, the lives of relays may depend on the power supply capacity.

#### Servo amplifier cooling fan

The cooling fan bearings reach the end of their life in 10,000 hours to 30,000 hours. Normally, therefore, the cooling fan must be replaced in a few years of continuous operation as a guideline. It must also be changed if unusual noise or vibration is found during inspection.

The life indicates under the yearly average ambient temperature of 40 ℃, free from corrosive gas, flammable gas, oil mist, dust and dirt.

# 2.6 Restrictions when using the servo amplifiers at altitude exceeding 1000 m and up to 2000 m above sea level

#### Effective load ratio and regenerative load ratio

Heat dissipation effects decrease in proportion to decreasing air density, and hence use the servo amplifiers with the effective load ratio and the regenerative load ratio within the following range.

When closely mounting the servo amplifiers, operate them at the ambient temperatures of 0  $^{\circ}$ C to 45  $^{\circ}$ C or at 75% or smaller effective load ratio.

Page 77 Installation direction and clearances

#### Input voltage

Generally, withstand voltage decreases as altitude increases; however, there is no restriction on the withstand voltage. Use in the same manner as in 1000 m or less.

Page 30 Servo amplifier standard specifications

#### Parts having service life

#### Smoothing capacitor

The capacitor will reach the end of its life in 10 years of continuous operation in air-conditioned environment (30 ℃ ambient temperature or less).

#### ■Relays

There is no restriction. Use in the same manner as in 1000 m or less.  $\square$  Page 80 Parts having service life

#### Servo amplifier cooling fan

There is no restriction. Use in the same manner as in 1000 m or less.

Page 80 Parts having service life

# 

- Any person who is involved in wiring should be fully competent to do the work.
- Before wiring, turn off the power and wait for 15 minutes or more until the charge lamp turns off. Then, confirm that the voltage between P+ and N- is safe with a voltage tester and others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, always confirm it from the front of the servo amplifier.
- · Ground the servo amplifier and servo motor securely.
- Do not attempt to wire the servo amplifier and servo motor until they have been installed. Otherwise, it may cause an electric shock.
- The cables should not be damaged, stressed, loaded, or pinched. Otherwise, it may cause an electric shock.
- · To avoid an electric shock, insulate the connections of the power supply terminals.

# 

- · Wire the equipment correctly and securely. Otherwise, the servo motor may operate unexpectedly, resulting in injury.
- Connect cables to the correct terminals. Otherwise, a burst, damage, etc., may occur.
- Ensure that polarity (+/-) is correct. Otherwise, a burst, damage, etc., may occur.
- The surge absorbing diode installed to the DC relay for control output should be fitted in the specified direction. Otherwise, the converter unit and the drive unit will malfunction and will not output signals, disabling the emergency stop and other protective circuits.

- Use a noise filter, etc., to minimize the influence of electromagnetic interference. Electromagnetic interference may affect the electronic equipment used near the servo amplifier.
- Do not install a power capacitor, surge killer or radio noise filter (optional FR-BIF(-H)) with the power line of the servo motor.
- When using the regenerative resistor, switch power off with the alarm signal. Otherwise, a transistor fault or the like may overheat the regenerative resistor, causing a fire.
- Do not modify the equipment.
- Connect the servo amplifier power output (U/V/W) to the servo motor power input (U/V/W) directly. Do not connect a magnetic contactor and others between them. Otherwise, it may cause a malfunction.

- Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- Before wiring, switch operation, etc., eliminate static electricity. Otherwise, it may cause a malfunction.

When you use a linear servo motor, replace the following left words to the right words. Load to motor inertia ratio  $\rightarrow$  Load mass

Torque  $\rightarrow$  Thrust

# **3.1** Connection example of power circuit

# 

- Always connect a magnetic contactor between the power supply and the main circuit power supply (L1/L2/L3) of the servo amplifier, in order to configure a circuit that shuts down the power supply on the side of the servo amplifier's power supply. If a magnetic contactor is not connected, continuous flow of a large current may cause a fire when the servo amplifier malfunctions.
- Use ALM (Malfunction) to switch main circuit power supply off. Not doing so may cause a fire when a regenerative transistor malfunctions or the like may overheat the regenerative resistor.
- Check the servo amplifier model, and then input proper voltage to the servo amplifier power supply. If input voltage exceeds the upper limit, the servo amplifier will break down.
- The servo amplifier has a built-in surge absorber (varistor) to reduce exogenous noise and to suppress lightning surge. Exogenous noise or lightning surge deteriorates the varistor characteristics, and the varistor may be damaged. To prevent a fire, use a molded-case circuit breaker or fuse for input power supply.
- Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- The N- terminal is not a neutral point of the power supply. Incorrect wiring will cause a burst, damage, etc.

Point P

- Even if alarm has occurred, do not switch off the control circuit power supply. When the control circuit power supply has been switched off, network communication is interrupted. Therefore, the next servo amplifier displays "AA" at the indicator and turns into base circuit shut-off. The servo motor stops with starting dynamic brake.
- EM2 has the same function as EM1 in the torque mode.
- When using the MR-J4-\_GF-RJ servo amplifier with the DC power supply input, refer to the following.

Configure the wiring so that the main circuit power supply is shut off and the servo-on command turns off after deceleration to a stop due to an alarm occurring, an enabled servo forced stop, or a sudden stop command from controller. A molded-case circuit breaker (MCCB) must be used with the input cables of the main circuit power supply.

#### For 3-phase 200 V AC to 240 V AC power supply of MR-J4-10GF(-RJ) to MR-J4-350GF(-RJ)

- \*1 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- \*2 Always connect between P+ and D terminals. (factory-wired) When using the regenerative option, refer to the following.
- \*3 For the encoder cable, use of the option cable is recommended. For selecting cables, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*4 If disabling ALM (Malfunction) output with the parameter, configure up the power supply circuit which switches off the magnetic contactor after detection of alarm occurrence on the controller side.
- \*5 This diagram shows sink I/O interface. For source I/O interface, refer to the following.
- \*6 For connecting servo motor power wires, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*7 Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*8 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*9 When not using the STO function, attach the short-circuit connector came with a servo amplifier.
- \*10 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*11 Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- \*12 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

#### For 1-phase 200 V AC to 240 V AC power supply of MR-J4-10GF(-RJ) to MR-J4-200GF(-RJ)

- \*1 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- \*2 Always connect between P+ and D terminals. (factory-wired) When using the regenerative option, refer to the following.
- \*3 For the encoder cable, use of the option cable is recommended. For selecting cables, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*4 If disabling ALM (Malfunction) output with the parameter, configure up the power supply circuit which switches off the magnetic contactor after detection of alarm occurrence on the controller side.
- \*5 This diagram shows sink I/O interface. For source I/O interface, refer to the following.
- \*6 For connecting servo motor power wires, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*7 Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*8 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*9 When not using the STO function, attach the short-circuit connector came with a servo amplifier.
- \*10 When wires used for L11 and L21 are thinner than wires used for L1, and L3, use a molded-case circuit breaker.
- \*11 Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- \*12 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

#### MR-J4-500GF(-RJ)

- \*1 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- \*2 Always connect between P+ and D terminals. (factory-wired) When using the regenerative option, refer to the following.

- \*11 Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- \*12 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

#### MR-J4-700GF(-RJ)

- \*1 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- \*2 When using the regenerative option, refer to the following.
- \*3 For the encoder cable, use of the option cable is recommended. For selecting cables, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*4 If disabling ALM (Malfunction) output with the parameter, configure up the power supply circuit which switches off the magnetic contactor after detection of alarm occurrence on the controller side.
- \*5 This diagram shows sink I/O interface. For source I/O interface, refer to the following.
- \*6 For connecting servo motor power wires, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*7 Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*8 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*9 When not using the STO function, attach the short-circuit connector came with a servo amplifier.
- \*10 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*11 Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- \*12 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

#### MR-J4-11KGF(-RJ)/MR-J4-15KGF(-RJ)/MR-J4-22KGF(-RJ)

- \*1 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- \*2 When using the regenerative option, refer to the following.
- \*3 For the encoder cable, use of the option cable is recommended. For selecting cables, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*4 If disabling ALM (Malfunction) output with the parameter, configure up the power supply circuit which switches off the magnetic contactor after detection of alarm occurrence on the controller side.
- \*5 This diagram shows sink I/O interface. For source I/O interface, refer to the following.
- \*6 For connecting servo motor power wires, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*7 Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*8 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*9 When not using the STO function, attach the short-circuit connector came with a servo amplifier.
- \*10 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*11 Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- \*12 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
- \*13 For the servo motor with a cooling fan.
- \*14 For the cooling fan power supply, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*15 Use an external dynamic brake for this servo amplifier. Failure to do so will cause an accident because the servo motor does not stop immediately but coasts at an alarm occurrence for which the servo motor does not decelerate to stop. Ensure the safety in the entire equipment. For alarms for which the servo motor does not decelerate to stop, refer to the following.
  - Page 283 TROUBLESHOOTING
  - For wiring of the external dynamic brake, refer to the following.
  - Page 439 External dynamic brake
- \*16 The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.

- \*1 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.

- \*5 This diagram shows sink I/O interface. For source I/O interface, refer to the following.
- \*6 For connecting servo motor power wires, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*7 Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less.

Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.

- \*8 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*9 When not using the STO function, attach the short-circuit connector came with a servo amplifier.
  \*10 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- Page 406 Molded-case circuit breakers, fuses, magnetic contactors
- \*11 Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- \*12 Stepdown transformer is required when the coil voltage of the magnetic contactor is 200 V class.
- \*13 For the servo motor with a cooling fan.
- \*14 For the cooling fan power supply, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*15 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
- \*16 Use an external dynamic brake for this servo amplifier. Failure to do so will cause an accident because the servo motor does not stop immediately but coasts at an alarm occurrence for which the servo motor does not decelerate to stop. Ensure the safety in the entire equipment. For alarms for which the servo motor does not decelerate to stop, refer to the following. Page 283 TROUBLESHOOTING
  - For wiring of the external dynamic brake, refer to the following.
  - Page 439 External dynamic brake
- \*17 The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.

### 100 V class

- \*1 The power factor improving DC reactor cannot be used.
- \*2 Always connect between P+ and D terminals. (factory-wired) When using the regenerative option, refer to the following.
- \*3 For the encoder cable, use of the option cable is recommended. For selecting cables, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*4 If disabling ALM (Malfunction) output with the parameter, configure up the power supply circuit which switches off the magnetic contactor after detection of alarm occurrence on the controller side.
- \*5 This diagram shows sink I/O interface. For source I/O interface, refer to the following. Page 119 Source I/O interface
- \*6 For connecting servo motor power wires, refer to "Servo Motor Instruction Manual (Vol. 3)".
- \*7 Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*8 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*9 When not using the STO function, attach the short-circuit connector came with a servo amplifier.
- \*11 Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- \*12 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

## 

• The CN1A and CN1B connectors are designed for CC-Link IE Field Network only. Do not connect these connectors to other than CC-Link IE Field Network. Otherwise, a malfunction may occur.

Point P

- EM2 has the same function as EM1 in the torque mode.
- When the servo amplifier is used in the motion mode, use the switching hub DT135TX (Mitsubishi Electric System & Service) to branch a CC-Link IE Field Network.

## For sink I/O interface

- \*1 To prevent an electric shock, always connect the protective earth (PE) terminal (marked  $\textcircled$ ) of the servo amplifier to the protective earth (PE) of the cabinet.
- \*2 Connect the diode in the correct direction. If it is connected reversely, the servo amplifier will malfunction and will not output signals, disabling EM2 (Forced stop 2) and other protective circuits.
- \*3 If the controller does not have forced stop function, always install the forced stop 2 switch (normally closed contact).
- \*4 When starting operation, always turn on EM2 (Forced stop 2), LSP (Forward rotation stroke end) and LSN (Reverse rotation stroke end). (Normally closed contact)

When C\_FLS (Upper stroke limit) and C\_RLS (Lower stroke limit) are used through a controller, wiring LSP and LSN is unnecessary. In that case, set [Pr. PD41].

- \*5 Use SW1DNC-MRC2-\_.
  - Page 385 MR Configurator2
- \*6 You can change devices of these pins with [Pr. PD03], [Pr. PD05], and [Pr. PD06].
- \*7 The device is available only with MR-J4-\_GF\_-RJ.
- \*8 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*9 When not using the STO function, attach the short-circuit connector came with a servo amplifier.
- \*10 Supply 24 V DC ± 10% for interfaces from outside. Set the total current capacity to 300 mA. 300 mA is the value applicable when all I/O signals are used. The current capacity can be decreased by reducing the number of I/O points. Refer to the following for the current value necessary for the interface.
  - Page 117 Digital input interface DI-1

The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

- \*11 ALM (Malfunction) turns on in normal alarm-free condition. (Normally closed contact)
- \*12 The pins with the same signal name are connected in the servo amplifier.
- \*13 You can change devices of these pins with [Pr. PD07], [Pr. PD08], and [Pr. PD09].
- \*14 When you use a linear servo motor or direct drive motor, use MBR (Electromagnetic brake interlock) for an external brake mechanism.

## For source I/O interface

Point P

For notes, refer to the following.

Page 95 For sink I/O interface

# **3.3** Explanation of power supply system

## Signal explanations

#### Point P

- For the layout of connector and terminal block, refer to the following. 🖙 Page 295 DIMENSIONS
- When using the MR-J4-\_GF-RJ servo amplifier with the DC power supply input, refer to the following.

| Symbol   | Connection target (application)              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                    |                                              |                                              |                                       |  |  |
|----------|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|----------------------------------------------|----------------------------------------------|---------------------------------------|--|--|
| L1/L2/L3 | Main circuit power<br>supply                 | Supply the following power to L1, L2, and L3. For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                    |                                              |                                              |                                       |  |  |

#### **Power-on sequence**

**Point** 

The output signal, etc. may be unstable at power-on.

#### **Power-on procedure**

- Always wire the power supply as shown in the following section using the magnetic contactor with the main circuit power supply (L1/L2/L3). Configure up an external sequence to switch off the magnetic contactor as soon as an alarm occurs.
   Page 83 Connection example of power circuit
- 2. Switch on the control circuit power supply (L11/L21) simultaneously with the main circuit power supply or before switching on the main circuit power supply. If the control circuit power supply is turned on with the main circuit power supply off, and then the servo-on command is transmitted, [AL. E9 Main circuit off warning] will occur. Turning on the main circuit power supply stops the warning and starts the normal operation.
- **3.** The servo amplifier receives the servo-on command in 3 s to 4 s + network initial communication time after the main circuit power supply is switched on. Figure 99 Timing chart

\*1 This range will be "5 s to 6 s + network initial communication time" for the linear servo system and fully closed loop system.

\*2 The time will be longer during the magnetic pole detection of a linear servo motor and direct drive motor.

## Wiring CNP1, CNP2, and CNP3

Point P

- For the wire sizes used for wiring, refer to the following. 🖙 Page 402 Selection example of wires
- When wiring, remove the power connectors from the servo amplifier.
- Insert only one wire or ferrule to each wire insertion hole.
- MR-J4-500GF(-RJ) or more and MR-J4-500GF4(-RJ) or more do not have these connectors.

Use the servo amplifier power connector for wiring CNP1, CNP2, and CNP3.

#### Connector

#### ■MR-J4-10GF(-RJ) to MR-J4-100GF(-RJ)

| Connector | Receptacle assembly | Applicable wire |                   | Stripped length | Open tool                    | Manufacturer |
|-----------|---------------------|-----------------|-------------------|-----------------|------------------------------|--------------|
|           |                     | Size            | Insulator OD      | [mm]            |                              |              |
| CNP1      | 06JFAT-SAXGDK-H7.5  | AWG 18 to 14    | 3.9 mm or shorter | 9               | J-FAT-OT (N) or J-<br>FAT-OT | JST          |
| CNP2      | 05JFAT-SAXGDK-H5.0  |                 |                   |                 |                              |              |
| CNP3      | 03JFAT-SAXGDK-H7.5  |                 |                   |                 |                              |              |

#### MR-J4-200GF(-RJ)/MR-J4-350GF(-RJ)

| Connector | Receptacle assembly | Applicable wire |                   | Stripped length | Open tool    | Manufacturer |
|-----------|---------------------|-----------------|-------------------|-----------------|--------------|--------------|
|           |                     | Size            | Insulator OD      | [mm]            |              |              |
| CNP1      | 06JFAT-SAXGFK-XL    | AWG 16 to 10    | 4.7 mm or shorter | 11.5            | J-FAT-OT-EXL | JST          |
| CNP3      | 03JFAT-SAXGFK-XL    |                 |                   |                 |              |              |
| CNP2      | 05JFAT-SAXGDK-H5.0  | AWG 18 to 14    | 3.9 mm or shorter | 9               |              |              |

#### ■MR-J4-60GF4(-RJ) to MR-J4-350GF4(-RJ)

\*1 A pin for preventing improper connection is inserted to N- of CNP1 connector.

| Connector | Receptacle assembly  | Applicable wire |                   | Stripped length | Open tool   | Manufacturer |
|-----------|----------------------|-----------------|-------------------|-----------------|-------------|--------------|
|           |                      | Size            | Insulator OD      | [mm]            |             |              |
| CNP1      | 06JFAT-SAXGDK-HT10.5 | AWG 16 to 14    | 3.9 mm or shorter | 10              | J-FAT-OT-XL | JST          |
| CNP2      | 05JFAT-SAXGDK-HT7.5  | -               |                   |                 |             |              |
| CNP3      | 03JFAT-SAXGDK-HT10.5 |                 |                   |                 |             |              |

#### ■MR-J4-10GF1(-RJ) to MR-J4-40GF1(-RJ)

| Connector | Receptacle assembly | Applicable wire |                   | Stripped length | Open tool                    | Manufacturer |
|-----------|---------------------|-----------------|-------------------|-----------------|------------------------------|--------------|
|           |                     | Size            | Insulator OD      | [mm]            |                              |              |
| CNP1      | 06JFAT-SAXGDK-H7.5  | AWG 18 to 14    | 3.9 mm or shorter | 9               | J-FAT-OT (N) or J-<br>FAT-OT | JST          |
| CNP2      | 05JFAT-SAXGDK-H5.0  |                 |                   |                 |                              |              |

#### Cable connection procedure

#### ■Fabrication on cable insulator

Refer to the following for stripped length of cable insulator. The appropriate stripped length of cables depends on their type, etc. Set the length considering their status.

Page 100 Connector

Twist strands lightly and straighten them as follows.

Loose and bent strands

Twist and straighten the strands.

You can also use a ferrule to connect with the connectors. When using a ferrule, select a ferrule and crimping tool listed in the table below.

| Servo amplifier         | Wire size | Ferrule model (Phoenix C | Crimping tool (Phoenix |              |
|-------------------------|-----------|--------------------------|------------------------|--------------|
|                         |           | For one                  | For two                | Contact)     |
| MR-J4-10GF(-RJ) to      | AWG 16    | AI1.5-10BK               | AI-TWIN2 × 1.5-10BK    | CRIMPFOX-ZA3 |
| MR-J4-100GF(-RJ)        | AWG 14    | AI2.5-10BU               | -                      |              |
| MR-J4-200GF(-RJ) to     | AWG 16    | AI1.5-10BK               | AI-TWIN2 × 1.5-10BK    |              |
| MR-J4-350GF(-RJ)        | AWG 14    | AI2.5-10BU               | AI-TWIN2 × 2.5-10BU    |              |
|                         | AWG 12    | AI4-10GY                 | —                      |              |
| MR-J4-60GF4(-RJ) to     | AWG 16    | AI1.5-10BK               | AI-TWIN2 × 1.5-10BK    |              |
| MR-J4-350GF4(-RJ)       | AWG 14    | AI2.5-10BU               | —                      |              |
| MR-J4-10GF1(-RJ) to MR- | AWG 16    | AI1.5-10BK               | AI-TWIN2 × 1.5-10BK    |              |
| J4-40GF1(-RJ)           | AWG 14    | AI2.5-10BU               | -                      |              |

#### ■Inserting wire

Insert only one wire or ferrule to each wire insertion hole.

Insert the open tool as follows and push it down to open the spring.

While the open tool is pushed down, insert the stripped wire into the wire insertion hole. Check the wire insertion depth, and make sure that the cable insulator will not be caught by the spring and that the conductive part of the stripped wire will not be exposed.

Release the open tool to fix the wire. Pull the wire lightly to confirm that the wire is surely connected. In addition, make sure that no conductor wire sticks out of the connector.

The following shows a connection example of the CNP3 connector for MR-J4-200GF(-RJ) and MR-J4-350GF(-RJ).

# **3.4** Connectors and pin assignment

#### Point P

- The pin assignment of the connectors is as viewed from the cable connector wiring section.
- For the STO I/O signal connector (CN8), refer to the following. I Page 469 USING STO FUNCTION
- For the CN3 connector, securely connect the shielded external conductor of the cable to the ground plate and fix it to the connector shell.

The servo amplifier front view shown is that of the MR-J4-60GF-RJ or less. Refer to the following for the appearances and connector layouts of the other servo amplifiers.

#### Page 295 DIMENSIONS

The frames of the CN2, CN2L, and CN3 connectors are connected to the protective earth terminal in the servo amplifier.

\*1 The MR-J4-\_GF\_ servo amplifier does not have CN2L connector.

\*2 This is a connector of 3M. Refer to the following and "Linear Encoder Instruction Manual" for connection of the external encoders.

# 3.5 Signal (device) explanations

For the I/O interfaces (symbols in I/O division column in the table), refer to the following.

Series Page 117 Detailed explanation of interfaces

The pin numbers in the connector pin No. column are those in the initial status.

## Input device

#### Input device pin

The following shows the input device pins and parameters for setting devices.

| Connector pin No. | Parameter  | Initial device | I/O division |
|-------------------|------------|----------------|--------------|
| CN3-2             | [Pr. PD03] | LSP            | DI-1         |
| CN3-12            | [Pr. PD04] | LSN            |              |
| CN3-19            | [Pr. PD05] | DOG            |              |
| CN3-20            | [Pr. PA04] | EM2            |              |

| Device        | Symbol | Connector<br>pin No. | Function and                                          | Function and application                                                                                                                                                                                                                                                                                                                                                       |                                                                                                |                                                                                                |      |  |  |  |

| Electromagnetic brake<br>interlock | MBR    | When using the device, set operation delay time of the electromagnetic brake in [Pr. PC02].<br>When a servo-off status or alarm occurs, MBR will turn off.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |  |  |
| Malfunction                        | ALM    | When the protective circuit is activated to shut off the base circuit, ALM will turn off.<br>When an alarm does not occur, ALM will turn on after 2.5 s to 3.5 s after power-on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |  |  |
| In-position                        | INP    | When the number of droop pulses is in the in-position range, INP will turn on. The in-position range can be changed using [Pr. PA10]. When the in-position range is increased, INP may be on during low-speed rotation. The device cannot be used in the velocity mode and torque mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |  |  |  |
| Dynamic brake interlock            | DB     | When using the signal, enable it by the setting of [Pr. PD07] to [Pr. PD09].<br>DB turns off when the dynamic brake needs to operate. When using the external dynamic brake on the servo<br>amplifier of 11 kW or more, this device is required.<br>Page 439 External dynamic brake<br>For the servo amplifier of 7 kW or less, it is not necessary to use this device.<br>The external dynamic brake cannot be used with 11 kW or more servo amplifier for compliance with SEMI-F47<br>standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the<br>servo amplifier to become servo-off when an instantaneous power failure occurs.                                                                                                                                                                                                                                                                                                                                                                                             |  |  |  |
| Ready                              | RD     | Enabling servo-on to make the servo amplifier ready to operate will turn on RD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |  |  |
| Speed reached                      | SA     | SA will turn off during servo-off. When the servo motor speed reaches the following range, SA will turn on.<br>Set speed $\pm$ ((Set speed $\times$ 0.05) + 20) r/min<br>When the preset speed is 20 r/min or less, SA always turns on.<br>The device cannot be used in the position mode and torque mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |  |  |
| Limiting speed                     | VLC    | When the speed reaches the speed limit value in the torque mode, VLC will turn on. When the servo is off, VLC will be turned off.<br>The device cannot be used in the position mode and velocity mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |  |  |
| Zero speed detection               | ZSP    | ZSP turns on when the servo motor speed is zero speed (50 r/min) or less. Zero speed can be changed with [Pr<br>PC07].<br>Forward OFF level<br>70 r/min<br>direction ON level<br>50 r/min<br>direction Or /min<br>direction OFF level<br>-50 r/min<br>OFF level<br>-70 r/min<br>direction<br>V F level<br>-70 r/min<br>OFF level<br>-70 r/min<br>OFF level<br>-70 r/min<br>ZSP<br>(Zero speed<br>detection)<br>ZSP will turn on when the servo motor is decelerated to 50 r/min (at 1)), and will turn off when the servo motor is<br>accelerated to 70 r/min again (at 2)).<br>ZSP will turn on when the servo motor is decelerated again to 50 r/min (at 3)), and will turn off when the servo<br>motor speed has reached -70 r/min (at 4)).<br>The range from the point when the servo amotor speed has reached on level, and ZSP turns on, to the point whe<br>it is accelerated again and has reached off level is called hysteresis width.<br>Hysteresis width is 20 r/min for this servo amplifier.<br>When you use a linear servo motor, [r/min] explained above will be [mm/s]. |  |  |  |
| Limiting torque                    | TLC    | When the torque reaches the torque limit value during torque generation, TLC will turn on. When the servo is off VLC will be turned off.<br>This device cannot be used in the torque mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |  |  |

# **3.6** Forced stop deceleration function

### Point P

- When alarms not related to the forced stop function occur, control of motor deceleration cannot be guaranteed.
  - Page 283 TROUBLESHOOTING
- When network communication is shut-off, forced stop deceleration will operate.
- In the torque mode, the forced stop deceleration function is not available.
- Disable the forced stop deceleration function for a machine in which multiple axes are connected together, such as a tandem structure. If an alarm occurs with the forced stop deceleration function disabled, the servo motor will stop with the dynamic brake.
- Keep the servo-on command (from controller) and ready-on command (from controller) on while EM2 (Forced stop 2) is off. When the servo-on command (from controller) or ready-on command (from controller) is off, forced stop deceleration, base circuit shut-off delay time, and vertical axis freefall prevention do not function.

## Forced stop deceleration function

When EM2 is turned off, dynamic brake will start to stop the servo motor after forced stop deceleration. During this sequence, the display shows [AL. E6 Servo forced stop warning].

During normal operation, do not use EM2 (Forced stop 2) to alternate stop and drive. The servo amplifier life may be shortened.

### **Connection diagram**

\*1 This diagram shows sink I/O interface. For source I/O interface, refer to the following.

### Timing chart

When EM2 (Forced stop 2) is turned off, the motor will decelerate according to [Pr. PC24 Forced stop deceleration time constant]. Once the motor speed is below [Pr. PC07 Zero speed] after completion of the deceleration command, base power is cut and the dynamic brake activates.

## Base circuit shut-off delay time function

The base circuit shut-off delay time function is used to prevent vertical axis from dropping at a forced stop (EM2 goes off), alarm occurrence, or network communication shut-off due to delay time of the electromagnetic brake. Set the time from MBR (Electromagnetic brake interlock) off to base circuit shut-off with [Pr. PC02].

### **Timing chart**

When EM2 (Forced stop 2) turns off or an alarm occurs during driving, the servo motor will decelerate based on the deceleration time constant. MBR (Electromagnetic brake interlock) will turn off, and then after the delay time set in [Pr. PC02], the servo amplifier will be base circuit shut-off status.

### Adjustment

While the servo motor is stopped, turn off EM2 (Forced stop 2), adjust the base circuit shut-off delay time in [Pr. PC02], and set the value to approximately 1.5 times of the smallest delay time in which the servo motor shaft does not freefall.

# Vertical axis freefall prevention function

The vertical axis freefall prevention function avoids machine damage by pulling up the shaft slightly like the following case. When the servo motor is used for operating vertical axis, the servo motor electromagnetic brake and the base circuit shut-off delay time function avoid dropping axis at forced stop. However, the functions may not avoid dropping axis a few µm due to the backlash of the servo motor electromagnetic brake.

The vertical axis freefall prevention function is performed when all of the following conditions are met.

- · The position control mode is set.
- The setting value for [Pr. PC31 Vertical axis freefall prevention compensation amount] is other than "0".
- "Forced stop deceleration function selection" of [Pr. PA04] is set to "Forced stop deceleration function enabled (2 \_ \_ \_)".
- EM2 (Forced stop 2) turned off, an alarm occurred, or network communication shut-off occurred while the servo motor speed is zero speed or less.
- MBR (Electromagnetic brake interlock) is enabled in [Pr. PD07] to [Pr. PD09], and the base circuit shut-off delay time is set in [Pr. PC02].

#### Adjustment

- Set the freefall prevention compensation amount in [Pr. PC31].
- While the servo motor is stopped, turn off the EM2 (Forced stop 2). Adjust the base circuit shut-off delay time in [Pr. PC02] in accordance with the travel distance ([Pr. PC31]). Adjust it considering the freefall prevention compensation amount by checking the servo motor speed, torque ripple, etc.

## Residual risks of the forced stop function (EM2)

- The forced stop function is not available for alarms that activate the dynamic brake when the alarms occur.
- When an alarm that activates the dynamic brake during forced stop deceleration occurs, the braking distance until the servo motor stops will be longer than that of normal forced stop deceleration without the dynamic brake.
- If STO is turned off during forced stop deceleration, [AL.63 STO timing error] will occur.

# 

• When an alarm has occurred, remove its cause, make sure that the operation signal is not being input, ensure safety, and reset the alarm before restarting operation.

```
Point P
```

In the torque mode, the forced stop deceleration function is not available.

To deactivate the alarm, cycle the control circuit power, give the error reset command from the controller, or perform network communication reset. However, the alarm cannot be deactivated unless its cause is removed.

# When you use the forced stop deceleration function

#### Point P

- To enable the function, set "2 \_ \_ \_ (initial value)" in [Pr. PA04].
- Disable the forced stop deceleration function for a machine in which multiple axes are connected together, such as a tandem structure. If an alarm occurs with the forced stop deceleration function disabled, the servo motor will stop with the dynamic brake.

### When the forced stop deceleration function is enabled

\*1 The model speed command is a speed command generated in the servo amplifier for forced stop deceleration of the servo motor.

#### When the forced stop deceleration function is not enabled

#### When network communication is shut-off

The dynamic brake may operate depending on the communication shut-off status.

\*1 The model speed command is a speed command generated in the servo amplifier for forced stop deceleration of the servo motor.

# When you do not use the forced stop deceleration function

Point P

To disable the function, set "0 \_ \_ " in [Pr. PA04].

The timing chart that shows the servo motor condition when an alarm or network communication shut-off occurs is the same as the following section.

Page 115 When the forced stop deceleration function is not enabled

# 3.8 Interfaces

# Internal connection diagram

### Point P

Refer to the following for the CN8 connector.

Page 474 Connection example for CN8 connector

- \*1 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
- \*2 The signal cannot be used in the velocity mode and torque mode.
- \*3 This diagram shows sink I/O interface. For source I/O interface, refer to the following.
- \*4 Refer to the following for connections of external encoders.
- \*5 The device is available only with MR-J4-\_GF\_-RJ.

## **Detailed explanation of interfaces**

This section provides the details of the I/O signal interfaces (refer to the I/O division in the table) given in the following section. Refer to this section and make connection with the external device.

Page 104 Signal (device) explanations

#### **Digital input interface DI-1**

This is an input circuit whose photocoupler cathode side is input terminal. Transmit signals from sink (open-collector) type transistor output, relay switch, etc. The following is a connection diagram for sink input. Refer to the following for source input.

\*1 It will be approximately 4.3 k $\Omega$  for interface of CN3-1 and CN3-10 pins.

#### **Digital output interface DO-1**

This is a circuit in which the collector of the output transistor is the output terminal. When the output transistor is turned on, the current will flow to the collector terminal.

A lamp, relay or photocoupler can be driven. Install a diode (D) for an inductive load, or install an inrush current suppressing resistor (R) for a lamp load.

(Rated current: 40 mA or less, maximum current: 50 mA or less, inrush current: 100 mA or less) A maximum of 2.6 V voltage drop occurs in the servo amplifier. The following shows a connection diagram for sink output. Refer to the following for source output.

Page 119 Source I/O interface

\*1 If the voltage drop (maximum of 2.6 V) interferes with the relay operation, apply high voltage (maximum of 26.4 V) from external source.

### Encoder output pulses DO-2 (differential line driver type)

#### ■Interfaces

Maximum output current: 35 mA

#### ■Output pulse

LA

LAR LB

LBR  $\pi/2$ 

LZ LZR

### Analog output

\*1 Output voltage range varies depending on the output contents.

## Source I/O interface

In this servo amplifier, source type I/O interfaces can be used.

#### **Digital input interface DI-1**

This is an input circuit whose photocoupler anode side is input terminal. Transmit signals from source (open-collector) type transistor output, relay switch, etc.

\*1 It will be approximately 4.3 k $\Omega$  for interface of CN3-1 and CN3-10 pins.

#### Digital output interface DO-1

This is a circuit in which the emitter of the output transistor is the output terminal. When the output transistor is turned on, the current will flow from the output terminal to a load.

A maximum of 2.6 V voltage drop occurs in the servo amplifier.

\*1 If the voltage drop (maximum of 2.6 V) interferes with the relay operation, apply high voltage (maximum of 26.4 V) from external source.

# **3.9** Servo motor with an electromagnetic brake

## Safety precautions

# 

· Configure an electromagnetic brake circuit which is interlocked with an external emergency stop switch.

- The electromagnetic brake is provided for holding purpose and must not be used for ordinary braking.
- · Before operating the servo motor, be sure to confirm that the electromagnetic brake operates properly.
- Do not use the 24 V DC interface power supply for the electromagnetic brake. Always use the power supply designed exclusively for the electromagnetic brake. Otherwise, it may cause a malfunction.
- When using EM2 (Forced stop 2), use MBR (Electromagnetic brake interlock) for operating the electromagnetic brake. Operating the electromagnetic brake without using MBR during deceleration to a stop will saturate servo motor torques at the maximum value due to brake torque of the electromagnetic brake. This can result in delay of the deceleration to a stop from a set value.

Point ዖ

- Refer to "Servo Motor Instruction Manual (Vol. 3)" for specifications such as the power supply capacity and
  operation delay time of the electromagnetic brake.
- Refer to "Servo Motor Instruction Manual (Vol. 3)" for the selection of a surge absorber for the electromagnetic brake.

Note the following when the servo motor with an electromagnetic brake is used.

- The electromagnetic brake will operate when the power (24 V DC) turns off.
- · Turn off the servo-on command after the servo motor stopped.

### **Connection diagram**

\*1 Create the circuit in order to shut off by interlocking with the emergency stop switch.

\*2 Do not use the 24 V DC interface power supply for the electromagnetic brake.

#### Setting

In [Pr. PC02 Electromagnetic brake sequence output], set a delay time (Tb) from MBR (Electromagnetic brake interlock) off to base circuit shut-off at a servo-off as in the timing chart in the following section.

Page 121 Timing chart

## **Timing chart**

#### When you use the forced stop deceleration function

Point P

To enable the function, set "2 \_ \_ (initial value)" in [Pr. PA04].

#### Servo-on command (from controller) on/off

#### Point P

Keep the ready-on command (from controller) on while the servo-on command (from controller) is off. When the ready-off command (from controller) is off, Tb [Pr. PC02 Electromagnetic brake sequence output] does not function.

When servo-on command is turned off, the servo lock will be released after Tb [ms], and the servo motor will coast. If the electromagnetic brake is enabled during servo-lock, the brake life may be shorter. Therefore, set Tb about 1.5 times of the minimum delay time where the moving part will not drop down for a vertical axis system, etc.

\*1 ON: Electromagnetic brake is not activated.

OFF: Electromagnetic brake is activated.

\*2 Electromagnetic brake is released after the release delay time of electromagnetic brake and operation time of external circuit relay, etc. For the release delay time of electromagnetic brake, refer to "Servo Motor Instruction Manual (Vol. 3)".

\*3 Give the operation command from the controller after the electromagnetic brake is released.

### ■Off/on of the quick stop command (from controller) or EM2 (Forced stop 2)

Point P

• In the torque mode, the forced stop deceleration function is not available.

• Keep the ready-on command (from controller) on while the quick stop command (from controller) or the EM2 (Forced stop 2) is off. When the ready-off command (from controller) is off, Tb [Pr. PC02 Electromagnetic brake sequence output] does not function.

\*1 ON: Electromagnetic brake is not activated. OFF: Electromagnetic brake is activated.

\*2 The model speed command is a speed command generated in the servo amplifier for forced stop deceleration of the servo motor.

#### ■Alarm occurrence

· When the forced stop deceleration function is enabled

\*1 The model speed command is a speed command generated in the servo amplifier for forced stop deceleration of the servo motor.

· When the forced stop deceleration function is disabled

The operation status of the servo motor is the same as in the following.

 $\ensuremath{\boxtimes}^{\ensuremath{\square}}$  Page 115 When you use the forced stop deceleration function

• The dynamic brake may operate depending on the communication shut-off status.

\*1 The model speed command is a speed command generated in the servo amplifier for forced stop deceleration of the servo motor.

### Both main and control circuit power supplies off

\*1 Variable according to the operation status.

\*2 ON: Electromagnetic brake is not activated. OFF: Electromagnetic brake is activated.

### ■Main circuit power supply off with control circuit power supply on

- OFF: Electromagnetic brake is activated.
- \*2 Variable according to the operation status.

#### Ready-off command from controller

\*1 ON: Electromagnetic brake is not activated. OFF: Electromagnetic brake is activated.

#### When you do not use the forced stop deceleration function

### Point P

To disable the function, set "0 \_ \_ " in [Pr. PA04].

#### Servo-on command (from controller) on/off

It is the same as the following section.

Page 121 Servo-on command (from controller) on/off

#### ■Off/on of the sudden stop command (from controller) or EM1 (Forced stop 1)

\*1 ON: Electromagnetic brake is not activated. OFF: Electromagnetic brake is activated.

#### ■Alarm occurrence

The operation status during an alarm is the same as the following section.

Page 115 When you do not use the forced stop deceleration function

#### Both main and control circuit power supplies off

It is the same as the following section.

Page 124 Both main and control circuit power supplies off

#### Main circuit power supply off with control circuit power supply on

\*1 Variable according to the operation status.

\*2 ON: Electromagnetic brake is not activated.

OFF: Electromagnetic brake is activated.

#### ■Ready-off command from controller

It is the same as the following section.

Page 125 Ready-off command from controller

# 

· Ground the servo amplifier and servo motor securely.

• To prevent an electric shock, always connect the protective earth (PE) terminal (marked 🚖) of the servo amplifier to the protective earth (PE) of the cabinet.

The servo amplifier switches the power transistor on-off to supply power to the servo motor. Depending on the wiring and ground cable routing, the servo amplifier may be affected by the switching noise (due to di/dt and dv/dt) of the transistor. To prevent such a fault, refer to the following diagram and always ground.

To conform to the EMC Directive, refer to "EMC Installation Guidelines".

\*1 For the power supply specifications, refer to the following.

# 

- Do not operate the switches with wet hands. Otherwise, it may cause an electric shock.
- When executing a test run, follow the notice and procedures in this instruction manual. Otherwise, it may cause a malfunction, damage to the machine, or injury.

# 

- Before starting operation, check the parameters. Improper settings may cause some machines to operate unexpectedly.
- The servo amplifier heat sink, regenerative resistor, servo motor, etc., may be hot while the power is on and for some time after power-off. Take safety measures such as providing covers to avoid accidentally touching them by hands and parts such as cables.
- During operation, never touch the rotor of the servo motor. Otherwise, it may cause injury.
- · Before wiring, switch operation, etc., eliminate static electricity. Otherwise, it may cause a malfunction.

### Point P

When you use a linear servo motor, replace the following left words to the right words. Load to motor inertia ratio  $\rightarrow$  Load to motor mass ratio

Torque  $\rightarrow$  Thrust

# 4.1 Switching power on for the first time

- To use the servo amplifier in the motion mode, set [Pr. PN03] to "\_\_\_0" (initial value).
- To use the servo amplifier in the motion mode changed from the I/O mode, settings must be configured on GX Works. Refer to the following for settings with GX Works.

Page 134 Settings of GX Works

When switching power on for the first time, follow this section to make a startup.

## Startup procedure

#### **1.** Wiring check

Check whether the servo amplifier and servo motor are wired correctly by performing a visual check, using DO forced output function, etc.

- Page 130 Wiring check
- Page 142 Test operation mode in MR Configurator2
- **2.** Surrounding environment check
- Check the surrounding environment of the servo amplifier and servo motor.
- Page 134 Surrounding environment
- 3. Station No. setting

Set the station number with the station number setting rotary switch (SW2/SW3).

Page 137 Station number setting rotary switch (SW2/SW3)

4. Parameter setting

Set the parameters as necessary, such as the used operation mode and regenerative option selection.

Page 172 PARAMETERS

When a simple motion module QD77GF\_ or RD77GF\_ or simple motion board MR-EM340GF is used as a controller, set [Pr. PD41] to "\_ 1 \_ \_" (enabled only for home position return mode).

5. Test operation of the servo motor alone in test operation mode

For the test operation, with the servo motor disconnected from the machine and operated at the speed as low as possible, check whether the servo motor rotates correctly.

Page 142 Test operation mode

6. Test operation of the servo motor alone by commands

For the test operation with the servo motor disconnected from the machine and operated at the speed as low as possible, give commands to the servo amplifier and check whether the servo motor rotates correctly.

7. Test operation with the servo motor and machine connected

After connecting the servo motor with the machine, check machine motions with sending operation commands from the controller.

8. Gain adjustment

Make gain adjustment to optimize the machine motions.

**9.** Actual operation

**10.** Stop

Stop giving commands and stop operation.

Point P

# Wiring check

Before switching on the main circuit and control circuit power supplies, check the following items.

#### Power supply system

- The power supplied to the power input terminals (L1/L2/L3/L11/L21) of the servo amplifier should satisfy the defined specifications.
  - Page 30 Servo amplifier standard specifications
- When the power factor improving DC reactor is not used, between P3 and P4 should be connected.

\*1 The 100 V class servo amplifiers do not have P3 and P4.

#### Connection of servo amplifier and servo motor

• The servo amplifier power output (U/V/W) should match in phase with the servo motor power input terminals (U/V/W).

• The power supplied to the servo amplifier should not be connected to the servo motor power terminals (U/V/W). Doing so will fail the servo amplifier and servo motor.

• The grounding terminal of the servo motor is connected to the PE terminal of the servo amplifier.

• The CN2 connector of the servo amplifier should be connected to the encoder of the servo motor securely using the encoder cable.

#### When you use an option and peripheral equipment (200 V class)

#### When you use a regenerative option for 5 kW or less servo amplifiers

• The lead wire between P+ terminal and D terminal should not be connected.

- The regenerative option wire should be connected between P+ and C terminal.
- · Twisted wires should be used.

Page 344 Connection of regenerative option

#### When you use a regenerative option for 7 kW or more servo amplifiers

- For 7 kW servo amplifiers, the lead wire of the built-in regenerative resistor connected to P+ terminal and C terminal should not be connected.
- The regenerative option wire should be connected between P+ and C terminal.
- Twisted wires should be used.

Page 344 Connection of regenerative option

# When you use a brake unit and power regeneration converter for 5 kW or more servo amplifiers

- For 5 kW servo amplifiers, the lead wire between P+ terminal and D terminal should not be connected.
- For 7 kW servo amplifiers, the lead wire of the built-in regenerative resistor connected to P+ terminal and C terminal should not be connected.
- Wires of a brake unit or power regeneration converter should be connected to P+ terminal and N- terminal. SPage 357 FR-BU2-(H) brake unit
  - Page 370 FR-RC-(H) power regeneration converter
- Twisted wires should be used when wiring is over 5 m and equal to or less than 10 m using a brake unit.

#### When you use a power regeneration common converter

- For 5 kW or less servo amplifiers, the lead wire between P+ terminal and D terminal should not be connected.
- For 7 kW servo amplifiers, the lead wire of the built-in regenerative resistor connected to P+ terminal and C terminal should not be connected.
- The wire of power regeneration common converter should be connected to P4 terminal and N- terminal.
- ST Page 374 FR-CV-(H) power regeneration common converter

#### When you use a multifunction regeneration converter

- For 5 kW or less servo amplifiers, the lead wire between P+ terminal and D terminal should be connected. (factory-wired)
- For 7 kW servo amplifiers, the lead wire of the built-in regenerative resistor connected to P+ terminal and C terminal should be connected. (factory-wired)
- The wire of multifunction regeneration converter should be connected to P4 terminal and N- terminal.

#### When you use a power factor improving DC reactor

• The power factor improving DC reactor should be connected between P3 and P4.

\*1 Always disconnect between P3 and P4 terminals.

#### When you use an option and peripheral equipment (400 V class)

#### When you use a regenerative option for 3.5 kW or less servo amplifiers

- The lead wire between P+ terminal and D terminal should not be connected.
- The regenerative option wire should be connected between P+ and C terminal.
- Twisted wires should be used.

Page 344 Connection of regenerative option

#### When you use a regenerative option for 5 kW or more servo amplifiers

- For 5 kW or 7 kW servo amplifiers, the lead wire of the built-in regenerative resistor connected to P+ terminal and C terminal should not be connected.
- The regenerative option wire should be connected between P+ and C terminal.
- Twisted wires should be used.

Page 344 Connection of regenerative option

# When you use a brake unit and power regeneration converter for 5 kW or more servo amplifiers

- For 5 kW or 7 kW servo amplifiers, the lead wire of the built-in regenerative resistor connected to P+ terminal and C terminal should not be connected.
- Wires of a brake unit or power regeneration converter should be connected to P+ terminal and N- terminal.
  - Page 370 FR-RC-(H) power regeneration converter

  - Page 409 Power factor improving DC reactors

\*1 Always disconnect between P3 and P4 terminals.

#### When you use an option and peripheral equipment (100 V class)

#### When you use a regenerative option

- The lead wire between P+ terminal and D terminal should not be connected.
- The regenerative option wire should be connected between P+ and C terminal.
- · Twisted wires should be used.
  - Page 344 Connection of regenerative option

### I/O signal

- The I/O signals should be connected correctly. Use DO forced output to forcibly turn on/off the pins of the CN3 connector. You can use the function to check the wiring. In this case, switch on the control circuit power supply only. Refer to the following for details of I/O signal connection.
  - Page 95 I/O signal connection example
- 24 V DC or higher voltage is not applied to the pins of the CN3 connector.
- Plate and DOCOM of the CN3 connector is not shorted.

# Surrounding environment

#### Cable routing

- The wiring cables should not be stressed.
- The encoder cable should not be used in excess of its bending life.
- The connector of the servo motor should not be stressed.

### Environment

Signal cables and power cables are not shorted by wire offcuts, metallic dust or the like.

# **Settings of GX Works**

To use GX Works2 or GX Works3, make settings as indicated in this section.

### Station-specific mode setting

Make "Station-specific mode setting" in the "CC IE Field Configuration" window according to the operation mode to be used.

#### Precautions for "Detect Now"

With GX Works, connected devices can be automatically configured by performing "Detect Now" in the "CC IE Field Configuration" window. However, the contents of "Station-specific mode setting" in [Pr. PN03] and the operation mode setting cannot be discriminated. Make "Station-specific mode setting" according to the section above.

# 4.2 Startup

Confirm that the servo motor operates properly before connecting with a machine.

#### Power on

When the main and control circuit power supplies are turned on, "b01" (for the first station) appears on the servo amplifier display.

When the absolute position detection system is used in a rotary servo motor, first power-on results in [AL. 25 Absolute position erased] and the servo-on cannot be ready. The alarm can be deactivated by then switching power off once and on again. Also, if power is switched on at the servo motor speed of 3000 r/min or higher, position mismatch may occur due to external force or the like. Power must therefore be switched on when the servo motor is at a stop.

#### Parameter setting

### Point P

The following encoder cables are of four-wire type. When using any of these encoder cables, set [Pr. PC04] to "1 \_ \_ \_" to select the four-wire type. Incorrect setting will result in [AL. 16 Encoder initial communication error 1]. MR-EKCBL30M-L MR-EKCBL30M-H MR-EKCBL40M-H MR-EKCBL50M-H

Set the parameters according to the structure and specifications of the machine.

Page 172 PARAMETERS

After setting the above parameters, turn power off as necessary. Then switch power on again to enable the parameter values.

#### Servo-on

Enable the servo-on with the following procedure.

- **1.** Switch on main circuit power supply and control circuit power supply.
- **2.** Transmit the servo-on command with the controller.

When the servo-on status is enabled, the servo amplifier is ready to operate and the servo motor is locked.

#### Home position return

Always perform home position return before starting positioning operation.

#### Stop

Turn off the servo-on command after the servo motor has stopped, and then switch the power off.

If any of the following situations occurs, the servo amplifier suspends the running of the servo motor and brings it to a stop. Refer to the following for the servo motor with an electromagnetic brake.

Page 120 Servo motor with an electromagnetic brake

| Unit                             | Operation/command                                                                                                                                                                                           | Stopping condition                                                                                                                                                                           |  |

[AL. E6 Servo forced stop warning] occurs.<br>EM2 has the same function as EM1 in the torque mode.                                   |  |
|                                  | STO (STO1, STO2) off                                                                                                                                                                                        | The base circuit is shut off and the dynamic brake operates to bring the servo motor to a stop.                                                                                              |  |

\*1 Only a list of alarms and warnings is listed in chapter 8. Refer to the following for details of alarms and warnings. Immunolate Servo-J4 Servo Amplifier Instruction Manual (Troubleshooting)

### **CC-Link IE Field Network connection**

#### ■Network disconnection procedure

Always make the servo-off status before turning off the system power and disconnecting the servo amplifier from the network. Otherwise, [AL. 8D] may occur. For the detection conditions of [AL. 8D], refer to [Pr. PN06].

#### ■Network configuration change

If the network configuration in the same network as the servo amplifier is changed, such as adding or disconnecting a slave station, and adding a hub, all connected slave stations may be disconnected. Always make the servo-off status before changing the network configuration. Otherwise, [AL. 8D] may occur or the servo amplifier may not be reconnected.

#### ■Restrictions on CC-Link IE Field diagnosis

The following shows restrictions on CC-Link IE Field diagnosis.

| Diagnosis item                  |                                         | Restrictions                                                                                                                                                                                                                                             |  |

| Selected Station<br>Operation   | Remote Operation                        | Not compatible.                                                                                                                                                                                                                                          |  |

#### ■Model code

The following shows the vendor code and model code.

| Vendor code | Model code | Model   |
|-------------|------------|---------|
| 0002        | 1002       | MR-J4GF |

# 4.3 Switch setting and display of the servo amplifier

Switching to the test operation mode and setting station No. are enabled with switches on the servo amplifier. On the servo amplifier display (three-digit, seven-segment LED), check the status of communication with the controller at power-on, and the station number, and diagnose a malfunction at occurrence of an alarm. The communication status of the CN1A connector and CN1B connector can be checked with the LED.

## Switches

### WARNING • When switching the station number setting rotary switch (SW2/SW3) and mode select switch (SW1), use insulated screw driver. Do not use a metal screw driver. Touching patterns on electronic boards, lead of electronic parts, etc. may cause an electric shock. Point P • Turning "ON (up)" all the mode select switches (SW1) enables an operation mode for manufacturer setting and displays "off". The mode is not available. Set the mode select switches (SW1) correctly according to this section. • Cycling the main circuit power supply and control circuit power supply enables the setting of each switch. The following explains the mode select switches and the station number setting rotary switch. 3-digit, 7-segment LED Mode select switch (SW1) 2 For manufacturer setting (SW1-2) Test operation select switch (SW1-1) Station number setting rotary switch (upper) (SW2) Station number setting rotary switch (lower) (SW3)

### Test operation select switch (SW1-1)

To use the test operation mode, turn "ON (up)" the switch. Turning "ON (up)" the switch enables the test operation mode. In the test operation mode, the functions such as JOG operation, positioning operation, and machine analyzer are available with MR Configurator2.

#### Station number setting rotary switch (SW2/SW3)

Set the station number of the servo amplifier in hexadecimal. When the station number is set to a value other than "01h (1)" to "78h (120)", [AL. 11.1 Station number setting error] will occur.

# Scrolling display

Station number will be displayed in hexadecimal.

### Normal display

When there is no alarm, the station No. is displayed.

Status Station No. (1 digit) (2 digits)

1

"b": Indicates ready-off and servo-off status. "C": Indicates ready-on and servo-off status.

"C": Indicates ready-on and servo-off status. "d": Indicates ready-on and servo-on status.

### Alarm display

When an alarm occurs, the alarm number (two digits) and the alarm detail (one digit) are displayed following the status display. For example, the following shows when [AL. 32 Overcurrent] is occurring.

"n": Indicates that an alarm is occurring.

If an alarm occurs during initial communication through a network, the status, the alarm number (two digits) and alarm detail (one digit), and the network initial communication status are displayed, in that order. For example, the following shows when [AL. 16.1 Encoder initial communication - Receive data error 1] is occurring.

# Status display of a station

#### **Display sequence**

- \*1 . The segment of the last 2 digits shows the station number. Station Station No. 1 No. 2
- \*2 Always make the servo-off status before turning off the controller power. Otherwise, [AL. 8D] may occur.

| Indication list                          | Indication list                   |                                                                                                                                 |  |  |  |

| 888                                      | CPU error                         | CPU watchdog error has occurred.                                                                                                |  |  |  |
| b # #. <sup>*1</sup><br>d # #.<br>C # #. | Test operation mode <sup>*3</sup> | JOG operation, positioning operation, program operation, output signal (DO) forced output, or motor-<br>less operation was set. |  |  |  |

\*1 ## is displayed in hexadecimal. The following table shows the description.

| ## | Description     |
|----|-----------------|
| 01 | Station No. 1   |
|    | ÷               |
| 78 | Station No. 120 |

\*2 \*\*\* indicates the alarm No. and the warning No.

\*3 Requires the MR Configurator2.

\*4 Only a list of alarms and warnings is listed in chapter 8. Refer to the following for details of alarms and warnings. MELSERVO-J4 Servo Amplifier Instruction Manual (Troubleshooting)

# CC-Link IE Field status display LED

The following shows the CC-Link IE Field status display LED.

| LED                 | Name              | Lighting status | Description                       |
|---------------------|-------------------|-----------------|-----------------------------------|
| L ER<br>(CN1A/CN1B) | Line error status | Lit             | Erroneous data is being received. |
| LINK<br>(CN1A/CN1B) | Link status       | Lit             | Linking up                        |

# 4.4 Test operation

Before starting actual operation, perform test operation to make sure that the machine operates normally.

Refer to the following for the power on and off methods of the servo amplifier.

🖙 Page 135 Startup

#### Point P

If necessary, verify controller program by using motor-less operation. Refer to the following for the motor-less operation.

Page 145 Motor-less operation in controller

**1.** Test operation of the servo motor alone in JOG operation of test operation mode

In this step, confirm that the servo amplifier and servo motor operate normally. With the servo motor disconnected from the machine, use the test operation mode and check whether the servo motor rotates correctly. Refer to the following for the test operation mode.

Page 142 Test operation mode

2. Test operation of the servo motor alone by commands

In this step, confirm that the servo motor rotates correctly under the commands from the controller.

Give a low speed command at first and check the rotation direction, etc. of the servo motor. If the machine does not operate in the intended direction, check the input signal.

**3.** Test operation with the servo motor and machine connected

In this step, connect the servo motor with the machine and confirm that the machine operates normally under the commands from the controller.

Give a low speed command at first and check the operation direction, etc. of the machine. If the machine does not operate in the intended direction, check the input signal.

Check any problems with the servo motor speed, load ratio, and other status display items with MR Configurator2. Then, check automatic operation with the program of the controller.

# 

• The test operation mode is designed for checking servo operation. It is not for checking machine operation. Do not use this mode with the machine. Always use the servo motor alone.

• If the servo motor operates abnormally, use EM2 (Forced stop 2) to stop it.

### Point P

The content described in this section indicates that the servo amplifier and a personal computer are directly connected.

By using a personal computer and MR Configurator2, you can execute JOG operation, positioning operation, output signal forced output, and program operation.

## Test operation mode in MR Configurator2

### Point P

When the test operation mode is selected with the test operation select switch (SW1-1), the Network communication for the servo amplifier in the test operation mode and the following servo amplifiers is blocked.

#### Test operation mode

#### ■Jog operation

Jog operation can be performed without using the controller. Use this operation with the forced stop reset. This operation may be used independently of whether the servo is on or off and whether the controller is connected or not. Exercise control on the jog operation screen of MR Configurator2.

#### Operation pattern

| Item                                         | Initial value | Setting range   |
|----------------------------------------------|---------------|-----------------|
| Motor speed [r/min]                          | 200           | 0 to max. speed |
| Acceleration/deceleration time constant [ms] | 1000          | 0 to 50000      |

#### · Operation method

When the check box of "Rotation only while the CCW or CW button is being pushed." is checked.

| Operation              | Screen control                         |
|------------------------|----------------------------------------|
| Forward rotation start | Keep pressing "Forward CCW".           |
| Reverse rotation start | Keep pressing "Reverse CW".            |
| Stop                   | Release "Forward CCW" or "Reverse CW". |
| Forced stop            | Click "Forced stop".                   |

When the check box of "Rotation only while the CCW or CW button is being pushed." is not checked.

| Operation              | Screen control       |
|------------------------|----------------------|
| Forward rotation start | Click "Forward CCW". |
| Reverse rotation start | Click "Reverse CW".  |
| Stop                   | Click "Stop".        |
| Forced stop            | Click "Forced stop". |

#### ■Positioning operation

Positioning operation can be performed without using the controller. Use this operation with the forced stop reset. This operation may be used independently of whether the servo is on or off and whether the controller is connected or not. Exercise control on the positioning operation screen of MR Configurator2.

· Operation pattern

| Item                                         | Initial value                     | Setting range                                                                                                                        |  |  |
|----------------------------------------------|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|--|--|
| Travel distance [pulse]                      | 4000                              | 0 to 99999999                                                                                                                        |  |  |
| Motor speed [r/min]                          | 200                               | 0 to max. speed                                                                                                                      |  |  |
| Acceleration/deceleration time constant [ms] | 1000                              | 0 to 50000                                                                                                                           |  |  |
| Repeat pattern                               | Fwd. rot. (CCW) to rev. rot. (CW) | Fwd. rot. (CCW) to rev. rot. (CW)Fwd. rot. (CCW) to fwd. rot. (CCW)Rev. rot. (CW) to fwd. rot. (CCW)Rev. rot. (CW) to rev. rot. (CW) |  |  |
| Dwell time [s]                               | 2.0                               | 0.1 to 50.0                                                                                                                          |  |  |
| Number of repeats [time]                     | 1                                 | 1 to 9999                                                                                                                            |  |  |

#### · Operation method

| Operation              | Screen control       |
|------------------------|----------------------|
| Forward rotation start | Click "Forward CCW". |
| Reverse rotation start | Click "Reverse CW".  |
| Pause                  | Click "Pause".       |
| Stop                   | Click "Stop".        |
| Forced stop            | Click "Forced stop". |

#### ■Program operation

Positioning operation can be performed in two or more operation patterns combined, without using the controller. Use this operation with the forced stop reset. This operation may be used independently of whether the servo is on or off and whether the controller is connected or not.

Exercise control on the program operation screen of MR Configurator2. For full information, refer to Help of MR Configurator2.

| Operation   | Screen control       |
|-------------|----------------------|
| Start       | Click "Start".       |
| Pause       | Click "Pause".       |
| Stop        | Click "Stop".        |
| Forced stop | Click "Forced stop". |

#### ■Output signal (DO) forced output

Output signals can be switched on/off forcibly independently of the servo status. Use this function for output signal wiring check, etc. Exercise control on the DO forced output screen of MR Configurator2.

#### Operation procedure

- **1.** Turn off the power.
- 2. Turn "ON (up)" SW1-1.

Turning "ON (up)" SW1-1 during power-on will not start the test operation mode.

**3.** Turn on the servo amplifier.

When initialization is completed, the decimal point on the first digit will blink.

When an alarm or warning also occurs during the test operation, the decimal point on the first digit will blink as follows.

4. Start operation with the personal computer.

### Motor-less operation in controller

Point P

- Connect the controller to the servo amplifier before the motor-less operation.
- The motor-less operation cannot be used in the fully closed loop control mode, linear servo motor control mode, or DD motor control mode.

#### Motor-less operation

Without connecting the servo motor to the servo amplifier, output signals or status displays can be provided in response to the controller commands as if the servo motor is actually running. This operation may be used to check the controller sequence. Use this operation with the forced stop reset. Use this operation with the servo amplifier connected to the controller. To stop the motor-less operation, set "Disabled ( $\_$  0)" of "Motor-less operation selection" in [Pr. PC05]. The motor-less operation will be disabled from the next power-on.

#### Load conditions

| Load item                   | Condition                                                       |
|-----------------------------|-----------------------------------------------------------------|
| Load torque                 | 0                                                               |
| Load to motor inertia ratio | [Pr. PB06 Load to motor inertia ratio/load to motor mass ratio] |

#### ■Alarms

The following alarms and warning do not occur. However, the other alarms and warnings occur as when the servo motor is connected.

- [AL. 16 Encoder initial communication error 1]
- [AL. 1E Encoder initial communication error 2]
- [AL. 1F Encoder initial communication error 3]
- [AL. 20 Encoder normal communication error 1]
- [AL. 21 Encoder normal communication error 2]
- [AL. 25 Absolute position erased]
- [AL. 92 Battery cable disconnection warning]
- [AL. 9F Battery warning]

#### **Operation procedure**

- 1. Set the servo amplifier to the servo-off status.
- Set [Pr. PC05] to "\_\_\_1", turn "OFF (down)" the test operation select switch (SW1-1), and then turn on the power supply.

Set SW1-1 to "OFF (down)".

**3.** Start the motor-less operation with the controller.

The display shows the following screen.

# 4.6 Home position return mode

#### Point P

Before performing the home position return, make sure that the limit switch operates. Check the home position return direction. An incorrect setting will cause a reverse running. Check the input polarity of the proximity dog. Otherwise, it may cause an unexpected operation. To execute a home position return securely start a home position return after moving the server

To execute a home position return securely, start a home position return after moving the servo motor to the opposite stroke end.

For the home position return used in the linear servo motor control mode, refer to the following.

For the home position return used in the direct drive motor control mode, refer to the following.

For the home position return used in the fully closed loop control mode, refer to the following.

Page 549 Home position return

## Outline of home position return

A home position return is performed to match the command coordinates and the machine coordinates. Under the incremental method, each power-on of the input power supply requires the home position return. Contrastingly, in the absolute position detection system, once you have performed the home position return at machine installation, the current position will be retained even if the power supply is shut off. Therefore, the home position return is unnecessary when the power supply is switched on again.

This section shows the home position return types of the servo amplifier. Select the optimum method according to the configuration and uses of the machine.

When a home position return is started with the controller, Controlword bit 4 will turn on. For details of the home position return, refer to the controller instruction manual.

### Home position return types

Select the optimum home position return type according to the machine type or others.

| Method<br>No. | Home position return type                    | Home position return direction                  | Description                                                                                                                                                              |  |  |  |  |  |

| 28            | Homing without index pulse                     | Reverse rotation (CW) or negative direction    | Although this type is the same as the dog cradle type home position return, the stop position is not on the Z-phase. Starting from the front end of the dog, the position is shifted by the travel distance after proximity dog and the home position shift distance. The position after the shifts is set as the home position.                                                                                                                     |  |  |  |  |  |

| Method<br>No. | Home position return type  | Home position return direction                  | Description                                                                                                                                   |
|---------------|----------------------------|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 33            | Homing on index pulse      | Reverse rotation (CW) or<br>negative direction  | Although this type is the same as the dogless Z-phase reference home position return, the creep speed is applied as the movement start speed. |
| 34            | Homing on index pulse      | Forward rotation (CCW) or<br>positive direction | Although this type is the same as the dogless Z-phase reference home position return, the creep speed is applied as the movement start speed. |
| 35            | Homing on current position | _                                               | The current position is set as the home position. This type can be executed not in the Operational enabled state.                             |
| 37            | Homing on current position | _                                               | The current position is set as the home position. This type can be executed not in the Operational enabled state.                             |

#### Parameters for home position return

To perform the home position return, set each parameter as follows.

#### ■[Pr. PT45 Home position return type]

Select the home position return type and home position return direction.

| Setting | Home position return direction               | Home position return type                             |  |  |  |  |  |
|---------|----------------------------------------------|-------------------------------------------------------|--|--|--|--|--|
| value   |                                              |                                                       |  |  |  |  |  |
| 1       | Forward rotation (CCW) or positive direction | Dog type (rear end detection, Z-phase reference)      |  |  |  |  |  |
| 2       |                                              | Count type (front end detection, Z-phase reference)   |  |  |  |  |  |
| 4       |                                              | Stopper type (stopper position reference)             |  |  |  |  |  |
| 6       |                                              | Dog type (rear end detection, rear end reference)     |  |  |  |  |  |

#### ■[Pr. PT29 Function selection T-3]

Select the polarity where the proximity dog is detected with the DOG (Proximity dog) polarity selection.

Setting "0" detects a proximity dog when DOG (Proximity dog) is switched off. Setting "1" detects a proximity dog when DOG (Proximity dog) is switched on.

#### Precautions when using a proximity dog

#### ■Length of proximity dog

Set the length of the proximity dog to satisfy the following, so that the servo motor speed changes from the home position return speed to the creep speed during detection of the proximity dog.

$$L_1 \ge \frac{V}{60} \cdot \frac{td}{2}$$

L<sub>1</sub>: Length of the proximity dog [mm]

V: Home position return speed [mm/min]

td: Time to change from the home position return speed to the creep speed [s]

#### ■Adjustment of proximity dog position

To eliminate variations in the home position return completion position, adjust the proximity dog detection position to be near the center between the positions specified by a Z-phase signal and the next Z-phase signal.

The generated position of the Z-phase signals can be checked with "Position within one-revolution" of "Status display" on MR Configurator2.

#### Home position return type in CiA 402 type

The following shows the CiA 402-type home position return.

#### Method 3 and 4: Homing on positive home switch and index pulse

These home position return types use the front end of the proximity dog as reference and set the Z-phase right before and right after the dog as a home position.

Method 3 has the operation of the dog type last Z-phase reference home position return, and Method 4 has the operation of the dog cradle type home position return at a forward rotation start. However, if the stroke end is detected during home position return, [AL. 90] occurs.

#### Method 5 and 6: Homing on negative home switch and index pulse

These home position return types use the front end of the proximity dog as reference and set the Z-phase right before and right after the dog as a home position. Method 5 and 6 differ from Method 3 and Method 4 in the starting direction: the starting direction of Method 5 and 6 is the reversed direction.

#### Method 7, 8, 11, 12: Homing on home switch and index pulse

These types include the operation at stroke end detection in addition to the operation of Method 3 to Method 6. Thus, the home position is the same as that of Method 3 to Method 6. Method 7 has the operation of the dog type last Z-phase reference home position return. Method 8 has the operation of the dog cradle type home position return at a forward rotation start. Method 11 and 12 differ from Method 7 and Method 8 only in the starting direction: the starting direction of Method 11 and 12 is the reversed direction.

#### Method 17 to 30: Homing without index pulse

Method 17 to 30 have the operation of Method 1 to Method 14; however, these types set the home position not on the Zphase but on the dog. The following figure shows the operation of the home position return type of Method 19 and Method 20. Method 19 and Method 20 have the operation of Method 3 and Method 4; however, these types set the home position not on the Z-phase but on the dog Method 19 has the operation of the dog type front end reference home position return. Method 20 has the operation of the dog cradle type home position return; however, the stop position is not on the Z-phase but on the dog.

#### Method 33 and 34: Homing on index pulse

These home position return types set the Z-phase detected first as a home position. The operation is the same as that of the dogless Z-phase reference home position return except that the creep speed is applied at the start.

#### Method 35 and 37: Homing on current position

These home position return types set the current position as a home position. These methods can be performed even while the servo is off.

When a simple motion module QD77GF\_ or RD77GF\_ or simple motion board MR-EM340GF is used, these methods cannot be performed while the servo is off.

Page 162 Method 35 and Method 37 (Homing on current position)

#### **Operation example of the CiA 402-type Homing method**

The following shows an operation example of the home position return in the CiA 402-type Homing method.

#### Method 3 (Homing on positive home switch and index pulse) and Method 5 (Homing on negative home switch and index pulse)

The following figure shows the operation of Homing method 3. The operation direction of Homing method 5 is opposite to that of Homing method 3.

- \*1 After the front end of the proximity dog is detected, if the rear end of the proximity dog is detected without stop, [AL. 90] occurs. Check the length of the proximity dog or check the home position return speed and creep speed.
- \*2 Home position return position data can be changed with [Pr. PT08] and [Pr. PT47]. Home position return position data is the current position at the time of home position return completion. (I/O mode only)
- \*3 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69].
- When a home position return is started from the proximity dog

#### Method 4 (Homing on positive home switch and index pulse) and Method 6 (Homing on negative home switch and index pulse)

The following figure shows the operation of Homing method 4. The operation direction of Homing method 6 is opposite to that of Homing method 4.

#### Method 7 and Method 11 (Homing on home switch and index pulse)

The following figure shows the operation of Homing method 7. The operation direction of Homing method 11 is opposite to that of Homing method 7.

#### Method 8 and Method 12 (Homing on home switch and index pulse)

The following figure shows the operation of Homing method 8. The operation direction of Homing method 12 is opposite to that of Homing method 8.

- \*1 Home position return position data can be changed with [Pr. PT08] and [Pr. PT47]. Home position return position data is the current position at the time of home position return completion. (I/O mode only)
- \*2 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69].
- · When a home position return is started from the proximity dog

#### Method 19 and Method 21 (Homing without index pulse)

The following figure shows the operation of Homing method 19. The operation direction of Homing method 21 is opposite to that of Homing method 19.

#### Method 20 and Method 22 (Homing without index pulse)

The following figure shows the operation of Homing method 20. The operation direction of Homing method 22 is opposite to that of Homing method 20.

#### Method 23 and Method 27 (Homing without index pulse)

The following figure shows the operation of Homing method 23. The operation direction of Homing method 27 is opposite to that of Homing method 23.

#### Method 24 and Method 28 (Homing without index pulse)

The following figure shows the operation of Homing method 24. The operation direction of Homing method 28 is opposite to that of Homing method 24.

#### Method 33 and Method 34 (Homing on index pulse)

The following figure shows the operation of Homing method 34. The operation direction of Homing method 33 is opposite to that of Homing method 34.

#### ■Method 35 and Method 37 (Homing on current position)

The following figure shows the operation of Homing method 35 and Homing method 37. These methods can be performed in the servo-off status.

When a simple motion module QD77GF\_ or RD77GF\_ or simple motion board MR-EM340GF is used, these methods cannot be performed while the servo is off.

| Statusword bit 12<br>Homing attained        | ON<br>OFF                                             |                                       |

- \*1 After the front end of the proximity dog is detected, if the rear end of the proximity dog is detected without reaching the creep speed, [AL. 90] occurs. Check the length of the proximity dog or check the home position return speed and creep speed.
- \*2 Home position return position data can be changed with [Pr. PT08] and [Pr. PT47]. Home position return position data is the current position at the time of home position return completion. (I/O mode only)
- \*3 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69].
- When a home position return is started from the proximity dog

\*1 This is not available with the software limit.

4

#### Method -2 and -34 (Count type home position return)

### Point P

For the count type home position return, after the front end of the proximity dog is detected, the position is shifted by the distance set in the travel distance after proximity dog. Then, the first Z-phase is set as the home position. Therefore, when the on-time of the proximity dog is 10 ms or more, the length of the proximity dog has no restrictions. Use this home position return type when the dog type home position return cannot be used because the length of the proximity dog cannot be reserved or other cases.

The following figure shows the operation of Homing method -2. The operation direction of Homing method -34 is opposite to that of Homing method -2.

#### Method -4 and -36 (stopper type home position return)

Point P

Since the workpiece collides with the mechanical stopper, the home position return speed must be low enough.

The following figure shows the operation of Homing method -4. The operation direction of Homing method -36 is opposite to that of Homing method -4.

| Statusword bit 10<br>Target reached  | ON -<br>OFF      |                                                                  |
|--------------------------------------|------------------|------------------------------------------------------------------|
| Statusword bit 12<br>Homing attained | ON               |                                                                  |
|                                      | OFF -            | Acceleration time constant                                       |
|                                      | rotation         | Home position return speed Home position return position data *3 |
| Servo motor speed                    | 0 r/min -        |                                                                  |
|                                      | Reverse rotation | ↓ 10 ms or shorter                                               |
| Controlword bit 4                    | ON               |                                                                  |
| Homing operation start               | OFF -            | 5 ms or longer                                                   |
| TLC (Limiting torque)                | ON<br>OFF -      | [Pr. PT10 Stopper type home position return stopper time]        |
| Torque limit value                   | -                | Torque limit value *1 [Pr. PT11] Torque limit value *1           |

- \*1 When Method -4 is set, the torque limit value (Positive torque limit value (60E0h)) is applied. When Method -36 is set, the torque limit value (Negative torque limit value (60E1h)) is applied.
- \*2 If the torque limit value is reached, TLC remains on after the home position return is completed.
- \*3 Home position return position data can be changed with [Pr. PT08] and [Pr. PT47]. Home position return position data is the current position at the time of home position return completion. (I/O mode only)
- · When the stroke end is detected

#### Method -6 and -38 (dog type rear end reference home position return)

Point P

This home position return type depends on the timing of reading DOG (Proximity dog) that has detected the rear end of the proximity dog. Therefore, when the creep speed is set to 100 r/min and a home position return is performed, the home position has an error calculated by the following expression.

 $\pm$  (Encoder resolution)  $\times$  100/65536 [pulse]

The higher the creep speed, the greater the error of the home position.

The following figure shows the operation of Homing method -6. The operation direction of Homing method -38 is opposite to that of Homing method -6.

#### Method -7 and -39 (count type front end reference home position return)

Point P

This home position return type depends on the timing of reading DOG (Proximity dog) that has detected the front end of the proximity dog. Therefore, when the creep speed is set to 100 r/min and a home position return is performed, the home position has an error calculated by the following expression.

 $\pm$  (Encoder resolution)  $\times$  100/65536 [pulse]

The faster home position return speed sets a larger error in the home position.

The following figure shows the operation of Homing method -7. The operation direction of Homing method -39 is opposite to that of Homing method -7.

- \*1 After the front end of the proximity dog is detected, if the distance after proximity dog is traveled without reaching the creep speed, [AL. 90] occurs. Set the travel distance after proximity dog and the home position shift distance large enough for deceleration from the home position return speed to the creep speed.
- \*2 Home position return position data can be changed with [Pr. PT08] and [Pr. PT47]. Home position return position data is the current position at the time of home position return completion. (I/O mode only)
- \*3 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69].
- \*4 Travel distance after proximity dog can be changed with [Pr. PT09] and [Pr. PT71].
- · When a home position return is started from the proximity dog

#### Method -8 and -40 (dog cradle type home position return)

The following figure shows the operation of Homing method -8. The operation direction of Homing method -40 is opposite to that of Homing method -8.

\*1 Home position return position data can be changed with [Pr. PT08] and [Pr. PT47]. Home position return position data is the current position at the time of home position return completion. (I/O mode only)

- \*2 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69].
- · When a home position return is started from the proximity dog

#### Method -9 and -41 (dog type last Z-phase reference home position return)

The following figure shows the operation of Homing method -9. The operation direction of Homing method -41 is opposite to that of Homing method -9.

\*1 After the front end of the proximity dog is detected, if the rear end of the proximity dog is detected without stop, [AL. 90] occurs. Check the length of the proximity dog or check the home position return speed and creep speed.

- \*2 Home position return position data can be changed with [Pr. PT08] and [Pr. PT47]. Home position return position data is the current position at the time of home position return completion. (I/O mode only)
- \*3 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69].
- · When a home position return is started from the proximity dog

#### Method -10 and -42 (dog type front end reference home position return)

The following figure shows the operation of Homing method -10. The operation direction of Homing method -42 is opposite to that of Homing method -10.

#### Method -11 and -43 (dogless Z-phase reference home position return)

The following figure shows the operation of Homing method -11. The operation direction of Homing method -43 is opposite to that of Homing method -11.

When home position return is performed from near the Z-phase, the home position return completion position varies. The recommended start position for home position return can be found by rotating the servo motor about a half-turn away from the home position return direction.

\*1 Home position return position data can be changed with [Pr. PT08] and [Pr. PT47]. Home position return position data is the current position at the time of home position return completion. (I/O mode only)

- \*2 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69].
- · When the stroke end is detected

Point P

# 

- Never make a drastic adjustment or change to the parameter values as doing so will make the operation unstable.
- Do not change the parameter settings as described below. Doing so may cause an unexpected condition, such as failing to start up the servo amplifier. • Changing the values of the parameters for manufacturer setting
- · Setting a value out of the range
- $\cdot$  Changing the fixed values in the digits of a parameter
- When you write parameters with the controller, make sure that the station No. of the servo amplifier is set correctly. Otherwise, the parameter settings of another station may be written, possibly causing the servo amplifier to be an unexpected condition.

# 5.1 Parameter list

### Point P

The parameter whose symbol is preceded by \* is enabled with the following conditions:

- \*: After setting the parameter, cycle the power or reset the controller.
- \*\*: After setting the parameter, cycle the power.

Abbreviations of operation modes indicate the following. Operation modes other than the standard mode is used with servo amplifiers with software version A1 or later.

- · Standard: use of rotary servo motors in semi closed loop system
- Full.: use of rotary servo motors in fully closed loop system
- Lin.: use of linear servo motors
- DD: use of direct drive motors

|                                                                       | x                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0h                         |

## 5.3 Software limit

The limit stop with the software limit ([Pr. PT15] to [Pr. PT18]) is the same as the motion of the stroke end. Exceeding a setting range will stop and servo-lock the shaft. This will be enabled at power-on and will be disabled in the velocity mode, torque mode, and homing mode. Setting a same value to "Software limit +" and "Software limit -" will disable this function. Setting a larger value to "Software limit +" will disable this function.

# 6 NORMAL GAIN ADJUSTMENT

#### Point P

- In the torque mode, you do not need to make gain adjustment.
- Before making gain adjustment, check that your machine is not being operated at maximum torque of the servo motor. If operated over maximum torque, the machine may vibrate and may operate unexpectedly. In addition, make gain adjustment with a safety margin considering characteristic differences of each machine. It is recommended that generated torque during operation is under 90% of the maximum torque of the servo motor.
- When you use a linear servo motor, replace the following left words to the right words. Load to motor inertia ratio → Load to motor mass ratio
- $\text{Torque} \rightarrow \text{Thrust}$
- For the vibration suppression control tuning mode, the setting range of [Pr. PB07] is limited. Refer to the following for details.
- ST Page 259 Vibration suppression control manual mode

## 6.1 Different adjustment methods

### Adjustment on a single servo amplifier

The following table shows the gain adjustment modes that can be set on a single servo amplifier. For gain adjustment, first execute "Auto tuning mode 1". If you are not satisfied with the result of the adjustment, execute "Auto tuning mode 2" and "Manual mode" in this order.

#### Gain adjustment mode explanation

| Gain adjustment mode                            | [Pr. PA08] setting | Estimation of load to motor inertia ratio | Automatically set<br>parameters                                                                  | Manually set<br>parameters                                                                       |

#### Adjustment sequence and mode usage

## Adjustment using MR Configurator2

This section explains the functions and adjustment using the servo amplifier with MR Configurator2.

| Function         | Description                                                                                                                                                                                                          | Adjustment                                                                                                                         |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Machine analyzer | With the machine and servo motor coupled, the characteristic of the mechanical system can be measured by giving a random vibration command from a personal computer to the servo and measuring the machine response. | You can grasp the machine resonance frequency<br>and determine the notch frequency of the machine<br>resonance suppression filter. |

# 6.2 One-touch tuning

Point P

- When executing the one-touch tuning, check the [Pr. PA21 One-touch tuning function selection] is "\_\_\_1" (initial value).
- Refer to the following for one-touch tuning via a network.
  - $\boxtimes$  Page 238 One-touch tuning via a network

Connect MR Configurator2 and open the one-touch tuning window, and you can use the function. The following parameters are set automatically with one-touch tuning.

| Parameter | Symbol | Name                                                                                  |
|-----------|--------|---------------------------------------------------------------------------------------|
| PA08      | ATU    | Auto tuning mode                                                                      |
| PA09      | RSP    | Auto tuning response                                                                  |
| PB01      | FILT   | Adaptive tuning mode (adaptive filter II)                                             |
| PB02      | VRFT   | Vibration suppression control tuning mode (advanced vibration suppression control II) |
| PB06      | GD2    | Load to motor inertia ratio/load to motor mass ratio                                  |
| PB07      | PG1    | Model loop gain                                                                       |
| PB08      | PG2    | Position loop gain                                                                    |
| PB09      | VG2    | Speed loop gain                                                                       |
| PB10      | VIC    | Speed integral compensation                                                           |
| PB12      | OVA    | Overshoot amount compensation                                                         |
| PB13      | NH1    | Machine resonance suppression filter 1                                                |
| PB14      | NHQ1   | Notch shape selection 1                                                               |
| PB15      | NH2    | Machine resonance suppression filter 2                                                |
| PB16      | NHQ2   | Notch shape selection 2                                                               |
| PB18      | LPF    | Low-pass filter setting                                                               |
| PB19      | VRF11  | Vibration suppression control 1 - Vibration frequency                                 |
| PB20      | VRF12  | Vibration suppression control 1 - Resonance frequency                                 |
| PB21      | VRF13  | Vibration suppression control 1 - Vibration frequency damping                         |
| PB22      | VRF14  | Vibration suppression control 1 - Resonance frequency damping                         |
| PB23      | VFBF   | Low-pass filter selection                                                             |
| PB47      | NHQ3   | Notch shape selection 3                                                               |
| PB48      | NH4    | Machine resonance suppression filter 4                                                |
| PB49      | NHQ4   | Notch shape selection 4                                                               |
| PB51      | NHQ5   | Notch shape selection 5                                                               |
| PE41      | EOP3   | Function selection E-3                                                                |

### **One-touch tuning flowchart**

Make one-touch tuning as follows.

1. Startup of the system

Start a system referring to the following.

🖙 Page 128 STARTUP

#### 2. Operation

Rotate the servo motor by an external controller, etc. (The one-touch tuning cannot be performed if the servo motor is not operating.)

**3.** One-touch tuning start

Start one-touch tuning of MR Configurator2.

#### 4. Response mode selection

Select a response mode (high mode, basic mode, and low mode) in the one-touch tuning window of MR Configurator2.

#### 5. One-touch tuning execution

Push the start button to start one-touch tuning. Push it during servo motor driving.

When one-touch tuning is completed normally, the parameters described in the following section will be set automatically.

### Display transition and operation procedure of one-touch tuning

#### **Response mode selection**

Select a response mode from 3 modes in the one-touch tuning window of MR Configurator2.

| One-touch                  | n Tuning                                   |                                          |          | >                                                         |
|----------------------------|--------------------------------------------|------------------------------------------|----------|-----------------------------------------------------------|

| Response mode | Explanation                                       |
|---------------|---------------------------------------------------|
| High mode     | This mode is for high rigid system. <sup>*1</sup> |
| Basic mode    | This mode is for standard system.                 |
| Low mode      | This mode is for low rigid system.                |

\*1 When the communication cycle of the controller is 2 ms or more, a higher gain may be applied. In this case, use the basic mode or low mode to readjust the gain.

Refer to the following table for selecting a response mode.

| Response mode |            |           | Response     | Machine characteristic                                                                                         |
|---------------|------------|-----------|--------------|----------------------------------------------------------------------------------------------------------------|
| Low mode      | Basic mode | High mode |              | Guideline of corresponding machine                                                                             |

#### One-touch tuning execution

Point P

For equipment in which overshoot during one-touch tuning is in the permissible level of the in-position range, changing the value of [Pr. PA25 One-touch tuning - Overshoot permissible level] will shorten the settling time and improve the response.

After the response mode is selected in the following section, pushing the start button during driving will start one-touch tuning.

If the start button is pushed while the servo motor stops, "C 0 0 2" or "C 0 0 4" will be displayed at status in error code. (Refer to the following for error codes.)

#### Page 236 If an error occurs

| Set the detailed parameter relating to One-touch tuning<br>Tuning of overshoot amount may be enabled.                                                                                      | eter Setting |

During processing of one-touch tuning, the status will be displayed in the progress window as follows. One-touch tuning will be finished at 100%.

| Progress Display Screen | X    |
|-------------------------|------|
| 0%                      | 100% |

Completing the one-touch tuning starts writing tuning parameters to the servo amplifier. "0 0 0 0" is displayed at status in error code. In addition, settling time and overshoot amount will be displayed in "Adjustment result" after adjustment.

#### Stop of one-touch tuning

During one-touch tuning, pushing the stop button stops one-touch tuning.

If the one-touch tuning is stopped, "C 0 0 0" will be displayed at status in error code.

#### If an error occurs

If a tuning error occurs during tuning, one-touch tuning will be forcibly terminated. With that, the following error code will be displayed in status. Check the cause of tuning error.

| Error<br>code | Name                                        | Description                                                                                                  | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

#### If an alarm occurs

If an alarm occurs during tuning, one-touch tuning will be forcibly terminated. Remove the cause of the alarm and execute one-touch tuning again.

#### If a warning occurs

If a warning which continue the motor driving occurs during the tuning, one-touch tuning will be continued. If a warning which does not continue the motor driving occurs during the tuning, one-touch tuning will be stopped.

#### Clearing one-touch tuning

You can clear the parameter values set with one-touch tuning.

Refer to the following for the parameters which you can clear.

Page 232 One-touch tuning

Pushing "Return to value before adjustment" in the one-touch tuning window of MR Configurator2 enables to rewrite the parameter to the value before pushing the start button

In addition, pushing "Return to initial value" in the one-touch tuning window enables to rewrite the parameter to the initial value.

Clearing one-touch tuning is completed, the following window will be displayed. (returning to initial value)

### Caution for one-touch tuning

- The tuning is not available in the torque mode.
- The one-touch tuning cannot be executed while an alarm or warning which does not continue the motor driving is occurring.
- The tuning is not available during the following test operation mode. Output signal (DO) forced output

Motor-less operation

 If one-touch tuning is performed when the gain switching function is enabled, vibration and/or unusual noise may occur during the tuning.

### One-touch tuning via a network

#### Point P

One-touch tuning via a network is available with servo amplifiers with software version A3 or later.

Using One-touch tuning mode (2D50h) allows one-touch tuning from a controller.

When a simple motion module RD77GF or simple motion board MR-EM340GF is used, the one-touch tuning is available with the servo transient transmission function. For settings of the servo transient transmission function, refer to the controller instruction manual.

#### Procedure of one-touch tuning via a network

Perform one-touch tuning via a network in the following procedure.

1. Startup of the system

Start a system referring to the following.

- 🖙 Page 128 STARTUP
- 2. Operation

Rotate the servo motor with a controller. (One-touch tuning cannot be performed if the servo motor is not operating.)

#### **3.** One-touch tuning execution

Write a value corresponding to the response mode (High mode, basic mode, or Low mode) to perform in One-touch tuning mode (2D50h) during servo motor driving to perform one-touch tuning.

#### **4.** One-touch tuning in progress

Gains and filters will be adjusted automatically. During one-touch tuning, the progress can be checked with One-touch tuning status (2D51h).

#### **5.** One-touch tuning completion

Check whether one-touch tuning is completed normally with One-touch tuning Error Code (2D54h). When one-touch tuning is completed normally, the parameters will be set automatically. Refer to the following for the parameters that are set automatically.

#### Page 232 One-touch tuning

After a tuning error is returned, take the appropriate action according to the following section.

Page 236 If an error occurs

#### 6. Tuning result check

Check the tuning result.

If the tuning result is not satisfactory, you can return the parameter to the value before the one-touch tuning or the initial value using One-touch tuning Clear (2D53h).

## 6.3 Auto tuning

### Auto tuning mode

The servo amplifier has a real-time auto tuning function which estimates the machine characteristic (load to motor inertia ratio) in real time and automatically sets the optimum gains according to that value. This function permits ease of gain adjustment of the servo amplifier.

#### Auto tuning mode 1

The servo amplifier is factory-set to the auto tuning mode 1.

In this mode, the load to motor inertia ratio of a machine is always estimated to set the optimum gains automatically. The following parameters are automatically adjusted in the auto tuning mode 1.

| Parameter | Symbol | Name                                                 |
|-----------|--------|------------------------------------------------------|
| PB06      | GD2    | Load to motor inertia ratio/load to motor mass ratio |
| PB07      | PG1    | Model loop gain                                      |
| PB08      | PG2    | Position loop gain                                   |
| PB09      | VG2    | Speed loop gain                                      |
| PB10      | VIC    | Speed integral compensation                          |

#### Point P

The auto tuning mode 1 may not be performed properly if all of the following conditions are not satisfied.

- The acceleration/deceleration time constant to reach 2000 r/min (mm/s) is 5 s or less.
- Servo motor speed is 150 r/min (mm/s) or higher.
- The load to servo motor (mass of linear servo motor's primary side or direct drive motor) inertia ratio is 100 times or less.
- The acceleration/deceleration torque is 10% or more of the rated torque.

Under operating conditions which will impose sudden disturbance torque during acceleration/deceleration or on a machine which is extremely loose, auto tuning may not function properly, either. In such cases, use the auto tuning mode 2 or manual mode to make gain adjustment.

#### Auto tuning mode 2

Use the auto tuning mode 2 when proper gain adjustment cannot be made by auto tuning mode 1. Since the load to motor inertia ratio is not estimated in this mode, set the value of a correct load to motor inertia ratio in [Pr. PB06]. The following parameters are automatically adjusted in the auto tuning mode 2.

| Parameter | Symbol | Name                        |
|-----------|--------|-----------------------------|
| PB07      | PG1    | Model loop gain             |
| PB08      | PG2    | Position loop gain          |
| PB09      | VG2    | Speed loop gain             |
| PB10      | VIC    | Speed integral compensation |

### Auto tuning mode basis

The block diagram of real-time auto tuning is shown below.

When a servo motor is accelerated/decelerated, the load to motor inertia ratio estimation section always estimates the load to motor inertia ratio from the current and speed of the servo motor. The results of estimation are written to [Pr. PB06 Load to motor inertia ratio/load to motor mass ratio]. These results can be confirmed on the status display screen of the MR Configurator2.

If you have already known the value of the load to motor inertia ratio or failed to estimate, set "Gain adjustment mode selection" to "Auto tuning mode 2 (\_\_\_2)" in [Pr. PA08] to stop the estimation (turning off the switch in above diagram), and set the load to motor inertia ratio ([Pr. PB06]) manually.

From the preset load to motor inertia ratio ([Pr. PB06]) value and response ([Pr. PA09]), the optimum loop gains are automatically set on the basis of the internal gain table.

The auto tuning results are saved in the EEP-ROM of the servo amplifier every 60 minutes since power-on. At power-on, auto tuning is performed with the value of each loop gain saved in the EEP-ROM being used as an initial value.

#### Point P

- When any of the auto tuning mode 1 and auto tuning mode settings is changed to the manual mode 2 setting, the current loop gains and load to motor inertia ratio estimation value are saved in the EEP-ROM.

## Adjustment procedure by auto tuning

Since auto tuning is enabled before shipment from the factory, simply running the servo motor automatically sets the optimum gains that match the machine. Merely changing the response level setting value as required completes the adjustment. The adjustment procedure is as follows.

### Response level setting in auto tuning mode

Set the response of the whole servo system by [Pr. PA09]. As the response level setting is increased, the trackability and settling time for a command decreases, but a too high response level will generate vibration. Hence, make setting until desired response is obtained within the vibration-free range.

If the response level setting cannot be increased up to the desired response because of machine resonance beyond 100 Hz, filter tuning mode selection in [Pr. PB01] or machine resonance suppression filter in [Pr. PB13] to [Pr. PB16], [Pr. PB46] to [Pr. PB51] may be used to suppress machine resonance. Suppressing machine resonance may allow the response level setting to increase. Refer to the following for settings of the adaptive tuning mode and machine resonance suppression filter.

#### [Pr. PA09]

| Setting value | Machine characteri     | stic                                              | Reference (setting value of MR-J3) |  |
|---------------|------------------------|---------------------------------------------------|------------------------------------|--|
|               | Response               | Guideline for machine resonance frequency<br>[Hz] | -                                  |  |
|               | Increasing the setting | 2.7                                               | _                                  |  |

## 6.4 Manual mode

If you are not satisfied with the adjustment of auto tuning, you can adjust all gains manually.

#### Point P

If machine resonance occurs, filter tuning mode selection in [Pr. PB01] or machine resonance suppression filter in [Pr. PB13] to [Pr. PB16] and [Pr. PB46] to [Pr. PB51] may be used to suppress machine resonance.

Page 253 Adaptive filter II

#### For speed control

#### ■Parameter

The following parameters are used for gain adjustment.

| Parameter | Symbol | Name                                                 |
|-----------|--------|------------------------------------------------------|
| PB06      | GD2    | Load to motor inertia ratio/load to motor mass ratio |
| PB07      | PG1    | Model loop gain                                      |
| PB09      | VG2    | Speed loop gain                                      |
| PB10      | VIC    | Speed integral compensation                          |

#### ■Adjustment procedure

| Step | Operation                                                                                                                                                                                                                                                                              | Description                                                                                                         |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| 1    | Brief-adjust with auto tuning. Refer to the following.                                                                                                                                                                                                                                 | -                                                                                                                   |
| 2    | Change the setting of auto tuning to the manual mode ([Pr. PA08]: 3).                                                                                                                                                                                                                  | -                                                                                                                   |
| 3    | Set the estimated value to the load to motor inertia ratio/load to motor mass ratio. (If the estimate value with auto tuning is correct, setting change is not required.)                                                                                                              | -                                                                                                                   |
| 4    | Decrease the model loop gain.<br>Increase the speed integral compensation.                                                                                                                                                                                                             | -                                                                                                                   |
| 5    | Increase the speed loop gain within the vibration- and unusual noise-free range, and return slightly if vibration takes place.                                                                                                                                                         | Increase the speed loop gain.                                                                                       |
| 6    | Decrease the speed integral compensation within the vibration-free range, and return slightly if vibration takes place.                                                                                                                                                                | Decrease the time constant of the speed integral compensation.                                                      |
| 7    | Increase the model loop gain, and return slightly if overshoot takes place.                                                                                                                                                                                                            | Increase the model loop gain.                                                                                       |
| 8    | If the gains cannot be increased due to mechanical system resonance or the like and the desired response cannot be achieved, response may be increased by suppressing resonance with the adaptive tuning mode or machine resonance suppression filter and then executing steps 3 to 7. | Suppression of machine resonance<br>Page 250 Machine resonance<br>suppression filter<br>Page 253 Adaptive filter II |
| 9    | While checking the motor status, fine-adjust each gain.                                                                                                                                                                                                                                | Fine adjustment                                                                                                     |

#### Parameter adjustment

#### • [Pr. PB09 Speed loop gain]

This parameter determines the response level of the speed control loop. Increasing this value enhances response but a too high value will make the mechanical system liable to vibrate. The actual response frequency of the speed loop is as indicated in the following expression.

Speed loop response frequency [Hz] =  $\frac{\text{Speed loop gain}}{(1 + \text{Load to motor inertia ratio}) \times 2\pi}$ 

#### • [Pr. PB10 Speed integral compensation]

To eliminate stationary deviation against a command, the speed control loop is under proportional integral control. For the speed integral compensation, set the time constant of this integral control. Increasing the setting lowers the response level. However, if the load to motor inertia ratio is large or the mechanical system has any vibratory element, the mechanical system is liable to vibrate unless the setting is increased to some degree. The guideline is as indicated in the following expression.

Speed integral compensation setting  $[ms] \ge \frac{1}{3}$  Speed loop gain/(1 + Load to motor inertia ratio)

• [Pr. PB07 Model loop gain]

This parameter determines the response level to a speed command. Increasing the value improves trackability to a speed command, but a too high value will make overshoot liable to occur at settling.

Model loop gain guideline  $\leq \frac{\text{Speed loop gain}}{(1 + \text{Load to motor inertia ratio})} \times \left(\frac{1}{4} \text{ to } \frac{1}{8}\right)$ 

#### For position control

#### Parameter

The following parameters are used for gain adjustment.

| Parameter | Symbol | Name                                                 |
|-----------|--------|------------------------------------------------------|
| PB06      | GD2    | Load to motor inertia ratio/load to motor mass ratio |
| PB07      | PG1    | Model loop gain                                      |
| PB08      | PG2    | Position loop gain                                   |
| PB09      | VG2    | Speed loop gain                                      |
| PB10      | VIC    | Speed integral compensation                          |

#### Adjustment procedure

| Step | Operation                                                                                                                                                                                                                                                                              | Description                                                                                                         |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| 1    | Brief-adjust with auto tuning. Refer to the following.                                                                                                                                                                                                                                 | -                                                                                                                   |
| 2    | Change the setting of auto tuning to the manual mode ([Pr. PA08]:3).                                                                                                                                                                                                                   | —                                                                                                                   |
| 3    | Set the estimated value to the load to motor inertia ratio/load to motor mass ratio. (If the estimate value with auto tuning is correct, setting change is not required.)                                                                                                              | -                                                                                                                   |
| 4    | Set a small value to the model loop gain and the position loop gain. Set a large value to the speed integral compensation.                                                                                                                                                             | -                                                                                                                   |
| 5    | Increase the speed loop gain within the vibration- and unusual noise-free range, and return slightly if vibration takes place.                                                                                                                                                         | Increase the speed loop gain.                                                                                       |
| 6    | Decrease the speed integral compensation within the vibration-free range, and return slightly if vibration takes place.                                                                                                                                                                | Decrease the time constant of the speed integral compensation.                                                      |
| 7    | Increase the position loop gain, and return slightly if vibration takes place.                                                                                                                                                                                                         | Increase the position loop gain.                                                                                    |
| 8    | Increase the model loop gain, and return slightly if overshoot takes place.                                                                                                                                                                                                            | Increase the model loop gain.                                                                                       |
| 9    | If the gains cannot be increased due to mechanical system resonance or the like and the desired response cannot be achieved, response may be increased by suppressing resonance with the adaptive tuning mode or machine resonance suppression filter and then executing steps 3 to 8. | Suppression of machine resonance<br>Page 250 Machine resonance<br>suppression filter<br>Page 253 Adaptive filter II |
| 10   | While checking the settling characteristic and motor status, fine-adjust each gain.                                                                                                                                                                                                    | Fine adjustment                                                                                                     |

#### ■Parameter adjustment

#### • [Pr. PB09 Speed loop gain]

This parameter determines the response level of the speed control loop. Increasing this value enhances response but a too high value will make the mechanical system liable to vibrate. The actual response frequency of the speed loop is as indicated in the following expression.

Speed loop response frequency [Hz] =  $\frac{\text{Speed loop gain}}{(1 + \text{Load to motor inertia ratio}) \times 2\pi}$ 

#### • [Pr. PB10 Speed integral compensation]

To eliminate stationary deviation against a command, the speed control loop is under proportional integral control. For the speed integral compensation, set the time constant of this integral control. Increasing the setting lowers the response level. However, if the load to motor inertia ratio is large or the mechanical system has any vibratory element, the mechanical system is liable to vibrate unless the setting is increased to some degree. The guideline is as indicated in the following expression.

Speed integral compensation setting [ms]  $\ge \frac{2000 \text{ to } 3000}{\text{Speed loop gain/(1 + Load to motor inertia ratio)}}$ 

• [Pr. PB08 Position loop gain]

This parameter determines the response level to a disturbance to the position control loop. Increasing the value increases the response level to the disturbance, but a too high value will increase vibration of the mechanical system.

| Position loop gain guideline $\leq$ | Speed loop gain                   | ¥ | 1 | $t_{0}$ | ĺ |
|-------------------------------------|-----------------------------------|---|---|---------|---|
|                                     | (1 + Load to motor inertia ratio) | ^ | 4 | 8       |   |

#### • [Pr. PB07 Model loop gain]

This parameter determines the response level to a position command. Increasing the value improves trackability to a position command, but a too high value will make overshoot liable to occur at settling.

Model loop gain guideline  $\leq \frac{\text{Speed loop gain}}{(1 + \text{Load to motor inertia ratio})} \times \left(\frac{1}{4} \text{ to } \frac{1}{8}\right)$ 

## 6.5 2 gain adjustment mode

The 2 gain adjustment mode is used to match the position loop gains of the axes when performing the interpolation operation of servo motors of two or more axes for an X-Y table or the like. In this mode, manually set the model loop gain that determines command trackability. Other parameters for gain adjustment are set automatically.

#### 2 gain adjustment mode 1

The 2 gain adjustment mode 1 manually set the model loop gain that determines command trackability. The mode constantly estimates the load to motor inertia ratio, and automatically set other parameters for gain adjustment to optimum gains using auto tuning response.

The following parameters are used for 2 gain adjustment mode 1.

#### ■Automatically adjusted parameter

The following parameters are automatically adjusted by auto tuning.

| Parameter | Symbol | Name                                                 |
|-----------|--------|------------------------------------------------------|
| PB06      | GD2    | Load to motor inertia ratio/load to motor mass ratio |
| PB08      | PG2    | Position loop gain                                   |
| PB09      | VG2    | Speed loop gain                                      |
| PB10      | VIC    | Speed integral compensation                          |

#### ■Manually adjusted parameter

The following parameters are adjustable manually.

| Parameter | Symbol | Name                 |
|-----------|--------|----------------------|
| PA09      | RSP    | Auto tuning response |
| PB07      | PG1    | Model loop gain      |

#### 2 gain adjustment mode 2

Use 2 gain adjustment mode 2 when proper gain adjustment cannot be made with 2 gain adjustment mode 1. Since the load to motor inertia ratio is not estimated in this mode, set the value of a proper load to motor inertia ratio in [Pr. PB06]. The following parameters are used for 2 gain adjustment mode 2.

#### ■Automatically adjusted parameter

The following parameters are automatically adjusted by auto tuning.

| Parameter | Symbol | Name                        |
|-----------|--------|-----------------------------|
| PB08      | PG2    | Position loop gain          |
| PB09      | VG2    | Speed loop gain             |
| PB10      | VIC    | Speed integral compensation |

#### ■Manually adjusted parameter

The following parameters are adjustable manually.

| Parameter | Symbol | Name                                                 |
|-----------|--------|------------------------------------------------------|
| PA09      | RSP    | Auto tuning response                                 |
| PB06      | GD2    | Load to motor inertia ratio/load to motor mass ratio |
| PB07      | PG1    | Model loop gain                                      |

#### Adjustment procedure of 2 gain adjustment mode

Point P

Set the same value in [Pr. PB07 Model loop gain] for the axis used in 2 gain adjustment mode.

| Step | Operation                                                                                                                                                                                         | Description                                               |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| 1    | Set to the auto tuning mode.                                                                                                                                                                      | Select the auto tuning mode 1.                            |
| 2    | During operation, increase the response level setting value in [Pr. PA09], and return the setting if vibration occurs.                                                                            | Adjustment in auto tuning mode 1                          |
| 3    | Check value of the model loop gain and the load to motor inertia ratio in advance.                                                                                                                | Check the upper setting limits.                           |
| 4    | Set the 2 gain adjustment mode 1 ([Pr. PA08]: 0).                                                                                                                                                 | Select the 2 gain adjustment mode 1 (interpolation mode). |
| 5    | When the load to motor inertia ratio is different from the design value, select the 2 gain adjustment mode 2 ([Pr. PA08]: 4) and then set the load to motor inertia ratio manually in [Pr. PB06]. | Check the load to motor inertia ratio.                    |
| 6    | Set the model loop gain of all the axes to be interpolated to the same value. At that time, adjust to the setting value of the axis, which has the smallest model loop gain.                      | Set model loop gain.                                      |
| 7    | Considering the interpolation characteristic and motor status, fine-adjust the model loop gain and response level setting.                                                                        | Fine adjustment                                           |

#### Parameter adjustment

[Pr. PB07 Model loop gain]

This parameter determines the response level of the position control loop. Increasing the value improves trackability to a position command, but a too high value will make overshoot liable to occur at settling. The droop pulses value is determined by the following expression.

Number of droop pulses [pulse] = Position command frequency [pulse/s]

Model loop gain setting

Position command frequency differs depending on the operation mode.

Rotary servo motor and direct drive motor:

Position command frequency

Servo motor speed [r/min] × Encoder resolution (number of pulses per servo motor revolution) \_ 60

Linear servo motor:

Position command frequency = Speed [mm/s] ÷ Encoder resolution (travel distance per pulse)

# **7** SPECIAL ADJUSTMENT FUNCTIONS

#### Point P

- The functions given in this chapter need not be used normally. Use them if you are not satisfied with the machine status after making adjustment in the methods in the following chapter. 🖙 Page 230 NORMAL GAIN ADJUSTMENT
- When you use a linear servo motor, replace the following left words to the right words. Load to motor inertia ratio → Load to motor mass ratio

 $\text{Torque} \rightarrow \text{Thrust}$ 

## 7.1 Filter setting

The following filters are available with MR-J4 servo amplifiers.

### Machine resonance suppression filter

Point P

- The machine resonance suppression filter is a delay factor for the servo system. Therefore, vibration may increase if you set an incorrect resonance frequency or set notch characteristics too deep or too wide.
- If the frequency of machine resonance is unknown, decrease the notch frequency from higher to lower ones in order. The optimum notch frequency is set at the point where vibration is minimal.
- A deeper notch has a higher effect on machine resonance suppression but increases a phase delay and may increase vibration.
- A wider notch has a higher effect on machine resonance suppression but increases a phase delay and may increase vibration.
- The machine characteristic can be grasped beforehand by the machine analyzer on MR Configurator2. This allows the required notch frequency and notch characteristics to be determined.

If a mechanical system has a natural resonance point, increasing the servo system response level may cause the mechanical system to produce resonance (vibration or unusual noise) at that resonance frequency. Using the machine resonance suppression filter and adaptive tuning can suppress the resonance of the mechanical system. The setting range is 10 Hz to 4500 Hz.

### Function

The machine resonance suppression filter is a filter function (notch filter) which decreases the gain of the specific frequency to suppress the resonance of the mechanical system. You can set the frequency (notch frequency) at which the gain is decreased, and the notch depth and width.

You can set five machine resonance suppression filters at most.

| Filter                                    | Setting<br>parameter | Precaution                                                                                                                                                                                                                                                                                                                         | Parameter that is reset<br>with vibration tough<br>drive function | Parameter<br>automatically<br>adjusted with one-<br>touch tuning |

| Machine resonance<br>suppression filter 5 | PB50/PB51            | Enabling the robust filter disables the machine<br>resonance suppression filter 5.<br>The robust filter is disabled for the initial setting.                                                                                                                                                                                       | _                                                                 | PB51                                                             |

### Parameter

#### ■Machine resonance suppression filter 1 ([Pr. PB13] and [Pr. PB14])

Set the notch frequency, notch depth and notch width of the machine resonance suppression filter 1 ([Pr. PB13] and [Pr. PB14]).

When you select "Manual setting (\_\_\_2)" of "Filter tuning mode selection" in [Pr. PB01], the setting of the machine resonance suppression filter 1 is enabled.

#### ■Machine resonance suppression filter 2 ([Pr. PB15] and [Pr. PB16])

To use this filter, select "Enabled (\_\_\_1)" of "Machine resonance suppression filter 2 selection" in [Pr. PB16]. How to set the machine resonance suppression filter 2 ([Pr. PB15] and [Pr. PB16]) is the same as for the machine resonance suppression filter 1 ([Pr. PB13] and [Pr. PB14]).

#### ■Machine resonance suppression filter 3 ([Pr. PB46] and [Pr. PB47])

To use this filter, select "Enabled (\_\_\_1)" of "Machine resonance suppression filter 3 selection" in [Pr. PB47]. How to set the machine resonance suppression filter 3 ([Pr. PB46] and [Pr. PB47]) is the same as for the machine resonance suppression filter 1 ([Pr. PB13] and [Pr. PB14]).

### ■Machine resonance suppression filter 4 ([Pr. PB48] and [Pr. PB49])

To use this filter, select "Enabled (\_\_\_1)" of "Machine resonance suppression filter 4 selection" in [Pr. PB49]. However, enabling the machine resonance suppression filter 4 disables the shaft resonance suppression filter.

How to set the machine resonance suppression filter 4 ([Pr. PB48] and [Pr. PB49]) is the same as for the machine resonance suppression filter 1 ([Pr. PB13] and [Pr. PB14]).

### ■Machine resonance suppression filter 5 ([Pr. PB50] and [Pr. PB51])

To use this filter, select "Enabled (\_\_\_1)" of "Machine resonance suppression filter 5 selection" in [Pr. PB51]. However, enabling the robust filter ([Pr. PE41: \_\_\_ 1]) disables the machine resonance suppression filter 5.

How to set the machine resonance suppression filter 5 ([Pr. PB50] and [Pr. PB51]) is the same as for the machine resonance suppression filter 1 ([Pr. PB13] and [Pr. PB14]).

### Adaptive filter II

### Point P

- The machine resonance frequency which adaptive filter II (adaptive tuning) can respond to is about 100 Hz to 2.25 kHz. As for the resonance frequency out of the range, set manually.
- When adaptive tuning is executed, vibration sound increases as an excitation signal is forcibly applied for several seconds.
- When adaptive tuning is executed, machine resonance is detected for a maximum of 10 seconds and a filter is generated. After filter generation, the adaptive tuning mode automatically shifts to the manual setting.
- Adaptive tuning generates the optimum filter with the currently set control gains. If vibration occurs when the response setting is increased, execute adaptive tuning again.
- During adaptive tuning, a filter having the best notch depth at the set control gain is generated. To allow a filter margin against machine resonance, increase the notch depth in the manual setting.
- Adaptive vibration suppression control may provide no effect on a mechanical system which has complex resonance characteristics.

### Function

Adaptive filter II (adaptive tuning) is a function in which the servo amplifier detects machine resonance for a predetermined period of time and sets the filter characteristics automatically to suppress mechanical system vibration. Since the filter characteristics (frequency, depth) are set automatically, you need not be conscious of the resonance frequency of a mechanical system.

### Parameter

Select how to set the filter tuning in [Pr. PB01 Adaptive tuning mode (adaptive filter II)].

|   | [Pr. F | PB01 | ] |
|---|--------|------|---|
| 0 | 0      | 0    |   |

| I . | Eiltor | tuning | mada  | selection |  |
|-----|--------|--------|-------|-----------|--|
| _   | гшег   |        | nnoue | Selection |  |

| Setting<br>value | Filter tuning mode selection | Automatically set parameter |
|------------------|------------------------------|-----------------------------|
| 0                | Disabled                     | —                           |
| 1                | Automatic setting            | PB13/PB14                   |
| 2                | Manual setting               | —                           |

### Adaptive tuning procedure

### Shaft resonance suppression filter

### Point P

This filter is set properly by default according to servo motor you use and load moment of inertia. It is recommended that [Pr. PB23] be set to "\_\_\_0" (automatic setting) because changing "Shaft resonance suppression filter selection" in [Pr. PB23] or [Pr. PB17 Shaft resonance suppression filter] may lower the performance.

### Function

When a load is mounted to the servo motor shaft, resonance by shaft torsion during driving may generate a mechanical vibration at high frequency. The shaft resonance suppression filter suppresses the vibration.

When you select "Automatic setting", the filter will be set automatically on the basis of the motor you use and the load to servo motor inertia ratio. The disabled setting increases the response of the servo amplifier for high resonance frequency.

#### Parameter

Set "Shaft resonance suppression filter selection" in [Pr. PB23].

Shaft resonance suppression filter selection

- 0: Automatic setting
- 1: Manual setting
- 2: Disabled

To set [Pr. PB17 Shaft resonance suppression filter] automatically, select "Automatic setting".

To set [Pr. PB17 Shaft resonance suppression filter] manually, select "Manual setting". The setting values are as follows.

| Setting value | Frequency [Hz] | Setting value | Frequency [Hz] |
|---------------|----------------|---------------|----------------|
| 00            | Disabled       | 10            | 562            |
| 01            | Disabled       | 11            | 529            |
| 02            | 4500           | 12            | 500            |
| 03            | 3000           | 13            | 473            |
| 04            | 2250           | 14            | 450            |
| 05            | 1800           | 15            | 428            |
| 06            | 1500           | 16            | 409            |
| 07            | 1285           | 17            | 391            |
| 08            | 1125           | 18            | 375            |
| 09            | 1000           | 19            | 360            |
| 0A            | 900            | 1A            | 346            |
| 0 B           | 818            | 1 B           | 333            |

| 0 D           | 692            | 1 D           | 310            |
| 0 E           | 642            | 1E            | 300            |
| 0 F           | 600            | 1F            | 290            |

### Low-pass filter

### Function

When a ball screw or the like is used, resonance of high frequency may occur as the response level of the servo system is increased. To prevent this, the low-pass filter is enabled for a torque command as a default. The filter frequency of the low-pass filter is automatically adjusted to the value in the following equation.

Filter frequency ([rad/s]) = 
$$\frac{VG2}{1 + GD2} \times 10$$

However, when an automatically adjusted value is smaller than VG2, the filter frequency will be the VG2 value. To set [Pr. PB18] manually, select "Manual setting ( $_1$ )" of "Low-pass filter selection" in [Pr. PB23].

### Parameter

Set "Low-pass filter selection" in [Pr. PB23].

Low-pass filter selection
0: Automatic setting
1: Manual setting
2: Disabled

### Advanced vibration suppression control II

### Point P

- The function is enabled when "Gain adjustment mode selection" in [Pr. PA08] is "Auto tuning mode 2 (\_\_\_\_2)", "Manual mode (\_\_\_\_3)", or "2 gain adjustment mode 2 (\_\_\_4)".
- The machine resonance frequency supported in the vibration suppression control tuning mode is 1.0 Hz to 100.0 Hz. As for the vibration out of the range, set manually.
- Stop the servo motor before changing the vibration suppression control-related parameters. Otherwise, it may cause an unexpected operation.
- For positioning operation during execution of vibration suppression control tuning, provide a stop time to ensure a stop after vibration damping.
- Vibration suppression control tuning may not make normal estimation if the residual vibration at the servo motor side is small.
- Vibration suppression control tuning sets the optimum parameter with the currently set control gains. When the response setting is increased, set vibration suppression control tuning again.
- When using the vibration suppression control 2, set "\_\_\_1" in [Pr. PA24].

### Function

Vibration suppression control is used to further suppress load-side vibration, such as work-side vibration and base shake. The servo motor-side operation is adjusted for positioning so that the machine does not vibrate.

When the advanced vibration suppression control II ([Pr. PB02 Vibration suppression control tuning mode]) is executed, the vibration frequency at load side is automatically estimated to suppress load-side vibration two times at most.

In the vibration suppression control tuning mode, this mode shifts to the manual setting after the positioning operation is performed the predetermined number of times. For manual setting, adjust the vibration suppression control 1 with [Pr. PB19] to [Pr. PB22] and vibration suppression control 2 with [Pr. PB52] to [Pr. PB55].

#### Parameter

Set [Pr. PB02 Vibration suppression control tuning mode (advanced vibration suppression control II)]. When you use a vibration suppression control, set "Vibration suppression control 1 tuning mode selection". When you use two vibration suppression controls, set "Vibration suppression control 2 tuning mode selection" in addition.

### Vibration suppression control tuning procedure

The following flow chart is for the vibration suppression control 1. For the vibration suppression control 2, set "\_\_1\_" in [Pr. PB02] to execute the vibration suppression control tuning.

### Vibration suppression control manual mode

Point P

- When load-side vibration does not show up in servo motor-side vibration, the setting of the servo motor-side vibration frequency does not produce an effect.
- When the anti-resonance frequency and resonance frequency can be confirmed using the machine analyzer or external equipment, do not set the same value but set different values to improve the vibration suppression performance.
- The setting ranges of [Pr. PB19], [Pr. PB20], [Pr. PB52], and [Pr. PB53] vary depending on the value in [Pr. PB07]. If a value out of the range is set, the vibration suppression control is disabled.

Measure work-side vibration and device shake with the machine analyzer or external measuring instrument, and set the following parameters to adjust vibration suppression control manually.

| Setting item                                                | Vibration suppression control 1 | Vibration suppression control 2 |
|-------------------------------------------------------------|---------------------------------|---------------------------------|
| Vibration suppression control - Vibration frequency         | [Pr. PB19]                      | [Pr. PB52]                      |
| Vibration suppression control - Resonance frequency         | [Pr. PB20]                      | [Pr. PB53]                      |
| Vibration suppression control - Vibration frequency damping | [Pr. PB21]                      | [Pr. PB54]                      |
| Vibration suppression control - Resonance frequency damping | [Pr. PB22]                      | [Pr. PB55]                      |

- Select "Manual setting (\_\_\_2)" of "Vibration suppression control 1 tuning mode selection" or "Manual setting (\_\_2\_)" of "Vibration suppression control 2 tuning mode selection" in [Pr. PB02].
- **2.** Set "Vibration suppression control Vibration frequency" and "Vibration suppression control Resonance frequency" as follows.

However, the value of [Pr. PB07 Model loop gain], vibration frequency, and resonance frequency have the following usable range and recommended range.

| Vibration suppression control   | Usable range                                                                                                                                                                                                                                                                                                | Recommended setting range                                                                                                                                    |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vibration suppression control 1 | [Pr. PB19] > $1/2\pi \times (0.9 \times [Pr. PB07])$<br>[Pr. PB20] > $1/2\pi \times (0.9 \times [Pr. PB07])$                                                                                                                                                                                                | $[Pr. PB19] > 1/2\pi \times (1.5 \times [Pr. PB07])$<br>[Pr. PB20] > 1/2 $\pi \times (1.5 \times [Pr. PB07])$                                                |
| Vibration suppression control 2 | $\label{eq:when pressure} \begin{split} & \text{When [Pr. PB19] < [Pr. PB52],} \\ & [Pr. PB52] > (5.0 + 0.1 \times [Pr. PB07]) \\ & [Pr. PB53] > (5.0 + 0.1 \times [Pr. PB07]) \\ & 1.1 < [Pr. PB52]/[Pr. PB19] < 5.5 \\ & [Pr. PB07] < 2\pi \ (0.3 \times [Pr. PB19] + 1/8 \times [Pr. PB52]) \end{split}$ | When [Pr. PB19] < [Pr. PB52],<br>[Pr. PB52], [Pr. PB53] > 6.25 Hz<br>1.1 < [Pr. PB52]/[Pr. PB19] < 4<br>[Pr. PB07] < 1/3 × (4 × [Pr. PB19] + 2 × [Pr. PB52]) |

• When a vibration peak can be confirmed with machine analyzer using MR Configurator2, or external equipment.

· When vibration can be confirmed using monitor signal or external sensor

Set the same value.

**3.** Fine-adjust "Vibration suppression control - Vibration frequency damping" and "Vibration suppression control - Resonance frequency damping".

### **Command notch filter**

Point P

- By using the advanced vibration suppression control II and the command notch filter, the load-side vibration of three frequencies can be suppressed.
- The frequency range of machine vibration, which can be supported by the command notch filter, is between 4.5 Hz and 2250 Hz. Set a frequency close to the machine vibration frequency and within the range.
- When [Pr. PB45 Command notch filter] is changed during the positioning operation, the changed setting is not reflected. The setting is reflected approximately 150 ms after the servo motor stops (after servo-lock).

### Function

Command notch filter has a function that lowers the gain of the specified frequency contained in a position command. By lowering the gain, load-side vibration, such as work-side vibration and base shake, can be suppressed. Which frequency to lower the gain and how deep to lower the gain can be set.

Command notch filter: disabled

Command notch filter: enabled

### Parameter

Set [Pr. PB45 Command notch filter] as shown below. For the command notch filter setting frequency, set the closest value to the vibration frequency [Hz] at the load side.

|               | nd notch f        | ilt |               | <u> </u>          | С |               |                   |
|---------------|-------------------|-----|---------------|-------------------|---|---------------|-------------------|
| Setting value | Frequency<br>[Hz] |     | Setting value | Frequency<br>[Hz] |   | Setting value | Frequency<br>[Hz] |

## 7.2 Gain switching function

You can switch gains with the function. You can switch gains during rotation and during stop, and can use a control command from a controller to switch gains during operation.

### Applications

The following shows when you use the function.

- You want to increase the gains during servo-lock but decrease the gains to reduce noise during rotation.
- You want to increase the gains during settling to shorten the stop settling time.
- You want to change the gains using a control command from a controller to ensure stability of the servo system since the load to motor inertia ratio varies greatly during a stop (e.g. a large load is mounted on a carrier).

### Function block diagram

The control gains, load to motor inertia ratio, and vibration suppression control settings are changed according to the conditions selected by [Pr. PB26 Gain switching function] and [Pr. PB27 Gain switching condition].

### Parameter

When using the gain switching function, always select "Manual mode (\_\_\_3)" of "Gain adjustment mode selection" in [Pr. PA08 Auto tuning mode]. The gain switching function cannot be used in the auto tuning mode.

#### Parameter for setting gain switching condition Parameter Symbol Name Unit Description PB26 CDP Gain switching function Used to select the changing condition PB27 CDL [kpulse/s]/[pulse]/[r/min] Gain switching condition Used to set the changing condition values. PB28 CDT Gain switching time constant [ms] Set the filter time constant for a gain change at changing

### ■[Pr. PB26 Gain switching function]

Used to set the gain switching condition. Select the switching condition in the first to third digits.

### ■[Pr. PB27 Gain switching condition]

Set a level to switch gains with [Pr. PB27] after you select "Command frequency", "Droop pulses", or "Servo motor speed" with the gain switching selection in [Pr. PB26 Gain switching function].

The setting unit is as follows.

| Gain switching condition | Unit           |
|--------------------------|----------------|
| Command frequency        | [kpulse/s]     |
| Droop pulses             | [pulse]        |
| Servo motor speed        | [r/min]/[mm/s] |

### ■[Pr. PB28 Gain switching time constant]

You can set the primary delay filter to each gain at gain switching. This parameter is used to suppress shock given to the machine if the gain difference is large at gain switching, for example.

| Loop gain                                                           | Before swite | ching  |                                                                  | After switch | ing    |                                                                                        |

### ■[Pr. PB06] to [Pr. PB10]

\_ \_ \_ \_ \_

These parameters are the same as in ordinary manual adjustment. Gain switching allows the values of load to motor inertia ratio/load to motor mass ratio, position loop gain, model loop gain, speed loop gain, and speed integral compensation to be switched.

### ■[Pr. PB19] to [Pr. PB22]/[Pr. PB52] to [Pr. PB55]

These parameters are the same as in ordinary manual adjustment. Executing gain switching while the servo motor stops, you can change vibration frequency, resonance frequency, vibration frequency damping, and resonance frequency damping.

### ■[Pr. PB29 Load to motor inertia ratio/load to motor mass ratio after gain switching]

Set the load to motor inertia ratio or load to motor mass ratio after gain switching. If the load to motor inertia ratio does not change, set it to the same value as [Pr. PB06 Load to motor inertia ratio/load to motor mass ratio].

### ■[Pr. PB30 Position loop gain after gain switching], [Pr. PB31 Speed loop gain after gain

switching], and [Pr. PB32 Speed integral compensation after gain switching] Set the values of after switching position loop gain, speed loop gain and speed integral compensation.

## ■Vibration suppression control after gain switching ([Pr. PB33] to [Pr. PB36]/[Pr. PB56] to [Pr. PB59]), and [Pr. PB60 Model loop gain after gain switching]

The gain switching vibration suppression control and gain switching model loop gain are used only with control command from the controller.

You can switch the vibration frequency, resonance frequency, vibration frequency damping, resonance frequency damping, and model loop gain of the vibration suppression control 1 and vibration suppression control 2.

### Gain switching procedure

This operation will be described by way of setting examples.

### When you choose switching by control command from the controller

### ■Setting example

### Switching timing chart

### When the gain switching time constant is disabled

#### Time constant disabled at switching

The gain switching time constant is disabled. The time constant is enabled at gain return.

The following example shows for [Pr. PB26 (CDP)] = 0103, [Pr. PB27 (CDL)] = 100 [pulse], and [Pr. PB28 (CDT)] = 100 [ms].

#### Time constant disabled at returning

The gain switching time constant is enabled. The time constant is disabled at gain return. The following example shows for [Pr. PB26 (CDP)] = 0201, [Pr. PB27 (CDL)] = 0, and [Pr. PB28 (CDT)] = 100 [ms].

Switching at [Pr. PB28 (CDT)] = 100 [ms] only when gain switching on (when switching)

## 7.3 Tough drive function

### Point *P*

Set enable/disable of the tough drive function with [Pr. PA20 Tough drive setting].

This function makes the equipment continue operating even under the condition that an alarm occurs. The tough drive functions are the vibration tough drive and the instantaneous power failure tough drive.

### Vibration tough drive function

This function prevents vibration by resetting a filter instantaneously when machine resonance occurs due to varied vibration frequency caused by machine aging.

To reset the machine resonance suppression filters with the function, [Pr. PB13 Machine resonance suppression filter 1] and [Pr. PB15 Machine resonance suppression filter 2] should be set in advance.

Set [Pr. PB13] and [Pr. PB15] as follows.

One-touch tuning execution 🖙 Page 232 One-touch tuning

• Manual setting Page 195 Gain/filter setting parameters ([Pr. PB\_ ])

The vibration tough drive function operates when a detected machine resonance frequency is within  $\pm 30\%$  for a value set in [Pr. PB13 Machine resonance suppression filter 1] or [Pr. PB15 Machine resonance suppression filter 2].

To set a detection level of the function, set sensitivity in [Pr. PF23 Vibration tough drive - Oscillation detection level].

Point P

- Resetting [Pr. PB13] and [Pr. PB15] by the vibration tough drive function is performed constantly. However, the number of write times to the EEP-ROM is limited to once per hour.
- The vibration tough drive function does not reset [Pr. PB46 Machine resonance suppression filter 3], [Pr. PB48 Machine resonance suppression filter 4], and [Pr. PB50 Machine resonance suppression filter 5].
- The vibration tough drive function does not detect a vibration of 100 Hz or less.

The following shows the function block diagram of the vibration tough drive function.

This function compares the detected machine resonance frequency with the setting values of [Pr. PB13 Machine resonance suppression filter 1] and [Pr. PB15 Machine resonance suppression filter 2], and resets the setting value closer to the detected machine resonance frequency.

| Filter                                    | Setting parameter | Precaution                                                                                                                                                                                                                                                                                                                                          | Parameter that is reset<br>with vibration tough<br>drive function |

### Instantaneous power failure tough drive function

The instantaneous power failure tough drive function avoids [AL. 10 Undervoltage] even when an instantaneous power failure occurs during operation. When the instantaneous power failure tough drive activates, the function will increase the tolerance against instantaneous power failure using the electrical energy charged in the capacitor in the servo amplifier and will change an alarm level of [AL. 10 Undervoltage] simultaneously. The [AL. 10.1 Voltage drop in the control circuit power] detection time for the control circuit power supply can be changed by [Pr. PF25 SEMI-F47 function - Instantaneous power failure detection time]. In addition, [AL. 10.2 Voltage drop in the main circuit power] detection level for the bus voltage is changed automatically.

### Point P

- MBR (Electromagnetic brake interlock) will not turn off during the instantaneous power failure tough drive.
- When selecting "Enabled (\_\_\_1)" for "Torque limit function selection at instantaneous power failure" in [Pr. PA26], if an instantaneous power failure occurs during operation, you can save electric energy charged in the capacitor in the servo amplifier by limiting torque at acceleration. You can also delay the time until the occurrence of [AL. 10.2 Voltage drop in the main circuit power]. Doing this will enable you to set a longer time in [Pr. PF25 SEMI-F47 function Instantaneous power failure detection time].
- When the load of instantaneous power failure is large, [AL. 10.2] caused by the bus voltage drop may occur regardless of the set value of [Pr. PF25 SEMI-F47 function Instantaneous power failure detection time].
- The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.
- To comply with SEMI-F47 standard, it is unnecessary to change the initial value (200 ms) in [Pr. PF25 SEMI-F47 function Instantaneous power failure detection time]. When the instantaneous power failure time exceeds 200 ms, and the instantaneous power failure voltage is less than 70% of the rated input voltage, the power may be normally turned off even if a value larger than 200 ms is set in the parameter.

### Instantaneous power failure time of the control circuit power supply > [Pr. PF25 SEMI-F47 function - Instantaneous power failure detection time]

The alarm occurs when the instantaneous power failure time of the control circuit power supply exceeds [Pr. PF25 SEMI-F47 function - Instantaneous power failure detection time].

MTTR (During tough drive) turns on after detecting the instantaneous power failure.

MBR (Electromagnetic brake interlock) turns off when the alarm occurs.

\*1 For the undervoltage level, refer to "[AL. 10.2 Voltage drop in the main circuit power] will occur when bus voltage is as follows." in "Parameter setting" below.

Page 276 Parameter setting

### Instantaneous power failure time of the control circuit power supply < [Pr. PF25 SEMI-F47 function - Instantaneous power failure detection time]

Operation status differs depending on how bus voltage decreases.

## When the bus voltage decreases to the undervoltage level or lower within instantaneous power failure time of control circuit power supply

[AL. 10 Undervoltage] occurs when the bus voltage decreases to the undervoltage level or lower regardless of the enabled instantaneous power failure tough drive.

Instantaneous power failure time of the control circuit power supply

\*1 For the undervoltage level, refer to "[AL. 10.2 Voltage drop in the main circuit power] will occur when bus voltage is as follows." in "Parameter setting" below.

Page 276 Parameter setting

## When the bus voltage does not decrease to the undervoltage level or lower within instantaneous power failure time of control circuit power supply

The operation continues without alarming.

\*1 For the undervoltage level, refer to "[AL. 10.2 Voltage drop in the main circuit power] will occur when bus voltage is as follows." in "Parameter setting" below.

Page 276 Parameter setting

## 7.4 Compliance with SEMI-F47 standard

### Point P

- The control circuit power supply of the servo amplifier can be possible to comply with SEMI-F47 standard. However, a back-up capacitor may be necessary for instantaneous power failure in the main circuit power supply depending on the power supply impedance and operating situation.
- Use a 3-phase for the input power supply of the servo amplifier. Using a 1-phase 100 V AC/200 V AC for the input power supply will not comply with SEMI-F47 standard.
- The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.
- Be sure to perform actual machine tests and detail checks for power supply instantaneous power failure of SEMI-F47 standard with your equipment.

The following explains the compliance with "SEMI-F47 semiconductor process equipment voltage sag immunity test" of MR-J4 series.

This function enables to avoid triggering [AL. 10 Undervoltage] using the electrical energy charged in the capacitor in case that an instantaneous power failure occurs during operation.

### Parameter setting

Setting [Pr. PA20] and [Pr. PF25] as follows will enable SEMI-F47 function.

| Parameter | Setting value | Description                                                                               |
|-----------|---------------|-------------------------------------------------------------------------------------------|
| PA20      | _1            | Enable SEMI-F47 function selection.                                                       |
| PF25      | 200           | Set the time [ms] of the [AL. 10.1 Voltage drop in the control circuit power] occurrence. |

Enabling SEMI-F47 function will change operation as follows.

- The voltage will drop in the control circuit power at "Rated voltage × 50% or less". After 200 ms, [AL. 10.1 Voltage drop in the control circuit power] will occur.
- [AL. 10.2 Voltage drop in the main circuit power] will occur when bus voltage is as follows.

| Servo amplifier                       | Bus voltage which triggers alarm |
|---------------------------------------|----------------------------------|
| MR-J4-10GF(-RJ) to MR-J4-700GF(-RJ)   | 158 V DC                         |
| MR-J4-11KGF(-RJ) to MR-J4-22KGF(-RJ)  | 200 V DC                         |
| MR-J4-60GF4(-RJ) to MR-J4-22KGF4(-RJ) | 380 V DC                         |

• MBR (Electromagnetic brake interlock) will turn off when [AL. 10.1 Voltage drop in the control circuit power] occurs.

### **Requirement of SEMI-F47 standard**

The following shows the requirement of SEMI-F47 standard for the instantaneous power failure voltage and permissible time of instantaneous power failure.

| Instantaneous power failure voltage | Permissible time of instantaneous power failure [s] |
|-------------------------------------|-----------------------------------------------------|
| Rated voltage × 80%                 | 1                                                   |
| Rated voltage × 70%                 | 0.5                                                 |
| Rated voltage × 50%                 | 0.2                                                 |

### Calculation of tolerance against instantaneous power failure

The following shows tolerance against instantaneous power failure when instantaneous power failure voltage is "rated voltage  $\times$  50%" and instantaneous power failure time is 200 ms.

| Servo amplifier   | Instantaneous maximum output [W] | Tolerance against instantaneous power failure [W] (voltage drop between lines) |
|-------------------|----------------------------------|--------------------------------------------------------------------------------|
| MR-J4-10GF(-RJ)   | 350                              | 250                                                                            |
| MR-J4-20GF(-RJ)   | 700                              | 420                                                                            |
| MR-J4-40GF(-RJ)   | 1400                             | 630                                                                            |
| MR-J4-60GF(-RJ)   | 2100                             | 410                                                                            |
| MR-J4-70GF(-RJ)   | 2625                             | 1150                                                                           |
| MR-J4-100GF(-RJ)  | 3000                             | 1190                                                                           |
| MR-J4-200GF(-RJ)  | 5400                             | 2040                                                                           |
| MR-J4-350GF(-RJ)  | 10500                            | 2600                                                                           |
| MR-J4-500GF(-RJ)  | 15000                            | 4100                                                                           |
| MR-J4-700GF(-RJ)  | 21000                            | 5900                                                                           |

Instantaneous maximum output means power which servo amplifier can output in maximum torque at rated speed. You can examine margins to compare the values of following conditions and instantaneous maximum output.

Even if driving at maximum torque with low speed in actual operation, the motor will not drive with the maximum output. This can be handled as a margin.

The following shows the conditions of tolerance against instantaneous power failure.

#### ■Delta connection

For the 3-phase (L1/L2/L3) delta connection, an instantaneous power failure occurs in the voltage between a pair of lines (e.g. between L1 and L2) among voltages between three pairs of lines (between L1 and L2, L2 and L3, or L3 and L1).

#### ■Star connection

For the 3-phase (L1/L2/L3/neutral point N) star connection, an instantaneous power failure occurs in the voltage between a pair of lines (e.g. between L1 and N) among voltages at six locations, between three pairs of lines (between L1 and L2, L2 and L3, or L3 and L1) and between one of the lines and the neutral point (between L1 and N, L2 and N, or L3 and N).

## 7.5 Model adaptive control disabled

- Point P
- · Change the parameters while the servo motor stops.
- When setting auto tuning response ([Pr. PA09]), change the setting value one by one to adjust it while checking operation status of the servo motor.

### Summary

The servo amplifier has a model adaptive control. The servo amplifier has a virtual motor model and drives the servo motor following the output of the motor model in the model adaptive control. At model adaptive control disabled, the servo amplifier drives the motor with PID control without using the model adaptive control.

The following shows the available parameters at model adaptive control disabled.

| Parameter | Symbol | Name                        |
|-----------|--------|-----------------------------|
| PB08      | PG2    | Position loop gain          |
| PB09      | VG2    | Speed loop gain             |
| PB10      | VIC    | Speed integral compensation |

### Parameter setting

Set [Pr. PB25] to "\_\_\_2".

### Restrictions

The following functions are not available at model adaptive control disabled.

| Function                                                                                                                                       | Explanation                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Forced stop deceleration function ([Pr. PA04])                                                                                                 | Disabling the model adaptive control while the forced stop deceleration function is enabled, [AL. 37] will occur.<br>The forced stop deceleration function is enabled at factory setting. Set [Pr. PA04] to "0" (Forced stop deceleration function disabled). |
| Vibration suppression control 1 ([Pr. PB02]/[Pr.<br>PB19]/[Pr. PB20])<br>Vibration suppression control 2 ([Pr. PB02]/[Pr.<br>PB52]/[Pr. PB53]) | The vibration suppression control uses the model adaptive control. Disabling the model adaptive control will also disable the vibration suppression control.                                                                                                  |
| Overshoot amount compensation ([Pr. PB12])                                                                                                     | The overshoot amount compensation uses data used by the model adaptive control. Disabling the model adaptive control will also disable the overshoot amount compensation.                                                                                     |
| Super trace control ([Pr. PA22])                                                                                                               | The super trace control uses the model adaptive control. Disabling the model adaptive control will also disable the super trace control.                                                                                                                      |

## 7.6 Lost motion compensation function

### Point P

The lost motion compensation function is enabled only in the position mode.

The lost motion compensation function corrects response delays (caused by a non-sensitive band due to friction, twist, expansion, and backlash) caused when the machine travel direction is reversed. This function contributes to improvement for protrusions that occur at a quadrant change and streaks that occur at a quadrant change during circular cutting. This function is effective when a high follow-up performance is required such as drawing an arc with an X-Y table.

The locus before compensation

The locus after compensation

### Parameter setting

Setting [Pr. PE44] to [Pr. PE50] enables the lost motion compensation function.

### Lost motion compensation function selection ([Pr. PE48])

Select the lost motion compensation function.

### Lost motion compensation ([Pr. PE44]/[Pr. PE45])

Set the same value for the lost motion compensation for each of when the forward rotation switches to the reverse rotation and when the reverse rotation switches to the forward rotation. When the size of protrusions differ depending on the travel direction, set the different compensation for each travel direction. Set a value twice the usual friction torque and adjust the value while checking protrusions.

### ■Torque offset ([Pr. PE47])

For a vertical axis, unbalanced torque occurs due to the gravity. Although setting the torque offset is usually unnecessary, setting unbalanced torque of a machine as a torque offset cancels the unbalanced torque. The torque offset does not need to be set for a machine not generating unbalanced torque. The torque offset cannot be used for linear servo motors and direct drive motors. Set 0.00%.

### Lost motion compensation timing ([Pr. PE49])

You can set the delay time of the lost motion compensation start timing with this parameter. When a protrusion occurs belatedly, set the lost motion compensation timing corresponding to the protrusion occurrence timing.

### Lost motion compensation non-sensitive band ([Pr. PE50])

When the travel direction reverses frequently around the zero speed, unnecessary lost motion compensation is triggered by the travel direction switching. By setting the lost motion compensation non-sensitive band, the speed is recognized as 0 when the fluctuation of the droop pulse is the setting value or less. This prevents unnecessary lost motion compensation. When the value of this parameter is changed, the compensation timing is changed. Adjust the value of Lost motion compensation timing ([Pr. PE49]).

### ■Lost motion filter setting ([Pr. PE46])

Changing the value of this parameter is usually unnecessary. When a value other than 0.0 ms is set in this parameter, the high-pass filter output value of the set time constant is applied to the compensation and lost motion compensation continues.

### Adjustment procedure of the lost motion compensation function

The following shows the adjustment procedure of the lost motion compensation function.

#### ■Measuring the load current

Measure the load currents during the forward direction feed and reverse direction feed with MR Configurator2.

#### Setting the lost motion compensation

Calculate the friction torque from the measurement result of the section below and set a value twice the friction torque in [Pr. PE44] and [Pr. PE45] as lost motion compensation.

Page 280 Measuring the load current

(load current during feed in the forward rotation direction [%]) -(load current during feed in the reverse rotation direction [%])

Friction torque [%] =

2

### ■Checking protrusions

Drive the servo motor and check that the protrusions are corrected.

#### Adjusting the lost motion compensation

When protrusions still occur, the compensation is insufficient. Increase the lost motion compensation by approximately 0.5% until the protrusions are eliminated. When notches occur, the compensation is excessive. Decrease the lost motion compensation by approximately 0.5% until the notches are eliminated. Different values can be set as the compensation for each of when the forward rotation (CCW) switches to the reverse rotation (CW) and when the reverse rotation (CW) switches to the forward rotation (CCW).

The locus before compensation

The locus after compensation

#### ■Adjusting the lost motion compensation timing

When the machine has low rigidity, the speed loop gain is set lower than the standard setting value, or the servo motor is rotating at high speed, quadrant projections may occur behind the quadrant change points. In this case, you can suppress the quadrant projections by delaying the lost motion compensation timing with [Pr. PE49 Lost motion compensation timing]. Increase the setting value of [Pr. PE49] from 0 ms (Initial value) by approximately 0.5 ms to adjust the compensation timing.

Before timing delay compensation

After timing delay compensation

### ■Adjusting the lost motion compensation non-sensitive band

When the lost motion is compensated twice around a quadrant change point, set [Pr. PE50 Lost motion compensation nonsensitive band]. Increase the setting value so that the lost motion is not compensated twice. Setting [Pr. PE50] may change the compensation timing. Adjust the lost motion compensation timing in the following section.

Before timing delay compensation

After timing delay compensation

## 7.7 Super trace control

### Summary

In the normal position control, droop pulses are generated against the position control command from the controller. Using the feed forward gain sets droop pulses at a constant speed to almost 0. However, droop pulses generated during acceleration/ deceleration cannot be suppressed.

With the ideal model in the servo amplifier, the super trace control enables to set constant speed and uniform acceleration/ deceleration droop pulses to almost 0 that cannot be coped with by the feed forward gain.

| Control             | Position command (the same command) | Droop pulses                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Super trace control | Serve motor speed                   | $ \begin{array}{c}                                     $                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Adjustment procedure

- In the super trace control, droop pulses are near 0 during the servo motor control. Thus, the normal INP (In-position) may always be turned on. Be sure to set "INP (In-position) on condition selection" in [Pr. PD13] to
   "\_1\_\_".
- When you use the super trace control, it is recommended that the acceleration time constant up to the rated speed be set to 1 s or more.

The following shows the adjustment procedure.

| Step | Operation                                                                                                         |
|------|-------------------------------------------------------------------------------------------------------------------|
| 1    | Execute the gain adjustment with one-touch tuning, auto tuning, etc.                                              |
| 2    | Change the setting of auto tuning mode to the manual mode ([Pr. PA08]:3).                                         |
| 3    | Change the setting of feed forward gain ([Pr. PB04]), and adjust that droop pulses will be 0 at a constant speed. |
| 4    | Set the setting of INP (In-position) on condition selection ([Pr. PD13]) to "_1_".                                |
| 5    | Enable the super trace control. ([Pr. PA22]: _ 2 )                                                                |
| 6    | Change the setting of model loop gain ([Pr. PB07]), and adjust droop pulses during acceleration/deceleration.     |

Point P

# 8 TROUBLESHOOTING

### Point P

- Refer to the following for details of alarms and warnings.
- MELSERVO-J4 Servo Amplifier Instruction Manual (Troubleshooting)
- As soon as an alarm occurs, make the Servo-off status and interrupt the main circuit power.
- [AL. 37 Parameter error] and warnings (except [AL. F0 Tough drive warning]) are not recorded in the alarm history.
- In the initial setting, [AL. 8D.1 CC-Link IE communication error 1] and [AL. 8D.2 CC-Link IE communication error 2] are not recorded in the alarm history. The alarms are recorded by setting [Pr. PN06] to "\_\_\_ 1".

When an error occurs during operation, the corresponding alarm and warning are displayed. When an alarm or warning is displayed, refer to the following to remove the failure.

MELSERVO-J4 Servo Amplifier Instruction Manual (Troubleshooting)

When an alarm occurs, ALM (Malfunction) will turn off.

### 8.1 Explanation for the lists

### No./Name/Detail No./Detail name

Indicates each No./Name/Detail No./Detail name of alarms or warnings.

### Stop method

For the alarms and warnings in which "SD" is written in the stop method column, the servo motor stops with the dynamic brake after forced stop deceleration. For the alarms and warnings in which "DB" or "EDB" is written in the stop method column, the servo motor stops with the dynamic brake without forced stop deceleration.

#### Alarm deactivation

After its cause has been removed, the alarm can be deactivated in any of the methods marked  $\bigcirc$  in the alarm deactivation column. Warnings are automatically canceled after the cause of occurrence is removed. Alarms are deactivated with alarm reset, CPU reset, or cycling the power.

| Alarm deactivation | Explanation                                                                                                                                                                                                          |  |  |  |  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|--|--|

\*1 Leave for about 30 minutes of cooling time after removing the cause of occurrence.

\*2 The following shows three stop methods of DB, EDB, and SD.

DB: Stops with dynamic brake. (Coasts for the servo amplifier without dynamic brake.)

Coasts for MR-J4-03A6(-RJ) and MR-J4W2-0303B6. Note that EDB is applied when an alarm below occurs;

[AL. 30.1], [AL. 32.2], [AL. 32.4], [AL. 51.1], [AL. 51.2], [AL. 888]

EDB: Electronic dynamic brake stop (available with specified servo motors)

Refer to the following table for the specified servo motors. The stop method for other than the specified servo motors will be DB.

| Series | Servo motor                      |
|--------|----------------------------------|
| HG-KR  | HG-KR053/HG-KR13/HG-KR23/HG-KR43 |
| HG-MR  | HG-MR053/HG-MR13/HG-MR23/HG-MR43 |
| HG-SR  | HG-SR51/HG-SR52                  |
| HG-AK  | HG-AK0136/HG-AK0236/HG-AK0336    |

SD: Forced stop deceleration

\*3 This is applicable when [Pr. PA04] is set to the initial value. The stop system of SD can be changed to DB using [Pr. PA04].

\*4 The alarm can be canceled by setting as follows: For the fully closed loop control: set [Pr. PE03] to "1 \_ \_ \_

When a linear servo motor or direct drive motor is used: set [Pr. PL04] to "1  $\_$  .

 $^{\ast}5$   $\,$  In some controller communication status, the alarm factor may not be removed.

- \*6 This alarm will occur only in the J3 compatibility mode.
- \*7 Reset this while all the safety observation functions are stopped.

\*8 In the parallel drive system, the stop method is DB.

# 8.3 Warning list

| No. | Name                                           | Detail No. | Detail name                                                             | Stop<br>method *2*3 |
|-----|------------------------------------------------|------------|-------------------------------------------------------------------------|---------------------|
| 90  | Home position return incomplete warning        | 90.1       | Home position return incomplete                                         | -                   |
|     |                                                | 90.2       | Home position return abnormal termination                               | -                   |
|     |                                                | 90.5       | Z-phase unpassed                                                        | -                   |
| 91  | Servo amplifier overheat warning <sup>*1</sup> | 91.1       | Main circuit device overheat warning                                    | -                   |
| 92  | Battery cable disconnection warning            | 92.1       | Encoder battery cable disconnection warning                             | -                   |
|     |                                                | 92.3       | Battery degradation                                                     | -                   |

\*1 Leave for about 30 minutes of cooling time after removing the cause of occurrence.

\*2 The following shows two stop methods of DB and SD.
 DB: Stops with dynamic brake. (Coasts for the servo amplifier without dynamic brake.)
 Coasts for MR-J4-03A6(-RJ) and MR-J4W2-0303B6.
 SD: Forced stop deceleration

\*3 This is applicable when [Pr. PA04] is set to the initial value. The stop system of SD can be changed to DB using [Pr. PA04].

\*4 For MR-J4-\_A\_ servo amplifier, quick stop or slow stop can be selected using [Pr. PD30].

\*5 For MR-J4-\_GF\_ servo amplifier, quick stop or slow stop can be selected using [Pr. PD12]. (I/O mode only)

# 8.4 Troubleshooting at power on

When an error occurs at the power supply of the controller or servo amplifier, improper boot of the servo amplifier might be the cause. Check the display of the servo amplifier, and take actions according to this section.

| Display                                                        | Description                                              | Cause                                                                                               | Checkpoint                                                                                                    | Action                                                                                  |

# **10** CHARACTERISTICS

### Point P

For the characteristics of the linear servo motor and the direct drive motor, refer to the following.

- Page 508 Characteristics
- Page 528 Characteristics

# **10.1** Overload protection characteristics

An electronic thermal is built in the servo amplifier to protect the servo motor, servo amplifier and servo motor power wires from overloads.

[AL. 50 Overload 1] occurs if overload operation performed is above the electronic thermal protection curve shown in the following section. [AL. 51 Overload 2] occurs if the maximum current is applied continuously for several seconds due to machine collision, etc. Use the equipment on the left-hand side area of the continuous or broken line in the graph.

When unbalanced torque is generated, such as in a vertical lift machine, the unbalanced torque of the machine should be kept at 70% or lower of the motor's rated torque.

This servo amplifier has solid-state servo motor overload protection. (The servo motor overload current (full load current) is set on the basis of 120% rated current of the servo amplifier.)

The following table shows combinations of each servo motor and graph of overload protection characteristics.

| Rotary servo   | motor          |                                        |            |                   |                                                                                             | Graph of overload protection |  |  |

\*1 This combination is for increasing the maximum torque of the servo motor to 400%.

### Electronic thermal protection characteristics

The following graphs show overload protection characteristics.

#### ■Characteristics a

#### ■Characteristics b

### Characteristics d

### ■Characteristics e

- \*1 If operation that generates torque more than 100% of the rating is performed with an abnormally high frequency in a servo motor stop status (servo-lock status) or in a 50 r/min or less low-speed operation status, the servo amplifier may malfunction regardless of the electronic thermal protection.
- \*2 The load ratio ranging from 300% to 350% applies to the HG-KR servo motor.
- \*3 The operation time at the load ratio of 300% to 400% applies when the maximum torque of HG-JR servo motor is increased to 400% of rated torque.

# **10.2** Power supply capacity and generated loss

### Amount of heat generated by the servo amplifier

The following table indicates servo amplifiers' power supply capacities and losses generated under rated load. For thermal design of an enclosed type cabinet, use the values in the table in consideration for the worst operating conditions. The actual amount of generated heat will be intermediate between values at rated torque and servo-off according to the duty used during operation. When the servo motor is run at less than the rated speed, the power supply capacity will be smaller than the value in the table, but the servo amplifier's generated heat will not change.

| Servo amplifier  | Servo motor | Power supply                    | Servo amplifier- | Area required                                                                                                |                |                                           |

\*1 The power supply equipment capacity changes with the power supply impedance. This value is applicable when the power factor improving AC reactor or power factor improving DC reactor are not used.

\*2 Heat generated during regeneration is not included in the servo amplifier-generated heat. To calculate heat generated by the regenerative option, refer to the following.

Page 338 Regenerative options

\*3 This value is applicable when the servo amplifier is cooled by using the panel through attachment.

### Heat dissipation area for an enclosed type cabinet

The enclosed type cabinet (hereafter called the cabinet) which will contain the servo amplifier should be designed to ensure that its temperature rise is within +10  $^{\circ}$ C at the ambient temperature of 40  $^{\circ}$ C. (With an approximately 5  $^{\circ}$ C safety margin, the system should operate within a maximum 55  $^{\circ}$ C limit.) The necessary cabinet heat dissipation area can be calculated by equation 10.1.

$$A = \frac{P}{K \cdot \Delta T} \cdots \cdots (10.1)$$

A: Heat dissipation area [m<sup>2</sup>]

P: Loss generated in the cabinet [W]

 $\Delta T\!\!\!\!$  : Difference between internal and ambient temperatures [°C]

K: Heat dissipation coefficient [5 to 6]

When calculating the heat dissipation area with equation 10.1, assume that P is the sum of all losses generated in the cabinet. Refer to the following for heat generated by the servo amplifier.

Page 318 Amount of heat generated by the servo amplifier

"A" indicates the effective area for heat dissipation, but if the cabinet is directly installed on an insulated wall, that extra amount must be added to the cabinet's surface area. The required heat dissipation area will vary with the conditions in the cabinet. If convection in the cabinet is poor and heat builds up, effective heat dissipation will not be possible. Therefore, arrangement of the equipment in the cabinet and the use of a cooling fan should be considered. The following section lists the cabinet dissipation area for each servo amplifier (guideline) when the servo amplifier is operated at the ambient temperature of 40 °C under rated load.

Page 318 Amount of heat generated by the servo amplifier

When air flows along the outer wall of the cabinet, effective heat exchange will be possible, because the temperature slope inside and outside the cabinet will be steeper.

# **10.3** Dynamic brake characteristics

# 

• The coasting distance is a theoretically calculated value which ignores the running load such as friction. The calculated value will be longer than the actual distance. If the braking distance is not longer than the calculated value, a moving part may crash into the stroke end, which is very dangerous. Install the anticrash mechanism such as an air brake or an electric/mechanical stopper such as a shock absorber to reduce the shock of moving parts.

### Point P

- Do not use dynamic brake to stop in a normal operation as it is the function to stop in emergency.
- For a machine operating at the recommended load to motor inertia ratio or less, the estimated number of usage times of the dynamic brake is 1000 times while the machine decelerates from the rated speed to a stop once in 10 minutes.
- Be sure to enable EM1 (Forced stop 1) after servo motor stops when using EM1 (Forced stop 1) frequently in other than emergency.
- · Servo motors for MR-J4 may have the different coasting distance from that of the previous model.
- The electronic dynamic brake operates in the initial state for the HG series servo motors of 600 W or smaller capacity. The time constant "τ" for the electronic dynamic brake will be shorter than that of normal dynamic brake. Therefore, coasting distance will be longer than that of normal dynamic brake. For how to set the electronic dynamic brake, refer to [Pr. PF06] and [Pr. PF12].

## Dynamic brake operation

### Calculation of coasting distance

The following shows the pattern in which the servo motor comes to a stop when the dynamic brake is operated. Use equation 10.2 to calculate an approximate coasting distance to a stop. The dynamic brake time constant  $\tau$  varies with the servo motor and machine operation speeds.

Series Page 322 Dynamic brake time constant

A working part generally has a friction force. Therefore, actual coasting distance will be shorter than a maximum coasting distance calculated with the following equation.

Lmax: Maximum coasting distance [mm]

V<sub>0</sub>: Machine's fast feed speed [mm/min]

 $J_M$ : Moment of inertia of the servo motor [× 10<sup>-4</sup> kg•m<sup>2</sup>]

JL: Load moment of inertia converted into equivalent value on servo motor shaft [× 10<sup>-4</sup> kg•m<sup>2</sup>]

τ: Dynamic brake time constant [s]

t<sub>e</sub>: Delay time of control section [s]

For servo amplifier of 7 kW or less, there is internal relay delay time of about 10 ms. For the servo amplifier of 11 kW to 22 kW, there is delay caused by magnetic contactor built into the external dynamic brake (about 50 ms) and delay caused by the external relay.

### Dynamic brake time constant

The following shows necessary dynamic brake time constant  $\tau$  for equation 10.2.

### ■200 V class

#### ■400 V class

### Permissible load to motor inertia when the dynamic brake is used

Use the dynamic brake under the load to motor inertia ratio indicated in the following table. If the ratio is higher than this value, the dynamic brake may burn. If the load to motor inertia ratio exceeds the indicated value, contact your local sales office. The values of the permissible load to motor inertia ratio in the table are the values at the maximum speed of the servo motor. The value in the parenthesis shows the value at the rated speed.

| Servo motor | Permissible load to motor inertia ratio [multiplier] |

\*1 When the maximum torque is increased to 400%, the permissible load to motor inertia ratio at the maximum speed of the servo motor is 25 times.

# 10.4 Cable bending life

The bending life of the cables is shown below. This graph calculated values. Since they are not guaranteed values, provide a little allowance for these values.

# 10.5 Inrush currents at power-on of main circuit and control circuit

### Point P

For a servo amplifier of 600 W or less, the inrush current values can change depending on frequency of turning on/off the power and ambient temperature.

Since large inrush currents flow in the power supplies, always use molded-case circuit breakers and magnetic contactors.

When circuit protectors are used, it is recommended that the inertia delay type, which is not tripped by an inrush current, be used.

### 200 V class

The following shows the inrush currents (reference data) that will flow when 240 V AC is applied at the power supply capacity. Even when you use a 1-phase 200 V AC power supply with MR-J4-10GF(-RJ) to MR-J4-200GF(-RJ), the inrush currents of the main circuit power supply is the same.

| Servo amplifier                                                          | Inrush currents (A <sub>0-P</sub> )         | Inrush currents (A <sub>0-P</sub> )               |  |  |  |  |

### 100 V class

The following shows the inrush currents (reference data) that will flow when 120 VAC is applied at the power supply capacity.

| Servo amplifier  | Inrush currents (A <sub>0-P</sub> )                                   |                                                      |  |
|------------------|-----------------------------------------------------------------------|------------------------------------------------------|--|
|                  | Main circuit power supply (L1/L2) Control circuit power supply (L11/L |                                                      |  |
| MR-J4-10GF1(-RJ) | 38 A (attenuated to approx. 14 A in 10 ms)                            | 20 A to 30 A (attenuated to approx. 0 A in 1 ms to 2 |  |
| MR-J4-20GF1(-RJ) |                                                                       | ms)                                                  |  |
| MR-J4-40GF1(-RJ) |                                                                       |                                                      |  |

# **11** OPTIONS AND PERIPHERAL EQUIPMENT

# 

• Before connecting any option or peripheral equipment, turn off the power and wait for 15 minutes or more until the charge lamp turns off. Then, confirm that the voltage between P+ and N- is safe with a voltage tester and others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, be sure to look at the lamp from the front of the servo amplifier.

# 

• Use the specified peripheral equipment and options to prevent a malfunction or a fire.

### Point P

We recommend using HIV wires to wire the servo amplifiers, options, and peripheral equipment. Therefore, the recommended wire sizes may differ from those used for the previous servo amplifiers.

# **11.1** Cable/connector sets

### Point P

The IP rating indicated for cables and connectors is their protection against ingress of dust and raindrops when they are connected to a servo amplifier or servo motor. If the IP rating of the cable, connector, servo amplifier and servo motor vary, the overall IP rating depends on the lowest IP rating of all components.

Please purchase the cable and connector options indicated in this section.

### **Combinations of cable/connector sets**

### For MR-J4-\_GF\_ servo amplifier

\*1 Connectors for 3.5 kW or less. For 5 kW or more, it is a terminal block.

\*2 When not using the STO function, attach the short-circuit connector (6)) came with a servo amplifier.

### For MR-J4-\_GF\_-RJ servo amplifier

\*1 Connectors for 3.5 kW or less. For 5 kW or more, it is a terminal block.

\*2 When not using the STO function, attach the short-circuit connector (6)) came with a servo amplifier.

### MR-D05UDL3M-B STO cable

This cable is for connecting an external device to the CN8 connector.

| Cable model   | Cable length | Application                            |
|---------------|--------------|----------------------------------------|
| MR-D05UDL3M-B | 3 m          | Connection cable for the CN8 connector |

### Configuration diagram

#### Internal wiring diagram

\*1 Do not use the two core wires with orange insulator (with red or black dots).

### Battery cable/junction battery cable

### Model explanations

The numbers in the cable length field of the table indicate the symbol filling the underline "\_" in the cable model. The cables of the lengths with the symbols are available.

| Cable model   | Cable length |     | Cable length Bending life | Application/remark              |
|---------------|--------------|-----|---------------------------|---------------------------------|
|               | 0.3 m        | 1 m |                           |                                 |
| MR-BT6V1CBL_M | 03           | 1   | Standard                  | For connection with MR-BT6VCASE |
| MR-BT6V2CBL_M | 03           | 1   | Standard                  | For junction                    |

### **Ethernet cable**

Point P

When the servo amplifier is used in the motion mode, use the switching hub DT135TX (Mitsubishi Electric System & Service) to branch a CC-Link IE Field Network.

For the wiring of CC-Link IE Field Network and CC-Link IE Field Network Basic, use a cable which meets the following standards.

| Item       | Description                                                                                                 |  |
|------------|-------------------------------------------------------------------------------------------------------------|--|
| Cable type | Category 5e or higher, (double shielded/STP) straight cable                                                 |  |
| Standard   | One of the following standards must be met.<br>• IEEE802.3 1000BASE-T<br>• ANSI/TIA/EIA-568-B (Category 5e) |  |
| Connector  | RJ-45 connector with shield                                                                                 |  |

A product example on the market is as follows. For the latest product information, contact the manufacturer.

| Model                     | Manufacturer                                      | Contact                                                       |
|---------------------------|---------------------------------------------------|---------------------------------------------------------------|
| SC-E5EW(-L) <sup>*1</sup> | Mitsubishi Electric System & Service Co.,<br>Ltd. | Please consult your local Mitsubishi Electric representative. |

\*1 The SC-E5EW cable is for in-enclosure and indoor uses. The SC-E5EW-L cable is for outdoor use.

# **11.2** Regenerative options

## 

• Do not use servo amplifiers with regenerative options other than the combinations specified below. Otherwise, it may cause a fire.

### Combination and regenerative power

The power values in the table are resistor-generated powers and not rated powers.

### 200 V class

| Servo amplifier  | Regenerative power [W]               |                        |                       |                       |                      |                        |                       |                                     |                                    |                                      |

### Selection of the regenerative option

A regenerative option for a horizontal axis can be selected with the rough calculation shown in this section. To select a regenerative option precisely, use the capacity selection software.

### Rotary servo motor

#### Regenerative energy calculation

V: Feed speed of moving part [mm/min]

N: Servo motor speed (N = V/ $\Delta$ S) [r/min]

 $\Delta$ S: Travel distance per servo motor revolution ( $\Delta$ S = PB) [mm/rev]

P<sub>B</sub>: Ball screw lead [mm]

L<sub>B</sub>: Ball screw length [mm]

D<sub>B</sub>: Ball screw diameter [mm]

W<sub>L</sub>: Moving part mass [kg]

F<sub>C</sub>: Load antidrag setting [N]

TL: Load torque converted into equivalent value on servo motor shaft [N•m]

η: Drive system efficiency

 $\mu$ : Friction coefficient

JL: Load moment of inertia converted into equivalent value on servo motor shaft [kg•cm<sup>2</sup>]

JM: Moment of inertia of the servo motor [kg•cm<sup>2</sup>]

 $\pi$ : Pi constant

g: Gravitational acceleration [m/s<sup>2</sup>]

| Regenerative power | Torque applied to servo motor [N•m] <sup>*1*2</sup>                                                              | Energy E [J]                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| 1)                 | $T_{1} = \frac{(J_{L}/\eta + J_{M}) \cdot N}{9.55 \cdot 10^{4}} \cdot \frac{1}{t_{psa1}} + T_{L}$                | $E_{1} = \frac{0.1047}{2} \cdot N \cdot T_{1} \cdot t_{psa1}$ |
| 2)                 | $T_2 = T_L$                                                                                                      | $E_2 = 0.1047 \cdot N \cdot T_2 \cdot t_1$                    |
| 3)                 | $T_{3} = \frac{-(J_{L} \bullet \eta + J_{M}) \bullet N}{9.55 \bullet 10^{4}} \bullet \frac{1}{t_{psd1}} + T_{L}$ | $E_{3} = \frac{0.1047}{2} \cdot N \cdot T_{3} \cdot t_{psd1}$ |
| 4), 8)             | T <sub>4</sub> , T <sub>8</sub> = 0                                                                              | $E_4$ , $E_8 = 0$ (No regeneration)                           |
| 5)                 | $T_5 = \frac{(J_L/\eta + J_M) \cdot N}{9.55 \cdot 10^4} \cdot \frac{1}{t_{psa2}} + T_L$                          | $E_{5} = \frac{0.1047}{2} \cdot N \cdot T_{5} \cdot t_{psa2}$ |
| 6)                 | $T_6 = T_L$                                                                                                      | $E_6 = 0.1047 \cdot N \cdot T_6 \cdot t_3$                    |
| 7)                 | $T_7 = \frac{-(J_L \bullet \eta + J_M) \bullet N}{9.55 \bullet 10^4} \bullet \frac{1}{t_{psd2}} + T_L$           | $E_7 = \frac{0.1047}{2} \cdot N \cdot T_7 \cdot t_{psd_2}$    |

\*1 Load torque converted into equivalent value on servo motor shaft TL can be calculated with the following expression.  $T_{L} = \{(F_{C} + (\mu \times W_{L} \times g)) \times \Delta S\} / (2000 \times \pi \times \eta)$ 

\*2 Load moment of inertia converted into equivalent value on servo motor shaft JL can be calculated with the following expression.  $J_L = J_{L1} + J_{L2} + J_{L3}$ 

 $J_{L1}$  is the load moment of inertia of the moving part,  $J_{L2}$  is the load moment of inertia of the ball screw, and  $J_{L3}$  is the load moment of inertia of the coupling.  $J_{L1}$  and  $J_{L2}$  can be calculated with the following expressions.

 $J_{L1} = W_L \times (\Delta S / (20 \times \pi))^2 J_{L2} = \{(\pi \times 0.0078 \times (L_B / 10)) / 32\} \times (D_B / 10)^4$ 

From the calculation results in 1) to 8), find the absolute value (Es) of the sum total of negative energies.

#### Losses of servo motor and servo amplifier in regenerative mode

The following table lists the efficiencies and other data of the servo motor and servo amplifier in the regenerative mode.

| Servo amplifier   | Inverse efficiency [%] | Capacitor charging [J] |
|-------------------|------------------------|------------------------|
| MR-J4-10GF(-RJ)   | 55                     | 9                      |

Inverse efficiency ( $\eta_m$ ): Efficiency including some efficiencies of the servo motor and servo amplifier when rated (regenerative) torque is generated at rated speed. Efficiency varies with the speed and generated torque. Since the characteristics of the electrolytic capacitor change with time, allow for approximately 10% higher inverse efficiency.

Capacitor charging (Ec): Energy charged into the electrolytic capacitor in the servo amplifier

Subtract the capacitor charging from the result of multiplying the sum total of regenerative energies by the inverse efficiency to calculate the energy consumed by the regenerative option.

#### $\mathsf{ER}\left[\mathsf{J}\right] = \mathsf{\eta}_{\mathsf{m}} \bullet \mathsf{E}_{\mathsf{s}} - \mathsf{E}_{\mathsf{c}}$

Calculate the power consumption of the regenerative option on the basis of single-cycle operation period tf [s] to select the necessary regenerative option.

PR [W] = ER/tf

### Linear servo motor

#### ■Thrust and energy calculation

The following shows equations of the linear servo motor thrust and energy at the driving pattern above.

| Section | Thrust F of linear servo motor [N]           | Energy E [J]                                          |  |
|---------|----------------------------------------------|-------------------------------------------------------|--|
| 1)      | $F_1 = (M_1 + M_2) \bullet V/t_{psa1} + F_t$ | $E_1 = V/2 \cdot F_1 \cdot t_{psa1}$                  |  |
| 2)      | F <sub>2</sub> = F <sub>1</sub>              | $E_2 = V \cdot F_2 \cdot t_1$                         |  |
| 3)      | $F_3 = -(M_1 + M_2) \cdot V/t_{psd1} + F_t$  | $E_3 = V/2 \cdot F_3 \cdot t_{psd1}$                  |  |
| 4), 8)  | F <sub>4</sub> , F <sub>8</sub> = 0          | E <sub>4</sub> , E <sub>8</sub> = 0 (No regeneration) |  |
| 5)      | $F_5 = (M_1 + M_2) \cdot V/t_{psa2} + F_t$   | $E_5 = V/2 \cdot F_5 \cdot t_{psa2}$                  |  |
| 6)      | F <sub>6</sub> = F <sub>t</sub>              | $E_6 = V \cdot F_6 \cdot t_3$                         |  |
| 7)      | $F_7 = -(M_1 + M_2) \cdot V/t_{psd2} + F_t$  | $E_7 = V/2 \cdot F_7 \cdot t_{psd2}$                  |  |

From the calculation results in 1) to 8), find the absolute value (Es) of the sum total of negative energies.

#### Losses of servo motor and servo amplifier in regenerative mode

For inverse efficiency and capacitor charging energy, refer to the following.

Page 342 Losses of servo motor and servo amplifier in regenerative mode

#### ■Regenerative energy calculation

Subtract the capacitor charging from the result of multiplying the sum total of regenerative energies by the inverse efficiency to calculate the energy consumed by the regenerative resistor.

 $ER[J] = \eta \cdot E_s - E_c$ 

From the total of ER's whose subtraction results are positive and one-cycle period, the power consumption PR [W] of the regenerative option can be calculated with the following equation.

PR [W] = total of positive ER's/one-cycle operation period (tf)

Select a regenerative option from the PR value. Regenerative option is not required when the energy consumption is equal to or less than the built-in regenerative energy.

### **Parameter setting**

Set [Pr. PA02] according to the option to be used.

| [Pr. PA02]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Connection of regenerative option                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### **Connection of regenerative option**

### Point P

- When MR-RB50, MR-RB51, MR-RB5N, MR-RB3M-4, MR-RB3G-4, MR-RB5G-4, MR-RB34-4, MR-RB54-4, MR-RB5K-4, or MR-RB6K-4 is used, a cooling fan is required to cool it. The cooling fan should be prepared by the customer.
- For the wire sizes used for wiring, refer to the following. 🖙 Page 402 Selection example of wires

The regenerative option generates heat of 100  $^{\circ}$ C higher than the ambient temperature. Fully consider heat dissipation, installation position, wires used, etc. before installing the option. For wiring, use flame-resistant wires or make the wires flame-resistant and keep them away from the regenerative option. Always use twisted cables of max. 5 m length for connection with the servo amplifier.

#### MR-J4-500GF(-RJ) or less/MR-J4-350GF4(-RJ) or less

Always remove the wiring from across P+ to D and fit the regenerative option across P+ to C. G3 and G4 are thermal sensor's terminals. Between G3 and G4 is opened when the regenerative option overheats abnormally.

- \*1 When using the MR-RB50, MR-RB5N, MR-RB51, MR-RB3M-4, MR-RB3G-4, or MR-RB5G-4, forcibly cool it with a cooling fan (1.0 m<sup>3</sup>/ min or more, 92 mm × 92 mm).
- \*2 When the ambient temperature is more than 55 °C and the regenerative load ratio is more than 60% in MR-RB30, MR-RB31, MR-RB32, and MR-RB3N, forcefully cool the air with a cooling fan (1.0 m<sup>3</sup>/min or more, 92 mm × 92 mm). A cooling fan is not required if the ambient temperature is 35 °C or less. (A cooling fan is required for the shaded area in the following graph.)

 \*3 Make up a sequence which will switch off the magnetic contactor when abnormal heating occurs. G3-G4 contact specifications Maximum voltage: 120 V AC/DC Maximum current: 0.5 A/4.8 V DC Maximum capacity: 2.4 VA

### MR-J4-500GF4(-RJ)/MR-J4-700GF(-RJ)/MR-J4-700GF4(-RJ)

Always remove the wiring (across P+ to C) of the servo amplifier built-in regenerative resistor and fit the regenerative option across P+ to C. G3 and G4 are thermal sensor's terminals. Between G3 and G4 is opened when the regenerative option overheats abnormally.

Always remove the wiring (across P+ to C) of the servo amplifier built-in regenerative resistor.

- \*1 When using the MR-RB51, MR-RB34-4, MR-RB54-4, MR-RB3U-4, or MR-RB5U-4, forcibly cool it with a cooling fan (1.0 m<sup>3</sup>/min or more, 92 mm × 92 mm).
- \*2 Make up a sequence which will switch off the magnetic contactor when abnormal heating occurs.

G3-G4 contact specifications Maximum voltage: 120 V AC/DC Maximum current: 0.5 A/4.8 V DC Maximum capacity: 2.4 VA

When using the regenerative option, remove the servo amplifier's built-in regenerative resistor wires (across P+ to C), fit them back to back, and secure them to the frame with the accessory screw as shown below.

Built-in regenerative resistor lead terminal fixing screw

## 

• The regenerative resistor supplied with 11 kW to 22 kW servo amplifiers does not have a protective cover. Touching the resistor (including wiring/screw hole area) may cause a burn injury and electric shock. Even if the power was shut-off, be careful until the bus voltage discharged and the temperature decreased because of the following reasons.

- · It may cause a burn injury due to very high temperature.
- · It may cause an electric shock due to charged capacitor of the servo amplifier.

• Do not use servo amplifiers with external regenerative resistors other than the combinations specified below. Otherwise, it may cause a fire.

When using the regenerative resistors supplied to the servo amplifier, the specified number of resistors (4 or 5 resistors) must be connected in series. If they are connected in parallel or in less than the specified number, the servo amplifier may become faulty and/or the regenerative resistors burn.

Install the resistors at intervals of about 70 mm. Cooling the resistors with two cooling fans ( $1.0 \text{ m}^3/\text{min}$  or more,  $92 \text{ mm} \times 92 \text{ mm}$ ) improves the regeneration capability. In this case, set " F A" in [Pr. PA02].

\*1 The number of resistors connected in series depends on the resistor type. The thermal sensor is not mounted on the attached regenerative resistor. An abnormal heating of resistor may be generated at a regenerative circuit failure. Install a thermal sensor near the resistor and establish a protective circuit to shut off the main circuit power supply when abnormal heating occurs. The detection level of the thermal sensor varies according to the settings of the resistor. Set the thermal sensor in the most appropriate position on the design basis of the device, or use the thermal sensor built-in regenerative option. (MR-RB5R, MR-RB9F, MR-RB9T, MR-RB5K-4, or MR-RB6K-4)

\*1 The following shows an indication example of symbol.

11

### MR-J4-11KGF-PX to MR-J4-22KGF-PX, MR-J4-11KGF-RZ to MR-J4-22KGF-RZ, MR-J4-11KGF4-PX to MR-J4-22KGF4-PX, and MR-J4-11KGF4-RZ to MR-J4-22KGF4-RZ (when using the regenerative option)

The MR-J4-11KGF-PX to MR-J4-22KGF-PX, MR-J4-11KGF-RZ to MR-J4-22KGF-RZ, MR-J4-11KGF4-PX to MR-J4-22KGF4-PX, and MR-J4-11KGF4-RZ to MR-J4-22KGF4-RZ servo amplifiers are not supplied with regenerative resistors. When using any of these servo amplifiers, always use the regenerative option MR-RB5R, MR-RB9F, MR-RB9T, MR-RB5K-4, and MR-RB6K-4.

Cooling the regenerative option with cooling fans improves regenerative capability. G3 and G4 are thermal sensor's terminals. Between G3 and G4 is opened when the regenerative option overheats abnormally.

Configure up a circuit which shuts off main circuit power when thermal protector operates.

\*1 G3-G4 contact specifications Maximum voltage: 120 V AC/DC Maximum current: 0.5 A/4.8 V DC Maximum capacity: 2.4 VA

# 11.3 FR-BU2-(H) brake unit

### Point P

- Use a 200 V class brake unit and a resistor unit with a 200 V class servo amplifier, and a 400 V class brake unit and a resistor unit with a 400 V class servo amplifier. Combination of different voltage class units cannot be used.
- When a brake unit and a resistor unit are installed horizontally or diagonally, the heat dissipation effect diminishes. Install them on a flat surface vertically.
- The temperature of the resistor unit case will be higher than the ambient temperature by 100 °C or over. Keep cables and flammable materials away from the case.
- Ambient temperature condition of the brake unit is between -10 °C and 50 °C. Note that the condition is different from the ambient temperature condition of the servo amplifier (between 0 °C and 55 °C).
- Configure the circuit to shut down the power-supply with the alarm output of the brake unit and the resistor unit under abnormal condition.
- Use the brake unit with a combination indicated in the following section. 🖙 Page 357 Selection
- For performing a continuous regenerative operation, use FR-RC-(H) power regeneration converter, FR-CV-(H) power regeneration common converter, or FR-XC-(H) multifunction regeneration converter.
- Brake unit and regenerative options (Regenerative resistor) cannot be used simultaneously.

Connect the brake unit to the bus of the servo amplifier. As compared to the MR-RB regenerative option, the brake unit can return larger power. Use the brake unit when the regenerative option cannot provide sufficient regenerative capability. When using the brake unit, set [Pr. PA02] to " $\_$  0 1".

When using the brake unit, always refer to the FR-BU2 Instruction Manual.

### Selection

Use a combination of servo amplifier, brake unit and resistor unit listed below.

| Brake unit  |             | Resistor unit | Number of<br>connected<br>units | Permissible<br>continuous power<br>[kW] | Resultant<br>resistance [Ω] | Applicable servo<br>amplifier <sup>*3</sup>                                  |

\*1 Only when using servo motor HG-RR353/HG-UR352

\*2 When HG-JR11K1M4 servo motor is used, limit the torque during power running to 180% or less, or the servo motor speed to 1800 r/min or less.

\*3 When the brake unit is selected by using the capacity selection software, a brake unit other than the combinations listed may be shown. Refer to the combinations displayed on the capacity selection software for detailed combinations.

### Brake unit parameter setting

Whether a parameter can be changed or not is listed below.

| Parameter |                                                  | Change                  | Remark                                  |  |
|-----------|--------------------------------------------------|-------------------------|-----------------------------------------|--|
| No.       | Name                                             | possible/<br>impossible |                                         |  |
| 0         | Brake mode switchover                            | Impossible              | Do not change the parameter.            |  |
| 1         | Monitor display data selection                   | Possible                | Refer to the FR-BU2 Instruction Manual. |  |
| 2         | Input terminal function selection 1              | Impossible              | Do not change the parameter.            |  |
| 3         | Input terminal function selection 2              |                         |                                         |  |

### **Connection example**

Point P

- EM2 has the same function as EM1 in the torque mode.
- Connecting PR terminal of the brake unit to P+ terminal of the servo amplifier results in brake unit malfunction. Always connect the PR terminal of the brake unit to the PR terminal of the resistor unit.

#### Combination with FR-BR-(H) resistor unit

#### When connecting a brake unit to a servo amplifier

• 200 V class

- \*1 For the power supply specifications, refer to the following.
- \*2 When using the servo amplifier of 7 kW or less, make sure to disconnect the wiring of built-in regenerative resistor (5 kW or less: P+ and D, 7 kW: P+ and C). For the servo amplifier of 11 kW to 22 kW, do not connect a supplied regenerative resistor to the P+ and C terminals.
- \*3 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously. Page 409 Power factor improving DC reactors
- \*4 Connect P/+ and N/- terminals of the brake unit to a correct destination. Incorrect connection destination results in servo amplifier and brake unit malfunction.
- \*5 Contact rating: 1b contact, 110 V AC, 5 A/220 V AC, 3 A Normal condition: TH1-TH2 is conducting. Abnormal condition: TH1-TH2 is not conducting.
- \*6 Contact rating: 230 V AC, 0.3 A/30 V DC, 0.3 A
- Normal condition: B-C is conducting./A-C is not conducting. Abnormal condition: B-C is not conducting./A-C is conducting.
- \*7 Do not connect more than one cable to each P+ and N- terminals of the servo amplifier.
- \*8 Always connect BUE and SD terminals. (factory-wired)
- \*9 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*10 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*11 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*12 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

- \*1 For the power supply specifications, refer to the following.
- \*2 For the servo amplifier of 5 kW and 7 kW, be sure to disconnect the lead wire of built-in regenerative resistor, which is connected to P+ and C terminals. For the servo amplifier of 11 kW to 22 kW, do not connect a supplied regenerative resistor to the P+ and C terminals.
- \*3 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- \*4 Connect P/+ and N/- terminals of the brake unit to a correct destination. Incorrect connection destination results in servo amplifier and brake unit malfunction.
- \*5 Contact rating: 1b contact, 110 V AC, 5 A/220 V AC, 3 A Normal condition: TH1-TH2 is conducting. Abnormal condition: TH1-TH2 is not conducting.
- \*6 Contact rating: 230 V AC, 0.3 A/30 V DC, 0.3 A
- Normal condition: B-C is conducting./A-C is not conducting. Abnormal condition: B-C is not conducting./A-C is conducting.
- \*7 Do not connect more than one cable to each P+ and N- terminals of the servo amplifier.
- \*8 Always connect BUE and SD terminals. (factory-wired)
- \*9 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*10 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*11 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*12 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

#### When connecting two brake units to a servo amplifier

- To use brake units with a parallel connection, use two sets of FR-BU2 brake unit. Combination with other brake unit results in alarm occurrence or malfunction.
- Always connect the terminals for master/slave (MSG to MSG, SD to SD) between the two brake units.
- Do not connect the servo amplifier and brake units as below. Connect the cables with a terminal block to distribute as indicated in this section.

- \*1 For the power supply specifications, refer to the following.
- \*2 When using the servo amplifier of 7 kW or less, make sure to disconnect the wiring of built-in regenerative resistor (5 kW or less: P+ and D, 7 kW: P+ and C). For the servo amplifier of 11 kW to 22 kW, do not connect a supplied regenerative resistor to the P+ and C terminals.
- \*3 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously. Page 409 Power factor improving DC reactors
- \*4 Connect P/+ and N/- terminals of the brake unit to a correct destination. Incorrect connection destination results in servo amplifier and brake unit malfunction.
- \*5 Contact rating: 1b contact, 110 V AC, 5 A/220 V AC, 3 A
- Normal condition: TH1-TH2 is conducting. Abnormal condition: TH1-TH2 is not conducting.
- \*6 Contact rating: 230 V AC, 0.3 A/30 V DC, 0.3 A
- Normal condition: B-C is conducting./A-C is not conducting. Abnormal condition: B-C is not conducting./A-C is conducting.
- \*7 Do not connect more than one cable to each P+ and N- terminals of the servo amplifier.
- \*8 Always connect BUE and SD terminals. (factory-wired)
- \*9 Connect MSG and SD terminals of the brake unit to a correct destination. Incorrect connection destination results in servo amplifier and brake unit malfunction.
- \*10 For connecting P+ and N- terminals of the servo amplifier to the terminal block, use the cable indicated in the following section.
- \*11 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*12 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*13 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*14 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

#### Combination with MT-BR5-(H) resistor unit

#### ■200 V class

\*1 For the power supply specifications, refer to the following.

- \*2 Do not connect a supplied regenerative resistor to the P+ and C terminals.
- \*3 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- \*4 Connect P/+ and N/- terminals of the brake unit to a correct destination. Incorrect connection destination results in servo amplifier and brake unit malfunction.
- \*5 Contact rating: 1a contact, 110 V AC, 5 A/220 V AC, 3 A Normal condition: TH1-TH2 is not conducting. Abnormal condition: TH1-TH2 is conducting.
- \*6 Contact rating: 230 V AC, 0.3 A/30 V DC, 0.3 A
- Normal condition: B-C is conducting./A-C is not conducting. Abnormal condition: B-C is not conducting./A-C is conducting.
- \*7 Do not connect more than one cable to each P+ and N- terminals of the servo amplifier.
- \*8 Always connect BUE and SD terminals. (factory-wired)
- \*9 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*10 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*11 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*12 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

#### ■400 V class

- \*1 For the power supply specifications, refer to the following.
- \*2 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- \*3 Connect P/+ and N/- terminals of the brake unit to a correct destination. Incorrect connection destination results in servo amplifier and brake unit malfunction.
- \*4 Contact rating: 1a contact, 110 V AC, 5 A/220 V AC, 3 A
- Normal condition: TH1-TH2 is not conducting. Abnormal condition: TH1-TH2 is conducting. \*5 Contact rating: 230 V AC, 0.3 A/30 V DC, 0.3 A
- Normal condition: B-C is conducting./A-C is not conducting. Abnormal condition: B-C is not conducting./A-C is conducting.
- \*6 Do not connect more than one cable to each P+ and N- terminals of the servo amplifier.
- \*7 Always connect BUE and SD terminals. (factory-wired)
- \*8 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*9 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*10 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*11 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

#### Precautions for wiring

Keep the wires between the servo amplifier and the brake unit, and between the resistor unit and the brake unit as short as possible. For wires longer than 5 m, twist the wires five times or more per meter. The wires should not exceed 10 m even when the wires are twisted. If wires exceeding 5 m without twisted or exceeding 10 m with or without twisted are used, the brake unit may malfunction.

#### Wires

#### Wires for the brake unit

For the brake unit, HIV wire (600 V Grade heat-resistant polyvinyl chloride insulated wire) is recommended.

· Control circuit terminal

Point P

Under tightening can cause a cable disconnection or malfunction. Over tightening can cause a short circuit or malfunction due to damage to the screw or the brake unit.

Wire the stripped cable after twisting to prevent the cable from becoming loose. In addition, do not solder it.

Screw size: M3

Tightening torque: 0.5 N•m to 0.6 N•m

Wire size: 0.3  $\mbox{mm}^2$  to 0.75  $\mbox{mm}^2$ 

Screw driver: Small flat-blade screwdriver (Tip thickness: 0.4 mm/Tip width: 2.5 mm)

# Cables for connecting the servo amplifier and a distribution terminal block when connecting two sets of the brake unit

| Brake unit | Wire size                   |     |
|------------|-----------------------------|-----|
|            | HIV wire [mm <sup>2</sup> ] | AWG |
| FR-BU2-15K | 8                           | 8   |

#### Crimp terminals for P+ and N- terminals of servo amplifier

#### ■Recommended crimp terminals

Point P

Some crimp terminals may not be mounted depending on the size. Make sure to use the recommended ones or equivalent ones.

# **11.4** FR-RC-(H) power regeneration converter

Point P

- When using the FR-RC-(H) power regeneration converter, set [Pr. PA04] to "0 0 \_ \_" to enable EM1 (Forced stop 1).
- When using the FR-RC-(H) power regeneration converter, refer to "Power Regeneration Converter FR-RC Instruction Manual (IB(NA)66330)".

When using the FR-RC-(H) power regeneration converter, set [Pr. PA02] to "\_\_0 1" and set [Pr. PC20] to "\_\_1".

#### Selection

The converters can continuously return 75% of the nominal regenerative power. They are applied to the servo amplifiers of the 5 kW to 22 kW.

| Power regeneration converter | Nominal regenerative power [kW] | Applicable servo amplifier                               |
|------------------------------|---------------------------------|----------------------------------------------------------|
| FR-RC-15K                    | 15                              | MR-J4-500GF(-RJ)                                         |
| FR-RC-30K                    | 30                              | MR-J4-700GF(-RJ)<br>MR-J4-11KGF(-RJ)<br>MR-J4-15KGF(-RJ) |
| FR-RC-55K                    | 55                              | MR-J4-22KGF(-RJ)                                         |
| FR-RC-H15K                   | 15                              | MR-J4-500GF4(-RJ)<br>MR-J4-700GF4(-RJ)                   |
| FR-RC-H30K                   | 30                              | MR-J4-11KGF4(-RJ)<br>MR-J4-15KGF4(-RJ)                   |
| FR-RC-H55K                   | 55                              | MR-J4-22KGF4(-RJ)                                        |

#### **Connection example**

Point P

In this configuration, only the STO function is supported. The forced stop deceleration function is not available.

- \*1 When not using the phase detection terminals, fit the jumpers across RX-R, SX-S and TX-T. If the jumpers remain removed, the FR-RC will not operate.
- \*2 When using the servo amplifier of 7 kW or less, make sure to disconnect the wiring of built-in regenerative resistor (5 kW or less: P+ and D, 7 kW: P+ and C). For the servo amplifier of 11 kW to 22 kW, do not connect a supplied regenerative resistor to the P+ and C terminals.
- \*3 If disabling ALM (Malfunction) output with the parameter, configure up the power supply circuit which switches off the magnetic contactor after detection of alarm occurrence on the controller side.
- \*4 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- \*5 For the power supply specifications, refer to the following.
  - Page 30 Servo amplifier standard specifications
- \*6 Set [Pr. PA04] to "0 0 \_ \_" to enable EM1 (Forced stop 1). Configure up the circuit which shuts off main circuit power with external circuit at EM1 (Forced stop 1) off.
- \*7 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*8 This diagram shows sink I/O interface. For source I/O interface, refer to the following.
- \*9 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
- \*10 For selection of power factor improving AC reactors, refer to "Power Regeneration Converter FR-RC Instruction Manual (IB(NA)66330)".

- \*1 When not using the phase detection terminals, fit the jumpers across RX-R, SX-S and TX-T. If the jumpers remain removed, the FR-RC-H will not operate.
- \*2 For the servo amplifier of 5 kW and 7 kW, be sure to disconnect the lead wire of built-in regenerative resistor, which is connected to P+ and C terminals. For the servo amplifier of 11 kW to 22 kW, do not connect a supplied regenerative resistor to the P+ and C terminals.
- \*3 If disabling ALM (Malfunction) output with the parameter, configure up the power supply circuit which switches off the magnetic contactor after detection of alarm occurrence on the controller side.
- \*4 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- \*5 For the power supply specifications, refer to the following.
- \*6 Set [Pr. PA04] to "0 0 \_\_\_" to enable EM1 (Forced stop 1). Configure up the circuit which shuts off main circuit power with external circuit at EM1 (Forced stop 1) off.
- \*7 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*8 This diagram shows sink I/O interface. For source I/O interface, refer to the following.
- \*9 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
- \*10 For selection of power factor improving AC reactors, refer to "Power Regeneration Converter FR-RC Instruction Manual (IB(NA)66330)".

# **11.5** FR-CV-(H) power regeneration common converter

#### Point P

- For details of the power regeneration common converter FR-CV-(H), refer to the FR-CV Installation Guide (IB(NA)0600075).
- Do not supply power to the main circuit power supply terminals (L1/L2/L3) of the servo amplifier. Doing so will fail the servo amplifier and FR-CV-(H).
- Connect the DC power supply between the FR-CV-(H) and servo amplifier with correct polarity. Connection with incorrect polarity will fail the FR-CV-(H) and servo amplifier.
- Two or more FR-CV-(H)s cannot be installed to improve regeneration capability. Two or more FR-CV-(H)s cannot be connected to the same DC power supply line.
- When using FR-CV-(H), set [Pr. PA04] to "0 0 \_ \_" to enable EM1 (Forced stop 1).

When using the FR-CV-(H) power regeneration common converter, set [Pr. PA02] to "\_\_0 1" and set [Pr. PC20] to "\_\_\_1".

# **Model designation**

The following describes what each block of a model name indicates. Not all combinations of the symbols are available.

#### 200 V class

FR-CV power regeneration common converter can be used for the 200 V class servo amplifier of 100 W to 22 kW. The following shows the restrictions on using the FR-CV.

- Up to six servo amplifiers can be connected to one FR-CV.
- + FR-CV capacity [W]  $\geq$  Total of rated capacities [W]  $\times$  2 of servo amplifiers connected to FR-CV
- The total of used servo motor rated currents should be equal to or less than the applicable current [A] of the FR-CV.
- Among the servo amplifiers connected to the FR-CV, the rated capacity of the servo amplifier with the maximum rated capacity should be equal to or less than the value of "Maximum servo amplifier capacity" in the following table.
   The following table lists the restrictions.

| Item                                                 | FR-CV | FR-CV |     |     |     |      |      |
|------------------------------------------------------|-------|-------|-----|-----|-----|------|------|
|                                                      | 7.5K  | 11K   | 15K | 22K | 30K | 37K  | 55K  |
| Maximum number of connected servo amplifiers         | 6     |       |     |     |     |      |      |
| Total of connectable servo amplifier capacities [kW] | 3.75  | 5.5   | 7.5 | 11  | 15  | 18.5 | 27.5 |
| Total of connectable servo motor rated currents [A]  | 33    | 46    | 61  | 90  | 115 | 145  | 215  |
| Maximum servo amplifier capacity [kW]                | 3.5   | 5     | 7   | 11  | 15  | 15   | 22   |

When using the FR-CV, always install the dedicated stand-alone reactor (FR-CVL).

| Power regeneration common converter | Dedicated stand-alone reactor |
|-------------------------------------|-------------------------------|
| FR-CV-7.5K(-AT)                     | FR-CVL-7.5K                   |
| FR-CV-11K(-AT)                      | FR-CVL-11K                    |
| FR-CV-15K(-AT)                      | FR-CVL-15K                    |
| FR-CV-22K(-AT)                      | FR-CVL-22K                    |
| FR-CV-30K(-AT)                      | FR-CVL-30K                    |
| FR-CV-37K                           | FR-CVL-37K                    |
| FR-CV-55K                           | FR-CVL-55K                    |

#### 400 V class

Maximum servo amplifier capacity [kW]

FR-CV-H power regeneration common converter can be used for the servo amplifier of 600 W to 22 kW. The following shows the restrictions on using the FR-CV-H.

- · Up to six servo amplifiers can be connected to one FR-CV-H.
- FR-CV-H capacity [W]  $\geq$  Total of rated capacities [W]  $\times$  2 of servo amplifiers connected to FR-CV-H.
- When FR-CV-H capacity is less than the total of rated capacities of the connected servo amplifiers × 2.5, make the maximum torque of the connected servo motors equal to or less than 200 % of the rated torque. When FR-CV-H capacity exceeds the total of rated capacities of the connected servo amplifiers × 2.5, the maximum torque of the connected servo amplifiers is not limited.
- The total of used servo motor rated currents should be equal to or less than the applicable current [A] of the FR-CV-H.
- Among the servo amplifiers connected to the FR-CV-H, the rated capacity of the servo amplifier with the maximum rated capacity should be equal to or less than the value of "Maximum servo amplifier capacity" in the following table. The following table lists the restrictions.

#### **Connection diagram**

### Point P

In this configuration, only the STO function is supported. The forced stop deceleration function is not available.

#### ■200 V class

### Point P

When using the servo amplifier of 7 kW or less, make sure to disconnect the wiring of built-in regenerative resistor (5 kW or less: P+ and D, 7 kW: P+ and C).

- \*1 Configure a sequence that will shut off main circuit power in the following. An alarm occurred at FR-CV or servo amplifier. EM1 (Forced stop 1) is enabled.
- \*2 For the servo amplifier, configure a sequence that will switch the servo-on after the FR-CV is ready.
- \*3 Configure a sequence that will make a stop with the emergency stop input of the controller if an alarm occurs in the FR-CV. When the controller does not have an emergency stop input, use the forced stop input of the servo amplifier to make a stop as shown in the diagram.
- \*4 When using FR-CV, always disconnect wiring between P3 and P4 terminals.
- \*5 Set [Pr. PA04] to "0 0 \_ \_" to enable EM1 (Forced stop 1).
- \*6 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*7 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

#### ■400 V class

Point P

When using the servo amplifier of 7 kW or less, be sure to disconnect the wiring of built-in regenerative resistor (3.5 kW or less: P+ and D, 5 kW/7 kW: P+ and C).

- \*1 Configure a sequence that will shut off main circuit power in the following. An alarm occurred at FR-CV-H or servo amplifier. EM1 (Forced stop 1) is enabled.
- \*2 For the servo amplifier, configure a sequence that will switch the servo-on after the FR-CV-H is ready.
- \*3 Configure a sequence that will make a stop with the emergency stop input of the controller if an alarm occurs in the FR-CV-H. When the controller does not have an emergency stop input, use the forced stop input of the servo amplifier to make a stop as shown in the diagram.
- \*4 When using FR-CV-H, always disconnect wiring between P3 and P4 terminals.
- \*5 Set [Pr. PA04] to "0 0 \_ \_" to enable EM1 (Forced stop 1).
- \*6 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*7 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

#### Selection example of wires used for wiring

Point P

• Selection conditions of wire size are as follows. Wire type: 600 V Grade heat-resistant polyvinyl chloride insulated wire (HIV wire) Construction condition: Single wire set in midair

#### ■Wire size

• Between P and P4, and between N and N-

The following table indicates the connection wire sizes of the DC power supply (P4, N- terminals) between the FR-CV and servo amplifier.

| Total of servo amplifier capacities [kW] | Wire [mm <sup>2</sup> ] |
|------------------------------------------|-------------------------|
| 1 or less                                | 2 (AWG 14)              |
| 2                                        | 3.5 (AWG 12)            |
| 5                                        | 5.5 (AWG 10)            |
| 7                                        | 8 (AWG 8)               |
| 11                                       | 14 (AWG 6)              |
| 15                                       | 22 (AWG 4)              |
| 22                                       | 50 (AWG 1/0)            |
| 27.5                                     | 50 (AWG 1/0)            |

The following table indicates the connection wire sizes of the DC power supply (P4, N- terminals) between the FR-CV-H and servo amplifier.

| Total of servo amplifier capacities [kW] | Wire [mm <sup>2</sup> ] |
|------------------------------------------|-------------------------|
| 2 or less                                | 2 (AWG 14)              |
| 3.5                                      | 3.5 (AWG 12)            |
| 5                                        | 5.5 (AWG 10)            |
| 7                                        | 5.5 (AWG 10)            |
| 11                                       | 8 (AWG 8)               |
| 15                                       | 8 (AWG 8)               |
| 22                                       | 14 (AWG 6)              |
| 27.5                                     | 22 (AWG 4)              |

Grounding

For grounding, use the wire of the size equal to or greater than that indicated in the following table, and make it as short as possible.

| Power regeneration common converter | Grounding wire size [mm <sup>2</sup> ] |
|-------------------------------------|----------------------------------------|
| FR-CV-7.5K to FR-CV-15K             | 8 (AWG 8)                              |
| FR-CV-22K/FR-CV-30K                 | 22 (AWG 4)                             |
| FR-CV-37K/FR-CV-55K                 | 38 (AWG 2)                             |
| FR-CV-H7.5K to FR-CV-H15K           | 3.5 (AWG 12)                           |
| FR-CV-H22K/FR-CV-H30K               | 8 (AWG 8)                              |
| FR-CV-H37K/FR-CV-H55K               | 14 (AWG 6)                             |

#### Example of selecting the wire sizes

#### • 200 V class

When connecting multiple servo amplifiers, always use junction terminals for wiring the servo amplifier terminals P4 and N-. Also, connect the servo amplifiers in the order of larger to smaller capacities.

\*1 When using the servo amplifier of 7 kW or less, make sure to disconnect the wiring of built-in regenerative resistor (5 kW or less: P+ and D, 7 kW: P+ and C).

#### • 400 V class

#### Other precautions

- When using the FR-CV-(H), always install the dedicated stand-alone reactor (FR-CVL-(H)). Do not use the power factor improving AC reactor (FR-HAL-(H)) or power factor improving DC reactor (FR-HEL-(H)).
- The inputs/outputs (main circuits) of the FR-CV-(H) and servo amplifiers include high-frequency components and may provide electromagnetic wave interference to communication equipment (such as AM radios) used near them. In this case, interference can be reduced by installing the radio noise filter (FR-BIF(-H)) or line noise filter (FR-BSF01, FR-BLF).
- The overall wiring length for connection of the DC power supply between the FR-CV-(H) and servo amplifiers should be 5 m or less, and the wiring must be twisted.

\*1 This is the time when the protective function of the FR-CV-(H) is activated. The protective function of the servo amplifier is activated in the time indicated in the following section.

Page 314 Overload protection characteristics

\*2 The specified value is the power supply capacity of FR-CV-(H). The total power supply capacities of the connected servo amplifiers are actually required.

\*1 This is the time when the protective function of the FR-CV-(H) is activated. The protective function of the servo amplifier is activated in the time indicated in the following section.

 $\ensuremath{\boxtimes}\xspace$  Page 314 Overload protection characteristics

\*2 The specified value is the power supply capacity of FR-CV-(H). The total power supply capacities of the connected servo amplifiers are actually required.

# **11.6** Junction terminal block PS7DW-20V14B-F (recommended)

#### Usage

Always use the junction terminal block (PS7DW-20V14B-F (Toho Technology Corp. Kyoto factory)) with the option cable (MR-J2HBUS\_M) as a set. A connection example is shown below.

Servo amplifier

Ground the option cable on the junction terminal block side with the cable clamp fitting (AERSBAN-ESET). For the use of the cable clamp fitting, refer to the following.

Page 425 Cable clamp fitting AERSBAN-\_SET

#### Connection of MR-J2HBUS\_M cable and junction terminal block

### Dimensions of junction terminal block

[Unit: mm]

# **11.7** MR Configurator2

Point P

The MR-J4-\_GF\_ servo amplifier is supported with software version 1.49B or later.

### **Engineering software**

The following engineering software can be used for this servo amplifier.

| Engineering software           | Installation guide                                                |
|--------------------------------|-------------------------------------------------------------------|
| MR Configurator2 SW1DNC-MRC2-E | MR Configurator2 SW1DNC-MRC2-E Installation Guide (IB(NA)0300163) |

For the engineering software specifications and system configuration, refer to the installation guide.

# **Precautions for using USB communication function**

Note the following to prevent an electric shock and malfunction of the servo amplifier.

#### Power connection of personal computers

Connect your personal computer with the following procedures.

#### When you use a personal computer with AC power supply

- **1.** When using a personal computer with a three-core power plug or power plug with grounding wire, use a three-pin socket or ground the grounding wire.
- 2. When your personal computer has two-core plug and has no grounding wire, connect the personal computer to the servo amplifier with the following procedures.
- a) Disconnect the power plug of the personal computer from an AC power socket.
- b) Check that the power plug was disconnected and connect the device to the servo amplifier.
- c) Connect the power plug of the personal computer to the AC power socket.

#### When you use a personal computer with battery

You can use as it is.

#### Connection with other devices using servo amplifier communication function

When the servo amplifier is charged with electricity due to connection with a personal computer and the charged servo amplifier is connected with other devices, the servo amplifier or the connected devices may malfunction. Connect the servo amplifier and other devices with the following procedures.

- 1. Shut off the power of the device for connecting with the servo amplifier.
- 2. Shut off the power of the servo amplifier which was connected with the personal computer and check the charge lamp is off.
- **3.** Connect the device with the servo amplifier.
- Turn on the power of the servo amplifier and the device.

# 11.8 Battery

Point P

Refer to the following for battery transportation and the new EU Battery Directive.

□ Page 592 Handling of AC servo amplifier batteries for the United Nations Recommendations on the Transport of Dangerous Goods

Improve Page 594 Symbol for the new EU Battery Directive

This battery is used to construct an absolute position detection system. Refer to the following for construction of the absolute position detection system.

ST Page 462 ABSOLUTE POSITION DETECTION SYSTEM

# Selection of battery

The available batteries vary depending on servo amplifiers. Select a required battery.

| Applications of the batteries |                                    |                                                             |                  |  |  |
|-------------------------------|------------------------------------|-------------------------------------------------------------|------------------|--|--|
| Model                         | Name                               | Application                                                 | Built-in battery |  |  |

#### Combinations of batteries and the servo amplifier

| Model          | MR-J4GF_ |
|----------------|----------|
| MR-BAT6V1SET-A | 0        |
| MR-BAT6V1BJ    | O*1      |
| MR-BT6VCASE    | 0        |

\*1 For using the MR-J4-350GF4(-RJ), contact your local sales office.

# **MR-BAT6V1SET-A** battery

Point P

For the specifications and year and month of manufacture of the built-in MR-BAT6V1 battery, refer to the following.

Page 401 MR-BAT6V1 battery

#### Parts identification and dimensions

Mass: 55 [g] (including MR-BAT6V1 battery)

11

Connect as follows.

Servo amplifier

#### Battery replacement procedure

# 

• Before replacing a battery, turn off the main circuit power and wait for 15 minutes or longer until the charge lamp turns off. Then, check the voltage between P+ and N- with a voltage tester or others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, be sure to look at the lamp from the front of the servo amplifier.

#### 

• The internal circuits of the servo amplifier may be damaged by static electricity. Always take the following precautions. Ground human body and work bench.

Do not touch the conductive areas, such as connector pins and electrical parts, directly by hand.

Point P

- Replacing battery with the control circuit power off will erase the absolute position data.
- Before replacing batteries, check that the new battery is within battery life.

Replace the battery while only control circuit power is on. Replacing battery with the control circuit power on triggers [AL. 9F.1 Low battery]. However, the absolute position data will not be erased.

#### Battery installation and removal procedure

Installation procedure

#### Point P

For the servo amplifier with a battery holder on the bottom, it is not possible to wire for the earth with the battery installed. Insert the battery after executing the earth wiring of the servo amplifier.

For the servo amplifier with a battery holder on the bottom

#### For the servo amplifier with a battery holder on the front

Install a battery, and connect the plug to the CN4 connector.

Removal procedure

# 

• Pulling out the connector of the battery without the lock release lever pressed may damage the CN4 connector of the servo amplifier or the connector of the battery.

#### Replacement procedure of the built-in battery

When the MR-BAT6V1SET-A reaches the end of its life, replace the MR-BAT6V1 battery in the MR-BAT6V1SET-A.

**1.** While pressing the locking part, open the cover.

# MR-BAT6V1BJ battery for junction battery cable

#### Point P

- MR-BAT6V1BJ is compatible only with HG series servo motors. It cannot be used with direct drive motors.
- MR-BAT6V1BJ cannot be used for fully closed loop system.
- When MR-BAT6V1BJ is mounted on the MR-J4-500GF(-RJ), the front cover does not open. For this reason, carry out wiring to the terminal block before mounting MR-BAT6V1BJ.
- For using the MR-J4-350GF4(-RJ), contact your local sales office.

#### Parts identification and dimensions

#### Production year and month of batteries

Production year and month are indicated in a serial number (SERIAL) on the rating plate. The second digit from left in the number indicates the first digit of the dominical year, the third digit from left indicates a month (Oct: X, Nov: Y, Dec.: Z). For November 2013, the Serial No. would be "SERIAL: \_ 3Y \_ \_ \_ \_ \_".

#### Specification list

| Item                                    | Description                                                                                                                                                                      |  |  |  |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|--|
| Battery pack                            | 2CR17335A (CR17335A × 2 pcs. in series)                                                                                                                                          |  |  |  |
| Nominal voltage [V]                     | 6                                                                                                                                                                                |  |  |  |

| Mercury content                         | Less than 1 ppm                                                                                                                                                                  |  |  |  |
| Dangerous goods class                   | Inapplicable to the dangerous goods (Class 9)<br>SP Page 592 Handling of AC servo amplifier batteries for the United Nations Recommendations on the Transport of Dangerous Goods |  |  |  |
| Operating humidity and storage humidity | 5 %RH to 90 %RH (non-condensing)                                                                                                                                                 |  |  |  |
| Battery life <sup>*1</sup>              | 5 years from date of manufacture                                                                                                                                                 |  |  |  |
| Mass [g]                                | 66                                                                                                                                                                               |  |  |  |

\*1 Quality of the batteries degrades by the storage condition. The battery life is 5 years from the production date regardless of the connection status.

#### **Battery mounting**

Connect the MR-BAT6V1BJ using the MR-BT6VCBL03M junction battery cable as follows.

#### Transporting a servo motor and machine apart

#### Point P

Be sure to connect the black connector to the MR-BT6VCBL03M junction battery cable when transporting a servo motor and machine apart. When the black connector is not connected to the MR-BT6VCBL03M junction battery cable, no alarm occurs. However, the absolute position data will be erased when you transport a servo motor and machine apart.

When you transport a servo motor and machine apart, disconnect only CN2 and CN4 of the servo amplifier. When other connectors or cables are disconnected between the servo motor and battery, the absolute position data will be deleted.

#### Servo amplifier

Orange: Connector for servo amplifier

#### Battery replacement procedure

# 

• Before replacing a battery, turn off the main circuit power and wait for 15 minutes or longer until the charge lamp turns off. Then, check the voltage between P+ and N- with a voltage tester or others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, be sure to look at the lamp from the front of the servo amplifier.

#### 

• The internal circuits of the servo amplifier may be damaged by static electricity. Always take the following precautions. Ground human body and work bench.

Do not touch the conductive areas, such as connector pins and electrical parts, directly by hand.

• The battery built in MR-BAT6V1BJ cannot be replaced. Do not disassemble the MR-BAT6V1BJ. Otherwise, it may cause a malfunction.

#### Point P

 To replace the MR-BAT6V1BJ, follow the procedures given in this section to avoid erasing absolute position data.

· Before replacing batteries, check that the new battery is within battery life.

MR-BAT6V1BJ can be replaced even with the control circuit power supply off.

#### Battery installation and removal procedure

For the battery installation and removal procedure, refer to the following.

Page 388 Battery replacement procedure

#### Preparation for replacing MR-BAT6V1BJ

Prepare a new MR-BAT6V1BJ as follows.

| Model       | Number and use    | Remark                                             |
|-------------|-------------------|----------------------------------------------------|
| MR-BAT6V1BJ | 1 for replacement | Battery within two years from the production date. |

#### ■Procedures of replacing MR-BAT6V1BJ

Replace the battery with the following procedure regardless of on/off of the control circuit power supply. When it is replaced with other procedures, the absolute position data will be erased.

1. Remove the black connector of the old MR-BAT6V1BJ.

- Old MR-BAT6V1BJ
  - Black New MR-BAT6V1BJ
- 2. Connect the black connector of the new MR-BAT6V1BJ.

3. Remove the orange connector of the old MR-BAT6V1BJ. When the control circuit power supply is on, performing 3) without [AL. 9F.1 Low battery] triggers [AL. 9F.1].

4. Remove the old MR-BAT6V1BJ from servo amplifier and mount the new MR-BAT6V1BJ. When the control circuit power supply is on, [AL. 9F.1] occurs after 3).

5. Mount the orange connector of the new MR-BAT6V1BJ. When the control circuit power supply is on, [AL. 9F.1] is canceled.

### **MR-BT6VCASE** battery case

Point P

- The battery unit consists of an MR-BT6VCASE battery case and five MR-BAT6V1 batteries.
- For the specifications and year and month of manufacture of MR-BAT6V1 battery, refer to the following. Page 401 MR-BAT6V1 battery

MR-BT6VCASE is a case used for connecting and mounting five MR-BAT6V1 batteries. A battery case does not have any batteries. Please prepare MR-BAT6V1 batteries separately.

#### Number of connectable servo motors

One MR-BT6VCASE can hold the absolute position data of up to 8-axis servo motors. For direct drive motors, up to four axes can be connected. Servo motors and direct drive motors in the incremental system are included as the axis numbers. Linear servo motors are not counted as the axis numbers. Refer to the following table for the number of connectable axes of each servo motor.

| Servo motor        | Number of axes |   |   |   |   |   |   |   |   |
|--------------------|----------------|---|---|---|---|---|---|---|---|
| Rotary servo motor | 0              | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Direct drive motor | 4              | 4 | 4 | 4 | 4 | 3 | 2 | 1 | 0 |

#### Dimensions

[Unit: mm]

[Mass: 0.18 kg]

#### **Battery mounting**

Point P

One battery unit can be connected to up to 8-axis servo motors. However, when using direct drive motors, the number of axes of the direct drive motors should be up to 4 axes. Servo motors and direct drive motors in the incremental system are included as the axis numbers. Linear servo motors are not counted as the axis numbers.

#### Battery replacement procedure

### 

• Before replacing a battery, turn off the main circuit power and wait for 15 minutes or longer until the charge lamp turns off. Then, check the voltage between P+ and N- with a voltage tester or others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, be sure to look at the lamp from the front of the servo amplifier.

#### 

• The internal circuits of the servo amplifier may be damaged by static electricity. Always take the following precautions. Ground human body and work bench.

Do not touch the conductive areas, such as connector pins and electrical parts, directly by hand.

Point P

- Replacing battery with the control circuit power off will erase the absolute position data.
- · Before replacing batteries, check that the new battery is within battery life.

Replace the battery while only control circuit power is on. Replacing battery with the control circuit power on triggers [AL. 9F.1 Low battery]. However, the absolute position data will not be erased.

#### ■Assembling a battery unit

### 

- Do not use new batteries with old ones together.
- · Replace all the batteries with new ones at the same time at battery replacement.

Always install five MR-BAT6V1 batteries to an MR-BT6VCASE battery case.

#### · Required items

| Product name | Model       | Quantity | Remark                                                                              |
|--------------|-------------|----------|-------------------------------------------------------------------------------------|
| Battery case | MR-BT6VCASE | 1        | MR-BT6VCASE is a case used for connecting and<br>mounting five MR-BAT6V1 batteries. |
| Battery      | MR-BAT6V1   | 5        | Lithium battery (primary battery, nominal + 6 V)                                    |

• Disassembly and assembly of the battery case MR-BT6VCASE

Disassembly of the case

MR-BT6VCASE is shipped assembled. To mount MR-BAT6V1 batteries, the case needs to be disassembled.

**1.** Securely mount an MR-BAT6V1 to the BAT1 holder.

**2.** Insert the MR-BAT6V1 connector mounted on BAT1 holder to CON1.

Confirm the click sound at this point.

The connector has to be connected in the right direction.

If the connector is pushed forcefully in the incorrect direction, the connector will break.

Place the MR-BAT6V1 lead wire to the duct designed to store lead wires.

Insert MR-BAT6V1 to the holder in the same procedure in the order from BAT2 to BAT5.

**3.** Bring out the lead wire from the space between the ribs, and bend it as shown above to store it in the duct. Connect the lead wire to the connector.

Be careful not to get the lead wire caught in the case or other parts. When the lead wire is damaged, external short circuit may occur, and the battery can become hot. 11

#### Assembly of the case

After all MR-BAT6V1 batteries are mounted, fit the cover and insert screws into the two holes and tighten them. Tightening torque is 0.71 N•m.

#### Precautions for removal of battery

The connector attached to the MR-BAT6V1 battery has the lock release lever. When removing the connector, pull out the connector while pressing the lock release lever.

· Battery cable removal

#### 

• Pulling out the connector of the MR-BT6V1CBL and the MR-BT6V2CBL without the lock release lever pressed may damage the CN4 connector of the servo amplifier or the connector of the MR-BT6V1CBL or MR-BT6V2CBL.

### **MR-BAT6V1** battery

The MR-BAT6V1 battery is a lithium primary battery to be replaced in MR-BAT6V1SET-A and inserted in MR-BT6VCASE. Store the MR-BAT6V1 in the case to use.

The year and month of manufacture of MR-BAT6V1 battery are described to the rating plate put on an MR-BAT6V1 battery.

| Rating plate                            | 2CR17335A WK17<br>11-04<br>6V 1650mAh<br>The year and month of manufacture                                                                                                    |

| Battery life <sup>*1</sup>              | 5 years from date of manufacture                                                                                                                                              |
| Mass [g]                                | 34                                                                                                                                                                            |

\*1 Quality of the batteries degrades by the storage condition. The battery life is 5 years from the production date regardless of the connection status.

# **11.9** Selection example of wires

### Point P

- To comply with the IEC/EN/UL/CSA standard, use the wires shown in the following section for wiring. To comply with other standards, use a wire that is complied with each standard. 🖙 Page 595 Compliance with global standards
- For the selection example of when the MR-J4-\_GF-RJ servo amplifier is used with the DC power supply input, refer to the following. 🖙 Page 589 Selection example of wires
- · Selection conditions of wire size are as follows.

Construction condition: Single wire set in midair

Wire length: 30 m or less

The following diagram shows the wires used for wiring. Use the wires given in this section or equivalent.

3) Regenerative option lead

#### Example of selecting the wire sizes

Use the 600 V Grade heat-resistant polyvinyl chloride insulated wire (HIV wire) for wiring. The following shows the wire size selection example.

#### ■200 V class

| Servo amplifier                                  | Wire [mm <sup>2</sup> ] <sup>*1</sup> |                                                 |                 |                                                                     |  |  |  |  |

\*1 Alphabets in the table indicate crimping tools. For crimp terminals and applicable tools, refer to the following.

\*2 To connect these models to a terminal block, be sure to use the screws that come with the terminal block.

\*3 The wire size shows applicable size of the servo amplifier connector and terminal block. For wires connecting to the servo motor, refer to each servo motor instruction manual.

\*4 Be sure to use the size of 2 mm<sup>2</sup> when corresponding to IEC/EN/UL/CSA standard.

\*5 This is for connecting to the linear servo motor with natural cooling method.

Use wires (5)) of the following sizes with the power regeneration converter (FR-RC).

| Model     | Wire [mm <sup>2</sup> ] |
|-----------|-------------------------|
| FR-RC-15K | 14 (AWG 6)              |
| FR-RC-30K | 14 (AWG 6)              |
| FR-RC-55K | 22 (AWG 4)              |

\*1 Coat the crimping part with an insulation tube.

\*2 Some crimp terminals may not be mounted depending on the size. Make sure to use the recommended ones or equivalent ones.

# 11.10 Molded-case circuit breakers, fuses, magnetic contactors

### 

• To prevent the servo amplifier from smoke and a fire, select a molded-case circuit breaker which shuts off with high speed.

Always use one molded-case circuit breaker and one magnetic contactor with one servo amplifier.

#### Point P

For the selection when the MR-J4-\_GF-RJ servo amplifier is used with the DC power supply input, refer to the following.

IP Page 590 Molded-case circuit breakers, fuses, magnetic contactors

#### For main circuit power supply

When using a fuse instead of the molded-case circuit breaker, use the one having the specifications given in this section.

| Servo amplifier                                     | Molded-case circuit breaker*1*3                     |                                              |                | Fuse  |             |            | Magnetic                     |

\*2 Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less.

\*3 Use a molded-case circuit breaker which has the same or higher operation characteristics than our lineup.

\*4 S-N18 can be used when auxiliary contact is not required.

The Type E Combination motor controller can also be used instead of a molded-case circuit breaker.

\*1 The values of the SCCR vary depending on the combination with the servo amplifier.

\*2 1-phase input is not supported.

407

#### For control circuit power supply

When the wiring for the control circuit power supply (L11/L21) is thinner than that for the main circuit power supply (L1/L2/L3), install an overcurrent protection device (molded-case circuit breaker, fuse, etc.) to protect the branch circuit.

| Servo amplifier   | Molded-case circuit  | breaker <sup>*1</sup> | Fuse (Class T) |                | Fuse (Class K5) | l              |

\*1 When having the servo amplifier comply with the IEC/EN/UL/CSA standard, refer to the following.

## **11.11** Power factor improving DC reactors

#### Advantages

- It improves the power factor by increasing the form factor of the servo amplifier's input current.
- · It decreases the power supply capacity.
- The input power factor is improved to about 85%.
- · As compared to the power factor improving AC reactor (FR-HAL-(H)), it decreases the loss.

#### Restrictions

When connecting the power factor improving DC reactor to the servo amplifier, always disconnect P3 and P4. If it remains connected, the effect of the power factor improving DC reactor is not produced.

When used, the power factor improving DC reactor generates heat. To dissipate heat, therefore, maintain a minimum clearance of 10 cm each at the top and bottom, and 5 cm at the sides.

\*1 Use this for grounding.

\*2 When using the power factor improving DC reactor, remove the short bar between P3 and P4.

\*3 Maximum dimensions. The dimension varies depending on the input/output lines.

\*4 Selection conditions of wire size are as follows.

Wire type: 600 V Grade heat-resistant polyvinyl chloride insulated wire (HIV wire) Construction condition: Single wire set in midair

409

4-d mounting hole (Varnish is removed from lower right only (front and back).)\*1 6

# 11.12 Power factor improving AC reactors

#### Advantages

- It improves the power factor by increasing the form factor of the servo amplifier's input current.
- · It decreases the power supply capacity.
- The input power factor is improved to about 80%.

#### Restrictions

When using power factor improving AC reactors for two servo amplifiers or more, be sure to connect a power factor improving AC reactor to each servo amplifier. If one unit of power factor improving reactor is used for multiple servo amplifiers, the power factor cannot be improved sufficiently unless all servo amplifiers are operated.

# 11.13 Relay (recommended)

The following relays should be used with the interfaces.

| Interface                                    | Selection example                                                            |
|----------------------------------------------|------------------------------------------------------------------------------|
| Digital input (interface DI-1)               | To prevent defective contacts, use a relay for small signal (twin contacts). |
| Relay used for digital input command signals | (Ex.) Omron: type G2A, MY                                                    |
| Digital output (interface DO-1)              | Small relay with 12 V DC or 24 V DC of rated current 40 mA or less           |
| Relay used for digital output signals        | (Ex.) Omron: type MY                                                         |

# **11.14** Noise reduction techniques

Noises are classified into external noises which enter the servo amplifier to cause it to malfunction and those radiated by the servo amplifier to cause peripheral equipment to malfunction. Since the servo amplifier is an electronic device which handles small signals, the following general noise reduction techniques are required.

Also, the servo amplifier can be a source of noise as its outputs are chopped by high carrier frequencies. If peripheral equipment malfunctions due to noises produced by the servo amplifier, noise suppression measures must be taken. The measures will vary slightly with the routes of noise transmission.

#### Noise reduction techniques

#### ■General reduction techniques

- Avoid bundling power lines (input/output) and signal cables together or running them in parallel to each other. Separate the power lines from the signal cables.
- Use a shielded twisted pair cable for connection with the encoder and for control signal transmission, and connect the external conductor of the cable to the SD terminal.
- Ground the servo amplifier, servo motor, etc. together at one point.

#### ■Reduction techniques for external noises that cause the servo amplifier to malfunction

If there are noise sources (such as a magnetic contactor, an electromagnetic brake, and many relays which make a large amount of noise) near the servo amplifier and the servo amplifier may malfunction, the following countermeasures are required.

- Provide surge absorbers on the noise sources to suppress noises.
- Attach data line filters to the signal cables.
- · Ground the shields of the encoder connecting cable and the control signal cables with cable clamp fittings.
- Although a surge absorber is built into the servo amplifier, to protect the servo amplifier and other equipment against large exogenous noise and lightning surge, attaching a varistor to the power input section of the equipment is recommended.

# ■Techniques for noises radiated by the servo amplifier that cause peripheral equipment to malfunction

Noises produced by the servo amplifier are classified into those radiated from the cables connected to the servo amplifier and its main circuits (input and output circuits), those induced electromagnetically or statically by the signal cables of the peripheral equipment located near the main circuit cables, and those transmitted through the power supply cables.

| Noise transmission route | Suppression techniques                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 7)                       | <ul> <li>When the power supply of peripheral equipment is connected to the power supply of the servo amplifier system, noises produced by the servo amplifier may be transmitted back through the power supply cable and the devices may malfunction. The following techniques are required.</li> <li>Install the radio noise filter (FR-BIF(-H)) on the power lines (Input lines) of the servo amplifier.</li> <li>Install the line noise filter (FR-BSF01/FR-BLF) on the power lines of the servo amplifier.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 8)                       | If the grounding wires of the peripheral equipment and the servo amplifier make a closed loop circuit, leakage current may flow through, causing the equipment to malfunction. In this case, the malfunction may be prevented by the grounding wires disconnected from the equipment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

#### ■Noise reduction techniques for the network cable

Point P

Take measures against noise for both ends of the network cable.

When using it in an environment with excessive noise, directly connect the shield of the network cable to the ground plate with cable clamp fittings at a place 200 mm to 300 mm or less from the servo amplifier.

When connecting the network cable from outside the cabinet, connect it to the ground plate at a place 5 mm to 10 mm away from the cabinet entrance.

To reinforce measures against noise, it is recommended to install a data line filter (TDK ZCAT1730-0730) to the network cable. Install the data line filter to a place 80 mm or less from the servo amplifier.

#### ■Data line filter (recommended)

Noise can be prevented by installing a data line filter onto the encoder cable, etc.

For example, ZCAT3035-1330 by TDK, ESD-SR-250 by TOKIN, GRFC-13 by Kitagawa Industries, and E04SRM563218 by SEIWA ELECTRIC are available as data line filters.

As a reference example, the impedance specifications of the ZCAT3035-1330 (TDK) are indicated below. These impedances are reference values and not guaranteed values.

| Impedance [Ω]     |                    |  |  |  |  |
|-------------------|--------------------|--|--|--|--|
| 10 MHz to 100 MHz | 100 MHz to 500 MHz |  |  |  |  |
| 80                | 150                |  |  |  |  |

#### Surge killer (recommended)

Use of a surge killer is recommended for AC relay, magnetic contactor or the like near the servo amplifier. Use the following surge killer or equivalent.

Ex. CR-50500 (Okaya Electric Industries)

| Rated<br>voltage<br>AC [V] | C [μF ±<br>20%] | R [Ω ±<br>30%] | Test voltage                                                                                                             | Dimensions [Unit: mm]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Note that a diode should be installed to a DC relay or the like.

Maximum voltage: Not less than four times the drive voltage of the relay or the like.

Maximum current: Not less than twice the drive current of the relay or the like.

#### ■Cable clamp fitting AERSBAN-\_SET

Generally, connecting the grounding of the shielded wire to the SD terminal of the connector provides a sufficient effect. However, the effect can be increased when the shielded wire is connected directly to the grounding plate as shown below. Install the grounding plate near the servo amplifier for the encoder cable. Peel part of the cable sheath to expose the external conductor, and press that part against the grounding plate with the cable clamp. If the cable is thin, clamp several cables in a bunch.

The cable clamp comes as a set with the grounding plate.

#### Line noise filter (FR-BSF01/FR-BLF)

This filter is effective in suppressing noises radiated from the power supply side and output side of the servo amplifier and also in suppressing high-frequency leakage current (0-phase current). It especially affects the noises between 0.5 MHz and 5 MHz band.

#### ■Radio noise filter (FR-BIF(-H))

This filter is effective in suppressing noises radiated from the power supply side of the servo amplifier especially in 10 MHz and lower radio frequency bands. The FR-BIF(-H) is designed for the input only.

#### 100 V class/200 V class: FR-BIF

400 V class: FR-BIF-H

#### **Connection diagram**

Make the connection cables as short as possible. Grounding is always required.

When using the FR-BIF with a single-phase power supply, always insulate the lead wires that are not used for wiring.

• MR-J4-350GF(-RJ) or less, MR-J4-350GF4(-RJ) or less, and MR-J4-40GF1(-RJ) or less

• MR-J4-500GF(-RJ) or more, MR-J4-500GF4(-RJ) or more

#### 11 OPTIONS AND PERIPHERAL EQUIPMENT 11.14 Noise reduction techniques 427

#### ■Varistor for input power supply (recommended)

Varistors are effective to prevent exogenous noise and lightning surge from entering the servo amplifier. When using a varistor, connect it between each phase of the input power supply of the equipment. For varistors, the TND20V-431K, TND20V-471K and TND20V-102K, manufactured by Nippon Chemi-Con, are recommended. For detailed specification and usage of the varistors, refer to the manufacturer catalog.

## 11.15 Earth-leakage current breaker

#### Selection method

High-frequency chopper currents controlled by pulse width modulation flow in the AC servo circuits. Leakage currents containing harmonic contents are larger than those of the motor which is run with a commercial power supply. Select an earth-leakage current breaker according to the following formula, and ground the servo amplifier, servo motor, etc. securely.

To minimize leakage currents, make the input and output wires as short as possible, and keep a distance of 30 cm or longer between the wires and ground.

Rated sensitivity current  $\geq$  10 • {lg1 + lgn + lga + K • (lg2 + lgm)} [mA] · · · (11.1)

| Earth-leakage current breaker                     | к                            |   |

## Selection example

Indicated below is an example of selecting an earth-leakage current breaker under the following conditions.

Use an earth-leakage current breaker designed for suppressing harmonics/surges. Find the terms of equation (11.1) from the diagram.

$$Ig1 = 20 \cdot \frac{5}{1000} = 0.1 [mA]$$

 $Ig2 = 20 \cdot \frac{5}{1000} = 0.1 \text{ [mA]}$ 

Ign = 0 (not used)

Iga = 0.1 [mA]

Igm = 0.1 [mA]

Insert these values in equation (11.1).

 $lg \geq 10 \bullet \{0.1 + 0 + 0.1 + 1 \bullet (0.1 + 0.1)\}$ 

$$lg \ge 4 [mA]$$

According to the result of calculation, use an earth-leakage current breaker having the rated sensitivity current (Ig) of 4.0 mA or more.

Use an earth-leakage current breaker having Ig of 15 mA with the NV-SP/SW/CP/CW/HW series.

## 11.16 EMC filter (recommended)

**Point** 

When connecting multiple servo amplifiers to one EMC filter, refer to section 6.4 of "EMC Installation Guidelines".

It is recommended that one of the following filters be used to comply with EN EMC directive. Some EMC filters have large in leakage current.

| Combination with the servo amplifier                     |                                      |                   |                        |                         |           |
|----------------------------------------------------------|--------------------------------------|-------------------|------------------------|-------------------------|-----------|
| Servo amplifier                                          | Recommended filter (Soshin Electric) |                   |                        |                         | Mass [kg] |
|                                                          | Model                                | Rated current [A] | Rated voltage<br>[VAC] | Leakage current<br>[mA] |           |

## 11.17 External dynamic brake

## 

• Use an external dynamic brake for a servo amplifier of MR-J4-11KGF(-RJ) to MR-J4-22KGF(-RJ) and MR-J4-11KGF4(-RJ) to MR-J4-22KGF4(-RJ). Failure to do so will cause an accident because the servo motor does not stop immediately but coasts at an alarm occurrence for which the servo motor does not decelerate to stop. Ensure the safety in the entire equipment. For alarms for which the servo motor does not decelerate to stop, refer to the following.

• The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.

## Point P

- EM2 has the same function as EM1 in the torque mode.
- Configure a sequence which switches off the magnetic contactor of the external dynamic brake after (or as soon as) the servo-on command has been turned off at a power failure or a malfunction.
- For the braking time taken when the external dynamic brake is operated, refer to the following.
- The external dynamic brake is rated for a short duration. Do not use it very frequently.
- When using the 400 V class external dynamic brake, the power supply voltage is restricted to 1-phase 380 V AC to 463 V AC (50 Hz/60 Hz).
- The external dynamic brake operates when an alarm or [AL. E6 Servo forced stop warning] occurs, STO (STO1, STO2) or ready-on command is off, or the power is turned off. Do not use the external dynamic brake to stop in a normal operation as it is the function to stop in emergency.
- For a machine operating at the recommended load to motor inertia ratio or less, the estimated number of usage times of the external dynamic brake is 1000 times while the machine decelerates from the rated speed to a stop once in 10 minutes.
- Be sure to enable EM1 (Forced stop 1) after servo motor stops when using EM1 (Forced stop 1) frequently in other than emergency.

## Selection of external dynamic brake

The dynamic brake is designed to bring the servo motor to a sudden stop when a power failure occurs or the protective circuit is activated, and is built in the servo amplifier of 7 kW or less. Since it is not built in the servo amplifier of 11 kW or more, purchase it separately. Assign DB (Dynamic brake interlock) to any of CN3-9, CN3-13, and CN3-15 pins in [Pr. PD07] to [Pr. PD09].

| Servo amplifier   | External dynamic     | Molded-case circuit | case circuit breaker Fuse (Class T) |                   | s T) Fuse (Class K5) |                   | 5 K5) |
|-------------------|----------------------|---------------------|-------------------------------------|-------------------|----------------------|-------------------|-------|
| brake             | Frame, rated current | Voltage<br>AC [V]   | Current<br>[A]                      | Voltage<br>AC [V] | Current<br>[A]       | Voltage<br>AC [V] |       |
| MR-J4-11KGF(-RJ)  | DBU-11K              | 30 A frame 5 A      | 240                                 | 1                 | 300                  | 1                 | 250   |
| MR-J4-15KGF(-RJ)  | DBU-15K              |                     |                                     |                   |                      |                   |       |
| MR-J4-22KGF(-RJ)  | DBU-22K-R1           |                     |                                     |                   |                      |                   |       |
| MR-J4-11KGF4(-RJ) | DBU-11K-4            | 30 A frame 5 A      | 480                                 | 1                 | 600                  | 1                 | 600   |
| MR-J4-15KGF4(-RJ) | DBU-22K-4            | ]                   |                                     |                   |                      |                   |       |
| MR-J4-22KGF4(-RJ) | 1                    |                     |                                     |                   |                      |                   |       |

## **Connection example**

## 200 V class

- \*1 Terminals 13 and 14 are normally open contact outputs. If the external dynamic brake is seized, terminals 13 and 14 will open. Therefore, configure up an external sequence to prevent servo-on.
- \*2 Assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09].
- \*3 For the power supply specifications, refer to the following.
- \*4 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*5 Turn off EM2 when the main power circuit power supply is off.
- \*6 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
- \*7 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- \*8 The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.
- \*9 Install an overcurrent protection device (molded-case circuit breaker, fuse, or others) to protect the branch circuit.
  - Page 406 Molded-case circuit breakers, fuses, magnetic contactors
  - Page 439 Selection of external dynamic brake

## 400 V class

- \*1 Terminals 13 and 14 are normally open contact outputs. If the external dynamic brake is seized, terminals 13 and 14 will open. Therefore, configure up an external sequence to prevent servo-on.
- \*2 Assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09].
- \*3 For the power supply specifications, refer to the following.
- \*4 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*5 Turn off EM2 when the main power circuit power supply is off.
- \*6 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
- \*7 Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
  Improving Page 409 Power factor improving DC reactors
- \*8 Stepdown transformer is required when the coil voltage of the magnetic contactor is 200 V class.
- \*9 The power supply voltage of the inside magnet contactor for 400 V class external dynamic brake DBU-11K-4 and DBU-22K-4 is restricted as follows. When using these external dynamic brakes, use them within the following range of the power supply.

| External dynamic brake | Power supply voltage                      |
|------------------------|-------------------------------------------|
| DBU-11K-4              | 1-phase 380 V AC to 463 V AC, 50 Hz/60 Hz |
| DBU-22K-4              |                                           |

- \*10 The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.
- \*11 Install an overcurrent protection device (molded-case circuit breaker, fuse, or others) to protect the branch circuit.
  - Page 406 Molded-case circuit breakers, fuses, magnetic contactors
  - Page 439 Selection of external dynamic brake

## When you use the forced stop deceleration function

## ■Ready-off command from controller

\*1 ON: Dynamic brake is not activated.

OFF: Dynamic brake is activated.

\*2 There is delay caused by magnetic contactor built into the external dynamic brake (about 50 ms) and delay caused by the external relay.

## When the quick stop command (from controller) or EM2 (Forced stop 2) is off

Point P

• Keep the servo-on command (from controller) and ready-on command (from controller) on while EM2 (Forced stop 2) is off. When the servo-on command (from controller) or ready-on command (from controller) is off, forced stop deceleration does not function.

\*1 The model speed command is a speed command generated in the servo amplifier for forced stop deceleration of the servo motor.

\*2 ON: Dynamic brake is not activated. OFF: Dynamic brake is activated.

\*3 There is delay caused by magnetic contactor built into the external dynamic brake (about 50 ms) and delay caused by the external relay.

### ■Alarm occurrence

· When the forced stop deceleration function is enabled

\*1 The model speed command is a speed command generated in the servo amplifier for forced stop deceleration of the servo motor.

\*2 ON: Dynamic brake is not activated.

OFF: Dynamic brake is activated.

\*3 There is delay caused by magnetic contactor built into the external dynamic brake (about 50 ms) and delay caused by the external relay.

• When the forced stop deceleration function is disabled

\*1 ON: Dynamic brake is not activated.

OFF: Dynamic brake is activated.

\*2 There is delay caused by magnetic contactor built into the external dynamic brake (about 50 ms) and delay caused by the external relay.

### Both main and control circuit power supplies off

- \*1 When powering off, DB (Dynamic brake interlock) will be turned off, and the base circuit is turned off earlier than usual before an output shortage occurs.
- (Only when DB is assigned as an output signal)
- \*2 Variable according to the operation status.
- \*3 ON: Electromagnetic brake is not activated.
- OFF: Electromagnetic brake is activated.\*4 ON: Dynamic brake is not activated.
- OFF: Dynamic brake is activated.
- \*5 There is delay caused by magnetic contactor built into the external dynamic brake (about 50 ms) and delay caused by the external relay.

## When you do not use the forced stop deceleration function

#### Ready-off command from controller

It is the same as the following section.

Page 442 Ready-off command from controller

#### When the quick stop command (from controller) or EM1 (Forced stop 1) is off

\*1 ON: Dynamic brake is not activated. OFF: Dynamic brake is activated.

\*2 There is delay caused by magnetic contactor built into the external dynamic brake (about 50 ms) and delay caused by the external relay.

#### ■Alarm occurrence

Operation is the same as "When the forced stop deceleration function is disabled" in the following reference.

Page 444 Alarm occurrence

#### Both main and control circuit power supplies off

It is the same as the following section.

Page 445 Both main and control circuit power supplies off

# 11.18 Panel through attachment (MR-J4ACN15K/MR-J3ACN)

By using the panel through attachment, you can mount the servo amplifier with its heat generation area exposed outside the cabinet to dissipate the heat, enabling smaller cabinets.

In the cabinet, machine a hole having the panel cut dimensions, fit the panel through attachment to the servo amplifier with the fitting screws (4 screws supplied), and install the servo amplifier to the cabinet.

Please prepare screws for mounting. They do not come with.

The environment outside the cabinet when using the panel through attachment should be within the range of the servo amplifier operating environment.

The panel through attachments are used for MR-J4-11KGF(-RJ) to MR-J4-22KGF(-RJ) and MR-J4-11KGF4(-RJ) to MR-J4-22KGF4(-RJ).

The following shows the combinations.

# **11.19** Multifunction regeneration converter FR-XC-(H)

## Point P

For details of the multifunction regeneration converter FR-XC-(H), refer to the FR-XC Installation Guide (IB(NA)0600668ENG).

# Multifunction regeneration converter and dedicated stand-alone reactor

For the multifunction regeneration converter FR-XC-(H), install the dedicated stand-alone reactors in the following table.

| Multifunction regeneration converter | Dedicated stand-alone reactor |
|--------------------------------------|-------------------------------|
| FR-XC-7.5K                           | FR-XCL-7.5K                   |
| FR-XC-11K                            | FR-XCL-11K                    |
| FR-XC-15K                            | FR-XCL-15K                    |
| FR-XC-22K                            | FR-XCL-22K                    |
| FR-XC-30K                            | FR-XCL-30K                    |
| FR-XC-37K                            | FR-XCL-37K                    |
| FR-XC-55K                            | FR-XCL-55K                    |
| FR-XC-H7.5K                          | FR-XCL-H7.5K                  |
| FR-XC-H11K                           | FR-XCL-H11K                   |
| FR-XC-H15K                           | FR-XCL-H15K                   |
| FR-XC-H22K                           | FR-XCL-H22K                   |
| FR-XC-H30K                           | FR-XCL-H30K                   |
| FR-XC-H37K                           | FR-XCL-H37K                   |
| FR-XC-H55K                           | FR-XCL-H55K                   |

## Safety precautions

- Turn switch 1 of the function selection switch (SW2) for FR-XC-(H) to on (common bus regeneration mode).
- Do not supply power to the main circuit power supply terminals (L1/L2/L3) of the servo amplifier. Doing so will fail the servo amplifier and FR-XC-(H).
- Connect the DC power supply between the FR-XC-(H) and servo amplifier with correct polarity. Connection with incorrect polarity will fail the FR-XC-(H) and servo amplifier.
- For 400 V, use an input power supply with a rated voltage and permissible fluctuation in the following ranges. Rated voltage: 3-phase 380 V to 480 V, 50 Hz/60 Hz

Permissible fluctuation: 3-phase 323 V to 528 V, 50 Hz/60 Hz

## Servo amplifier setting

When using the FR-XC-(H), set the parameters as follows.

- [Pr. PA02]: "\_\_0 1"
- [Pr. PA04]: "0 0 \_ \_"
- [Pr. PC20]: "\_\_\_1"

## **Capacity selection**

## Selection conditions

FR-XC-(H) multifunction regeneration converter can be used for 200 V-class servo amplifiers from 100 W to 22 kW and 400 Vclass servo amplifiers from 600 W to 22 kW. Select a multifunction regeneration converter that meets the following conditions.

- Up to 10 servo amplifiers per FR-XC-(H)
- Total capacity of servo amplifiers [kW] ≤ Total capacity of servo amplifiers that can connect with FR-XC-(H) [kW]
- Effective value of total output power of servo motors [kW] ≤ Continuous output of FR-XC-(H) [kW]
- Maximum value of total output power of servo motors [kW] ≤ Instantaneous maximum output of FR-XC-(H) [kW]

| Item                                                               | FR-XC-(H)_ |           |          |      |     |      |      |
|--------------------------------------------------------------------|------------|-----------|----------|------|-----|------|------|
|                                                                    | 7.5K       | 11K       | 15K      | 22K  | 30K | 37K  | 55K  |
| Rated capacity [kW]                                                | 7.5        | 11        | 15       | 22   | 30  | 37   | 55   |
| Maximum number of connected servo amplifiers                       | 10         |           |          |      |     |      |      |
| Total of connectable servo amplifier capacities [kW] <sup>*1</sup> | 3.5 (5.5)  | 5.5 (7.5) | 7.5 (11) | 22   | 30  | 37   | 55   |
| Continuous output [kW] *1                                          | 3.5 (5.5)  | 5.5 (7.5) | 7.5 (11) | 18.5 | 22  | 30   | 45   |
| Instantaneous maximum output [kW]                                  | 11.25      | 16.5      | 22.5     | 33   | 45  | 55.5 | 82.5 |

\*1 Values in parentheses are for connections with six or fewer servo amplifiers.

## Selection example

This section shows the selection method for a multifunction regeneration converter used for connecting the following servo amplifiers.

| Servo amplifier | Servo motor |
|-----------------|-------------|
| MR-J4-500GF     | HG-SR502    |
| MR-J4-500GF     | HG-SR502    |
| MR-J4-11KGF     | HG-JR11K1M  |
| MR-J4-22KGF     | HG-JR22K1M  |

- 1. Calculate running power and regenerative power from the servo motor speed and torque as follows.
- · For rotary servo motors
- Running power and regenerative power [W] = Servo motor speed [r/min] × Torque [N·m]/9.55
- For linear servo motors
   Running power and regenerative power [W] = Servo motor speed [m/s] × Thrust [N]
   (Values with a positive sign are running power, and values with a negative sign are regenerative power.)
- **2.** Calculate the total output power of the servo motors from the running power and regenerative power of each servo motor.

- 3. Select a multifunction regeneration converter based on the selection conditions.
- Number of servo amplifiers:  $4 \le 10$
- $\Rightarrow$  No problem with the number of connected units
- Total of servo amplifier capacity [kW] = 5 kW + 5 kW + 11 kW + 22 kW = 43 kW  $\Rightarrow$  FR-XC-55K
- Effective value of total output power of servo motors [kW]

 $= \sqrt{(20^2 \times 0.1 + 5^2 \times 0.2 + 20^2 \times 0.5 + 40^2 \times 0.1 + 5^2 \times 0.1 + (-15)^2 \times 0.1)/1.2} = 18.93 \text{ kW}$ 

- $\Rightarrow$  Equivalent to or greater than FR-XC-30K
- Maximum value of total output power of servo motors [kW] = 40 kW
  - $\Rightarrow$  Equivalent to or greater than FR-XC-30K

From the conditions above, "FR-XC-55K" will be selected as the multifunction regeneration converter.

## **Connection diagram**

## 200 V class

- \*1 Configure a sequence that will shut off main circuit power in the following. • An alarm occurred at FR-XC or servo amplifier. • EM1 (Forced stop 1) is enabled.
- \*2 For the servo amplifier, configure a sequence that will switch the servo-on after the FR-XC is ready.
- \*3 Configure a sequence that will use the forced stop input of the servo amplifier to make a stop if an alarm occurs in the FR-XC. When the controller does not have an emergency stop input, use the forced stop input of the servo amplifier to make a stop as shown in the diagram.
- \*4 When using FR-XC, always disconnect wiring between P3 and P4 terminals.
- \*5 Set [Pr. PA04] to "0 0 \_ \_" to enable EM1 (Forced stop 1).
- \*6 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*7 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
- \*8 For supplying power dedicated to the control circuit, remove the jumpers for R1/L11 and S1/L21.
- \*9 Do not connect anything to the P4 terminal of the FR-XC.
- \*10 Install a fuse to each of the wires between the FR-XC and servo amplifier.
- \*11 When using the servo amplifier of 7 kW or less, make sure to connect the wiring of the built-in regenerative resistor. (factory-wired) (5 kW or less: Between P+ and D, 7 kW: Between P+ and C)

## 400 V class

- \*1 Configure a sequence that will shut off main circuit power in the following. • An alarm occurred at FR-XC-H or servo amplifier.
  - · EM1 (Forced stop 1) is enabled.
- \*2 For the servo amplifier, configure a sequence that will switch the servo-on after the FR-XC-H is ready.
- \*3 Configure a sequence that will use the forced stop input of the servo amplifier to make a stop if an alarm occurs in the FR-XC-H. When the controller does not have an emergency stop input, use the forced stop input of the servo amplifier to make a stop as shown in the diagram.
- \*4 When using FR-XC-H, always disconnect wiring between P3 and P4 terminals.
- \*5 Set [Pr. PA04] to "0 0 \_ \_" to enable EM1 (Forced stop 1).
- \*6 When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker.
- \*7 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
- \*8 For supplying power dedicated to the control circuit, remove the jumpers for R1/L11 and S1/L21.
- \*9 Do not connect anything to the P4 terminal of the FR-XC-H.
- \*10 Install a fuse to each of wires between the FR-XC-H and servo amplifier.
- \*11 When using the servo amplifier of 7 kW or less, make sure to connect the wiring of the built-in regenerative resistor. (factory-wired) (3.5 kW or less: Between P+ and D, 5 kW/7 kW: Between P+ and C)

## Wires and peripheral options

## Wire size

## Point P

Selection conditions of wire size are as follows. Wire type: 600 V Grade heat-resistant polyvinyl chloride insulated wire (HIV wire) Construction condition: Single wire set in midair

## ■Between P/+ and P4, and between N/- and N-

The following table shows the wire sizes between the FR-XC-(H) and servo amplifier.

| Total of servo amplifier capacities [kW] | Wire size [mm <sup>2</sup> ] |              |
|------------------------------------------|------------------------------|--------------|
|                                          | 200 V class                  | 400 V class  |
| 1 or less                                | 2 (AWG 14)                   | 2 (AWG 14)   |
| 2                                        | 3.5 (AWG 12)                 | 2 (AWG 14)   |
| 3.5                                      | 5.5 (AWG 10)                 | 3.5 (AWG 12) |

#### ■Grounding

The following shows grounding wire sizes of FR-XC-(H). Make the wire as short as possible.

| Multifunction regeneration converter | Wire size [mm <sup>2</sup> ]                                                                                    |                                                                                                                 |  |  |  |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|--|--|--|

## Selection example of wire size (Between P/+ and P4, and between N/- and N-)

When connecting multiple servo amplifiers, always use junction terminals for wiring the servo amplifier terminals P4 and N-. Connect the servo amplifiers in the order of larger to smaller capacities.

## ■200 V class

#### ■400 V class

## Fuse (Between P/+ and P4, and between N/- and N-)

The following table shows the recommended fuse products to be installed between the FR-XC-(H) and servo amplifier.

| Servo amplifier | 200 V class        |                     | 400 V class        |                     |  |
|-----------------|--------------------|---------------------|--------------------|---------------------|--|
| capacity [kW]   | Rating of fuse [A] | Model *1            | Rating of fuse [A] | Model <sup>*1</sup> |  |
| 0.1             | 20                 | 6.900CPGR10.38 0020 | —                  | —                   |  |

\*1 Models in parentheses can be used when the following condition is met: Rated capacity of multifunction regeneration converter ≥ Total capacity of connected servo amplifiers × 2.

# **12** ABSOLUTE POSITION DETECTION SYSTEM

## 

• If [AL. 25 Absolute position erased] or [AL. E3 Absolute position counter warning] occurs, be sure to make perform home position setting again. Otherwise, it may cause an unexpected operation.

• If [AL. 25], [AL. 92], or [AL. 9F] occurs due to a failure, such as short circuit of the battery, the MR-BAT6V1 battery may be hot. Use the MR-BAT6V1 battery with a case to prevent getting burnt.

## Point P

Refer to the following for the replacement procedure of the battery.

Page 386 Battery

For configuring the absolute position detection system, there are three batteries of MR-BAT6V1SET-A, MR-BAT6V1BJ and MR-BT6VCASE. Compared with other batteries, MR-BAT6V1BJ has the following advantages.

- You can disconnect the encoder cable from the servo amplifier.
- · You can change the battery with the control circuit power supply off.

When absolute position data is erased from the encoder, always execute home position setting before operation. The absolute position data of the encoder will be erased in the following. When the battery is used out of specification, the absolute position data can be erased.

When the MR-BAT6V1SET-A and MR-BT6VCASE are used

- The encoder cable was disconnected.
- The battery was replaced when the control circuit power supply was off.

When the MR-BAT6V1BJ is used

- · A connector or cable was disconnected between the servo motor and battery.
- The battery was replaced with other procedure than in the following section.
  - Page 393 Battery replacement procedure

When the following parameters are changed, the home position will be erased at the next power-on.

Execute the home position return again at the next power-on.

- [Pr. PA01 Operation mode]
- [Pr. PA06 Electronic gear numerator (command pulse multiplication numerator)]
- [Pr. PA07 Electronic gear denominator (command pulse multiplication denominator)]
- [Pr. PA14 Rotation direction selection/travel direction selection]
- "Unit for position data (\_ x \_ \_)" in [Pr. PT01]
- [Pr. PT08 Home position return position data]
- [Pr. PT28 Number of stations per rotation]
- [Pr. PT47 Home position return position data (extension parameter)]

#### Restrictions

The absolute position detection system cannot be configured under the following condition.

• Stroke-less coordinate system, such as an axis of rotation whose unit for position data is set to other than [degree], infinite positioning

For the use in the I/O mode and on CC-Link IE Field Network Basic, the absolute position detection system cannot be configured under the following condition as well.

• Incremental value command method ([Pr. PT01] = "\_\_\_1") is used.

When any of the following conditions is met, ZP2 turns off. Therefore, executing positioning operation again without home position return will trigger [AL. 90 Home position return incomplete warning].

#### **ZP2** off conditions

Servo-off status (The servo is off, EM1 or EM2 is off, an alarm occurs, STO is off, or [AL. E9 Main circuit off warning] occurs.)

Stroke limit is off.

Software limit is detected.

For configuring the absolute position detection system in the incremental value command method, specify the incremental value command by a point table auxiliary function. Refer to the following for details.

MELSERVO MR-J4-\_GF\_(-RJ) Servo Amplifier Instruction Manual (I/O Mode)

MELSERVO MR-J4-\_GF\_(-RJ) Servo Amplifier Instruction Manual (CC-Link IE Field Network Basic)

# 12.1 Summary

## Features

For normal operation, the encoder consists of a detector designed to detect a position within one revolution and a cumulative revolution counter designed to detect the number of revolutions.

The absolute position detection system always detects the absolute position of the machine and keeps it battery-backed, independently of whether the controller power is on or off. Therefore, once home position return is made at the time of machine installation, home position return is not needed when power is switched on thereafter. Even at a power failure or a malfunction, the system can be easily restored.

## Structure

The following shows the structure of the absolute position detection system. Refer to the following for each battery connection.

Page 386 Battery

## **Parameter setting**

## Absolute position detection system selection

Set "\_\_\_1" in [Pr. PA03] to enable the absolute position detection system.

Absolute position detection system selection

0: Disabled (used in incremental system)

1: Enabled (used in absolute position detection system)

## [AL. E3 Absolute position counter warning] selection

When a simple motion module QD77GF\_ or RD77GF\_, or simple motion board MR-EM340GF is used, set [Pr. PC18] to "\_\_ 0 \_".

[AL. E3 Absolute position counter warning] selection 0: Disabled 1: Enabled

## Confirmation of absolute position detection data

You can check the absolute position data with MR Configurator2. Choose "Monitor" and "ABS Data Display" to open the absolute position data display screen.

| ABS Data Display                                 |                                        |

|                                                       | Direct drive motor | Approximately 5,000 hours (equipment power supply: off, ambient temperature: 20 °C)<br>Approximately 15,000 hours (power-on time ratio: 25%, ambient temperature: $20 \ ^{\circ}C)^{*3}$ |  |  |  |

\*1 Maximum speed available when the shaft is rotated by external force at the time of power failure or the like. Also, if power is switched on at the servo motor speed of 3000 r/min or higher, position mismatch may occur due to external force or the like.

\*2 The data-holding time by the battery using MR-BAT6V1SET-A. Replace the batteries within three years since the operation start regardless of the power supply of the servo amplifier on/off. If the battery is used out of specification, [AL. 25 Absolute position erased] may occur.

\*3 The power-on time ratio of 25% is equivalent to when the power is on for 8 hours a day on weekdays and off on weekends.

## Using MR-BAT6V1BJ battery for junction battery cable

Point P

MR-BAT6V1BJ is compatible only with HG series servo motors. It cannot be used with direct drive motors.
MR-BAT6V1BJ cannot be used for fully closed loop system.

## Using MR-BT6VCASE battery case

Point P

• One MR-BT6VCASE can hold the absolute position data of up to 8-axis servo motors.

• Always install five MR-BAT6V1 batteries to an MR-BT6VCASE.

| Maximum speed at power failure [r/<br>min] <sup>*1</sup> | Rotary servo motor | 6000<br>(only when acceleration time until 6000 r/min is 0.2 s or more)                                                                                                                                                                                                                                                   |
|                                                          | Direct drive motor | 500<br>(only when acceleration time until 500 r/min is 0.1 s or more)                                                                                                                                                                                                                                                     |
| Battery backup time <sup>*2</sup>                        | Rotary servo motor | Approximately 40,000 hours/2 axes or less, 30,000 hours/3 axes, or 10,000<br>hours/8 axes<br>(equipment power supply: off, ambient temperature: 20 ℃)<br>Approximately 55,000 hours/2 axes or less, 38,000 hours/3 axes, or 15,000<br>hours/8 axes<br>(power-on time ratio: 25%, ambient temperature: 20 ℃) <sup>*3</sup> |
|                                                          | Direct drive motor | Approximately 10,000 hours/2 axes or less, 7,000 hours/3 axes, or 5,000<br>hours/4 axes<br>(equipment power supply: off, ambient temperature: 20 ℃)<br>Approximately 15,000 hours/2 axes or less, 13,000 hours/3 axes, or 10,000<br>hours/4 axes<br>(power-on time ratio: 25%, ambient temperature: 20 ℃) <sup>*3</sup>   |

\*1 Maximum speed available when the shaft is rotated by external force at the time of power failure or the like. Also, if power is switched on at the servo motor speed of 3000 r/min or higher, position mismatch may occur due to external force or the like.

\*2 The data-holding time by the battery using five MR-BAT6V1s. The battery life varies depending on the number of axes (including axis for using in the incremental system). Replace the batteries within three years since the operation start regardless of the power supply of the servo amplifier on/off. If the battery is used out of specification, [AL. 25 Absolute position erased] may occur.

\*3 The power-on time ratio of 25% is equivalent to when the power is on for 8 hours a day on weekdays and off on weekends.

## **13** USING STO FUNCTION

Point P

In the torque mode, the forced stop deceleration function cannot be used.

## 13.1 Introduction

This section provides the cautions of the STO function.

## Summary

This servo amplifier complies with the following safety standards.

- ISO/EN ISO 13849-1:2015 Category 3 PL e
- IEC 61508 SIL 3
- IEC/EN 61800-5-2
- IEC/EN 62061 SIL CL3

## Terms related to safety

The STO function shuts off energy to servo motors, thus removing torque. MR-J4 shuts off the energy by turning off the power supply electronically in the servo amplifier.

The purpose of this function is as follows.

- · Uncontrolled stop according to stop category 0 of IEC/EN 60204-1
- · Preventing unexpected restart

## Cautions

The following basic safety notes must be read carefully and fully in order to prevent injury to persons or damage to property. Only qualified personnel are authorized to install, start-up, repair or service the machines in which these components are installed.

They must be familiar with all applicable local regulations and laws in which machines with these components are installed, particularly the standards mentioned in this manual.

The staff responsible for this work must be given express permission from the company to perform start-up, programming, configuration, and maintenance of the machine in accordance with the safety standards.

## 

• Improper installation of the safety related components or systems may cause improper operation in which safety is not assured, and may result in severe injuries or even death.

**Protective Measures** 

 This servo amplifier satisfies the Safe Torque Off (STO) function described in IEC/EN 61800-5-2 by preventing the energy supply from the servo amplifier to the servo motor. If an external force acts upon the drive axis, additional safety measures, such as brakes or counterbalances must be used.

469

## **Residual risks of the STO function**

Machine manufacturers are responsible for all risk evaluations and all associated residual risks. Below are residual risks associated with the STO function. Mitsubishi Electric is not liable for any damages or injuries caused by these risks.

- The STO function disables energy supply to the servo motor by electrical shut-off. The function does not mechanically
  disconnect electricity from the motor. Therefore, it cannot prevent exposure to electric shock. To prevent an electric shock,
  install a magnetic contactor or a molded-case circuit breaker to the main circuit power supply (L1/L2/L3) of the servo
  amplifier.
- The STO function disables energy supply to the servo motor by electrical shut-off. It does not guarantee the stop control or the deceleration control of the servo motor.
- For proper installation, wiring, and adjustment, thoroughly read the manual of each individual safety related component.
- · In the safety circuit, use components that are confirmed safe or meet the required safety standards.
- The STO function does not guarantee that the drive part of the servo motor will not rotate due to external or other forces.
- · Safety is not assured until safety-related components of the system are completely installed or adjusted.
- When replacing this servo amplifier, confirm that the model name of servo amplifiers are exactly the same as those being replaced. Once installed, make sure to verify the performance of the functions before commissioning the system.
- · Perform all risk assessments to the machine or the entire system.
- To prevent accumulation of malfunctions, perform function checks at regular intervals based on the risk assessments of the machine or the system. Regardless of the system safety level, malfunction checks should be performed at least once per year.
- If the upper and lower power modules in the servo amplifier are shorted and damaged simultaneously, the servo motor may make a half revolution at a maximum. For a linear servo motor, the primary side will move a distance of pole pitch.
- The STO input signals (STO1 and STO2) must be supplied from one power source. Otherwise, the STO function may not function properly due to a sneak current, failing to bring the STO shut-off state.
- For the STO I/O signals of the STO function, supply power by using a safety extra low voltage (SELV) power supply with the reinforced insulation.

#### Signals and STO state

The following table shows the TOFB and STO states when the power is on in normal state and STO1 and STO2 are on (closed) or off (opened).

| Input si | gnal | Status                                         |                                                |                                              |                   |  |
|----------|------|------------------------------------------------|------------------------------------------------|----------------------------------------------|-------------------|--|
| STO1     | STO2 | Between TOFB1 and<br>TOFCOM<br>(State of STO1) | Between TOFB2 and<br>TOFCOM<br>(State of STO2) | Between TOFB1 and<br>TOFB2<br>(State of STO) | STO               |  |
| Off      | Off  | On: STO state                                  | On: STO state                                  | On                                           | STO state         |  |
| Off      | On   | On: STO state                                  | Off: STO release state                         | Off *1                                       | STO state         |  |
| On       | Off  | Off: STO release state                         | On: STO state                                  | Off *1                                       | STO state         |  |
| On       | On   | Off: STO release state                         | Off: STO release state                         | Off                                          | STO release state |  |

\*1 Although the state is off between TOFB1 and TOFB2, the servo amplifier is in the STO state.

#### Test pulse of STO input signal

Set the test pulse off time inputted from outside to 1 ms or less.

## How to pull out the STO cable

The following shows how to pull out the STO cable from the CN8 connector of the servo amplifier.

With the clip (1)) of the STO cable plug pressed in the direction of the arrow, hold the plug (2)) and pull out.

## **13.3** Connection example

#### Point P

• Turn off STO (STO1 and STO2) after the servo motor stops by the servo off state or with forced stop deceleration by turning off EM2 (Forced stop 2). Configure an external sequence that has the timings shown as below using an external device such as the MR-J3-D05 safety logic unit.

| STO1 · STO2          | ON<br>OFF |  |
|----------------------|-----------|--|
| EM2                  | ON<br>OFF |  |
| Servo motor<br>speed | 0 r/min   |  |

• If STO is turned off during operation, the servo motor stops with the dynamic brake stop (stop category 0), and [AL. 63 STO timing error] occurs.

## **Connection example for CN8 connector**

This servo amplifier is equipped with the connector (CN8) in accordance with the STO function. When this connector is used with a certified external safety relay, power to the motor can be safely removed and unexpected restart can be prevented. The safety relay used should meet the applicable safety standards and have forcibly guided or mirror contacts for the purpose of error detection.

In addition, the MR-J3-D05 safety logic unit can be used instead of a safety relay for implementation of various safety standards.

Page 609 MR-J3-D05 Safety logic unit

The following diagram is for source interface. For sink interface, refer to the following.

Page 479 Sink I/O interface

\*1 With TOFB, whether the servo is in the STO state can be confirmed. For connection examples, refer to the following.
\*1 Page 475 External I/O signal connection example using an MR-J3-D05 safety logic unit
\*2 Page 478 External I/O signal connection example using an external safety relay unit
The safety level depends on the setting value of [Pr. PF18 STO diagnosis error detection time] and whether STO input diagnosis by
TOFB output is performed or not. For details, refer to the Function column of [Pr. PF18] below.
\*2 Page 217 Extension setting 3 parameters ([Pr. PF\_\_])

\*2 When using the STO function, turn off STO1 and STO2 at the same time. Turn off STO1 and STO2 after the servo motor stops by the servo off state or with forced stop deceleration by turning off EM2 (Forced stop 2).

\*3 Configure the interlock circuit so that the door opens after the servo motor stops.

## External I/O signal connection example using an MR-J3-D05 safety logic unit

Point P

This connection is for source interface. For the other I/O signals, refer to the connection examples in the following section.

Page 97 For source I/O interface

#### Connection example

\*1 Set the delay time of STO output with SW1 and SW2. These switches are recessed to prevent accidental change of the setting.

\*2 To release the STO state (base circuit shut-off), turn RESA and RESB on and turn them off.

#### Basic operation example

#### STOA is connected to the servo amplifier via MR-J3-D05. STOB is connected to the servo amplifier via MR-J3-D05.

## External I/O signal connection example using an external safety relay unit

Point P

This connection is for source interface. For the other I/O signals, refer to the connection examples in the following section.

Page 97 For source I/O interface

This connection example complies with the requirements of ISO/EN ISO 13849-1:2015 Category 3 PL d. For details, refer to the safety relay module user's manual.

\*1 To enable the STO function of the servo amplifier by using "Emergency switching off", change S1 to EMG. The stop category at this time is "0". If STO is turned off while the servo motor is rotating, [AL. 63 STO timing error] will occur.

## **13.4** Detailed explanation of interfaces

This section provides the details of the I/O signal interfaces (refer to the I/O division in the table) given in the following section. Refer to this section and make connection with the external device.

IP Page 472 STO I/O signal connector (CN8) and pin assignment

## Sink I/O interface

#### **Digital input interface DI-1**

This is an input circuit whose photocoupler cathode side is input terminal. Transmit signals from sink (open-collector) type transistor output, relay switch, etc.

#### Digital output interface DO-1

This is a circuit of collector output terminal of the output transistor. When the output transistor is turned on, collector terminal current will be applied to the output.

A lamp, relay or photocoupler can be driven. Install a diode (D) for an inductive load, or install an inrush current suppressing resistor (R) for a lamp load.

(Rated current: 40 mA or less, maximum current: 50 mA or less, inrush current: 100 mA or less)

A maximum of 5.2 V voltage drop occurs in the servo amplifier.

#### When outputting two STO states by using each TOFB

\*1 If the voltage drop (maximum of 2.6 V) interferes with the relay operation, apply high voltage (maximum of 26.4 V) from external source.

#### When outputting two STO states by using each TOFB

\*1 If the voltage drop (maximum of 5.2 V) interferes with the relay operation, apply high voltage (maximum of 26.4 V) from external source.

479

## Source I/O interface

In this servo amplifier, source type I/O interfaces can be used.

#### Digital input interface DI-1

This is an input circuit whose photocoupler anode side is input terminal. Transmit signals from source (open-collector) type transistor output, relay switch, etc.

#### **Digital output interface DO-1**

This is a circuit of emitter output terminal of the output transistor. When the output transistor is turned on, the current will flow from the output terminal to a load.

A maximum of 5.2 V voltage drop occurs in the servo amplifier.

#### When outputting two STO states by using each TOFB

\*1 If the voltage drop (maximum of 2.6 V) interferes with the relay operation, apply high voltage (maximum of 26.4 V) from external source.

#### When outputting two STO states by using each TOFB

\*1 If the voltage drop (maximum of 5.2 V) interferes with the relay operation, apply high voltage (maximum of 26.4 V) from external source.

## 

• When using the linear servo motor, read "Linear Servo Motor Instruction Manual" and "Linear Encoder Instruction Manual".

#### Point *P*

The linear servo motor is available for servo amplifiers with software version A1 or later.

## **14.1** Functions and configuration

## Summary

The following shows the differences between the linear servo motor and the rotary servo motor.

| Category                              | Item                                 |                         | Differences                            |                                    | Remark                                                                                                                                                                                                                                                                                                                       |

## **Configuration including peripheral equipment**

## 

· Connecting a linear servo motor for different axis to the U, V, W, or CN2 may cause a malfunction.

## Point P

- · Equipment other than the servo amplifier and linear servo motor are optional or recommended products. • When using the linear servo motor, set [Pr. PA01] to "\_\_4\_".

#### MR-J4-\_GF

The configuration diagram is an example of MR-J4-20GF. When using the other servo amplifiers, the configuration is the same as rotary servo motors except for connections of linear servo motors and linear encoders. Refer to the following depending on servo amplifiers you use.

Page 58 Configuration including peripheral equipment

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 A 1-phase 200 V AC to 240 V AC power supply may be used with the servo amplifier of MR-J4-200GF or less. For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 For the branch cable, use the MR-J4THCBL03M (optional).
- \*5 Always connect between P+ and D terminals. When using the regenerative option, refer to the following.
- \*6 Connect the thermistor to THM of branch cable and connect the encoder cable to SCALE correctly. Incorrect connection will trigger [AL. 16].

#### When using serial linear encoder with MR-J4-\_GF\_-RJ

The configuration diagram is an example of MR-J4-20GF-RJ. When using the other servo amplifiers, the configuration is the same as rotary servo motors except for connections of linear servo motors and linear encoders. Refer to the following depending on servo amplifiers you use.

Page 58 Configuration including peripheral equipment

- \*2 A 1-phase 200 V AC to 240 V AC power supply may be used with the servo amplifier of MR-J4-200GF-RJ or less. For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. Refer to the following for the power supply specifications.
  Image 30 Servo amplifier standard specifications
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 For the branch cable, use the MR-J4THCBL03M (optional).
- \*5 Always connect between P+ and D terminals. When using the regenerative option, refer to the following.
- \*6 Connect the thermistor to THM of branch cable and connect the encoder cable to SCALE correctly. Incorrect connection triggers [AL. 16].

#### When using A/B/Z-phase differential output linear encoder with MR-J4-\_GF\_-RJ

The configuration diagram is an example of MR-J4-20GF-RJ. When using the other servo amplifiers, the configuration is the same as rotary servo motors except for connections of linear servo motors and linear encoders. Refer to the following depending on servo amplifiers you use.

Page 58 Configuration including peripheral equipment

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 A 1-phase 200 V AC to 240 V AC power supply may be used with the servo amplifier of MR-J4-200GF-RJ or less. For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. Refer to the following for the power supply specifications.
  Image 30 Servo amplifier standard specifications
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 Always connect between P+ and D terminals. When using the regenerative option, refer to the following.
- \*5 Connect the thermistor to CN2 of servo amplifier and connect the encoder cable to CN2L correctly. Incorrect connection will trigger [AL. 16].

## 

- Any person who is involved in wiring should be fully competent to do the work.
- Before wiring, turn off the power and wait for 15 minutes or more until the charge lamp turns off. Then, confirm that the voltage between P+ and N- is safe with a voltage tester and others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, always confirm it from the front of the servo amplifier.
- · Ground the servo amplifier and the linear servo motor securely.
- Do not attempt to wire the servo amplifier and the linear servo motor until they have been installed. Otherwise, it may cause an electric shock.
- The cables should not be damaged, stressed, loaded, or pinched. Otherwise, it may cause an electric shock.
- To avoid an electric shock, insulate the connections of the power supply terminals.

## 

- Wire the equipment correctly and securely. Otherwise, the linear servo motor may operate unexpectedly, resulting in injury.
- · Connect cables to the correct terminals. Otherwise, a burst, damage, etc., may occur.
- Ensure that polarity (+/-) is correct. Otherwise, a burst, damage, etc., may occur.
- The surge absorbing diode installed to the DC relay for control output should be fitted in the specified direction. Otherwise, the converter unit and the drive unit will malfunction and will not output signals, disabling the emergency stop and other protective circuits.

- Use a noise filter, etc., to minimize the influence of electromagnetic interference. Electromagnetic interference may affect the electronic equipment used near the servo amplifier.
- Do not install a power capacitor, surge killer or radio noise filter (optional FR-BIF(-H)) with the power wire of the linear servo motor.
- When using the regenerative resistor, switch power off with the alarm signal. Otherwise, a transistor fault or the like may overheat the regenerative resistor, causing a fire.
- Connect the servo amplifier power output (U/V/W) to the linear servo motor power input (U/V/W) directly. Do not connect a magnetic contactor and others between them. Otherwise, it may cause a malfunction.

Connecting a linear servo motor for different axis to the U, V, W, or CN2 may cause a malfunction.

- · Before wiring, switch operation, etc., eliminate static electricity. Otherwise, it may cause a malfunction.
- · Do not modify the equipment.
- The cables such as power wires deriving from the primary side cannot stand the long-term bending action. Avoid the bending action by fixing the cables to the moving part, etc. Also, use the cable that stands the long-term bending action for the wiring to the servo amplifier.

This chapter does not describe the following items. For details of the items, refer to each section of the detailed explanation field.

## 14.3 Operation and functions

## Startup

Point P

When using the linear servo motor, set [Pr. PA01] to "\_\_4\_".

#### Startup procedure

Start up the linear servo system in the following procedure.

\*1 Use MR Configurator2.

#### Setting of linear servo motor series and linear servo motor type

To use the linear servo motor, set the linear servo motor series and linear servo motor type with [Pr. PA17 Servo motor series setting] and [Pr. PA18 Servo motor type setting].

Page 186 Basic setting parameters ([Pr. PA\_ ])

#### Setting of linear encoder direction and linear servo motor direction

Point P

If an incorrect value is set for [Pr. PC27], the linear servo motor may not operate properly, or [AL. 50]/[AL. 51] may occur during the positioning operation/the magnetic pole detection.

Set the first digit of [Pr. PC27] (Encoder pulse count polarity selection) so that the positive direction of the linear servo motor matches the increasing direction of the linear encoder feedback.

Encoder pulse count polarity selection

1: Linear servo motor positive direction and linear encoder increasing direction 1: Linear servo motor positive direction and linear encoder decreasing direction

#### ■Parameter setting method

1. Confirm the positive direction of the linear servo motor. [Pr. PA14] determines the relation of the travel direction of the linear servo motor under commands as follows.

| [Pr. PA14] setting | Travel direction of linear servo motor |                            |  |
|--------------------|----------------------------------------|----------------------------|--|
|                    | Address increasing command             | Address decreasing command |  |
| 0                  | Positive direction                     | Negative direction         |  |
| 1                  | Negative direction                     | Positive direction         |  |

The positive/negative directions of the linear servo motor are as follows.

2. Confirm the increasing direction of the linear encoder.

3. If the positive direction of the linear servo motor matches the increasing direction of the linear encoder, set [Pr. PC27] to \_\_\_0". If the positive direction of the linear servo motor does not match the increasing direction of the linear encoder, set [Pr. PC27] to "\_ \_ 1".

#### Confirmation method

Confirm the positive direction of the linear servo motor and the increasing direction of the linear encoder in the following procedure.

- 1. In servo-off status, move the linear servo motor in the positive direction manually.
- 2. Confirm the motor speed (in the positive and negative directions) at that time with MR Configurator2.
- 3. A positive value is displayed for the motor speed when (1) [Pr. PC27] is set to "\_\_\_0", (2) the positive direction of the linear servo motor matches the increasing direction of the linear encoder, and (3) the linear servo motor is operated in the positive direction. If the positive direction of the linear servo motor does not match the increasing direction of the linear encoder, the motor speed will be a negative value. When [Pr. PC27] is set to "\_\_\_1" and the positive direction of the linear servo motor matches the increasing direction of the linear encoder, if the linear servo motor operates in the positive direction, the motor speed will be a negative value.

#### Linear encoder resolution setting

Point P

- To enable the parameter values, cycle the power after setting.
- If an incorrect value is set for [Pr. PL02]/[Pr. PL03], the linear servo motor may not operate properly, or [AL. 27]/[AL. 42] may occur during the positioning operation/the magnetic pole detection.

Set the ratio of the electronic gear to the linear encoder resolution with [Pr. PL02 Linear encoder resolution - Numerator] and [Pr. PL03 Linear encoder resolution - Denominator].

#### ■Parameter setting

Set the values that apply to the following equation.

[Pr. PL02 Linear encoder resolution - Numerator] [Pr. PL03 Linear encoder resolution - Denominator] = Linear encoder resolution [µm]

#### ■Parameter setting example

When the linear encoder resolution is 0.5  $\mu$ m

 $\frac{[Pr. PL02]}{[Pr. PL03]} = \text{Linear encoder resolution} = 0.5 \ \mu\text{m} = \frac{1}{2}$ 

The following shows the simplified chart for the setting values of [Pr. PL02] and [Pr. PL03].

| Parameter     |            | Linear encoder resolution [µm] |      |      |     |     |     |     |     |
|---------------|------------|--------------------------------|------|------|-----|-----|-----|-----|-----|
|               |            | 0.01                           | 0.02 | 0.05 | 0.1 | 0.2 | 0.5 | 1.0 | 2.0 |
| Setting value | [Pr. PL02] | 1                              | 1    | 1    | 1   | 1   | 1   | 1   | 2   |
|               | [Pr. PL03] | 100                            | 50   | 20   | 10  | 5   | 2   | 1   | 1   |

## Magnetic pole detection

Point P

Set [Pr. PE47 Torque offset] to "0 (initial value)" before executing the magnetic pole detection.

Before the positioning operation of the linear servo motor, make sure to perform the magnetic pole detection. When [Pr. PL01] is set to the initial value, perform the magnetic pole detection only at the first servo-on after the power is turned on. The magnetic pole detection includes the following two methods. Each method has advantages and disadvantages. Select a

magnetic pole detection method suitable for your usage.

The position detection method is selected in the initial setting.

| Magnetic pole detection          | Advantage                                                                                                                                                                           | Disadvantage                                                                                                                                                                                                                       |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Position detection method        | <ol> <li>The magnetic pole detection has a high degree<br/>of accuracy.</li> <li>The adjustment procedure at the magnetic pole<br/>detection is simple.</li> </ol>                  | <ol> <li>The travel distance at the magnetic pole<br/>detection is large.</li> <li>For equipment with small friction, the initial<br/>magnetic pole detection error may occur.</li> </ol>                                          |

#### Magnetic pole detection method with MR Configurator2

The following shows the magnetic pole detection procedure with MR Configurator2.

#### Magnetic pole detection by the position detection method

\*1 For the incremental system, the [Pr. PL01] setting is not required.

#### ■Magnetic pole detection by the minute position detection method

\*1 For the incremental system, the [Pr. PL01] setting is not required.

\*2 If the load to mass of the linear servo motor primary-side ratio is unknown, perform the magnetic pole detection by the position detection method, and then perform the auto tuning to set an estimated value.

\*3 For the magnetic pole detection by the minute position detection method, the maximum travel distance at the magnetic pole detection must be 0.5 mm or less. To shorten the travel distance, increase the response by the minute position detection method in [Pr. PL17].

## State transition of the servo amplifier display (3-digit, 7-segment LED) at the magnetic pole detection

When the magnetic pole detection with MR Configurator2 is normally executed, the servo amplifier display (3-digit, 7-segment LED) shows the state as follows.

#### Preparation for the magnetic pole detection

### Point P

When the test operation mode is selected with the test operation select switch (SW1-1), the network communication for the servo amplifier and later shut off.

For the magnetic pole detection, use the test operation mode (positioning operation) of MR Configurator2. Turn off the servo amplifier power, and set the test operation select switch (SW1-1) as follows. Turning on the power enables the test operation mode.

#### Operation at the magnetic pole detection

## 

Note that the magnetic pole detection automatically starts simultaneously with the turning-on of the servo-on command.

#### 

• If the magnetic pole detection is not executed properly, the linear servo motor may operate unexpectedly.

#### Point P

- Establish the machine configuration to use LSP (Forward rotation stroke end) and LSN (Reverse rotation stroke end). The machine may be damaged due to a collision without LSP and LSN.
- · Assign LSP and LSN and perform the magnetic pole detection also in the torque mode.
- At the magnetic pole detection, whether the linear servo motor moves in the positive or negative direction is unpredictable.
- Depending on the setting value of [Pr. PL09 Magnetic pole detection voltage level], an overload, overcurrent, magnetic pole detection alarm, or others may occur.
- When performing the positioning operation from a controller, use the sequence which confirms the normal completion of the magnetic pole detection and the servo-on status, then outputs the positioning command. If the controller outputs the positioning command before RD (Ready) turns on, the command may not be accepted or an alarm may occur.
- After the magnetic pole detection, check the positioning accuracy with the test operation (positioning operation function) of MR Configurator2.
- When the absolute position linear encoder is used, if a gap is generated to the positional relation between the linear encoder and the linear servo motor, perform the magnetic pole detection again.
- The magnetic pole detection improves in accuracy when performed with no load.
- An alarm may occur when the linear encoder is not mounted properly, or when the linear encoder resolution setting ([Pr. PL02] and [Pr. PL03]) or the setting value of [Pr. PL09 Magnetic pole detection voltage level] is incorrect.
- For the machine whose friction becomes 30% or more of the continuous thrust, the linear servo motor may
  not operate properly after the magnetic pole detection.
- For the horizontal shaft of the machine whose unbalanced thrust becomes 20% or more of the continuous thrust, the linear servo motor may not operate properly after the magnetic pole detection.
- The magnetic pole detection may fail if performed simultaneously with multiple axes connected to each other (e.g. a tandem configuration). Perform the magnetic pole detection for each axis. At this time, set the axes for which the magnetic pole detection is not performed to servo-off.

#### For the incremental linear encoder

For the incremental linear encoder, the magnetic pole detection is required every time the power is turned on.

By turning on the servo-on command from the controller after the power-on, the magnetic pole detection is automatically carried out. Therefore, there is no need to set the parameter (first digit of [Pr. PL01]) for executing the magnetic pole detection.

#### · Timing chart

Point P

| Servo-on command | ON<br>OFF | 95 ms        |
|------------------|-----------|--------------|
| Base circuit     | ON<br>OFF |              |
| RD (Ready)       | ON<br>OFF |              |
|                  | Ма        | 15 s or less |

- \*1 The magnetic pole detection time indicates the operation time when LSP (Forward rotation stroke end) and LSN (Reverse rotation stroke end) are on.
- Linear servo motor movement (when LSP (Forward rotation stroke end) and LSN (Reverse rotation stroke end) are on)

- \*1 When you turn off LSP (Forward rotation stroke end) or LSN (Reverse rotation stroke end) during the magnetic pole detection, the operation of the magnetic pole detection is carried on to the opposite direction. When both LSP and LSN are off, [AL. 27 Initial magnetic pole detection error] occurs.
- \*2 The following shows the pitch against the magnetic pole.

| Linear servo motor series        | LM-H3 | LM-U2                                                    | LM-K2                                                 |    |
|----------------------------------|-------|----------------------------------------------------------|-------------------------------------------------------|----|
|                                  | LM-F  | Medium thrust<br>(Continuous thrust: Less<br>than 400 N) | Large thrust<br>(Continuous thrust: 400<br>N or more) |    |
| Pitch against magnetic pole [mm] | 48    | 30                                                       | 60                                                    | 48 |

· Linear servo motor movement (when LSP (Forward rotation stroke end) or LSN (Reverse rotation stroke end) is off)

When LSP or LSN is off at servo-on, the magnetic pole detection is carried out as follows.

The linear servo motor reciprocates several times and returns to the magnetic pole detection start position to complete the magnetic pole detection and to go into the servo-lock status. At this time, there may be a gap, approximately a quarter of the pitch against magnetic pole, from the start position.

\*1 The following shows the pitch against the magnetic pole.

| Linear servo motor series        | LM-H3 | LM-U2 | LM-K2                                                                                         | 4  |  |
|----------------------------------|-------|-------|-----------------------------------------------------------------------------------------------|----|--|

| Pitch against magnetic pole [mm] | 48    | 30    | 60                                                                                            | 48 |  |

#### For the absolute position linear encoder

Point P

The magnetic pole detection will be required with the following timings.

- When the system is set up (at the first startup of equipment)
- · After a servo amplifier is replaced
- · After a linear servo motor (primary-side or secondary-side) is replaced
- · After a linear encoder (scale or head) is replaced or remounted

If a gap is generated to the positional relation between the linear encoder and the linear servo motor, perform the magnetic pole detection again.

Perform the magnetic pole detection in the following procedure.

1. Set [Pr. PL01 Linear servo motor/DD motor function selection 1] to "\_\_\_1" (Magnetic pole detection at first servo-on).

Magnetic pole detection at first servo-on (Initial value)

- 2. Execute the magnetic pole detection. 🖅 Page 494 For the incremental linear encoder
- 3. After completing the magnetic pole detection properly, change [Pr. PL01] to "\_\_\_0" (Magnetic pole detection disabled).

Magnetic pole detection disabled

After the magnetic pole detection, by disabling the magnetic pole detection function with [Pr. PL01], the magnetic pole detection after each power-on is not required.

#### Magnetic pole detection method setting

Point P

In the following cases, set the magnetic pole detection method to the minute position detection method.

- When a shortened travel distance at the magnetic pole detection is required
- When the magnetic pole detection by the position detection method is not completed properly

Set the magnetic pole detection method by using the first digit of [Pr. PL08] (Magnetic pole detection method selection).

<sup>-</sup> Magnetic pole detection method selection

0: Position detection method

4: Minute position detection method

#### Setting of the magnetic pole detection voltage level by the position detection method

For the magnetic pole detection by the position detection method, set the voltage level with [Pr. PL09 Magnetic pole detection voltage level]. For the magnetic pole detection by the minute position detection method, the voltage level setting is not required.

#### Guideline of parameter settings

Set the parameters by referring to the following table.

| Servo status                     | [Pr. PL09] setting (guide value)                                                         |                   |  |  |  |  |
|----------------------------------|------------------------------------------------------------------------------------------|-------------------|--|--|--|--|
|                                  | Small $\leftarrow$ Medium $\rightarrow$ Large<br>(10 or less (initial value) 50 or more) |                   |  |  |  |  |
| Thrust at operation              | Small                                                                                    | Large             |  |  |  |  |
| Overload, overcurrent alarm      | Seldom occurs                                                                            | Frequently occurs |  |  |  |  |
| Magnetic pole detection alarm    | Frequently occurs                                                                        | Seldom occurs     |  |  |  |  |
| Magnetic pole detection accuracy | Low                                                                                      | High              |  |  |  |  |

#### ■Setting procedure

- 1. Perform the magnetic pole detection, and increase the setting value of [Pr. PL09 Magnetic pole detection voltage level] until [AL. 33 Overvoltage], [AL. 50 Overload 1], [AL. 51 Overload 2], [AL. E1 Overload warning 1], and [AL. EC Overload warning 2] occur. Increase the setting value by five as a guide value. When these alarms and warnings occur during the magnetic pole detection with MR Configurator2, the test operation of MR Configurator2 automatically completes and the servo-off status is established.
- 2. Specify the setting value that is an approximately 70% of the value set when [AL. 50 Overload 1], [AL. 51 Overload 2], [AL. 33 Overvoltage], [AL. E1 Overload warning 1], and [AL. EC Overload warning 2] occurred as the final setting value. If [AL. 27 Initial magnetic pole detection error] occurs with this value, specify a value intermediate between the value set at [AL. 50 Overload 1], [AL. 51 Overload 2], [AL. 33 Overvoltage], [AL. E1 Overload 2], [AL. 33 Overvoltage], [AL. 50 Overload 1], [AL. 51 Overload 2], [AL. 33 Overvoltage], [AL. E1 Overload warning 1], and [AL. EC Overload warning 2] and the value set at the magnetic pole detection alarm as the final setting value.
- **3.** Perform the magnetic pole detection again with the final setting value, and make sure that the accuracy of the magnetic pole detection is as required.

#### Setting example

| Linear enco<br>pole detecti | der magnetic<br>on         |                                                                                                                                                                                |
|-----------------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [Pr. PL09] s                | etting                     | 30 35 40 45 65 70                                                                                                                                                              |
| Alarm                       | Occurring<br>Not occurring |                                                                                                                                                                                |
|                             |                            | While increasing the setting value of [Pr. PL09], carry out the magnetic pole detection repeatedly. An alarm has occurred when the setting value of [Pr. PL09] is set to "70". |

In this example, the final setting value of [Pr. PL09] is 49 (Setting value at the alarm occurrence =  $70 \times 0.7$ ).

## Home position return

#### Precautions when using a proximity dog

#### ■Length of proximity dog

Set the length of the proximity dog to satisfy the following, so that the linear servo motor speed changes from the home position return speed to the creep speed during detection of the proximity dog.

$$L_1 \ge \frac{V}{60} \cdot \frac{td}{2}$$

L1: Length of the proximity dog [mm]

V: Home position return speed [mm/min]

td: Time to change from the home position return speed to the creep speed [s]

#### ■Adjustment of proximity dog position

To eliminate variations in the home position return completion position, adjust the proximity dog detection position to be near the center between a reference home position and the next reference home position.

The incremental linear encoder and the absolute position linear encoder have different reference home positions at the home position return. Refer to the following for information on the reference home position.

Page 498 For the absolute position linear encoder

Page 499 If wanting to stop at the reference home position

\*1 This can be changed with [Pr. PL01].

#### Timing of when the linear encoder home position is passed

For an incremental type linear encoder, the linear encoder home position (reference mark) must be passed during the period from a home position return start until the proximity dog detection. When the home position is not passed, [AL. 90.5 Z-phase unpassed] may occur.

#### For the absolute position linear encoder

When an absolute linear encoder is used, the reference home position is the position per 1048576 pulses (changeable with the third digit of [Pr. PL01]) with reference to the linear encoder home position (absolute position data = 0). The linear encoder home position can be set in any position.

LZ (Encoder Z-phase pulse) is outputted based on "Stop interval selection at the home position return" in [Pr. PL01]. In the case of a proximity dog type home position return, after the proximity dog rear end is detected, the nearest reference home position shifted by the home position shift distance is used as the home position.

\*1 This can be changed with [Pr. PL01].

\*2 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69].

## 

• If the resolution or the stop interval (the third digit of [Pr. PL01]) of the linear encoder is large, the linear servo motor may crash into the stroke end, which is very dangerous.

#### Point P

If no linear encoder home position (reference mark) exists, only the home position return type without using Zphase can be performed.

Page 146 Home position return types

#### If wanting to stop at the reference home position

#### Point P

To perform a home position return securely, pass the linear encoder home position (reference mark) with the JOG operation or another operation, and then start the home position return.

Change the value of the third digit in [Pr. PL01] according to the linear encoder resolution.

When the reference home position of an incremental linear encoder is used, the reference home position is the position per 1048576 pulses (can be changed with the third digit of [Pr. PL01]) to the linear encoder home position (reference mark) that has been passed through. Change the setting value of [Pr. PL01] according to the linear encoder resolution.

Stop interval setting at the home position return

| Stop interval [pulse]   |
|-------------------------|
| 8192                    |
| 131072                  |
| 262144                  |
| 1048576 (initial value) |
| 4194304                 |
| 16777216                |
| 67108864                |
|                         |

The following shows the relation between the stop interval at the home position return and the linear encoder resolution. For example, when the linear encoder resolution is 0.001  $\mu$ m and the parameter for the stop interval at the home position return, [Pr. PL01], is set to "\_5 \_\_" (16777216 pulses), the stop interval is 16.777 mm. The value inside a bold box indicates the recommended stop interval for each linear encoder resolution.

|          |                     |           |                               |         |          |          |          |           |           |           | [Unit: mm] |
|----------|---------------------|-----------|-------------------------------|---------|----------|----------|----------|-----------|-----------|-----------|------------|

Set one linear encoder home position in the full stroke, and set it in the proximity dog signal detection position.

When two or more reference marks exist during the full stroke of the linear encoder, select "Enabled (\_\_1\_)" of "Linear scale multipoint Z-phase input function selection" in [Pr. PC17].

LZ (Encoder Z-phase pulse) is outputted at the linear encoder home position (reference mark).

In the case of a dog type home position return, after the proximity dog signal rear end is detected, the nearest reference home position shifted by the home position shift distance is used as the home position.

#### Home position return direction

\*1 This can be changed with [Pr. PL01].

\*2 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69].

As shown below, in an area where the linear encoder home position (reference mark) is not passed after the home position return starts (home position return restricted area), home position return may be disabled depending on the conditions.

Home position return direction

#### If wanting to stop at the linear encoder home position

When "Stop position selection at home position return" of [Pr. PT41] is set to "\_\_1\_", the home position return for Homing methods 33, 34, -11, and -43 is set to the linear encoder home position (reference mark). This parameter is enabled when an incremental linear encoder compatible with a serial interface is used.

• For Homing methods 33 and 34

The following figure shows the operation of Homing method 34 when "Stop position selection at home position return" of [Pr. PT41] is set to " $\__1$ ". The operation direction of Homing method 33 is opposite to that of Homing method 34.

\*1 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69]. When the stroke end is detected

#### • For Homing methods -11 and -43

The following figure shows the operation of Homing method -11 when "Stop position selection at home position return" of [Pr. PT41] is set to " $\__1$ ". The operation direction of Homing method -43 is opposite to that of Homing method -11.

Home position Linear encoder home position

\*1 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69]. When the movement is returned at the stroke end

The home position return automatically starts from here.

\*1 This is not available with the software limit.

## 

- The test operation mode is designed for checking servo operation. It is not for checking machine operation. Do not use this mode with the machine. Always use the linear servo motor alone.
- If the servo motor operates abnormally, use EM2 (Forced stop 2) to stop it.

#### Point P

- The content described in this section indicates the environment where the servo amplifier and a personal computer are directly connected.
- When the test operation mode is selected with the test operation select switch (SW1-1), the network communication for the servo amplifier and later shut off.

By using a personal computer and MR Configurator2, you can execute the positioning operation, the output signal (DO) forced output, and the program operation without connecting the controller.

#### Test operation mode types

#### ■Positioning operation

Positioning operation can be performed without using the controller. Use this operation with the forced stop reset. This operation may be used independently of whether the servo is on or off and whether the controller is connected or not. Exercise control on the positioning operation screen of MR Configurator2.

· Operation pattern

#### Operation method

| Operation                 | Screen control                       |  |
|---------------------------|--------------------------------------|--|
| Positive direction travel | Click "Positive Direction Movement". |  |
| Negative direction travel | Click "Reverse Direction Movement".  |  |
| Pause                     | Click "Pause".                       |  |
| Stop                      | Click "Stop".                        |  |
| Forced stop               | Click "Forced stop".                 |  |

#### ■Output signal (DO) forced output

Output signals can be switched on/off forcibly independently of the servo status. Use this function for checking output signal wiring, etc. Exercise control on the DO forced output screen of MR Configurator2.

#### ■Program operation

Positioning operation can be performed in two or more operation patterns combined, without using the controller. Use this operation with the forced stop reset. This operation may be used independently of whether the servo is on or off and whether the controller is connected or not.

Exercise control on the program operation screen of MR Configurator2. For full information, refer to Help of MR Configurator2.

| Operation   | Screen control       |
|-------------|----------------------|
| Start       | Click "Start".       |
| Pause       | Click "Pause".       |
| Stop        | Click "Stop".        |
| Forced stop | Click "Forced stop". |

#### **Operation procedure**

- **1.** Turn off the power.
- 2. Turn "ON (up)" SW1-1.

Turning "ON (up)" SW1-1 during power-on will not enable the test operation mode.

3. Turn on the servo amplifier.

When initialization is completed, the display shows the following screen.

4. Start operation with the personal computer.

## **Operation from controller**

For the system using the incremental linear encoder, the magnetic pole detection is automatically performed at the first servoon after the power-on. For this reason, when performing the positioning operation, create the sequence which surely confirms the servo-on status as the inter lock condition of the positioning command.

### Function

#### Linear servo control error detection function

#### Point P

For the linear servo control error detection function, the position and speed deviation error detections are enabled by default. ([Pr. PL04]: \_ \_ 3)

If the linear servo control becomes unstable for some reasons, the linear servo motor may not operate properly. To detect this state and to stop operation, the linear servo control error detection function is used as a protective function.

The linear servo control error detection function has three different detection methods: the position deviation, speed deviation, and thrust deviation. An error is detected when each method is enabled with [Pr. PL04 Linear servo motor/DD motor function selection 2]. The detection level can be changed with [Pr. PL05], [Pr. PL06], and [Pr. PL07].

#### ■Outline of linear servo control error detection function

 3) Model feedback speed [mm/s]

 5) Command thrust [%]

 Linear encoder

 2) Feedback position [mm]

 4) Feedback speed [mm/s]

 6) Feedback thrust [%]

#### ■Position deviation error detection

Set [Pr. PL04] to "\_\_\_ 1" to enable the position deviation error detection.

[Pr. PL04]

Position deviation error detection enabled

When the difference between 1) and 2) in figure 14.1 is equal to or more than the value of [Pr. PL05 Position deviation error detection level] (1 mm to 1000 mm), [AL. 42.1 Servo control error by position deviation] occurs and the linear servo motor stops. The initial value of this detection level is 50 mm. Change the setting value as necessary.

For "Outline of linear servo control error detection function", refer to the following.

IP Page 505 Outline of linear servo control error detection function

#### Speed deviation error detection

Set [Pr. PL04] to "\_\_\_\_2" to enable the speed deviation error detection.

| [Pr. PL04] |  |  |   |
|------------|--|--|---|
|            |  |  | 2 |
|            |  |  |   |

Speed deviation error detection enabled

When you compare the model feedback speed (3)) and the feedback speed (4)) in "Outline of linear servo control error detection function", if the deviation is more than the value of [Pr. PL06 Speed deviation error detection level] (1 mm/s to 5000 mm/s), [AL. 42.2 Servo control error by speed deviation] will occur and the linear servo motor will stop. The initial value of this detection level is 1000 mm/s. Change the setting value as necessary.

For "Outline of linear servo control error detection function", refer to the following.

Page 505 Outline of linear servo control error detection function

505

#### Thrust deviation error detection

Set [Pr. PL04] to "\_\_\_4" to enable the thrust deviation error detection.

| [Pr. PL04] |  |  |   |
|------------|--|--|---|
|            |  |  | 4 |
|            |  |  |   |

L Thrust deviation error detection enabled

When you compare the command thrust (5)) and the feedback thrust (6)) in "Outline of linear servo control error detection function", if the deviation is more than the value of [Pr. PL07 Torque/thrust deviation error detection level] (1% to 1000%), [AL. 42.3 Servo control error by torque/thrust deviation] will occur and the linear servo motor will stop. The initial value of this detection level is 100%. Change the setting value as necessary.

For "Outline of linear servo control error detection function", refer to the following.

Page 505 Outline of linear servo control error detection function

#### Detecting multiple deviation errors

When setting [Pr. PL04] as follows, multiple deviation errors can be detected. For the error detection methods, refer to the following.

Page 505 Position deviation error detection

Page 505 Speed deviation error detection

Page 506 Thrust deviation error detection

| [Pr. PL04] |  |  |  |
|------------|--|--|--|
|            |  |  |  |

| Setting value | Position deviation<br>error detection | Speed deviation<br>error detection | Thrust deviation<br>error detection |
|---------------|---------------------------------------|------------------------------------|-------------------------------------|
| 1             | 0                                     | —                                  | —                                   |
| 2             | —                                     | 0                                  | —                                   |
| 3             | 0                                     | 0                                  | —                                   |
| 4             | —                                     | _                                  | 0                                   |
| 5             | 0                                     | _                                  | 0                                   |
| 6             | _                                     | 0                                  | 0                                   |
| 7             | 0                                     | 0                                  | 0                                   |

#### Auto tuning function

Point P

The auto tuning mode 1 may not be performed properly if the following conditions are not satisfied.

- Time to reach 2000 mm/s is the acceleration/deceleration time constant of 5 s or less.
- The linear servo motor speed is 150 mm/s or higher.
- The load to mass of the linear servo motor primary-side ratio is 100 times or less.
- The acceleration/deceleration thrust is 10% or less of the continuous thrust.

Although the auto tuning function during the linear servo motor operation is the same as that of the rotary servo motor, the calculation method of the load to motor mass ratio (J ratio) is different. The load to motor mass ratio (J ratio) on the linear servo motor is calculated by dividing the load mass by the mass of the linear servo motor primary side.

#### Ex.

Mass of linear servo motor primary side = 2 kg Load mass (excluding the mass of the linear servo motor primary side) = 4 kg Mass ratio = 4/2 = 2 times For the parameters set with the auto tuning function, refer to the following.

Page 230 NORMAL GAIN ADJUSTMENT

#### Machine analyzer function

Point P

- Make sure to perform the machine analyzer function after the magnetic pole detection. If the magnetic pole detection is not performed, the machine analyze function may not operate properly.
- The stop position at the completion of the machine analyzer function can be arbitrary.

## Absolute position detection system

When the linear servo motor is used with the absolute position detection system, an absolute position linear encoder is required. The linear encoder backs up the absolute position data. Therefore, the encoder battery need not be installed to the servo amplifier. Additionally, [AL. 25 Absolute position erased], [AL. 92 Battery cable disconnection warning], [AL. 9F Battery warning], and [AL. E3 Absolute position counter warning] are not provided for the linear servo motor.

# **14.4** Characteristics

## **Overload protection characteristics**

An electronic thermal is built in the servo amplifier to protect the linear servo motor, servo amplifier and linear servo motor power wires from overloads.

[AL. 50 Overload 1] occurs if overload operation performed is above the electronic thermal protection curve shown in the following figures. [AL. 51 Overload 2] occurs if the maximum current is applied continuously for several seconds due to machine collision, etc. Use the equipment on the left-hand side area of the continuous or broken line in the graph. Use the linear servo motor with 70% or less of the effective load ratio when it is in the servo lock state or in a small reciprocating motion.

This servo amplifier has linear servo motor overload protection. (The linear servo motor overload current (full load current) is set on the basis of 120% rated current of the servo amplifier.)

## Power supply capacity and generated loss

The following table indicates servo amplifiers' power supply capacities and losses generated under rated load. For thermal design of an enclosed type cabinet, use the values in the table in consideration for the worst operating conditions. The actual amount of generated heat will be intermediate between values at rated torque and servo-off according to the duty used during operation. When the linear servo motor is run at less than the rated speed, the power supply capacity will be smaller than the value in the table, but the servo amplifier's generated heat will not change.

Mounting a heat sink outside of the cabinet enables to reduce heat in the cabinet and design a compact enclosed type cabinet.

\*1 The power supply equipment capacity changes with the power supply impedance. This value is applicable when the power factor improving AC reactor or power factor improving DC reactor are not used.

\*2 Heat generated during regeneration is not included in the servo amplifier-generated heat. To calculate heat generated by the regenerative option, refer to the following.

Page 338 Regenerative options

## 

• The coasting distance is a theoretically calculated value which ignores the running load such as friction. The calculated value will be longer than the actual distance. If the braking distance is not longer than the calculated value, a moving part may crash into the stroke end, which is very dangerous. Install the anticrash mechanism such as an air brake or an electric/mechanical stopper such as a shock absorber to reduce the shock of moving parts. No linear servo motor with an electromagnetic brake is available.

Point P

• Do not use dynamic brake to stop in a normal operation as it is the function to stop in emergency.

- For a machine operating at the recommended load to motor mass ratio or less, the estimated number of usage times of the dynamic brake is 1000 times while the machine decelerates from the rated speed to a stop once in 10 minutes.
- Be sure to enable EM1 (Forced stop 1) after the linear servo motor stops when using EM1 (Forced stop 1) frequently in other than emergency.

The approximate coasting distance from when the dynamic brake is activated until when the linear servo motor stops can be calculated with the equation below.

Lmax =  $V_0 \cdot (0.03 + M \cdot (A + B \cdot V_0^2))$ 

Lmax: Coasting distance of the machine [m]

 $V_0$ : Speed when the brake is activated [m/s]

M: Full mass of the moving part [kg]

A: Coefficient (Refer to the following tables.)

B: Coefficient (Refer to the following tables.)

| LM-K2P3E-24M-1SS1                 | 2.53 × 10 <sup>-4</sup> | $5.52 \times 10^{-5}$   |

# Permissible load to motor mass ratio when the dynamic brake is used

Use the dynamic brake under the load to motor mass ratio indicated in the following table. If the load to motor mass ratio is higher than this value, the dynamic brake may burn. If there is a possibility that the ratio may exceed the value, contact your local sales office.

The values of the permissible load to motor mass ratio in the table are the values when the linear servo motor is used at the maximum speed.

| Linear servo motor (primary side) | Permissible load to motor mass ratio [multiplier] |
|-----------------------------------|---------------------------------------------------|
| LM-H3 series                      | 40                                                |
| LM-U2 series                      | 100                                               |
| LM-F series                       |                                                   |
| LM-K2 series                      | 50                                                |

When actual speed does not reach the maximum speed of the linear servo motor, calculate the permissible load to motor mass ratio of the dynamic brake by the following equation. (The upper limit is 300 times.)

Permissible load to motor mass ratio at the time of using the dynamic brake = Value in the table  $\times$  (Linear servo motor maximum speed<sup>2</sup>/Actual using speed<sup>2</sup>)

For example, when an actual using speed is 2 m/s or less for the LM-H3P2A-07P motor (maximum speed: 3.0 m/s), the equation will be as follows.

Permissible load to motor mass ratio of the dynamic brake =  $40 \times (3^2/2^2) = 90$  [times]

## 

• When using the direct drive motor, read the "Direct Drive Motor Instruction Manual".

#### Point P

For the software version of the servo amplifier that is compatible with the direct drive servo system, refer to the following.

Page 36 Combinations of servo amplifiers and servo motors

## **15.1** Functions and configuration

## Summary

The following shows the differences between the direct drive motor and the rotary servo motor.

| Category                           | Item                                          | Differences        |                                   | Remark                                                                                                                                                                                                                                               |

## Configuration including peripheral equipment

## 

• Connecting a direct drive motor for different axis to the U, V, W, or CN2 may cause a malfunction.

Point P

- Equipment other than the servo amplifier and direct drive motor are optional or recommended products.
- When using the direct drive motor, set [Pr. PA01] to "\_\_6\_".

The configuration diagram is an example of MR-J4-20GF. When using the other servo amplifiers, the configuration will be the same as rotary servo motors except for connections of direct drive motors. Refer to the following depending on servo amplifiers you use.

Page 58 Configuration including peripheral equipment

- \*1 The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- \*2 A 1-phase 200 V AC to 240 V AC power supply may be used with the servo amplifier of MR-J4-200GF(-RJ) or less. For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. Refer to the following for the power supply specifications.
- \*3 Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 The battery unit is used for the absolute position detection system.
- \*5 Always connect between P+ and D terminals. When using the regenerative option, refer to the following.
- \*6 The absolute position storage unit is used for the absolute position detection system.
- \*7 This is for MR-J4-\_GF\_. MR-J4-\_GF-RJ has a CN2L connector. However, CN2L is not used for the direct drive servo system.

## 

• Any person who is involved in wiring should be fully competent to do the work.

- Before wiring, turn off the power and wait for 15 minutes or more until the charge lamp turns off. Then, confirm that the voltage between P+ and N- is safe with a voltage tester and others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, always confirm it from the front of the servo amplifier.
- · Ground the servo amplifier and the direct drive motor securely.
- Do not attempt to wire the servo amplifier and the direct drive motor until they have been installed. Otherwise, it may cause an electric shock.
- The cables should not be damaged, stressed, loaded, or pinched. Otherwise, it may cause an electric shock.
- To avoid an electric shock, insulate the connections of the power supply terminals.

## 

- Wire the equipment correctly and securely. Otherwise, the direct drive motor may operate unexpectedly, resulting in injury.
- Connect cables to the correct terminals. Otherwise, a burst, damage, etc., may occur.
- Ensure that polarity (+/-) is correct. Otherwise, a burst, damage, etc., may occur.
- The surge absorbing diode installed to the DC relay for control output should be fitted in the specified direction. Otherwise, the converter unit and the drive unit will malfunction and will not output signals, disabling the emergency stop and other protective circuits.

- Use a noise filter, etc., to minimize the influence of electromagnetic interference. Electromagnetic interference may affect the electronic equipment used near the servo amplifier.
- Do not install a power capacitor, surge killer, or radio noise filter (FR-BIF option) with the power wire of the direct drive motor.
- When using the regenerative resistor, switch power off with the alarm signal. Otherwise, a transistor fault or the like may overheat the regenerative resistor, causing a fire.
- · Do not modify the equipment.
- Connect the servo amplifier power output (U/V/W) to the power input of the direct drive motor (U/V/W) directly. Do not connect a magnetic contactor and others between them. Otherwise, it may cause a malfunction.

• Connecting a direct drive motor for different axis to the U, V, W, or CN2 may cause a malfunction.

· Before wiring, switch operation, etc., eliminate static electricity. Otherwise, it may cause a malfunction.

This chapter does not describe the following items. For details of the items, refer to each section of the detailed explanation field.

| Item                                              | Detailed explanation                                       |

# **15.3** Operation and functions

## Point P

- When using the direct drive motor, set [Pr. PA01] to "\_\_6\_".
- For the test operation, refer to the following.  $\Join$  Page 141 Test operation
- The Z-phase pulse of the direct drive motor must be turned on after power-on. When the machine configuration does not allow one or more revolution of the direct drive motor, install the direct drive motor so that the Z-phase pulse can be turned on.

## Startup procedure

- \*1 Use MR Configurator2.
- \*2 In the absolute position detection system, be sure to turn on the Z-phase pulse of the direct drive motor while the servo amplifier power is on, and then cycle the power of the servo amplifier. Cycling the power confirms the absolute position. Without this operation, the absolute position will not be regained properly, and a warning occurs at the controller.
- \*3 If the Z-phase pulse of the direct drive motor can be turned on manually, the Z-phase pulse does not have to be turned on by the magnetic pole detection or the JOG operation. For this operation, make sure to connect the direct drive motor encoder and the servo amplifier, and turn on the control circuit power supply (L11/L21) of the servo amplifier (turn off the main circuit power supply (L1/L2/L3)). Ensure the safety at this time.

## Magnetic pole detection

#### Point P

- The magnetic pole detection is not required for the configured absolute position detection system where the Z-phase pulse of the direct drive motor can be turned on manually. For this operation, always connect the direct drive motor encoder and the servo amplifier and turn on the control circuit power supply of the servo amplifier. Perform this operation by considering the safety.
- When performing a magnetic pole detection without LSP (Forward rotation stroke end) and LSN (Reverse rotation stroke end), set [Pr. PL08 Linear servo motor/DD motor function selection 3] to "\_ 1 \_ \_" to disable LSP and LSN.
- Set [Pr. PE47 Torque offset] to "0 (initial value)" before executing the magnetic pole detection.
- For the magnetic pole detection of vertical axis with direct drive motors, refer to section 2.1 of "Direct Drive Motor Instruction Manual".

Before the positioning operation of the direct drive motor, make sure to perform the magnetic pole detection. Before starting up the equipment, perform the test operation (positioning operation) of MR Configurator2.

#### Magnetic pole detection method with MR Configurator2

The following shows the magnetic pole detection procedure with MR Configurator2.

#### ■Magnetic pole detection by the position detection method

\*1 For the incremental system, the [Pr. PL01] setting is not required.

#### ■Magnetic pole detection by the minute position detection method

\*1 For the incremental system, the [Pr. PL01] setting is not required.

\*2 If the load to direct drive motor inertia ratio is unknown, perform the magnetic pole detection by the position detection method, and then perform the auto tuning to set an estimated value.

\*3 For the magnetic pole detection by the minute position detection method, the maximum rotation angle at the magnetic pole detection must be five degrees or less. To shorten the travel distance, increase the response by the minute position detection method in [Pr. PL17].

# State transition of the servo amplifier display (3-digit, 7-segment LED) at the magnetic pole detection

When the magnetic pole detection with MR Configurator2 is normally executed, the servo amplifier display (3-digit, 7-segment LED) shows the state as follows.

#### Preparation for the magnetic pole detection

#### Point P

When the test operation mode is selected with the test operation select switch (SW1-1), the network communication for the servo amplifier and later shut off.

For the magnetic pole detection, use the test operation mode (positioning operation) of MR Configurator2. Turn off the servo amplifier power, and set the test operation select switch (SW1-1) as follows. Turning on the power enables the test operation mode.

#### Operation at the magnetic pole detection

## 

• Note that the magnetic pole detection automatically starts simultaneously with the turning-on of the servo-on command.

## 

• If the magnetic pole detection is not executed properly, the direct drive motor may operate unexpectedly.

Point P

- Establish the machine configuration to use LSP (Forward rotation stroke end) and LSN (Reverse rotation stroke end). The machine may be damaged due to a collision without LSP and LSN.
- Assign LSP and LSN and perform the magnetic pole detection also in the torque mode.
- At the magnetic pole detection, whether the motor rotates in the forward or reverse direction is unpredictable.
- Depending on the setting value of [Pr. PL09 Magnetic pole detection voltage level], an overload, overcurrent, magnetic pole detection alarm, or others may occur.
- When performing the positioning operation from a controller, use the sequence which confirms the normal completion of the magnetic pole detection and the servo-on status, then outputs the positioning command. If the controller outputs the positioning command before RD (Ready) turns on, the command may not be accepted or an alarm may occur.
- After the magnetic pole detection, check the positioning accuracy with the test operation (positioning operation function) of MR Configurator2.
- The accuracy of the magnetic pole detection improves with no load.

#### ■Incremental system

**Point** For the incremental system, the magnetic pole detection is required every time the power is turned on. By turning on the servo-on command from the controller after the power-on, the magnetic pole detection is automatically

By turning on the servo-on command from the controller after the power-on, the magnetic pole detection is automatically carried out. Therefore, there is no need to set the parameter (first digit of [Pr. PL01]) for executing the magnetic pole detection.

# Timing chart Servo-on command OFF Ig5 ms ON OFF OFF Ig5 ms ON OFF Ig5 ms Ig6 ms <

\*1 The magnetic pole detection time indicates the operation time when LSP (Forward rotation stroke end) and LSN (Reverse rotation stroke end) are on.

· Direct drive motor movement (when LSP and LSN are on)

\*1 When you turn off LSP or LSN during the magnetic pole detection, the magnetic pole detection is carried on to the opposite direction. When LSP and LSN are off, [AL. 27 Initial magnetic pole detection error] occurs.

• Direct drive motor movement (when LSP or LSN is off)

When LSP or LSN is off at servo-on, the magnetic pole detection is carried out as follows.

#### ■Absolute position detection system

Point P

The magnetic pole detection will be required with the following timings.

- When the system is set up (at the first startup of equipment)
- When the Z-phase pulse of the direct drive motor is not turned on at the system setup (When the Z-phase pulse of the direct drive motor can be turned on manually, the magnetic pole detection is not required.)
- After a direct drive motor is replaced
- When [AL. 25 Absolute position erased] has occurred

Turn on the Z-phase pulse of the direct drive motor in JOG operation from the controller after the magnetic pole detection.

Perform the magnetic pole detection in the following procedure.

**1.** Set [Pr. PL01 Linear servo motor/DD motor function selection 1] to "\_\_\_1" (Magnetic pole detection at first servo-on).

|  | [Pr. F | PL01] |   |
|--|--------|-------|---|
|  |        |       | 1 |
|  |        |       | _ |

Magnetic pole detection at first servo-on (initial value)

- 2. Execute the magnetic pole detection. 🖙 Page 522 Incremental system
- 3. After completing the magnetic pole detection properly, change [Pr. PL01] to "\_\_\_0" (Magnetic pole detection disabled).

| [Pr. PL01] |  |  |   |
|------------|--|--|---|
|            |  |  | 0 |
|            |  |  | _ |

<sup>-</sup> Magnetic pole detection disabled

After the magnetic pole detection, by turning on the Z-phase pulse of the direct drive motor in the JOG operation and disabling the magnetic pole detection function with [Pr. PL01], the magnetic pole detection after each power-on is not required.

#### Magnetic pole detection method setting

Set the magnetic pole detection method by using the first digit of [Pr. PL08] (Magnetic pole detection method selection).

Magnetic pole detection method selection

- 0: Position detection method
- 4: Minute position detection method

#### Setting of the magnetic pole detection voltage level by the position detection method

For the magnetic pole detection by the position detection method, set the voltage level with [Pr. PL09 Magnetic pole detection voltage level]. For the magnetic pole detection by the minute position detection method, the voltage level setting is not required.

#### ■Guideline of parameter settings

Set the parameters by referring to the following table.

| Servo status                                                      | [Pr. PL09] setting (guide value) |                   |
|-------------------------------------------------------------------|----------------------------------|-------------------|
| Small ← Medium → Large<br>(10 or less (initial value) 50 or more) |                                  |                   |
| Torques required for operation                                    | Small                            | Large             |
| Overload, overcurrent alarm                                       | Seldom occurs                    | Frequently occurs |
| Magnetic pole detection alarm                                     | Frequently occurs                | Seldom occurs     |
| Magnetic pole detection accuracy                                  | Low                              | High              |

#### Setting procedure

- 1. Perform the magnetic pole detection, and increase the setting value of [Pr. PL09 Magnetic pole detection voltage level] until [AL. 50 Overload 1], [AL. 51 Overload 2], [AL. E1 Overload warning 1], and [AL. EC Overload warning 2] occur. Increase the setting value by five as a guide value. When these alarms and warnings occur during the magnetic pole detection with MR Configurator2, the test operation of MR Configurator2 automatically completes and the servo-off status is established.
- 2. Specify the setting value that is an approximately 70% of the value set when [AL. 50 Overload 1], [AL. 51 Overload 2], [AL. E1 Overload warning 1], and [AL. EC Overload warning 2] occurred as the final setting value. However, if [AL. 27 Initial magnetic pole detection error] occurs with this value, specify a value intermediate between the value set at [AL. 50 Overload 1], [AL. 51 Overload 2], [AL. E1 Overload warning 1], or [AL. EC Overload warning 2] and the value set at the magnetic pole detection alarm as the final setting value.
- 3. Perform the magnetic pole detection again with the final setting value.

#### ■Setting example

While increasing the setting value of [Pr. PL09], carry out the<br/>magnetic pole detection repeatedly.An alarm has occurred when the setting<br/>value of [Pr. PL09] is set to "70".

In this example, the final setting value of [Pr. PL09] is 49 (Setting value at the alarm occurrence =  $70 \times 0.7$ ).

## Home position return

#### Precautions when using a proximity dog

#### Length of proximity dog

Set the length of the proximity dog to satisfy the following, so that the direct drive motor speed changes from the home position return speed to the creep speed during detection of the proximity dog.

$$L_1 \ge \frac{V}{60} \cdot \frac{td}{2}$$

L1: Length of the proximity dog [mm]

V: Home position return speed [mm/min]

td: Time to change from the home position return speed to the creep speed [s]

#### ■Adjustment of proximity dog position

To eliminate variations in the home position return completion position, adjust the proximity dog detection position to be near the center between the positions specified by a Z-phase signal and the next Z-phase signal.

The generated position of the Z-phase signals can be checked with "Position within one-revolution" of "Status display" on MR Configurator2.

#### ■Timing of when Z-phase is passed

The Z-phase must be passed during the period from a home position return start until the proximity dog detection. When the Z-phase is not passed, [AL. 90.5 Z-phase unpassed] may occur.

## **Operation from controller**

To configure the absolute position detection system by using the direct drive motor, the battery and the absolute position storage unit MR-BTAS01 are required.

For the incremental system, the magnetic pole detection is automatically performed at the first servo-on after the power-on.

For this reason, when performing the positioning operation, create the sequence which surely confirms the servo-on status as the inter lock condition of the positioning command.

## Function

#### Servo control error detection function

#### Point P

For the servo control error detection function, the position and speed deviation error detections are enabled by default. ([Pr. PL04]: \_\_\_ 3)

If the servo control gets unstable for some reasons, the direct drive motor may not operate properly. To detect this state and to stop operation, the servo control error detection function is used as a protective function.

The servo control error detection function has three different detection methods: the position deviation, speed deviation, and torque deviation. An error is detected when each method is enabled with [Pr. PL04 Linear servo motor/DD motor function selection 2]. The detection level can be changed with [Pr. PL05], [Pr. PL06], and [Pr. PL07].

#### ■Outline of servo control error detection function

#### ■Position deviation error detection

Set [Pr. PL04] to "\_\_\_1" to enable the position deviation error detection.

Position deviation error detection enabled

When you compare the model feedback position (1)) and the feedback position (2)) in "Outline of servo control error detection function", if the deviation is more than the value of [Pr. PL05 Position deviation error detection level] (1 (0.01 rev) to 1000 (10 rev)), [AL. 42.1 Servo control error by position deviation] will occur and the direct drive motor will stop. The initial value of this detection level is 0.09 rev. Replace the set value as required.

For "Outline of servo control error detection function", refer to the following.

Page 526 Outline of servo control error detection function

#### ■Speed deviation error detection

Set [Pr. PL04] to "\_\_\_\_2" to enable the speed deviation error detection.

| [Pr. F | PL04] |   |
|--------|-------|---|
|        |       | 2 |
| <br>   |       | — |

└─ Speed deviation error detection enabled

When you compare the model feedback speed (3)) and the feedback speed (4)) in "Outline of servo control error detection function", if the deviation is more than the value of [Pr. PL06 Speed deviation error detection level] (1 r/min to 2000 r/min), [AL. 42.2 Servo control error by speed deviation] will occur and the direct drive motor will stop. The initial value of this detection level is 100 r/min. Replace the set value as required.

For "Outline of servo control error detection function", refer to the following.

IP Page 526 Outline of servo control error detection function

#### ■Torque deviation error detection

Set [Pr. PL04] to "\_\_\_\_4" to enable the torque deviation error detection.

| [Pr. F | PL04] |                |
|--------|-------|----------------|
|        |       | 4              |
|        |       | $\overline{-}$ |

L Torque deviation error detection enabled

When you compare the command torque (5)) and the feedback torque (6)) in "Outline of servo control error detection function", if the deviation is more than the value of [Pr. PL07 Torque/thrust deviation error detection level] (1% to 1000%), [AL. 42.3 Servo control error by torque/thrust deviation] will occur and the direct drive motor will stop. The initial value of this detection level is 100%. Replace the set value as required.

For "Outline of servo control error detection function", refer to the following.

Page 526 Outline of servo control error detection function

#### Detecting multiple deviation errors

When setting [Pr. PL04] as follows, multiple deviation errors can be detected. For the error detection methods, refer to the following.

Page 526 Position deviation error detection

Page 526 Speed deviation error detection

Page 527 Torque deviation error detection

| Setting value | Position deviation<br>error detection | Speed deviation<br>error detection | Torque deviation<br>error detection |
|---------------|---------------------------------------|------------------------------------|-------------------------------------|
| 1             | 0                                     | —                                  | —                                   |
| 2             | —                                     | 0                                  | —                                   |
| 3             | 0                                     | 0                                  | —                                   |
| 4             | —                                     | _                                  | 0                                   |
| 5             | 0                                     | _                                  | 0                                   |

| 7             | 0                                     | 0                                  | 0                                   |

# **15.4** Characteristics

## **Overload protection characteristics**

An electronic thermal relay is built in the servo amplifier to protect the servo amplifier, the direct drive motor, and direct drive motor power wires from overloads.

[AL. 50 Overload 1] occurs if overload operation performed is above the electronic thermal protection curve shown in the following figures. [AL. 51 Overload 2] occurs if the maximum current is applied continuously for several seconds due to machine collision, etc. Use the equipment on the left-hand side area of the continuous or broken line in the graph. When unbalanced torque is generated, such as in a vertical lift machine, the unbalanced torque of the machine should be kept at 70% or lower of the motor's rated torque.

This servo amplifier has solid-state direct drive motor overload protection for each axis. (The direct drive motor overload current (full load current) is set on the basis of 120% rated current of the servo amplifier.)

\*1 If operation that generates torque more than 100% of the rating is performed with an abnormally high frequency in a direct drive motor stop status (servo-lock status) or in a 50 r/min or less low-speed operation status, the servo amplifier may malfunction regardless of the electronic thermal relay protection.

## Power supply capacity and generated loss

The following table indicates servo amplifiers' power supply capacities and losses generated under rated load. For thermal design of an enclosed type cabinet, use the values in the table in consideration for the worst operating conditions. The actual amount of generated heat will be intermediate between values at rated torque and servo-off according to the duty used during operation. When the direct drive motor is run at less than the rated speed, the power supply capacity will be smaller than the value in the table, but the servo amplifier's generated heat will not change.

| Direct drive motor Servo amplifier |                                     | Power supply   | Servo amplifier-ge | Servo amplifier-generated heat [W] |                                       |
|------------------------------------|-------------------------------------|----------------|--------------------|------------------------------------|---------------------------------------|
|                                    |                                     | capacity [kVA] | At rated output    | With servo-off                     | heat dissipation<br>[m <sup>2</sup> ] |

\*1 The combination increases the rated torque and the maximum torque.

## **Dynamic brake characteristics**

## 

• The coasting distance is a theoretically calculated value which ignores the running load such as friction. The calculated value will be longer than the actual distance. If the braking distance is not longer than the calculated value, a moving part may crash into the stroke end, which is very dangerous. Install the anticrash mechanism such as an air brake or an electric/mechanical stopper such as a shock absorber to reduce the shock of moving parts.

#### Point P

• Do not use dynamic brake to stop in a normal operation as it is the function to stop in emergency.

- For a machine operating at the recommended load to motor inertia ratio or less, the estimated number of usage times of the dynamic brake is 1000 times while the machine decelerates from the rated speed to a stop once in 10 minutes.
- Be sure to enable EM1 (Forced stop 1) after the direct drive motor stops when using EM1 (Forced stop 1) frequently in other than emergency.

#### Dynamic brake operation

#### ■Calculation of coasting distance

The following shows the pattern in which the servo motor comes to a stop when the dynamic brake is operated. Use equation 15.1 to calculate an approximate coasting distance to a stop. The dynamic brake time constant  $\tau$  varies with the direct drive motor and machine operation speeds.

Page 531 Dynamic brake time constant

Lmax: Maximum coasting distance [mm]

V<sub>0</sub>: Machine's fast feed speed [mm/min]

J<sub>M</sub>: Moment of inertia of direct drive motor [kg•cm<sup>2</sup>]

JL: Load moment of inertia converted into equivalent value on direct drive motor rotor [kg•cm]

 $\tau$ : Dynamic brake time constant [s]

 $t_e$ : Delay time of control section (There is internal relay delay time of about 10 ms.) [s]

#### ■Dynamic brake time constant

The following shows necessary dynamic brake time constant  $\tau$  for equation 15.1.

#### Permissible load to motor inertia ratio when the dynamic brake is used

Use the dynamic brake under the load to motor inertia ratio indicated in the following table. If the ratio is higher than this value, the dynamic brake may burn. If there is a possibility that the ratio may exceed the value, contact your local sales office. The values of the permissible load to motor inertia ratio in the table are the values at the maximum rotation speed of the direct drive motor.

The value in the parenthesis shows the value at the rated speed of the direct drive motor.

| Direct drive motor | Permissible load to motor inertia ratio [multiplier] |

| TM-RU2M_G30        |                                                      |

# **16** FULLY CLOSED LOOP SYSTEM

#### Point P

The fully closed loop system is available for servo amplifiers with software version A1 or later.

When fully closed loop control system is used with this servo amplifier, "Linear Encoder Instruction Manual" is needed.

Fully closed loop control system is available with position mode.

When fully closed loop system is configured with MR-J4-\_GF\_ servo amplifier, the following restrictions will be applied. However, these restrictions will not be applied to MR-J4-\_GF\_-RJ servo amplifiers.

- A/B/Z-phase differential output type encoder cannot be used.
- The load-side encoder and servo motor encoder are compatible with only the two-wire type. The four-wire type load-side encoder and servo motor encoder cannot be used.
- When you use the HG-KR and HG-MR series for driving and load-side encoder, the optional four-wire type encoder cables (MR-EKCBL30M-L, MR-EKCBL30M-H, MR-EKCBL40M-H, and MR-EKCBL50M-H) cannot be used. When an encoder cable of 30 m to 50 m is needed, fabricate a two-wire type encoder cable according to the following section.

## **16.1** Functions and configuration

## Function block diagram

A fully closed loop control block diagram is shown below. The fully closed loop system is controlled in the load-side encoder unit.

- \*1 Switching between semi closed loop control and fully closed loop control can be performed by changing the setting of [Pr. PE01]. When semi closed loop control is selected, a control is always performed on the bases of the position data of the servo motor encoder independently of whether the servo motor is at a stop or running.
- \*2 When the fully closed loop system is enabled in [Pr. PE01], dual feedback control in which the servo motor feedback signal and load-side encoder feedback signal are combined by the dual feedback filter in [Pr. PE08] is performed. In this case, fully closed loop control is performed when the servo motor is at a stop, and semi closed loop control is performed when the servo motor is operating to improve control performance. When "4500" is set as the filter value of [Pr. PE08 Fully closed loop dual feedback filter], fully closed loop control is always performed.

The following table shows the functions of each control mode.

| Control                                                                                         | Description                                                                                         |                                                                                                                                                                                                                                                        |  |
|-------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| Semi closed loop control Feature Position is controlled according to the servo motor-side data. |                                                                                                     | Position is controlled according to the servo motor-side data.                                                                                                                                                                                         |  |
|                                                                                                 | Advantage                                                                                           | Since this control is insusceptible to machine influence (such as machine resonance), the gains of the servo amplifier can be raised and the settling time shortened.                                                                                  |  |
|                                                                                                 | Disadvant If the servo motor side is at a stop, the side may be vibrating or the load-side accurace |                                                                                                                                                                                                                                                        |  |
| Advantage Control is performed accordin                                                         |                                                                                                     | Position is controlled according to the servo motor-side data and load-side data.                                                                                                                                                                      |  |
|                                                                                                 |                                                                                                     | Control is performed according to the servo motor-side data during operation, and according to the load side data at a stop in sequence to raise the gains during operation and shorten the settling time. A stop is made with the load-side accuracy. |  |
| Fully closed loop control                                                                       | Feature                                                                                             | Position is controlled according to the load-side data.                                                                                                                                                                                                |  |
| <u> </u>                                                                                        |                                                                                                     | The load-side accuracy is obtained not only at a stop but also during operation.                                                                                                                                                                       |  |
|                                                                                                 |                                                                                                     | Since this control is susceptible to machine resonance or other influences, the gains of the servo amplifier may not rise.                                                                                                                             |  |

## Selecting procedure of control mode

#### **Control mode configuration**

In this servo, a semi closed loop system or fully closed loop system can be selected as a control system. In addition, on the fully closed loop system, the semi closed loop control, fully closed loop control and dual feedback control can be selected by the [Pr. PE08] settings.

#### Dual feedback filter equivalent block diagram

A dual feedback filter equivalent block diagram on the dual feedback control is shown below.

\*1 " $\omega$ " (a dual feedback filter band) is set by [Pr. PE08].

## System configuration

#### For a linear encoder

#### ■MR-J4-\_GF\_ servo amplifier

\*1 Applicable for the absolute position detection system when an absolute position linear encoder is used. In that case, a battery is not required.

\*1 Applicable for the absolute position detection system when an absolute position linear encoder is used. In that case, a battery is not required.

#### For a rotary encoder

#### ■MR-J4-\_GF\_ servo amplifier

\*1 Use a two-wire type encoder cable. A four-wire type encoder cable cannot be used.

■MR-J4-\_GF\_-RJ servo amplifier

A/B/Z-phase differential output, two-wire type, or four-wire type rotary encoder HG-KR, HG-MR servo motor (4194304 pulses/rev) or synchronous encoder Q171ENC-W8 (4194304 pulses/rev)

# 16.2 Load-side encoder

Point P

- Always use the load-side encoder cable introduced in this section. Using other products may cause a malfunction.
- For details of the load-side encoder specifications, performance and assurance, contact each encoder manufacturer.

## Linear encoder

Refer to "Linear Encoder Instruction Manual" for usable linear encoders.

## **Rotary encoder**

When a rotary encoder is used as a load-side encoder, use either of the following servo motors or the encoder.

| Servo amplifier | HG-KR | HG-MR | Synchronous encoder<br>Q171ENC-W8 | A/B/Z-phase<br>differential output <sup>*1</sup> |
|-----------------|-------|-------|-----------------------------------|--------------------------------------------------|
| MR-J4GF_        | 0     | 0     | —                                 | -                                                |
| MR-J4GFRJ       | 0     | 0     | 0                                 | 0                                                |

\*1 A/B/Z-phase differential output rotary encoders that can be used as a load-side encoder have the same specifications as the A/B/Zphase differential output linear encoders. Refer to "Linear Encoder Instruction Manual".

Use a two-wire type encoder cable for MR-J4-\_GF\_ servo amplifiers. Do not use MR-EKCBL30M-L, MR-EKCBL30M-H, MR-EKCBL40M-H, or MR-EKCBL50M-H as they are four-wire type.

When an encoder cable of 30 m to 50 m is needed, fabricate a two-wire type encoder cable according to the following section.

# Configuration diagram of encoder cable

Configuration diagram for servo amplifier and load-side encoder is shown below. Cables used vary, depending on the loadside encoder.

#### Linear encoder

Refer to "Linear Encoder Instruction Manual" for encoder cables for linear encoder.

#### ■MR-J4-\_GF\_ servo amplifier

#### ■MR-J4-\_GF\_-RJ servo amplifier

You can connect the linear encoder without using a branch cable shown in the following section for MR-J4-\_GF\_-RJ servo amplifier. You can also use a four-wire type linear encoder.

Page 539 MR-J4-\_GF\_ servo amplifier

#### Rotary encoder

Refer to "Servo Motor Instruction Manual (Vol. 3)" for encoder cables for rotary encoders.

#### ■MR-J4-\_GF\_ servo amplifier

\*1 Use a two-wire type encoder cable. A four-wire type encoder cable cannot be used.

#### MR-J4-\_GF\_-RJ servo amplifier

For the MR-J4-\_GF\_-RJ servo amplifier, the rotary encoder can be connected without the use of a branch cable shown below. Four-wire type or A/B/Z-phase differential output rotary encoders can also be used.

Page 540 MR-J4-\_GF\_ servo amplifier

\*1 A/B/Z-phase differential output rotary encoders that can be used as a load-side encoder have the same specifications as the A/B/Zphase differential output linear encoders. Refer to "Linear Encoder Instruction Manual".

# MR-J4FCCBL03M branch cable

Use MR-J4FCCBL03M branch cable to connect the rotary encoder and the load-side encoder to CN2 connector. When fabricating the branch cable using MR-J3THMCN2 connector set, refer to "Linear Encoder Instruction Manual".

\*1 Receptacle: 36210-0100PL, shell kit: 36310-3200-008 (3M)

\*2 Plug: 36110-3000FD, shell kit: 36310-F200-008 (3M)

16

# **16.3** Operation and functions

### Startup

#### Startup procedure

Start up the fully closed loop system in the following procedure.

#### Selection of fully closed loop system

By setting [Pr. PA01], [Pr. PE01] and the control command of controller, the control method can be selected as shown in the following table.

| [Pr. PA01]                                                 | [Pr. PE01] | Semi closed loop control/<br>fully closed loop control<br>switching signal | Command unit             | Control system                                       | Absolute<br>position<br>detection<br>system |
|------------------------------------------------------------|------------|----------------------------------------------------------------------------|--------------------------|------------------------------------------------------|---------------------------------------------|
| "0_"<br>Semi closed loop system<br>(standard control mode) | _          | _                                                                          | Servo motor encoder unit | Semi closed loop control                             | 0                                           |
| " 1 _ "<br>Fully closed loop system                        | " 0"       | _                                                                          | Load-side encoder unit   | Dual feedback control (fully closed loop control)    | O <sup>*1</sup>                             |
| (fully closed loop control                                 | "1"        | Off                                                                        |                          | Semi closed loop control                             | ×                                           |
| mode)                                                      |            | On                                                                         |                          | Dual feedback control (fully<br>closed loop control) | ×                                           |

\*1 Applicable when the load-side encoder is set as the absolute position encoder.

#### Operation mode selection

Select an operation mode.

Operation mode selection

| Set value | Operation mode                                            | Control unit                         |  |
|-----------|-----------------------------------------------------------|--------------------------------------|--|
| 0         | Semi closed loop system (Standard control mode)           | Servo motor-side<br>resolution unit  |  |
| 1         | Fully closed loop system (Fully closed loop control mode) | Load-side encoder<br>resolution unit |  |

#### Semi closed loop control/fully closed loop control selection

Select the semi closed loop control/fully closed loop control.

Fully closed loop control selection

0: Always enabled

1: Switching by fully closed loop selection command from controller and Input device CLD (Fully closed loop selection)

|                         |                                                 | 1                         |
|-------------------------|-------------------------------------------------|---------------------------|
| Fully closed I          |                                                 |                           |
| Command from controller | CLD (fully closed loop selection) <sup>*1</sup> | Control system            |
| Off                     | Off                                             | Semi closed loop control  |
| On                      | Off                                             |                           |
| Off                     | On                                              | Fully closed loop control |
| On                      | On                                              |                           |

\*1 his is always off when CLD (Fully closed loop selection) is not assigned in [Pr. PD03] to [Pr. PD05].

To enable the setting, select "Fully closed loop control mode (\_\_1\_)" of "operation mode selection" in [Pr. PA01]. When "Absolute position detection system" is "Enabled (\_\_\_1)" in [Pr. PA03], setting "1" will trigger [AL. 37 Parameter error].

#### Selection of load-side encoder communication method

The communication method changes depending on the load-side encoder type. Refer to the following and "Linear Encoder Instruction Manual" for the communication method for each load-side encoder.

Page 18 Summary

Select the cable to be connected to CN2L connector in [Pr. PC26].

Load-side encoder cable communication method selection 0: Two-wire type 1: Four-wire type When using an encoder of A/B/Z-phase differential output method, set "0". Incorrect setting will trigger [AL. 70] and [AL. 71].

#### Setting of load-side encoder polarity

# 

• Do not set an incorrect direction to "Encoder pulse count polarity selection" in [Pr. PC27]. An abnormal operation and a machine collision may occur if an incorrect direction is set, which cause a fault and parts damaged.

#### Point P

- "Encoder pulse count polarity selection" in [Pr. PC27] is not related to [Pr. PA14 Rotation direction selection]. Make sure to set the parameter according to the relationships between servo motor and linear encoder/rotary encoder.
- Do not set an incorrect direction to "Encoder pulse count polarity selection" in [Pr. PC27]. Doing so may cause [AL. 42 Fully closed loop control error] during the positioning operation.

#### ■Parameter setting method

Set the load-side encoder polarity to be connected to CN2L connector in order to match the CCW direction of servo motor and the increasing direction of load-side encoder feedback.

#### How to confirm the load-side encoder feedback direction

For the way of confirming the load-side encoder feedback direction, refer to the following.

Page 547 Confirmation of load-side encoder position data

#### Setting of feedback pulse electronic gear

Point P

If an incorrect value is set in the feedback pulse electronic gear ([Pr. PE04], [Pr. PE05], [Pr. PE34], and [Pr. PE35]), [AL. 37 Parameter error] and an abnormal operation may occur. Also, it may cause [AL. 42.8 Fully closed loop control error by position deviation] during the positioning operation.

Set the electronic gear ([Pr. PE04], [Pr. PE34], [Pr. PE05], and [Pr. PE35]) for the servo motor-side encoder pulse. Set the electronic gear so that the number of servo motor encoder pulses per servo motor revolution is converted to the number of load-side encoder pulses. The relational expression is shown below.

Number of load-side encoder pulses per servo motor revolution = Number of servo motor encoder pulses per servo motor revolution  $\times \frac{[Pr. PE04] \times [Pr. PE34]}{[Pr. PE05] \times [Pr. PE35]}$ 

Select the load-side encoder so that the number of load-side encoder pulses per servo motor revolution is within the following range.

4096 ( $2^{12}$ )  $\leq$  Number of load-side encoder pulses per servo motor revolution  $\leq$  67108864 ( $2^{26}$ )

# ■When the servo motor is directly coupled with a ball screw and the linear encoder resolution is 0.05 µm

Conditions

Servo motor resolution: 4194304 pulses/rev Servo motor reduction ratio: 1/11 Ball screw lead: 20 mm Linear encoder resolution: 0.05 µm

Calculate the number of linear encoder pulses per ball screw revolution.

Number of linear encoder pulses per ball screw revolution

= Ball screw lead/linear encoder resolution

= 20 mm/0.05 µm = 400000 pulses

 $\frac{[Pr. PE04] \times [Pr. PE34]}{[Pr. PE05] \times [Pr. PE35]} = \frac{400000}{4194304} \times \frac{1}{11} = \frac{3125}{32768} \times \frac{1}{11}$ 

# Setting example when using the rotary encoder for the load-side encoder of roll feeder

Conditions

Servo motor resolution: 4194304 pulses/rev Pulley diameter on the servo motor side: 30 mm Pulley diameter on the rotary encoder side: 20 mm Rotary encoder resolution: 4194304 pulses/rev

When the pulley diameters or reduction ratios differ, consider that in calculation.

| [Pr. PE04] × [Pr. PE34] | <u>4194304 × 30</u> | _ 1 、 | 3 |
|-------------------------|---------------------|-------|---|
| [Pr. PE05] × [Pr. PE35] |                     |       | 2 |

#### Confirmation of load-side encoder position data

Check the load-side encoder mounting and parameter settings for any problems.

Point P

Depending on the check items, MR Configurator2 may be used. Refer to the following for the data displayed on the MR Configurator2. Image 557 About MR Configurator2

When checking the following items, the fully closed loop control mode must be set. For the setting of control mode, refer to the following.

IPage 543 Selection of fully closed loop system

| No.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Check item                                                                                         | Confirmation method and description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |

#### Setting of fully closed loop dual feedback filter

With the initial value (setting = 10) set in [Pr. PE08 Fully closed loop dual feedback filter the dual feedback filter], make gain adjustment by auto tuning, etc. as in semi closed loop control. While observing the servo operation waveform with the graph function, etc. of MR Configurator2, adjust the dual feedback filter.

| [Pr. PE08] setting | Control mode      | Vibration             | Settling time |
|--------------------|-------------------|-----------------------|---------------|
| 1                  | Dual feedback     | Not frequently occurs | Long          |
| to                 |                   | to                    | to            |
| 4499               |                   | Frequently occurs     | Short         |
| 4500               | Fully closed loop | _                     | -             |

Increasing the dual feedback filter setting shortens the settling time, but increases servo motor vibration since the motor is more likely to be influenced by the load-side encoder vibration. The maximum setting of the dual feedback filter should be less than half of the PG2 setting.

Reduction of settling time: Increase the dual feedback filter setting.

Suppression of vibration: Decrease the dual feedback filter setting.

# Home position return

#### **General instruction**

Home position return is all performed according to the load-side encoder feedback data, independently of the load-side encoder type. It is irrelevant to the Z-phase position of the servo motor encoder.

#### Precautions when using a proximity dog

#### Length of proximity dog

Set the length of the proximity dog to satisfy the following, so that the servo motor speed changes from the home position return speed to the creep speed during detection of the proximity dog.

$$L_1 \geq \ \frac{V}{60} \bullet \frac{td}{2}$$

L1: Length of the proximity dog [mm]

- V: Home position return speed [mm/min]
- td: Time to change from the home position return speed to the creep speed [s]

#### ■Adjustment of proximity dog position

To eliminate variations in the home position return completion position, adjust the proximity dog detection position to be near the center between a reference home position and the next reference home position.

The incremental linear encoder and the absolute position linear encoder have different reference home positions at the home position return. Refer to the following for information on the reference home position.

- Page 550 For the absolute position linear encoder
- Page 551 If wanting to stop at the reference home position
- Page 553 For the rotary encoder of a serial communication servo motor

\*1 The resolution is the load-side encoder resolution per servo motor revolution.

#### Timing of when the linear encoder home position is passed

During the period from a home position return start until the proximity dog detection, the linear encoder home position (reference mark) must be passed for an incremental type linear encoder, and the Z-phase must be passed for a rotary encoder. When those are not passed, [AL. 90.5 Z-phase unpassed] may occur.

#### For the absolute position linear encoder

When an absolute type linear encoder is used, the home position reference position is the position per servo motor revolution to the linear encoder home position (absolute position data = 0).

The linear encoder home position can be set in any position.

LZ (Encoder Z-phase pulse) is outputted at the reference home position.

In the case of a proximity dog type home position return, after the proximity dog rear end is detected, the nearest reference home position shifted by the home position shift distance is used as the home position.

#### Home position return direction

\*1 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69].

#### For the incremental linear encoder

Point P

If no linear encoder home position (reference mark) exists, only the home position return type without using Zphase can be performed.

Page 146 Home position return types

#### If wanting to stop at the reference home position

#### Point P

To perform a home position return securely, pass the linear encoder home position (reference mark) with the JOG operation or another operation, and then start the home position return.

When an incremental linear encoder is used, the home position is the position per servo motor revolution to the linear encoder home position (reference mark) that has been passed through.

Set one linear encoder home position in the full stroke, and set it in the proximity dog signal detection position.

LZ (Encoder Z-phase pulse) is outputted at the linear encoder home position (reference mark).

In the case of a dog type home position return, after the proximity dog signal rear end is detected, the nearest reference home position shifted by the home position shift distance is used as the home position.

\*1 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69].

As shown below, in an area where the linear encoder home position (reference mark) is not passed after the home position return starts (home position return restricted area), home position return may be disabled depending on the conditions.

Home position return direction

#### If wanting to stop at the linear encoder home position

When "Stop position selection at home position return" of [Pr. PT41] is set to "\_\_1\_", the home position return for Homing methods 33, 34, -11, and -43 is set to the linear encoder home position (reference mark). This parameter is enabled when an incremental linear encoder compatible with a serial interface is used.

• For Homing methods 33 and 34

The following figure shows the operation of Homing method 34 when "Stop position selection at home position return" of [Pr. PT41] is set to " $\__1$ ". The operation direction of Homing method 33 is opposite to that of Homing method 34.

\*1 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69]. When the stroke end is detected

#### • For Homing methods -11 and -43

The following figure shows the operation of Homing method -11 when "Stop position selection at home position return" of [Pr. PT41] is set to " $\__1$ ". The operation direction of Homing method -43 is opposite to that of Homing method -11.

\*1 Home position shift distance can be changed with [Pr. PT07] and [Pr. PT69]. When the movement is returned at the stroke end

The home position return automatically starts from here.

\*1 This is not available with the software limit.

#### For the rotary encoder of a serial communication servo motor

The home position for when using the rotary encoder of a serial communication servo motor for the load-side encoder is at the load-side Z-phase position.

# **Operation from controller**

An absolute type linear encoder is necessary to configure an absolute position detection system under fully closed loop control using a linear encoder. In this case, the encoder battery need not be installed to the servo amplifier. When a rotary encoder is used, an absolute position detection system can be configured by installing the encoder battery to the servo amplifier. In this case, the battery life will be shorter because the power consumption is increased as the power is supplied to the two encoders of motor side and load side.

Positioning operation from the controller is basically performed like the semi closed loop control.

# Fully closed loop control error detection functions

If fully closed loop control becomes unstable for some reason, the speed at servo motor side may increase abnormally. The fully closed loop control error detection function is a protective function designed to pre-detect it and stop operation. The fully closed loop control error detection function has a speed deviation detection method and a position deviation detection method. Select a detection method with [Pr. PE03 Fully closed loop function selection 2]. The detection level setting can be changed using [Pr. PE06] and [Pr. PE07].

#### Parameter

The fully closed loop control error detection function is selected.

| [Pr. F | PE03 | ] |
|--------|------|---|
|        |      |   |

Fully closed loop control error detection function

- 0: Disabled
- 1: Speed deviation error detection
- 2: Position deviation error detection
- 3: Speed deviation error, position deviation error detection (Initial value)

#### Fully closed loop control error detection functions

#### Speed deviation error detection

Set [Pr. PE03] to "\_\_\_1" to enable the speed deviation error detection.

Speed deviation error detection

The function compares the servo motor-side feedback speed (1)) and load-side feedback speed (3)). If the deviation is not less than the set value (1 r/min to the permissible speed) of [Pr. PE06 Fully closed loop control speed deviation error detection level], the function generates [AL. 42.2 Servo control error by speed deviation] and stops. The initial value of [Pr. PE06] is 400 r/min. Change the set value as required.

#### ■Position deviation error detection

Set [Pr. PE03] to "\_\_\_2" to enable the position deviation error detection.

| [Pr. F | PE03 |   |
|--------|------|---|
|        |      | 2 |
|        |      | _ |

Position deviation error detection

Comparing the servo motor-side feedback position (2)) and load-side feedback position (4)), if the deviation is not less than the set value (1 kpulses to 20000 kpulses) of [Pr. PE07 Fully closed loop control position deviation error detection level], the function generates [AL. 42.1 Servo control error by position deviation] and stops. The initial value of [Pr. PE07] is 100 kpulses. Change the set value as required.

#### Detecting multiple deviation errors

When setting [Pr. PE03] as shown below, multiple deviation errors can be detected. For the error detection methods, refer to the following.

- Page 554 Speed deviation error detection
- Page 554 Position deviation error detection

| [Pr. PE03] |  |  |  |

# Absolute position detection system under fully closed loop system

An absolute type linear encoder is necessary to configure an absolute position detection system under fully closed loop control using a linear encoder. In this case, the encoder battery need not be installed to the servo amplifier. When a rotary encoder is used, an absolute position detection system can be configured by installing the encoder battery to the servo amplifier. In this case, the battery life will be shorter because the power consumption is increased as the power is supplied to the two encoders of motor side and load side.

For an absolute position detection system using a linear encoder, enable the absolute position detection system with [Pr. PA03 Absolute position detection system] and use this servo within the following restrictions.

#### Using conditions

- Use an absolute type linear encoder with the load-side encoder.
- Set [Pr. PA01] to "\_\_1\_", and set [Pr. PE01] to "\_\_\_0".

#### Absolute position detection range using encoder

| Encoder type                      | Absolute position detection enabled range                                       |
|-----------------------------------|---------------------------------------------------------------------------------|
| Linear encoder (Serial interface) | Movable distance range of linear encoder (within 32-bit absolute position data) |

#### Alarm detection

The absolute position-related alarm ([AL. 25]) and warnings ([AL. 92] and [AL. 9F]) are not detected.

# About MR Configurator2

Using MR Configurator2 can confirm if the parameter setting is normal or if the servo motor and the load-side encoder operate properly.

This section explains the fully closed diagnosis screen.

Click "Monitor start" to constantly read the monitor display items from the servo amplifier. Then, click "Monitor stop" to stop reading.

Click "Parameter read" to read the parameter items from the servo amplifier, and then click "Parameter write" to write them.

PE08 Fully closed loop dual feedback filter] is displayed/set in this parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | — |  |  |  |
| m)     | Parameter (fully closed loop<br>function)     | The parameter for the fully closed loop control is displayed or set.<br>Click "Parameter setting" to display the "Fully closed loop control - Basic" window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |   |  |  |  |

# **17** APPLICATION OF FUNCTIONS

This chapter explains application of using servo amplifier functions.

# **17.1** Scale measurement function

The scale measurement function transmits position information of a scale measurement encoder to the controller by connecting the scale measurement encoder in semi closed loop control.

#### Point P

The scale measurement function is available for servo amplifiers with software version A1 or later. When a linear encoder is used as a scale measurement encoder for this servo amplifier, "Linear Encoder Instruction Manual" is necessary.

When the scale measurement function is used for MR-J4-\_GF\_ servo amplifiers, the following restrictions apply. However, these restrictions will not be applied to MR-J4-\_GF\_-RJ servo amplifiers.

- A/B/Z-phase differential output type encoder cannot be used.
- The scale measurement encoder and servo motor encoder are compatible with only the two-wire type. The four-wire type scale measurement encoder and servo motor encoder cannot be used.
- When you use the HG-KR and HG-MR series for driving and scale measurement encoder, the optional fourwire type encoder cables (MR-EKCBL30M-L, MR-EKCBL30M-H, MR-EKCBL40M-H, and MR-EKCBL50M-H) cannot be used. When an encoder cable of 30 m to 50 m is needed, fabricate a two-wire type encoder cable according to the following section.
  - $\ensuremath{\boxtimes}$  Page 630 Two-wire type encoder cable for HG-MR/HG-KR

The scale measurement function compatible servo amplifier can be used with any of the following controllers.

- Simple motion module RD77GF\_/QD77GF\_
- Simple motion board MR-EM340GF

For settings and restrictions of controllers compatible with the scale measurement function, refer to the following and user's manuals for each controller.

Page 567 Controller setting of the scale measurement function

### **Functions and configuration**

#### Function block diagram

The following shows a block diagram of the scale measurement function. The control will be performed per servo motor encoder unit for the scale measurement function.

#### System configuration

#### ■For a linear encoder

• MR-J4-\_GF\_ servo amplifier

#### ■For a rotary encoder

• MR-J4-\_GF\_ servo amplifier

<sup>\*1</sup> Use a two-wire type encoder cable. A four-wire type encoder cable cannot be used.

A/B/Z-phase differential output, two-wire type, or four-wire type rotary encoder HG-KR, HG-MR servo motor (4194304 pulses/rev) or synchronous encoder Q171ENC-W8 (4194304 pulses/rev)

## Scale measurement encoder

#### Point P

- Always use the scale measurement encoder cable introduced in this section. Using other products may cause a malfunction.
- For details of the scale measurement encoder specifications, performance and assurance, contact each encoder manufacturer.

#### Linear encoder

Refer to "Linear Encoder Instruction Manual" for usable linear encoders.

To use the scale measurement function in the absolute position detection system ([Pr. PA22] = 1\_\_\_), an absolute position linear encoder is required. In this case, you do not need to install the encoder battery to the servo amplifier for backing up the absolute position data of the load side. To use a servo motor in the absolute position detection system ([Pr. PA03] = \_\_\_1), the encoder battery must be installed to the servo amplifier for backing up the absolute position data of the servo motor side.

#### Rotary encoder

When a rotary encoder is used as a scale measurement encoder, use either of the following servo motors or the encoder.

| Servo amplifier | HG-KR | HG-MR | Synchronous encoder<br>Q171ENC-W8 | A/B/Z-phase<br>differential output <sup>*1</sup> |
|-----------------|-------|-------|-----------------------------------|--------------------------------------------------|
| MR-J4GF_        | 0     | 0     | —                                 | -                                                |
| MR-J4GFRJ       | 0     | 0     | 0                                 | 0                                                |

\*1 A/B/Z-phase differential output rotary encoders that can be used as a scale measurement encoder have the same specifications as the A/B/Z-phase differential output linear encoders. Refer to "Linear Encoder Instruction Manual".

Use a two-wire type encoder cable for MR-J4-\_GF\_ servo amplifiers. Do not use MR-EKCBL30M-L, MR-EKCBL30M-H, MR-EKCBL40M-H, or MR-EKCBL50M-H as they are four-wire type.

When an encoder cable of 30 m to 50 m is needed, fabricate a two-wire type encoder cable according to the following section.

To use the scale measurement function in the absolute position detection system ([Pr. PA22] = 1\_\_\_), the encoder battery must be installed to the servo amplifier for backing up the absolute position data of the load side. In this case, the battery life will be shorter because the power consumption is increased as the power is supplied to the two encoders of motor side and load side.

#### Configuration diagram of encoder cable

Configuration diagram for servo amplifier and scale measurement encoder is shown below. Cables vary depending on the scale measurement encoder.

#### ■Linear encoder

Refer to "Linear Encoder Instruction Manual" for encoder cables for linear encoder.

MR-J4-\_GF\_ servo amplifier

(Refer to "Linear Encoder Instruction Manual".)

#### • MR-J4-\_GF\_-RJ servo amplifier

You can connect the linear encoder without using a branch cable shown in "MR-J4-\_GF\_ servo amplifier" for MR-J4-\_GF\_-RJ servo amplifier. You can also use a four-wire type linear encoder.

#### ■Rotary encoder

Refer to "Servo Motor Instruction Manual (Vol. 3)" for encoder cables for rotary encoders.

• MR-J4-\_GF\_ servo amplifier

\*1 Use a two-wire type encoder cable. A four-wire type encoder cable cannot be used.

• MR-J4-\_GF\_-RJ servo amplifier

You can connect the rotary encoder without using an MR-J4FCCBL03M branch cable for MR-J4-\_GF\_-RJ servo amplifier. Four-wire type or A/B/Z-phase differential output rotary encoders can also be used.

\*1 A/B/Z-phase differential output rotary encoders that can be used as a scale measurement encoder have the same specifications as the A/B/Z-phase differential output linear encoders. Refer to "Linear Encoder Instruction Manual".

563

#### MR-J4FCCBL03M branch cable

Use MR-J4FCCBL03M branch cable to connect the scale measurement encoder to CN2 connector. When fabricating the branch cable using MR-J3THMCN2 connector set, refer to "Linear Encoder Instruction Manual".

View seen from the wiring side.

\*1 Receptacle: 36210-0100PL, shell kit: 36310-3200-008 (3M)

\*2 Plug: 36110-3000FD, shell kit: 36310-F200-008 (3M)

#### Selection of scale measurement function

The scale measurement function is set with the combination of basic setting parameters [Pr. PA01] and [Pr. PA22].

#### ■Operation mode selection

The scale measurement function can be used during semi closed loop system (standard control mode). Set [Pr. PA01] to " 0 \_".

#### ■Scale measurement function selection

Select the scale measurement function. Set [Pr. PA22] to "1 \_ \_\_" (Used in absolute position detection system) or "2 \_ \_\_" (Used in incremental system) according to the encoder you use.

Scale measurement function selection

0: Disabled

1: Used in absolute position detection system

2: Used in incremental system

#### Selection of scale measurement encoder communication method and polarity

### Point P

"Encoder pulse count polarity selection" in [Pr. PC27] is not related to [Pr. PA14 Rotation direction selection]. Make sure to set the parameter according to the relationships between servo motor and linear encoder/rotary encoder.

The communication method differs depending on the scale measurement encoder type. For the communication method for using a linear encoder as scale measurement encoder, refer to "Linear Encoder Instruction Manual". Select "Four-wire type" because there is only four-wire type for synchronous encoder.

Select the cable to be connected to CN2L connector in [Pr. PC26].

Load-side encoder cable communication method selection

0: Two-wire type

1: Four-wire type

When using a load-side encoder of A/B/Z-phase differential output method, set "0".

Incorrect setting will trigger [AL. 70] and [AL. 71]. Setting "1" while using an MR-J4-\_GF\_ servo amplifier will trigger [AL. 37].

Select a polarity of the scale measurement encoder with the following "Encoder pulse count polarity selection" and "Selection of A/B/Z-phase input interface encoder Z-phase connection judgment function" of [Pr. PC27] as necessary.

#### ■Parameter setting method

· Selection of the encoder pulse count polarity

This parameter is used to set the load-side encoder polarity to be connected to CN2L connector in order to match the CCW direction of servo motor and the increasing direction of load-side encoder feedback. Set this as necessary.

• A/B/Z-phase input interface encoder Z-phase connection judgment function

This function can trigger an alarm by detecting non-signal for Z phase.

The Z-phase connection judgment function is enabled by default. To disable the Z-phase connection judgment function, set [Pr. PC27].

|   | [Pr. F | C27 | ] |
|---|--------|-----|---|
| 0 |        | 0   | 0 |
|   | -      |     |   |

Selection of A/B/Z-phase input interface encoder Z-phase connection judgement function 0: Enabled 1: Disabled

#### How to confirm the scale measurement encoder feedback direction

You can confirm the directions of the cumulative feedback pulses of servo motor encoder and the load-side cumulative feedback pulses are matched by moving the device (scale measurement encoder) manually in the servo-off status. If mismatched, reverse the polarity.

#### Confirmation of scale measurement encoder position data

Check the scale measurement encoder mounting and parameter settings for any problems.

Operate the device (scale measurement encoder) to check the data of the scale measurement encoder is renewed correctly. If the data is not renewed correctly, check the scale measurement encoder mounting, wiring, and parameter settings. Change the scale polarity as necessary.

## Controller setting of the scale measurement function

When a simple motion module RD77GF or simple motion board MR-EM340GF is used, the scale function is available in the servo cyclic transmission function or servo transient transmission function. To use the simple motion module, set the objects 2D36h and 2D37h to any receive PDO, and the objects 2D35h, 2D38h, and 2D3Ch to any receive SDO. For settings of the servo cyclic transmission function and servo transient transmission function, refer to the controller instruction manual.

#### **Related object**

Check that bit 1 of SubIndex2 of 2D35h (Encoder status2) is on before reading the object. If the object is read while bit 1 is off, the value of each object will be 0.

| Index | Sub | Object | Name                                    | Data Type | Access | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

(OFF = Incremental type, ON = Absolute<br>position type) |

\*1 The counter indicates cumulative amount of travel distance from 0 (the position at power-on) to the travel direction. The range is between -2147483648 and 2147483647.

#### Method for calculating a scale measurement encoder position

The scale measurement encoder position is calculated as follows:

Scale position = (2D37h (Scale ABS counter) × 2D38h (Scale measurement encoder resolution)) + 2D36h (Scale cycle counter)

567

# 17.2 Touch probe

The touch probe function is available to latch the current position by sensor input.

With this function, the position feedback of the rising edge and falling edge of TPR1 (touch probe 1) and TPR2 (touch probe 2) can be memorized and stored into each object of 60BAh to 60BDh according to the conditions specified in Touch probe function (60B8h).

The following shows the touch probe detection resolution. Enabling the high precision touch probe will disable the encoder output pulses.

When a simple motion module RD77GF or simple motion board MR-EM340GF is used, the touch probe function is available with the servo cyclic transmission function or servo transient transmission function. To use the simple motion module, set 60B8h to any transmit PDO or any transmit SDO, and the objects 60BAh to 60BDh to any receive PDO or any receive SDO. For settings of the servo cyclic transmission function and servo transient transmission function, refer to the controller instruction manual.

#### **Timing chart**

\*1 Turn on and off Touch Probe Signal so that both the on time and off time are 0.5 ms or longer.

| Transition No. | Object                        | Description                                                                  |
|----------------|-------------------------------|------------------------------------------------------------------------------|
| 1              | 60B8h Bit 0, 4, 5 = 1         | Enables Touch Probe1. The rising edge and falling edge are enabled.          |
| 2              | → 60B9h Bit 0 = 1             | Turns on the Touch Probe1 enable status.                                     |
| 3              | —                             | Turns on Touch Probe Signal (TPR1).                                          |
| 4              | → 60B9h Bit 1 = 1             | Turns on the Touch Probe1 positive edge stored status.                       |
| 4a             | $\rightarrow$ 60BAh           | Sets the latched position feedback for Touch probe position1 positive value. |
| 5              | —                             | Turns off Touch Probe Signal (TPR1).                                         |
| 6              | → 60B9h Bit 2 = 1             | Turns on the Touch Probe1 negative edge stored status.                       |
| 6a             | $\rightarrow$ 60BBh           | Sets the latched position feedback for Touch probe position1 negative value. |
| 7              | 60B8h Bit 4 = 0               | Turns off Sample positive edge. Rising edge detection is disabled.           |
| 8              | $\rightarrow$ 60B9h Bit 1 = 0 | Turns off Touch Probe1 positive edge stored status.                          |
| 8a             | $\rightarrow$ 60BAh           | Touch probe position1 positive value does not change.                        |
| 9              | 60B8h Bit 4 = 1               | Turns on Sample positive edge. Rising edge detection is enabled.             |
| 10             | $\rightarrow$ 60BAh           | Touch probe position1 positive value does not change.                        |
| 11             | —                             | Turns on Touch Probe Signal (TPR1).                                          |
| 12             | → 60B9h Bit 1 = 1             | Turns on the Touch Probe1 negative edge stored status.                       |
| 12a            | $\rightarrow$ 60BAh           | Sets the latched position feedback for Touch probe position1 negative value. |
| 13             | 60B8h Bit 0 = 0               | Disables Touch Probe1.                                                       |
| 14             | → 60B9h Bit 0, 1, 2 = 0       | Clears all the status Bit.                                                   |
| 14a            | $\rightarrow$ 60BAh, 60BBh    | Touch probe position1 positive/negative value does not change.               |

#### High-precision touch probe

TPR2 (touch probe 2) supports high-precision touch probe. The normal touch probe has the latch function with precision of 55  $\mu$ s. On the other hand, the high-precision touch probe latches precisely startup of TPR2 (touch probe 2) with precision of 2  $\mu$ s. To use the high-precision touch probe, set [Pr. PD37] to "\_\_\_ 1". While the high-precision touch probe is being used, the encoder pulse output function cannot be used. The precision of falling edge is 55  $\mu$ s in this case as well.

# **17.3** Backup/restoration function

**P**oint

• Do not use the backup/restoration function with the following conditions.

| Function    | Non-functioning situation                                 |
|-------------|-----------------------------------------------------------|
| Backup      | At communication shut-off<br>During servo motor operation |
| Restoration | At communication shut-off<br>At servo-on                  |

- After a restore is executed, wait for 40 s or more, and then cycle the power of the servo amplifier. When the restore is executed with the absolute position detection system, a home position return must be performed after the setting.
- If a restore is interrupted, all data may not be written to the servo amplifier, causing the restore to fail. If the restore is interrupted, execute it again.
- Backup and restore cannot be executed from multiple GOTs to one servo amplifier at the same time.
- Do not read/write parameters with the engineering tool (MR Configurator2, etc.) while backup or restore is being executed. Otherwise, data backup or restore may fail.
- The backup/restoration function is not available with a connection from a local station.

The backup/restoration function is to back up and restore all parameter data, point table data and cam data in the MR-J4-GF (-RJ) to GOT using SLMP. The following data can be backed up.

| Item                   | Description          | Backup file name |
|------------------------|----------------------|------------------|
| Parameter              | All parameter data   | SUBID0001.QBR    |
| Point table            | All point table data | SUBID0002.QBR    |
| Cam data <sup>*1</sup> | All cam data         | SUBID0003.QBR    |

\*1 Cam data can be backed up and restored only in the I/O mode. For details, refer to the following and GOT User's Manual.

For the procedures of backup/restoration, refer to the GOT User's Manual.

Use the GOT with GT Designer3 Version 1.151H or later.

For details of connected devices, refer to the instruction manual of each device.

# 17.4 Parameter object

### **Definition of parameter objects**

When a simple motion module RD77GF or simple motion board MR-EM340GF is used, use the servo parameter change function to change the parameter of the servo amplifier by writing values to the following objects. Since the changed setting is deleted at power supply shut-off, resetting is required at the next startup. To hold the changed setting even at the next startup, save the parameter setting value to EEP-ROM using Store Parameters (1010h).

To change the setting of the parameters where the changes are reflected by cycling the power, change the value of the corresponding object and execute Store Parameters (1010h) before cycling the power. For parameters requiring power cycling, refer to the following.

Page 172 PARAMETERS

The following table lists the related objects. Refer to the controller instruction manual for setting of the servo parameter change function.

| Index | Sub | Object | Name | Data Type | Access | Description      |

# **Enabling parameters**

The parameters whose symbols are preceded by "\*" are enabled by the following operations. Refer to the following for "\*" of the parameter symbols.

Page 172 PARAMETERS

#### **Store Parameters**

Write "65766173h" (= reverse order of the ASCII code of "save") to the corresponding sub object of Store Parameters (1010h) to store the parameter setting in the EEP-ROM of the servo amplifier.

The value saved in the EEP-ROM is set to the object at the next power-on. For the parameters, the setting can also be changed with the servo parameter change function. However the new setting is not automatically written to the EEP-ROM. To write the new setting, use the Store Parameters (1010h).

Executing Store Parameters (1010h) takes about a maximum of 25 s because all parameters are written at the same time. Be careful not to shut off the power during writing.

| Index | Sub | Object | Name                | Data Type | Access | Description                                                                                                    |

# **17.5** Machine diagnosis function

# Function summary

Point P

The failure prediction function is used with servo amplifiers with software version A3 or later. This is available with MR Configurator2 with software version 1.60N or later.

The machine diagnosis function estimates the friction and vibrational component of the drive system in the equipment based on the data in the servo amplifier, and detects an error in the machine parts, including a ball screw and bearing. The machine diagnosis function includes the friction vibration estimation function and the failure prediction function.

### Friction vibration estimation function

In the friction vibration estimation function, the friction estimation function estimates the friction of the drive system in the equipment, and the vibration estimation function estimates the minute vibration level and vibration frequency based on the data in the servo amplifier. The friction estimation function estimates and detects the static friction (including gravity) and the dynamic friction of guides and ball screws after operation is performed in any operation pattern. The vibration estimation function estimates and detects the static friction (including gravity) and the dynamic friction estimates and detects the vibration level both during servo motor operation and at a servo motor stop, and vibration frequency both during servo motor operation and at a servo motor stop after operation is performed in any operation pattern.

### Failure prediction function

The failure prediction function predicts a failure of the equipment from the friction, vibration level during servo motor operation, and servo motor total travel distance, which are estimated by the friction vibration estimation function. In the failure prediction function, the friction failure prediction function predicts a failure of the equipment from the estimated friction, the vibration failure prediction function predicts a failure of the equipment from the estimated vibration level during servo motor operation, and the total travel distance failure prediction function predicts a failure of the equipment from the equipment from the servo motor total travel distance.

# How to set the function

# Friction estimation function/friction failure prediction function

Use the friction estimation function or the friction failure prediction function with the following procedure. In the friction failure prediction function, a threshold that outputs a warning can be automatically calculated in the servo amplifier with "Automatic threshold setting", or set by using parameters with "Manual threshold setting". With the manual threshold setting, you can set any threshold that outputs a warning.

- \*1 When the servo amplifier is replaced after the equipment is operated, set [Pr. PF41] and [Pr. PF34 (\_\_\_x)] based on the value obtained by subtracting the present servo motor total travel distance from the rated life.
- \*2 You can save the data of the estimated static friction and dynamic friction on the machine diagnosis screen of MR Configurator2.
- \*3 Even if [Pr. PF19] and [Pr. PF20] are unchanged from the initial value, the function operates properly. However, setting the value estimated by the automatic threshold setting will decrease the possibility of an erroneous detection for failure prediction.
- \*4 If the equipment is operated continuously for less than 3 hours, or the friction estimation is not completed for the travel direction set in [Pr. PF40], the threshold is not calculated automatically.

## Vibration estimation function/vibration failure prediction function

Use the vibration estimation function or the vibration failure prediction function with the following procedure. In the vibration failure prediction function, a threshold that outputs a warning can be automatically calculated in the servo amplifier with "Automatic threshold setting", or set by using parameters with "Manual threshold setting". With the manual threshold setting, you can set any threshold that outputs a warning.

- \*1 If the equipment is operated continuously for less than 3 hours, and operated in the position mode or velocity mode for a cumulative time of less than 90 hours, a threshold is not calculated automatically.
- \*2 The estimated vibration level and vibration frequency can be saved on the machine diagnosis screen of MR Configurator2.

## Total travel distance failure prediction function

Use the total travel distance failure prediction function with the following procedure.

# Friction vibration estimation function

# Point P

- If the vibration frequency is extremely low or high, vibration estimation cannot be performed. For example, a low frequency vibration of several tens of hertz is generated with a machine of low rigidity. Note that such a frequency cannot be detected.
- If the equipment vibrates at a plurality of frequencies simultaneously due to some mechanical resonance or others, vibration frequency may not be estimated properly.
- Vibration frequency may not be estimated properly under the condition that the torque crosses the torque limit value. Set a longer acceleration time and deceleration time, or slightly decrease the gains to prevent the occurrence of excessive torque vibrations.
- It is recommended to save the values estimated by the friction vibration estimation function at the start of operation. The degree of machine degradation after operation can be checked by comparing the value estimated by the friction vibration estimation function after operation and the value at the start of operation, facilitating preventive maintenance.

In the friction vibration estimation function, the friction estimation function estimates the friction of the drive system in the equipment, and the vibration estimation function estimates the minute vibration level and vibration frequency based on the data in the servo amplifier. The friction estimation function estimates and detects the static friction (including gravity) and the dynamic friction of guides and ball screws after operation is performed in any operation pattern. The vibration estimation function estimates and detects the static friction (including gravity) and the dynamic friction of guides and ball screws after operation is performed in any operation pattern. The vibration estimation function estimates and detects the vibration level both during servo motor operation and at a servo motor stop, and vibration frequency both during servo motor operation and at a servo motor stop after operation is performed in any operation pattern.

### Friction estimation function

To perform friction estimation, the servo motor must be rotated at zero speed or higher, and operated for 150 s both in the high and low-speed sections. High-speed section indicates that the absolute value of the servo motor speed is [Pr. PF31 Machine diagnosis function - Friction judgment speed] or more. Low-speed section indicates that the absolute value of the servo motor speed is less than [Pr. PF31]. For the above operation pattern, when the cumulative time of (a) + (c) is 150 s or more and the cumulative time of (b) is 150 s or more, the friction in the forward rotation direction is estimated. The friction in the reverse rotation direction is not estimated, even if time (d) is 150 s or more because the servo motor is not operated in the high-speed section. In this case, decrease the setting value of [Pr. PF31] to perform friction estimation. When "0" is set in [Pr. PF31], 1/2 of the rated speed will be the threshold.

For the following operation pattern, it takes approximately 20 min. for completing friction estimation.

The friction estimation function estimates the static friction both at forward rotation and reverse rotation, and the dynamic friction (at rated speed) both at forward rotation and reverse rotation. To estimate these values, it is unnecessary to perform to-and-fro positioning operation. By operating the servo motor in acceleration/deceleration for forward rotation, you can only estimate the static friction and dynamic friction (at rated speed) at forward rotation. By operating the servo motor in acceleration/deceleration for reverse rotation, you can only estimate the static friction and dynamic friction, you can only estimate the static friction and dynamic friction (at rated speed) at reverse rotation.

# Vibration estimation function

The vibration estimation function monitors torque vibrations to estimate high-frequency minute vibration level and vibration frequency. Thus, the function enables to monitor a backlash on the guide, ball screw, belt, etc. and the increase in vibration level and change in vibration frequency due to deterioration.

The vibration estimation function estimates the vibration level and vibration frequency respectively during servo motor operation and at a servo motor stop. Concretely, the function estimates the vibration level both during servo motor operation and at a servo motor stop, and vibration frequency both during servo motor operation and at a servo motor stop.

579

# Failure prediction function

# Point P

- When the vibration failure prediction function is enabled, a vibration failure warning may occur if the gains of the servo amplifier are changed. To enable the vibration failure prediction function, enable it after the gains of the servo amplifier are adjusted.
- In the torque mode, the friction failure prediction function and the vibration failure prediction function cannot be used.
- To create a dynamic friction threshold with the automatic threshold setting in the friction failure prediction function, the equipment must be operated for 3 consecutive hours or more, and operated in the position or velocity mode for a cumulative time of 90 hours or more after the servo motor total travel distance exceeds 1/2 of "Failure prediction Servo motor total travel distance multiplication selection (x \_ \_ \_)" in [Pr. PF34] × [Pr. PF41 Failure prediction Servo motor total travel distance].
- To create a vibration level threshold with the automatic threshold setting in the vibration failure prediction function, the equipment must be operated for 3 consecutive hours or more, and operated in the position or velocity mode for a cumulative time of 90 hours or more.
- With MR Configurator2 or a controller, you can check thresholds when the friction failure prediction function and vibration failure prediction function are used.

The failure prediction function predicts a failure of the equipment from the friction and vibration level during servo motor operation, which are estimated by the friction vibration estimation function. In the failure prediction function, the friction failure prediction function predicts a failure of the equipment from the estimated friction, the vibration failure prediction function predicts a failure of the equipment from the estimated vibration level during servo motor operation, and the total travel distance failure prediction function predicts a failure of the equipment from the equipment from the servo motor operation, and the total travel distance failure prediction function predicts a failure of the equipment from the equipment from the servo motor total travel distance.

# Friction failure prediction function

The friction failure prediction function predicts a failure of the equipment from the increase and decrease in the dynamic friction (at rated speed) estimated by the friction estimation function. If a failure of the equipment is predicted, [AL. F7.2 Friction failure prediction warning] will occur.

In the friction failure prediction function, a threshold that triggers [AL. F7.2] can be set by the following two methods.

#### Automatic threshold setting

From the dynamic friction (at rated speed) estimated by the friction estimation function, a threshold that triggers [AL. F7.2] is automatically calculated in the servo amplifier. With this setting, you can use the friction failure prediction function without setting a threshold. However, after the servo motor total travel distance exceeds 1/2 of "Failure prediction - Servo motor total travel distance multiplication selection (x \_ \_ ) in [Pr. PF34] × [Pr. PF41 Failure prediction - Servo motor total travel distance]", a threshold is not set automatically until the equipment is operated continuously for 3 hours or more, and operated in the position mode or velocity mode for a cumulative time of 90 hours or more. [AL. F7.2] does not occur until a threshold is calculated in the servo amplifier.

#### ■Manual threshold setting

You can set a threshold that triggers [AL. F7.2] with "Friction failure prediction - Threshold multiplication (\_\_\_x)" in [Pr. PF40], and with [Pr. PF42 Friction failure prediction - Average characteristic] and [Pr. PF43 Friction failure prediction - Standard deviation]. For the manual threshold setting, if the servo motor total travel distance exceeds 1/2 of "[Pr. PF34 (x \_\_ \_)] × [Pr. PF41 Failure prediction - Servo motor total travel distance]", friction failure prediction will start. Thus, if the dynamic friction threshold is known, or the equipment you use is configured the same as another piece of equipment used for calculating the threshold with the automatic threshold setting, an initial failure or others can also be detected with the manual threshold setting.

If you manually set a threshold again with the equipment used for setting the threshold automatically, set the value, which is obtained by the automatic threshold setting, in [Pr. PF19 Friction failure prediction - Compensation coefficient 1] and [Pr. PF20 Friction failure prediction - Compensation coefficient 2]. Setting [Pr. PF19] and [Pr. PF20] will decrease the possibility of an erroneous detection for failure prediction.

The friction failure prediction function can be used with the following procedure.

#### Friction failure prediction warning setting

To enable the friction failure prediction warning, set "Friction failure prediction warning selection (\_\_\_x)" in [Pr. PF34] to "\_

\_ 1 (automatic threshold setting)" or "\_ \_ \_ 2 (manual threshold setting)".

Friction failure prediction warning selection

0: Disabled 1: Automatic threshold setting

Manual threshold setting

2: Manual threshold 3: Threshold reset

#### Setting of servo motor total travel distance for failure prediction

For the automatic threshold setting, set a servo motor total travel distance for failure prediction. It is recommended that the servo motor total travel distance for failure prediction be set to about the same as the rated life presented by each guide manufacturer and ball screw manufacturer. For example, for a rated life of 8 × 10<sup>5</sup> rev, set "Failure prediction - Servo motor total travel distance multiplication selection (x \_ \_ )" in [Pr. PF34] to "2 \_ \_ ", and set [Pr. PF41] to "80".

#### ■Threshold setting method

For the automatic threshold setting, [Pr. PF42 Friction failure prediction - Average characteristic] and [Pr. PF43 Friction failure prediction - Standard deviation] for determining a threshold are automatically rewritten according to the dynamic friction (at rated speed) estimated in the servo amplifier. At this time, changing "Friction failure prediction - Threshold multiplication ( x)" in [Pr. PF40] enables to change the threshold. If [AL. F7.2 Friction failure prediction warning] occurs with the value obtained by the automatic threshold setting, set "\_\_\_6" or more in [Pr. PF40 (\_\_\_x)]. After the threshold is calculated in the servo amplifier, [Pr. PF34 (\_\_\_x)] will be set to "\_\_\_2 (manual threshold setting)".

For the manual threshold setting, the upper and lower limit thresholds can be calculated with the equations below. When [Pr. PF40 (x)] is set to "0", the upper and lower limit thresholds are calculated assuming the setting as "5". Upper limit threshold [0.1%] = [Pr. PF42 Friction failure prediction - Average characteristic] + [Pr. PF43 Friction failure prediction - Standard deviation] × "Friction failure prediction - Threshold multiplication (\_ \_ \_ x)" in [Pr. PF40] Lower limit threshold [0.1%] = [Pr. PF42 Friction failure prediction - Average characteristic] - [Pr. PF43 Friction failure prediction - Standard deviation] × "Friction failure prediction - Threshold multiplication ( x)" in [Pr. PF40]

#### ■Execution of friction failure prediction

When upper and lower limit thresholds are inputted to the servo amplifier as indicated in the following section, the servo amplifier starts friction failure prediction. During friction failure prediction, if the dynamic friction (at rated speed) estimated by the friction estimation function exceeds the upper or lower limit threshold, [AL. F7.2 Friction failure prediction warning] will occur. After the occurrence of [AL. F7.2], if the dynamic friction (at rated speed) falls within the upper/lower limit threshold, [AL. F7.2] will be canceled.

#### Page 581 Threshold setting method

# Threshold reset method

To automatically reset thresholds after the upper and lower limit thresholds are set automatically, set "Friction failure prediction warning selection (\_\_\_x)" in [Pr. PF34] to "\_\_\_3 (threshold reset)", and then cycle the power. After the power is cycled, the thresholds are reset and [Pr. PF34 (\_\_\_x)] is set to "\_\_\_1 (automatic threshold setting)". If any part of the equipment is replaced after the friction failure prediction function operates, reset the friction thresholds and servo motor total travel distance.

# Vibration failure prediction function

The vibration failure prediction function predicts a failure of the equipment from the increase in the vibration level estimated by the vibration estimation function. If a failure of the equipment is predicted from the vibration level, [AL. F7.1 Vibration failure prediction warning] will occur.

In the vibration failure prediction function, a threshold that triggers [AL. F7.1] can be set by the following two methods.

## Automatic threshold setting

From the vibration level estimated by the vibration estimation function, a threshold that triggers [AL. F7.1] is automatically calculated in the servo amplifier. With this setting, you can use the vibration failure prediction function without setting a threshold. However, after the vibration failure prediction function operates, the equipment must be operated for about 90 hours before vibration failure prediction is actually performed. [AL. F7.1] does not occur until a threshold is calculated in the servo amplifier.

### Manual threshold setting

You can set a threshold that triggers [AL. F7.1 Vibration failure prediction warning] with "Vibration failure prediction -Threshold multiplication (\_ x \_)" in [Pr. PF40], and with [Pr. PF45 Vibration failure prediction - Average characteristic] and [Pr. PF46 Vibration failure prediction - Standard deviation]. For the manual threshold setting, vibration failure prediction will start immediately after the vibration failure prediction function operates. Thus, if the vibration amplitude threshold is known, or the equipment you use is configured the same as another piece of equipment used for calculating the threshold with the automatic threshold setting, an initial failure or others can also be detected with the manual threshold setting.

The vibration failure prediction function can be used with the following procedure.

### ■Vibration failure prediction warning setting

To enable the vibration failure prediction warning, set "Vibration failure prediction warning selection ( x )" in [Pr. PF34] to '\_\_1 (automatic threshold setting)" or "\_\_2 (manual threshold setting)".

Vibration failure prediction warning selection

0: Disabled 1: Automatic threshold setting

2: Manual threshold setting 3: Threshold reset

# Threshold setting method

For the automatic threshold setting, [Pr. PF45 Vibration failure prediction - Average characteristic] and [Pr. PF46 Vibration failure prediction - Standard deviation] for determining a threshold are automatically rewritten according to the vibration level estimated in the servo amplifier. At this time, changing "Vibration failure prediction - Threshold multiplication (\_ \_ x \_)" in [Pr. PF40] enables to change the threshold. If [AL. F7.1 Vibration failure prediction warning] occurs with the value obtained by the automatic threshold setting, set "\_\_6\_" or more in [Pr. PF40 (\_\_x\_)]. After the threshold is calculated in the servo amplifier, [Pr. PF34 (\_\_x\_)] will be set to "\_\_2\_ (manual threshold setting)".

For the manual threshold setting, the upper and lower limit thresholds can be calculated with the equations below. When [Pr. PF40 (\_\_x\_)] is set to "\_\_0\_", a threshold is calculated assuming the setting as "\_\_5\_".

Threshold [0.1%] = [Pr. PF45 Vibration failure prediction - Average characteristic] + [Pr. PF46 Vibration failure prediction -Standard deviation] × "Vibration failure prediction - Threshold multiplication ( x)" in [Pr. PF40]

The values of [Pr. PF45 Vibration failure prediction - Average characteristic] and [Pr. PF46 Vibration failure prediction -Standard deviation] can also be determined by measuring the torque ripple with the graph function of MR Configurator2. By setting the average and standard deviation of the torque ripple, which are measured by the graph function, in [Pr. PF45] and [Pr. PF46], you can also set the threshold for vibration failure prediction.

### Execution of vibration failure prediction

When a threshold is inputted to the servo amplifier as indicated in the following section, the servo amplifier starts vibration failure prediction. During vibration failure prediction, if the vibration level during servo motor operation, which is estimated by the vibration estimation function, exceeds the threshold, [AL. F7.1 Vibration failure prediction warning] will occur. After the occurrence of [AL. F7.1], if the vibration level during servo motor operation is lower than the threshold, [AL. F7.1] will be canceled.

Page 582 Threshold setting method

#### Threshold reset method

To automatically reset a threshold after the threshold is set with the automatic threshold setting, set "Vibration failure prediction warning selection ((x))" in [Pr. PF34] to "(3) (threshold reset)", and then cycle the power. After the power is cycled, the threshold is reset and [Pr. PF34 ((x))] is set to "(1) (automatic threshold setting)". If parameters such as gains and machine resonance suppression filters are changed, or any part of the equipment is replaced after the vibration failure prediction function operates, reset the threshold.

### Total travel distance failure prediction function

The total travel distance failure prediction function predicts a failure of the equipment from the servo motor total travel distance distance. If the servo motor total travel distance exceeds the value of "Failure prediction - Servo motor total travel distance multiplication selection (x \_ \_ \_)" in [Pr. PF34] × [Pr. PF41 Failure prediction - Servo motor total travel distance], [AL. F7.3 Total travel distance failure prediction warning] will occur.

The total travel distance failure prediction function can be used with the following procedure.

#### Total travel distance failure prediction warning setting

To enable the total travel distance failure prediction warning, "Servo motor total travel distance failure prediction warning selection ( $x_{-}$ )" in [Pr. PF34] to "\_ 1 \_ (enabled)".

Servo motor total travel distance failure prediction warning selection

0: Disabled 1: Enabled

2: Servo motor total travel distance reset

#### Setting of servo motor total travel distance for failure prediction

Set a servo motor total travel distance for failure prediction. It is recommended that the servo motor total travel distance for failure prediction be set to about the same as the rated life presented by each guide manufacturer and ball screw manufacturer. For example, for a rated life of  $8 \times 10^5$  rev, set "Failure prediction - Servo motor total travel distance multiplication selection (x \_ \_ \_)" in [Pr. PF34] to "2 \_ \_ \_", and set [Pr. PF41] to "80". When "0" is set in [Pr. PF41], total travel distance failure prediction does not start.

## Execution of total travel distance failure prediction

When a threshold is inputted to the servo amplifier as indicated in the following section, the servo amplifier starts total travel distance failure prediction. After the occurrence of [AL. F7.3 Total travel distance failure prediction warning], if "\_ 0 \_\_ (disabled)" is set in [Pr. PF34 (\_ x \_ )] and the power is cycled, [AL. F7.3] will be canceled.

#### ■Total travel distance reset

If any part of the equipment is replaced, reset the servo motor total travel distance. To reset the servo motor total travel distance, cycle the power after setting " $_2$ \_\_ (servo motor total travel distance reset)" in [Pr. PF34 ( $_x$ \_\_)]. When the servo motor total travel distance is reset, " $_1$ \_\_ (enabled)" is set in [Pr. PF34 ( $_x$ \_\_)].

# APPENDICES

# Appendix 1 When using the servo amplifier with the DC power supply input

Point P

The DC power supply input is available only with MR-J4-\_GF-RJ servo amplifiers.

# **Connection example**

# 

• Ensure that polarity (+/-) is correct. Otherwise, a burst, damage, etc., may occur.

For the signal and wirings not given in this section, refer to the following.

Page 84 200 V class

Page 90 400 V class

# MR-J4-10GF-RJ to MR-J4-100GF-RJ

- \*1 For the power supply specifications, refer to the following.
- \*2 This diagram shows sink I/O interface. For source I/O interface, refer to the following.
- \*3 Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*5 When not using the STO function, attach the short-circuit connector came with a servo amplifier.
- \*6 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
- \*7 Driving the on switch and off switch with the DC power supply meets IEC/EN 60204-1 requirements.
- \*8 Do not use the 24 V DC interface power supply for the magnetic contactor DC power supply. Always use the power supply designed exclusively for the magnetic contactor.
- \*9 If disabling ALM (Malfunction) output with the parameter, configure up the power supply circuit which switches off the magnetic contactor after detection of alarm occurrence on the controller side.
- \*10 When wires used for L11 and L21 are thinner than wires used for L1 and L3, use a fuse.

# Power supply capacity

The power supply capacity is the same as that for the AC power supply input.  $\square$  Page 318 Power supply capacity and generated loss

# Selection example of wires

Selection conditions of wire size are as follows. Construction condition: Single wire set in midair Wire length: 30 m or less

The following diagram shows the wires used for wiring. Use the wires given in this section or equivalent.

# Example of selecting the wire sizes

Use the 600 V Grade heat-resistant polyvinyl chloride insulated wire (HIV wire) for wiring. The following shows the wire size selection example.

| Servo amplifier              | Wire [mm <sup>2</sup> ] <sup>*1</sup> |                  |  |  |

\*1 Alphabets in the table indicate crimping tools. For crimp terminals and applicable tools, refer to the following.

\*2 To connect these models to a terminal block, be sure to use the screws that come with the terminal block.

# Selection example of crimp terminals

\*1 Coat the crimping part with an insulation tube.

\*2 Some crimp terminals may not be mounted depending on the size. Make sure to use the recommended ones or equivalent ones.

Point P

# For main circuit power supply

# 

• To prevent the servo amplifier from smoke and a fire, select a molded-case circuit breaker which shuts off with high speed.

• Always use one molded-case circuit breaker and one magnetic contactor with one servo amplifier.

When using a fuse instead of the molded-case circuit breaker, use the one having the specifications given in this section.

\*1 Use a molded-case circuit breaker which has the same or higher operation characteristics than our lineup.

\*2 Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less (160 ms or less for 5 kW or more).

# For control circuit power supply

When the wiring for the control circuit power supply (L11/L21) is thinner than that for the main circuit power supply (L1/L2/L3/ N-), install an overcurrent protection device (fuse, etc.) to protect the branch circuit.

| Servo amplifier | Fuse (Class T) |                | Fuse (Class K5) |                |  |

# Appendix 2 Handling of AC servo amplifier batteries for the United Nations Recommendations on the Transport of Dangerous Goods

United Nations Recommendations on the Transport of Dangerous Goods Rev. 15 (hereinafter Recommendations of the United Nations) has been issued. To reflect this, transport regulations for lithium metal batteries are partially revised in the Technical Instruction (ICAO-TI) by the International Civil Aviation Organization (ICAO) and the International Maritime Dangerous Goods Code (IMDG Code) by the International Maritime Organization (IMO).

To comply the instruction and code, we have modified the indication on the package for general-purpose AC servo batteries. The above change will not affect the function and performance of the product.

# Target model

# Purpose

Safer transportation of lithium metal batteries.

# Change in regulations

The following points are changed for lithium metal batteries in transportation by sea or air based on the revision of Recommendations of the United Nations Rev. 15 and ICAO-TI 2009-2010 edition, and IATA Dangerous Goods Regulations 54th Edition (effective January 1, 2013). For lithium metal batteries, cells are classified as UN3090, and batteries contained in or packed with equipment are classified as UN3091.

#### ■Transportation of lithium metal batteries alone

| Packaging requirement                                                                     | Classification          | Main requirement                                                                                                                                             |  |
|-------------------------------------------------------------------------------------------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| Less than eight cells per package with less than one gram of lithium content              | UN3090 PI968 Section II | The package must pass a 1.2 m drop test, and the handling label with battery illustration (size: $120 \times 110$ mm) must be                                |  |
| Less than two assembled batteries per package with less than two grams of lithium content |                         | attached on the package.                                                                                                                                     |  |
| More than eight cells per package with less than one gram of lithium content              | UN3090 PI968 Section IB | The package must pass a 1.2 m drop test, and the handling label with battery illustration (size: $120 \times 110$ mm) must be                                |  |
| More than two assembled batteries per package with less than two grams of lithium content |                         | attached on the package.<br>The Class 9 hazard label must be attached or others to<br>comply with dangerous goods (Class 9).                                 |  |

| Assembled batteries with more than two grams of lithium content                           |                         |                                                                                                                                                              |  |

#### Transportation of lithium metal batteries packed with or contained in equipment

- For batteries packed with equipment, follow the necessary requirements of UN3091 PI969. Batteries are classified into either Section II/Section I depending on the lithium content/packaging requirements.
- For batteries contained in equipment, follow the necessary requirements of UN3091 PI970. Batteries are classified into either Section II/Section I depending on the lithium content/packaging requirements. The special handling may be unnecessary depending on the number of batteries and gross mass per package.

# Ex. Mitsubishi label withbattery illustration

\* Location of UN Number \*\* Location of telephone number for additional information Example of Mitsubishi Electric label with battery illustration (Available since January 1, 2017)

Example of Mitsubishi Electric label with battery illustration (can be used until December 31, 2018)

The handling label shown in the figure in the left has been changed to the one shown in the figure in the right in accordance with the IATA Dangerous Goods Regulations 58th Edition (effective January 1, 2017). However, the label shown in Fig. app. 1 may be used until December 31, 2018 (for two years as an interim measure).

### ■Details of the package change

The following caution is added to the packages of the target batteries. "Containing lithium metal battery. Regulations apply for transportation."

#### ■Transportation precaution for customers

For sea or air transportation, the handling label (refer to the example above) must be attached to the package of a Mitsubishi cell or battery. In addition, attaching it to the outer package containing several packages of Mitsubishi cells or batteries is also required. When the content of a package must be handled as dangerous goods (Class 9), the Shipper's Declaration for Dangerous Goods is required, and the package must be compliant with Class 9 Packages. Documentations like the handling label in the specified design and the Shipper's Declaration for Dangerous Goods are required for transportation. Please attach the documentations to the packages and the outer package.

The IATA Dangerous Goods Regulations are revised, and the requirements are changed annually. When customers transport lithium batteries by themselves, the responsibility for the cargo lies with the customers. Thus, be sure to check the latest version of the IATA Dangerous Goods Regulations.

# Appendix 3 Symbol for the new EU Battery Directive

Symbol for the new EU Battery Directive (2006/66/EC) that is plastered to general-purpose AC servo battery is explained here.

Point P

This symbol is for EU countries only.

This symbol is in accordance with the EU directive 2006/66/EC Article 20 Information for end-users and Annex II.

Your MITSUBISHI ELECTRIC product is designed and manufactured with high quality materials and components which can be recycled and/or reused.

This symbol means that batteries and accumulators, at their end-of-life, should be disposed of separately from your household waste.

If a chemical symbol is printed beneath the symbol shown above, this chemical symbol means that the battery or accumulator contains a heavy metal at a certain concentration.

This will be indicated as follows.

Hg: mercury (0.0005%), Cd: cadmium (0.002%), Pb: lead (0.004%)

In the European Union there are separate collection systems for used batteries and accumulators. Please, dispose of batteries and accumulators correctly at your local community waste collection/recycling center.

Please, help us to conserve the environment we live in!

# Appendix 4 Compliance with global standards

# Terms related to safety (IEC 61800-5-2 Stop function)

STO function (Refer to IEC 61800-5-2: 2007 4.2.2.2 STO.)

The MR-J4 servo amplifiers have the STO function. The STO function shuts down energy to servo motors, thus removing torque. This function electronically cuts off power supply in the servo amplifier. In addition, MR-J4-03A6 and MR-J4W2-0303B6 don't support this function.

# About safety

This chapter explains safety of users and machine operators. Please read the section carefully before mounting the equipment.

# Professional engineer

Only professional engineers should mount MR-J4 servo amplifiers.

- Here, professional engineers should meet all the conditions below.
- Persons who took a proper training of related work of electrical equipment or persons who can avoid risk based on past experience.
- Persons who have read and familiarized himself/herself with this installation guide and operating manuals for the protective devices (e.g. light curtain) connected to the safety control system.

# Applications of the devices

MR-J4 servo amplifiers comply with the following standards.

- IEC/EN 61800-5-1/GB 12668.501, IEC/EN/KN 61800-3/GB 12668.3, IEC/EN 60204-1
- ISO/EN ISO 13849-1:2015 Category 3 PL e, IEC/EN 62061 SIL CL 3, IEC/EN 61800-5-2 (STO) (Except for MR-J4-03A6 and MR-J4W2-0303B6. Refer to the following for compatible models.)
  - Page 606 MR-J4 servo amplifier

MR-J4 servo amplifiers can be used with the MR-D30 functional safety unit, MR-J3-D05 safety logic unit, or safety PLCs. Refer to "MR-D30 Instruction Manual" for the combinations of the servo amplifiers and MR-D30. For the combinations of the servo amplifiers and MR-J3-D05, refer to the following.

Page 609 MR-J3-D05 Safety logic unit

# Correct use

Use the MR-J4 servo amplifiers within specifications. Refer to the following for specifications such as voltage, temperature, etc.

Page 30 Servo amplifier standard specifications

Mitsubishi Electric Co. accepts no claims for liability if the equipment is used in any other way or if modifications are made to the device, even in the context of mounting and installation.

# 

• If you need to get close to the moving parts of the machine for inspection or others, ensure safety by confirming the power off, etc. Otherwise, it may cause an accident.

• It takes 15 minutes maximum for capacitor discharging. Do not touch the unit and terminals immediately after power off.

## ■Peripheral device and power wiring

The following are selected based on IEC/EN 61800-5-1, UL 508C, and CSA C22.2 No. 274.

· Local wiring and crimping tool

The following table shows the stranded wire sizes [AWG] and the crimp terminal symbols rated at 75 °C/60 °C.

| Servo amplifier <sup>*7</sup>                                                                                     | 75 °C/60 °C stranded wire [AWG] <sup>*2</sup> |             |             |                    |  |

| MR-J4WB                                                                                                           | 14/14 <sup>*4</sup>                           | 14/14       | 14/14       | 14/14              |  |

\*1 To connect these models to a terminal block, be sure to use the screws that come with the terminal block.

\*2 Alphabets in the table indicate crimping tools. Refer to the following table for the crimp terminals and applicable tools.

\*3 Select wire sizes depending on the rated output of the servo motors. The values in the table are sizes based on rated output of the servo amplifiers.

\*4 Use the crimp terminal c for the PE terminal of the servo amplifier.

\*5 This value is of 24/0/PM/ ⇐ for MR-J4-03A6 and MR-J4W2-0303B6.

\*6 This value is of U/V/W/E for MR-J4-03A6 and MR-J4W2-0303B6.

\*7 "(S)" means 1-phase 200 V AC power input and "(T)" means 3-phase 200 V AC power input in the table.

\*1 Coat the crimping part with an insulation tube.

\*2 Some crimp terminals may not be mounted depending on the size. Make sure to use the recommended ones or equivalent ones.

#### Selection example of MCCB and fuse

Use T class fuses or molded-case circuit breaker (UL 489 Listed MCCB) as the following table. The T class fuses and molded-case circuit breakers in the table are selected examples based on rated I/O of the servo amplifiers. When you select a smaller capacity servo motor to connect it to the servo amplifier, you can also use smaller capacity T class fuses or moldedcase circuit breaker than ones in the table. For selecting ones other than Class T fuses and molded-case circuit breakers below and selecting a Type E Combination motor controller, refer to the following.

Page 406 Molded-case circuit breakers, fuses, magnetic contactors

· Power supply

This servo amplifier can be supplied from star-connected supply with grounded neutral point of overvoltage category III (overvoltage category II for 1-phase servo amplifiers, MR-J4-03A6, and MR-J4W2-0303B6) set forth in IEC/EN 60664-1. For the interface power supply, use an external 24 V DC power supply with reinforced insulation on I/O terminals. In case of MR-J4-03A6 and MR-J4W2-0303B6, use DC power supplies of reinforced insulation type. For the main circuit power, use UL listed (certified) 48 V DC/24 V DC power supplies which can generate more than 1.2 A/2.4 A per axis.

#### • Grounding

To prevent an electric shock, always connect the protective earth (PE) terminal (marked ) of the servo amplifier to the protective earth (PE) of the cabinet. Do not connect two grounding cables to the same protective earth (PE) terminal. Always connect cables to the terminals one-to-one.

This product can cause a DC current in the protective earthing conductor. To protect direct/indirect contact using an earthleakage current breaker (RCD), only an RCD of type B can be used for the power supply side of the product. The MR-J4-700\_4 is high protective earthing conductor current equipment, the minimum size of the protective earthing conductor must comply with the local safety regulations.

#### ■EU compliance

The EC directives were issued to standardize the regulations of countries that belong to the EU and to ensure smooth distribution of safety-guaranteed products. The CE marking proves the compliance of the manufacturer with the EC directives, and this marking also applies to machines and equipment that incorporate servos.

#### • EMC requirement

MR-J4 servo amplifiers comply with category C3 in accordance with EN 61800-3. As for I/O wires (max. length 10 m. However, 3 m for STO cable for CN8.) and encoder cables (max. length 50 m), use shielded wires and ground the shields. Install an EMC filter and surge protector on the primary side for input and output of 200 V class and for output of 400 V class servo amplifiers. In addition, use a line noise filter for outputs of the 11 kW and 15 kW of 400 V class servo amplifiers. The following shows recommended products.

EMC filter: Soshin Electric HF3000A-UN series, TF3000C-TX series, COSEL FTB series Surge protector: Okaya Electric Industries RSPD series Line noise filter: Mitsubishi Electric FR-BLF

MR-J4 series are not intended to be used on a low-voltage public network which supplies domestic premises; radio frequency interference is expected if used on such a network. The installer shall provide a guide for Installation and use, including recommended mitigation devices. To avoid the risk of crosstalk to signal cables, the installation instructions shall either recommend that the power interface cable be segregated from signal cables.

Use the DC power supply installed with the amplifiers in the same cabinet. Do not connect the other electric devices to the DC power supply.

• For Declaration of Conformity (DoC)

MITSUBISHI ELECTRIC EUROPE B.V. hereby declares that the servo amplifiers are in compliance with EC directives (Machinery directive (2006/42/EC), EMC directive (2014/30/EU), Low-voltage directive (2014/35/EU), and RoHS directive (2011/65/EU)). For the copy of Declaration of Conformity, contact your local sales office.

#### ■USA/Canada compliance

This servo amplifier is designed in compliance with UL 508C and CSA C22.2 No. 274.

Installation

The minimum cabinet size is 150% of each MR-J4 servo amplifier's volume. Also, design the cabinet so that the ambient temperature in the cabinet is 55  $^{\circ}$ C or less. The servo amplifier must be installed in a metal cabinet. Additionally, mount the servo amplifier on a cabinet that the protective earth based on the standard of IEC/EN 60204-1 is correctly connected. For environment, the units should be used in open type (UL 50) and overvoltage category shown in the following table.

Page 606 MR-J4 servo amplifier

The servo amplifier needs to be installed at or below pollution degree 2. For connection, use copper wires.

#### Short-circuit current rating (SCCR)

Suitable For Use On A Circuit Capable Of Delivering Not More Than 100 kA rms Symmetrical Amperes, 500 Volts Maximum (Not More Than 5 kA rms Symmetrical Amperes, 48 Volts Maximum for MR-J4-03A6 and MR-J4W2-0303B6). For SCCR (25 kA or 50 kA) when using a Type E Combination motor controller, refer to the following.

Overload protection characteristics

The MR-J4 servo amplifiers have solid-state servo motor overload protection. (It is set on the basis (full load current) of 120% rated current of the servo amplifier.)

Over-temperature protection for motor

Motor Over temperature sensing is not provided by the drive.

Integral thermal protection(s) is necessary for motor and refer to the following for the proper connection.

Page 601 Electrical Installation and configuration diagram

· Branch circuit protection

For installation in United States, branch circuit protection must be provided, in accordance with the National Electrical Code and any applicable local codes.

For installation in Canada, branch circuit protection must be provided, in accordance with the Canada Electrical Code and any applicable provincial codes.

#### South Korea compliance

This product complies with the Radio Wave Law (KC mark). Please note the following to use the product.

이 기기는 업무용 (A급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.

(The product is for business use (Class A) and meets the electromagnetic compatibility requirements. The seller and the user must note the above point, and use the product in a place except for home.)

In addition, use an EMC filter, surge protector, ferrite core, and line noise filter on the primary side for inputs. Use a ferrite core and line noise filter for outputs. Use a distance greater than 30 m between the product and third party sensitive radio communications for an MR-J4-22K\_(4).

#### General cautions for safety protection and protective measures

Observe the following items to ensure proper use of the MR-J4 servo amplifiers.

- · For safety components and installing systems, only qualified personnel and professional engineers should perform.
- When mounting, installing, and using the MR-J4 servo amplifier, always observe standards and directives applicable in the country.

#### **Residual risk**

- Be sure that all safety related switches, relays, sensors, etc., meet the required safety standards.
- · Perform all risk assessments and safety level certification to the machine or the system as a whole.
- If the upper and lower power modules in the servo amplifier are shorted and damaged simultaneously, the servo motor may make a half revolution at a maximum.
- Only qualified personnel are authorized to install, start-up, repair or service the machines in which these components are installed. Only trained engineers should install and operate the equipment. (ISO 13849-1:2015 Annex F Table F.1 No. 5)
- Separate the wiring for safety observation function from other signal wirings. (ISO 13849-1:2015 Annex F Table F.1 No. 1)
- Protect the cables with appropriate ways (routing them in a cabinet, using a cable guard, etc.).
- · Keep the required clearance/creepage distance depending on voltage you use.

599

# Disposal

Disposal of unusable or irreparable devices should always occur in accordance with the applicable country-specific waste disposal regulations. (Example: European Waste 16 02 14)

#### Lithium battery transportation

To transport lithium batteries, take actions to comply with the instructions and regulations such as the United Nations (UN), the International Civil Aviation Organization (ICAO), and the International Maritime Organization (IMO). The batteries (MR-BAT6V1SET, MR-BAT6V1SET-A, MR-BAT6V1, and MR-BAT6V1BJ) are assembled batteries from two batteries (lithium metal battery CR17335A) which are not subject to the dangerous goods (Class 9) of the UN Recommendations.

# Installation direction and clearances

# 

- The devices must be installed in the specified direction. Not doing so may cause a malfunction.
- Mount the servo amplifier on a cabinet which meets IP54 in the correct direction to maintain pollution degree 2
- The regenerative resistor supplied with 11 kW to 22 kW servo amplifiers does not have a protective cover. Touching the resistor (including wiring/screw hole area) may cause a burn injury and electric shock. Even if the power was shut-off, be careful until the bus voltage discharged and the temperature decreased because of the following reasons.
- $\cdot$  It may cause a burn injury due to very high temperature without cooling.
- · It may cause an electric shock due to charged capacitor of the servo amplifier.

To adapt your machine using MR-J4-03A6 or MR-J4W2-0303B6 to IEC/EN 60950-1, either supply the amplifier with a power supply complying with the requirement of 2.5 stated in IEC/EN 60950-1 (Limited Power Source), or cover the amplifier and motors connected to the outputs with a fire enclosure.

- \*1 For 11 kW to 22 kW servo amplifiers, the clearance between the bottom and ground will be 120 mm or more.
- \*2 When mounting MR-J4-500\_, maintain a minimum clearance of 25 mm on the left side.

# **Electrical Installation and configuration diagram**

# 

• Turn off the molded-case circuit breaker (MCCB) to avoid electrical shocks or damages to the product before starting the installation or wiring.

# 

• The installation complies with IEC/EN 60204-1. The voltage supply to machines must be 20 ms or more of tolerance against instantaneous power failure as specified in IEC/EN 60204-1.

· Connecting a servo motor for different axis to U, V, W, or CN2\_ of the servo amplifier may cause a malfunction.

• Securely connect the cables in the specified method and tighten them with the specified torque. Otherwise, the servo motor may operate unexpectedly.

The following shows representative configuration examples to conform to the IEC/EN/UL/CSA standards.

The connectors described by rectangles are safely separated from the main circuits described by circles. The connected motors will be limited as follows.

- HG/HF/HC/HA series servo motors (Mfg.: Mitsubishi Electric)
- Using a servo motor complied with IEC 60034-1 and Mitsubishi Electric encoder (OBA, OSA)

### 3-phase input for MR-J4 1-axis servo amplifier

- \*1 When the wire sizes of L1 and L11 are the same, MCCB or fuse is not required.
- \*2 Please use a thermal sensor, etc. for thermal protection of the servo motor.
- \*3 For 400 V class, a step-down transformer is not required.

#### 1-phase input for MR-J4 1-axis servo amplifier

\*1 When the wire sizes of L1 and L11 are the same, MCCB or fuse is not required.

- \*2 When using a 100 V class servo amplifier, step down the power supply voltage to 100 V and connect the main circuit power supply lines to L1 and L2. For 1-phase 200 V AC servo amplifiers, connect the lines to L1 and L3.
- \*3 Please use a thermal sensor, etc. for thermal protection of the servo motor.

#### Main circuit 48 V DC input for MR-J4 1-axis servo amplifier

\*1 Please use a thermal sensor, etc. for thermal protection of the servo motor.

# Signal

# Signal

The following shows MR-J4-10B signals as a typical example.

# I/O device

### ■Input device

| Symbol | Device                                      | Connector | Pin No. |

# WARNING

• To avoid an electric shock, only qualified personnel should attempt inspections. For repair and parts replacement, contact your local sales office.

# Inspection items

It is recommended that the following points periodically be checked.

• Check for loose terminal block screws. Retighten any loose screws. (Except for MR-J4-03A6 and MR-J4W2-0303B6)

| Servo amplifier                                                                                                         | Tight | Tightening torque [N•m] |    |    |    |    |    |   |   |     |     |     |   |   |     |

· Check the servo motor bearings, brake section, etc. for unusual noise.

· Check the cables and the like for scratches or cracks. Perform periodic inspection according to operating conditions.

- · Check that the connectors are securely connected to the servo motor.
- Check that the wires are not coming out from the connector.
- · Check for dust accumulation on the servo amplifier.
- · Check for unusual noise generated from the servo amplifier.
- Check the servo motor shaft and coupling for connection.
- Make sure that the emergency stop circuit operates properly such that an operation can be stopped immediately and a power is shut off by the emergency stop switch.

# Parts having service life

Service life of the following parts is listed below. However, the service life varies depending on operation and environment. If any fault is found in the parts, they must be replaced immediately regardless of their service life. For parts replacement, please contact your local sales office.

| Part name                         | Life guideline                                                                                                                   |

| Cooling fan                       | 10,000 hours to 30,000 hours (2 years to 3 years)                                                                                |
| Battery backup time <sup>*1</sup> | Approximately 20,000 hours (equipment power supply: off, ambient temperature: 20 °C)                                             |
| Battery life <sup>*2</sup>        | 5 years from date of manufacture                                                                                                 |

\*1 The time is for using MR-J4 1-axis servo amplifier with a rotary servo motor using MR-BAT6V1SET, MR-BAT6V1SET-A, or MR-BAT6V1BJ. For details and other battery backup time, refer to the following.

Page 462 ABSOLUTE POSITION DETECTION SYSTEM

\*2 Quality of the batteries degrades by the storage condition. The battery life is 5 years from the production date regardless of the connection status.

\*3 The characteristic of smoothing capacitor is deteriorated due to ripple currents, etc. The life of the capacitor greatly depends on ambient temperature and operating conditions. The capacitor will be the end of its life in 10 years of continuous operation in air-conditioned environment (ambient temperature of 40 °C or less for use at the maximum 1000 m above sea level, 30 °C or less for over 1000 m to 2000 m).

# Transportation and storage

# 

- Transport the products correctly according to their mass.
- Stacking in excess of the limited number of product packages is not allowed.
- For detailed information on transportation and handling of the battery, refer to the following.
- 🖙 Page 592 Handling of AC servo amplifier batteries for the United Nations Recommendations on the Transport of Dangerous Goods
- Page 594 Symbol for the new EU Battery Directive
- Install the product in a load-bearing place of servo amplifier and servo motor in accordance with the instruction manual.
- Do not put excessive load on the machine.
- Do not hold the front cover, cables, or connectors when carrying the servo amplifier. Otherwise, it may drop.

#### When you keep or use it, please fulfill the following environment.

| Item                 |                                    | Environment                                                                                                                                                             |  |  |  |  |

\*1 For MR-J4-\_-RJ, 283 V DC to 340 V DC are also supported.

\*2 Servo amplifiers manufactured in June 2015 or later comply with SIL 3 requirements. However, MR-J4-\_A\_/MR-J4-\_B\_ servo amplifiers manufactured in China comply with SIL 3 requirements from the December 2015 production.

# Check list for user documentation

MR-J4 installation checklist for manufacturer/installer

The following items must be satisfied by the initial test operation at least. The manufacturer/installer must be responsible for checking the standards in the items.

Maintain and keep this checklist with related documents of machines to use this for periodic inspection.

- 1. Is it based on directive/standard applied to the machine?
- 2. Is directive/standard contained in Declaration of Conformity (DoC)?
- 3. Does the protection instrument conform to the category required?
- 4. Are electric shock protective measures (protective class) effective?
- 5. Is the STO function checked (test of all the shut-off wiring)?

Checking the items will not be instead of the first test operation or periodic inspection by professional engineers.

# Stop function for IEC/EN 61800-5-2

### ■STO function (Refer to IEC/EN 61800-5-2: 2007 4.2.2.2 STO.)

This function is integrated into the MR-J4 series servo amplifiers.

The STO function shuts down energy to servo motors, thus removing torque. This function electronically cuts off power supply in servo amplifiers for MR-J4 series servo amplifiers.

The purpose of this function is as follows.

- · Uncontrolled stop according to stop category 0 of IEC/EN 60204-1
- · Preventing unexpected start-up

### ■SS1 function (Refer to IEC/EN 61800-5-2: 2007 4.2.2.3C Safe stop 1 temporal delay.)

SS1 is a function which initiates the STO function when the previously set delay time has passed after the servo motor starts decelerating. The delay time can be set with MR-J3-D05.

The purpose of this function is as follows. This function is available by using an MR-J4 series servo amplifier with MR-J3-D05.

· Controlled stop according to stop category 1 of IEC/EN 60204-1

# Emergency operation for IEC/EN 60204-1

#### Emergency stop (Refer to IEC/EN 60204-1: 2005 9.2.5.4.2 Emergency Stop.)

Emergency stop must override all other functions and actuation in all operation modes. Power to the machine driving part which may cause a hazardous state must be either removed immediately (stop category 0) or must be controlled to stop such hazardous state as soon as possible (stop category 1). Restart must not be allowed even after the cause of the emergency state has been removed.

# Emergency switching off (Refer to IEC/EN 60204-1: 2005 9.2.5.4.3 Emergency Switching OFF.)

Removal of input power to driving device to remove electrical risk and to meet above mentioned safety standards.

# Cautions

The following basic safety notes must be read carefully and fully in order to prevent injury to persons or damage to property. Only qualified personnel are authorized to install, start-up, repair or service the machines in which these components are installed.

They must be familiar with all applicable local safety regulations and laws in which machines with these components are installed, particularly the standards and guidelines mentioned in this Instruction Manual and the requirements mentioned in ISO/EN ISO 13849-1:2015, IEC 61508, IEC/EN 61800-5-2, and IEC/EN 60204-1.

The staff responsible for this work must be given express permission from the company to perform start-up, programming, configuration, and maintenance of the machine in accordance with the safety standards.

# 

• Improper installation of the safety related components or systems may cause improper operation in which safety is not assured, and may result in severe injuries or even death.

Protective Measures

 As described in IEC/EN 61800-5-2, the Safe Torque Off (STO) function only prevents the MR-J4 series servo amplifier from supplying energy to the servo motor. Therefore, if an external force acts upon the drive axis, additional safety measures, such as brakes or counter-weights must be used.

# **Residual risk**

Machine manufacturers are responsible for all risk evaluations and all associated residual risks. Below are residual risks associated with the STO/EMG function. Mitsubishi Electric is not liable for any damages or injuries caused by the residual risks.

- The SS1 function only guarantees the delay time before STO/EMG is engaged. Proper setting of this delay time is the full responsibility of the company and/or individuals responsible for installation and commissioning of the safety related system. The system, as a whole, must pass safety standards certification.
- When the SS1 delay time is shorter than the required servo motor deceleration time, if the forced stop function is malfunctioning, or if STO/EMG is engaged while the servo motor is still rotating; the servo motor will stop with the dynamic brake or freewheeling.
- For proper installation, wiring, and adjustment, thoroughly read the manual of each individual safety related component.
- Be sure that all safety related switches, relays, sensors, etc., meet the required safety standards. The Mitsubishi Electric safety related components mentioned in this manual are certified by Certification Body as meeting the requirements of ISO/ EN ISO 13849-1:2015 Category 3, PL d and IEC 61508 SIL 2.
- · Safety is not assured until safety-related components of the system are completely installed or adjusted.
- When replacing an MR-J4 series servo amplifier or MR-J3-D05, confirm that the new equipment is exactly the same as those being replaced. Once installed, be sure to verify the performance of the functions before commissioning the system.
- Perform all risk assessments and safety level certification to the machine or the system as a whole. It is recommended that a Certification Body final safety certification of the system be used.
- To prevent accumulation of multiple malfunctions, perform a malfunction check at regular intervals as deemed necessary by the applicable safety standard. Regardless of the system safety level, malfunction checks should be performed at least once per year.
- If the upper and lower power modules in the servo amplifier are shorted and damaged simultaneously, the servo motor may make a half revolution at a maximum.

## Maintenance and disposal

MR-J3-D05 is equipped with LED displays to check errors for maintenance. Please dispose this unit according to your local laws and regulations.

# **Functions and configuration**

#### Summary

MR-J3-D05 has two systems in which the each system has SS1 function (delay time) and output of STO function.

\*1 Inrush current of approximately 1.5 A flows instantaneously when turning the control circuit power supply on. Select an appropriate capacity of power supply considering the inrush current.

\*2 Power-on duration of the safety logic unit is 100,000 times.

\*3 \_: in signal name indicates a number or axis name.

\*4 For the test pulse input, contact your local sales office.

#### When using MR-J3-D05 with an MR-J4 series servo amplifier

#### System configuration diagram

The following shows the connection targets of the STO switch and STO release switch.

#### ■Connection example

\*1 Set the delay time of STO output with SW1 and SW2. These switches are recessed to prevent accidental change of the setting.

\*2 To release the STO state (base circuit shut-off), turn RESA and RESB on and turn them off.

#### Interfaces

For MR-J3-D05, source type I/O interfaces can be used.

#### Sink I/O interface (CN9, CN10 connector)

Digital input interface DI-1

This is an input circuit whose photocoupler cathode side is input terminal. Transmit signals from sink (open-collector) type transistor output, relay switch, etc.

• Digital output interface DO-1

This is a circuit of collector output terminal of the output transistor. When the output transistor is turned on, collector terminal current will be applied to the output.

A lamp, relay or photocoupler can be driven. Install a diode (D) for an inductive load, or install an inrush current suppressing resistor (R) for a lamp load. (Rated current: 40 mA or less, maximum current: 50 mA or less, inrush current: 100 mA or less) A maximum of 2.6 V voltage drop occurs internally.

\*1 If the voltage drop (maximum of 2.6 V) interferes with the relay operation, apply high voltage (maximum of 26.4 V) from external source.

#### Source I/O interfaces (CN9, CN10 connector)

• Digital input interface DI-1

This is an input circuit whose photocoupler anode side is input terminal. Transmit signals from source (open-collector) type transistor output, relay switch, etc.

 $I_{CEO} \le 100 \ \mu A$ 

• Digital output interface DO-1

This is a circuit of emitter output terminal of the output transistor. When the output transistor is turned on, the current will flow from the output terminal to a load.

A maximum of 2.6 V voltage drop occurs in the MR-J3-D05.

\*1 If the voltage drop (maximum of 2.6 V) interferes with the relay operation, apply high voltage (maximum of 26.4 V) from external source.

#### Wiring CN9 and CN10 connectors

Handle with the tool with care when connecting wires.

#### ■Wire strip

- Use wires with size of AWG 24 to 20 (0.22 mm<sup>2</sup> to 0.5 mm<sup>2</sup>) (recommended electric wire: UL 1007) and strip the wires to make the stripped length 7.0 mm ± 0.3 mm. Confirm the stripped length with gauge, etc. before using the wires.
- If the stripped wires are bent, loose, or too thick due to twisting too much, fix the wires by twisting lightly, etc. Then, confirm the stripped length before using the wires. Do not use excessively deformed wires.
- Smooth out the wire surface and stripped insulator surface.

#### ■Connecting wires

Before connecting wires, be sure to pull out the receptacle assembly from the header connector. If wires are connected with inserted connector, the connector and the printed board may malfunction.

• Using extraction tool (1891348-1 or 2040798-1)

Dimensions and mass

#### Connecting wires

- **1.** Confirm the model number of the housing, contact and tool to be used.
- 2. Insert the tool diagonally into the receptacle assembly.

**3.** Insert the tool until it hits the surface of the receptacle assembly. At this stage, the tool is vertical to the receptacle assembly.

4. Insert wires in the wiring hole till the end. The wires should be slightly twisted in advance to prevent it from being loose.

It is easy to insert the wire if the wire is inserted diagonally while twisting the tool.

5. Remove the tool.

#### · Using a screwdriver

To avoid damaging housings and springs when wiring with screwdriver, do not put excessive force. Be cautious when connecting.

#### Applicable screwdriver

#### Connecting wires

- **1.** Insert a screwdriver in the front slot a little diagonally, and depress the spring. While depressing the spring, insert the wires until they hit the end. Note that the housing and spring may be damaged if the screwdriver is inserted strongly. Never insert the screwdriver in the wire hole. Otherwise, the connector will be damaged.
- 2. Pull the screwdriver out while pressing the wires.
- **3.** Pull the wire lightly to confirm that the wire is surely connected.
- **4.** To remove the wires, depress the spring by the screwdriver in the same way as connecting wires, and then pull the wires out.

#### ■Connector insertion

Insert the connector all the way straight until you hear or feel clicking. When removing the connector, depress the lock part completely before pulling out. If the connector is pulled out without depressing the lock part completely, the housing, contact and/or wires may be damaged.

#### Compatible wire

Compatible wire size is listed below.

| Wire size       |     |
|-----------------|-----|
| mm <sup>2</sup> | AWG |
| 0.22            | 24  |
| 0.34            | 22  |
| 0.50            | 20  |

#### ■Others

- Fix a cable tie keeping a distance of "A"  $\times$  1.5 or longer from the end of the connector.

• Be sure that wires are not pulled excessively when the connector is inserted.

• Wire range

Single wire:  $\phi$ 0.4 mm to 1.2 mm (AWG 26 to AWG 16) Stranded wire: 0.2 mm<sup>2</sup> to 1.25 mm<sup>2</sup> (AWG 24 to AWG 16), wire  $\phi$  0.18 mm or more

# LED display

I/O status, malfunction and power on/off are displayed with LED for each A-axis and B-axis.

# **Rotary switch setting**

Rotary switch is used to shut off the power after control stop by SS1 function.

Set the delay time from when the STO shut off switch is pressed until when STO output is performed. Set the same setting for SW1 and SW2. The following table shows the delay time to be set according to the setting value of the rotary switch.

Setting cannot be changed while power is on. Notify users that setting cannot be changed by putting a seal or by another method so that end users will not change the setting after the shipment.

0 to F in the following table is the set value of the rotary switches (SW1 and SW2).

| Rotary switch   |             | B-axis | B-axis |       |       |       |        |  |  |
|-----------------|-------------|--------|--------|-------|-------|-------|--------|--|--|
| delay time at A | /B-axis [s] | 0 s    | 1.4 s  | 2.8 s | 5.6 s | 9.8 s | 30.8 s |  |  |
| A-axis          | 0 s         | 0      | 1      | 2     | —     | 3     | 4      |  |  |
|                 | 1.4 s       | —      | -      | 5     | -     | 6     | 7      |  |  |

## Troubleshooting

When power is not supplied or FAULT LED turns on, refer the following table and take the appropriate action.

| Event                  | Definition                                                     | Са | use                                                                                                         | Action                                             |

|                        |                                                                | 4. | MR-J3-D05 is malfunctioning.                                                                                | Replace the MR-J3-D05.                             |

# Dimensions

# Installation

Follow the instructions in this section and install MR-J3-D05 in the specified direction. Leave clearances between MR-J3-D05 and other equipment including the cabinet.

# **Combinations of cable/connector**

MR-D05UDL\_M (STO cable) for MR-J3 series cannot be used.

# Appendix 6 EC declaration of conformity

The MR-J4 series servo amplifiers and MR-J3-D05 safety logic unit complies with the safety component laid down in the Machinery directive.

# Appendix 7 How to replace servo amplifier without magnetic pole detection

# 

• Be sure to write the magnetic pole information of the servo amplifier before the replacement to the servo amplifier after the replacement. If the information before and after replacement are different, the servo motor may operate unexpectedly.

When replacing the servo amplifier, carry out the magnetic pole detection again. If the magnetic pole detection cannot be performed unavoidably, write the magnetic pole information from the servo amplifier before the replacement to the one after the replacement using MR Configurator2.

#### Procedures

- 1. Read the magnetic pole information of the servo amplifier before the replacement.
- 2. Write the read magnetic pole information to the servo amplifier after the replacement.
- 3. Perform the test operation with the torque limit for ensuring the safety, and confirm that there is no trouble.

#### Migration method of the magnetic pole information

#### How to read the magnetic pole information from the servo amplifier before the replacement

- 1. Open the project in MR Configurator2, select "MR-J4-GF(-RJ)" for model, and select "Linear" for operation mode.
- **2.** Check that the personal computer is connected with the servo amplifier, and select "Diagnosis" and then "Linear diagnosis".
- **3.** Click "Magnetic pole information" (1) in figure) to open the magnetic pole information window.
- 4. Click "Read All" of the magnetic pole information window. (2) in figure)
- 5. Confirm the data 1 and data 2 (3) in figure) of the magnetic pole information window and take notes.

#### How to write the magnetic pole information to the servo amplifier after the replacement

- 1. Open the project in MR Configurator2, select "MR-J4-GF(-RJ)" for model, and select "Linear" for operation mode.
- **2.** Check that the personal computer is connected with the servo amplifier, and select "Diagnosis" and then "Linear diagnosis".
- **3.** Click "Magnetic pole information" (1) in figure) to open the magnetic pole information window.
- **4.** Input the value of the magnetic pole information taken notes to the data 1 and data 2 (3) in figure) of the magnetic pole information window.
- 5. Click "Write All" (4) in figure) of the magnetic pole information window.
- 6. Cycle the power of the servo amplifier.

# Appendix 8 Two-wire type encoder cable for HG-MR/ HG-KR

For MR-EKCBL\_M-\_ encoder cables for HG-MR and HG-KR, up to 20 m cables are two-wire type. When you need a longer encoder cable of two-wire type than 20 m, fabricate one as shown in the internal wiring diagram in this section using the MR-ECNM connector set. In this case, the cable length should not exceed 50 m.

# **Configuration diagram**

## **Connector set**

\*1 Keep open the pins shown with \_\_\_\_\_. Especially, pin 10 is provided for manufacturer adjustment. If it is connected with any other pin, the servo amplifier cannot operate normally.

# Internal wiring diagram

\*1 Always make connection for use in an absolute position detection system. Wiring is not necessary for use in an incremental system.

# Appendix 9 Analog monitor

**Point** 

A voltage of analog monitor output may be irregular at power-on.

The servo status can be output to two channels in terms of voltage.

# Setting

Change the following digits of [Pr. PC09] and [Pr. PC10].

Analog monitor 1 output selection (the signal provided to the output across MO1 and LG)

 Analog monitor 2 output selection (the signal provided to the output across MO2 and LG)

[Pr. PC11] and [Pr. PC12] can be used to set the offset voltages to the analog output voltages. Setting value is -999 mV to 999 mV.

| Parameter | Description                                                       | Setting range [mV] |
|-----------|-------------------------------------------------------------------|--------------------|
| PC11      | This is used to set the offset voltage of MO1 (Analog monitor 1). | -999 to 999        |
| PC12      | This is used to set the offset voltage of MO2 (Analog monitor 2). |                    |

# Details of the setting

Point P

When you use a linear servo motor, replace the following left words to the right words. CCW direction  $\rightarrow$  Positive direction CW direction  $\rightarrow$  Negative direction Torque  $\rightarrow$  Thrust

The servo amplifier is factory-set to output the servo motor speed to MO1 (Analog monitor 1) and the torque to MO2 (Analog monitor 2). The setting can be changed as listed below by setting the [Pr. PC09] and [Pr. PC10] value. Refer to the following for the detection point.

\*1 Encoder pulse unit.

\*2 Available in position mode

\*3 This cannot be used in the torque mode.

\*4 For 400 V class servo amplifier, the bus voltage becomes +8 V/800 V.

\*5 This cannot be used in the velocity mode.

\*6 Output in the load-side encoder unit for the fully closed loop control. Output in the servo motor encoder unit for the semi closed loop control.

\*7 ±For details on the value of the maximum current command (maximum torque) for ±8 V, refer to the following.

# Maximum current command (maximum torque) for analog monitor ±8 V

Values of the maximum current command (maximum torque) when the analog monitor is  $\pm 8$  V are listed. The current command (torque) outputs the maximum current command (maximum torque) at  $\pm 8$  V. The maximum current command (maximum torque) may not match the rated current/maximum current ratio since it is created from the torque current in the servo amplifier.

#### Rotary servo motor

# Appendix 10 Special specification

### Amplifiers without dynamic brake

#### Summary

This section explains servo amplifiers without a dynamic brake. Items not given in this section will be the same as MR-J4-GF (-RJ).

#### Model

The following describes what each block of a model name indicates. Not all combinations of the symbols are available.

#### Specifications

Dynamic brake which is built in 7 kW or smaller servo amplifiers is removed.

Take safety measures such as making another circuit for an emergency stop, alarm occurrence, and power shut-off.

The following servo motors may function an electronic dynamic brake at an alarm occurrence.

| Series | Servo motor                      |
|--------|----------------------------------|
| HG-KR  | HG-KR053/HG-KR13/HG-KR23/HG-KR43 |
| HG-MR  | HG-MR053/HG-MR13/HG-MR23/HG-MR43 |
| HG-SR  | HG-SR51/HG-SR52                  |

Setting the following parameter disables the electronic dynamic brake.

| Servo amplifier | Parameter  | Setting value |
|-----------------|------------|---------------|
| MR-J4GFED       | [Pr. PF06] | 2             |
| MR-J4GFRU       |            |               |

When [Pr. PA04] is "2 \_ \_ " (default), the motor can be a state of forced stop deceleration at an alarm occurrence. Setting "0 \_ \_ " in [Pr. PA04] disables the forced stop deceleration function.

# Without regenerative resistor

#### Summary

This section explains servo amplifiers without a regenerative resistor. Items not given in this section will be the same as MR-J4-\_GF\_(-RJ).

#### Model

The following describes what each block of a model name indicates. Not all combinations of the symbols are available.

#### Specifications

Indicates a servo amplifier of 11 kW to 22 kW that does not use a regenerative resistor as standard accessory. When using any of these servo amplifiers, always use the regenerative option MR-RB5R, MR-RB9F, MR-RB9T, MR-RB5K-4, and MR-RB6K-4.

## Special coating-specification product (IEC 60721-3-3 Class 3C2)

### Summary

This section explains servo amplifiers with a special coating specification. Items not given in this section will be the same as MR-J4-\_GF\_(-RJ).

### Model

The following describes what each block of a model name indicates. Not all combinations of the symbols are available.

A

### **Specifications**

### ■Special coating

Using the MR-J4 series in an atmosphere containing a corrosive gas may cause its corrosion with time, resulting in a malfunction. For the printed circuit board of the servo amplifiers with a special coating specification, a urethane coating agent is applied to some parts capable of being coated technically (except LEDs, connectors, terminal blocks, etc.) to improve the resistance to corrosive gases. Use a servo amplifier with a special coating specification specifically for applications susceptible to corrosive gases, including tire manufacturing and water treatment. Although the special coating-specification products have the improved resistance to corrosive gases, proper operations in environments mentioned above are not guaranteed. Therefore, perform periodic inspections for any abnormality.

### ■Standard for corrosive gases

In IEC 60721-3-3, corrosive gases refer to sea salt, sulfur dioxide, hydrogen sulfide, chlorine, hydrogen chloride, hydrogen fluoride, ammonia, ozone, and nitrogen oxides shown in the environmental parameter column of the table below. The table also shows the corrosive gas concentrations defined in IEC 60721-3-3, Class 3C2.

| Environmental parameter | Unit                            | 3C2        |               |  |
|-------------------------|---------------------------------|------------|---------------|--|
|                         |                                 | Mean value | Maximum value |  |
| a) Sea salt             | None                            | Salt mist  | •             |  |
| b) Sulfur dioxide       | cm <sup>3</sup> /m <sup>3</sup> | 0.11       | 0.37          |  |
| c) Hydrogen sulfide     | cm <sup>3</sup> /m <sup>3</sup> | 0.071      | 0.36          |  |
| d) Chlorine             | cm <sup>3</sup> /m <sup>3</sup> | 0.034      | 0.1           |  |
| e) Hydrogen chloride    | cm <sup>3</sup> /m <sup>3</sup> | 0.066      | 0.33          |  |
| f) Hydrogen fluoride    | cm <sup>3</sup> /m <sup>3</sup> | 0.012      | 0.036         |  |
| g) Ammonia              | cm <sup>3</sup> /m <sup>3</sup> | 1.4        | 4.2           |  |
| h) Ozone                | cm <sup>3</sup> /m <sup>3</sup> | 0.025      | 0.05          |  |
| i) Nitrogen oxides      | cm <sup>3</sup> /m <sup>3</sup> | 0.26       | 0.52          |  |

The special coating-specification products have the improved corrosion resistance in environments with corrosive gas concentrations conforming to IEC 60721-3-3, Class 3C2. We tested typical models and confirmed that their corrosive gas resistance was improved, compared with the standard models.

# Appendix 11 Driving on/off of main circuit power supply with DC power supply

### **Connection example**

The power circuit is common to all capacity type of servo amplifiers. For the signal and wirings not given in this section, refer to the following.

Page 84 200 V class

Page 90 400 V class

- \*1 For the power supply specifications, refer to the following.
- \*2 This diagram shows sink I/O interface. For source I/O interface, refer to the following.
- \*3 Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less (160 ms or less for 5 kW or more). Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- \*4 Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- \*5 When not using the STO function, attach the short-circuit connector came with a servo amplifier.
- \*6 The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
- \*7 Driving the on switch and off switch with the DC power supply meets IEC/EN 60204-1 requirements.
- \*8 Do not use the 24 V DC interface power supply for the magnetic contactor DC power supply. Always use the power supply designed exclusively for the magnetic contactor.
- \*9 If disabling ALM (Malfunction) output with the parameter, configure up the power supply circuit which switches off the magnetic contactor after detection of alarm occurrence on the controller side.

## Magnetic contactor

Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less (160 ms or less for 5 kW or more).

## Appendix 12List of registration objects

Point *P* 

When you use a linear servo motor, replace the following left words to the right words. CCW direction  $\rightarrow$  Positive direction CW direction  $\rightarrow$  Negative direction Torque  $\rightarrow$  Thrust

### Servo cyclic transmission function

The servo cyclic transmission function is used to monitor data in the servo amplifier with the servo system controller. In the servo cyclic transmission function, data types of registered monitor objects can be set. Setting Index, Sub Index, and Data Type for 2B01h allows you to write to 2B01h.

For details on usage, unit of data types, and others, refer to the manuals for simple motion module RD77GF and simple motion board MR-EM340GF.

## Servo transient transmission function

The servo transient transmission function is used to monitor data in the servo amplifier with the servo system controller. In the servo transient transmission function, the following data can be monitored by setting Index, Sub Index, and Data Type for each command.

For details on usage, unit of data types, and others, refer to the manuals for simple motion module RD77GF and simple motion board MR-EM340GF.

| Index               | Sub Index | Data Type         | Access | Data type                            | Description                                                                                                                                                                                                                                                                                                                                            |

## Appendix 13 Status of general-purpose AC servo products for compliance with the China RoHS directive

### Summary

The China RoHS directive: 电子信息产品污染控制管理办法 (Management Methods for Controlling Pollution by Electronic Information Products) came into effect on March 1, 2007. The China RoHS directive was replaced by the following China RoHS directive: 电器电子产品有害物质限制使用管理办法 (Management Methods for the Restriction of the Use of Hazardous Substances in Electrical and Electronic Products). The succeeding China RoHS directive has been in effect since July 1, 2016.

The China RoHS directive restricts the use of six hazardous substances (lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB), and polybrominated diphenyl ethers (PBDE)) and other hazardous substances specified by the State (currently no applicable substances). The EU RoHS directive (2011/65/EU) also restricts the use of the above six hazardous substances.

### Status of our products for compliance with the China RoHS directive

The following table shows the content of six hazardous substances in our products and Environment-Friendly Use Period marks. The table is created based on the standard SJ/T11364.

| Part name                       |                   | Hazardous substance (name/threshold/standard)*1 |                 |                 |                                    |           |            | Environ                            | Remark        |
|---------------------------------|-------------------|-------------------------------------------------|-----------------|-----------------|------------------------------------|-----------|------------|------------------------------------|---------------|

|                                 | Plate and screw   | 0                                               | 0               | 0               | 0                                  | 0         | 0          |                                    |               |

\*1 O: Indicates that said hazardous substance contained in all of the homogeneous materials for this part is below the limit requirement of GB/T26572.

 $\times$ : Indicates that said hazardous substance contained in at least one of the homogeneous materials for this part is above the limit requirement of GB/T26572.

\*2 Indications based on "Marking for the restriction of the use of hazardous substances in electrical and electronic product" [SJ/T11364-2014]

Indicates that a certain hazardous substance is contained in the product manufactured or sold in China.

Observe safety and usage precautions for the product, and use it within a limited number of years from the production date. Thereby, any of the hazardous substances in the product does not cause environmental pollution, or seriously affect human health or property.

Indicates that no certain hazardous substance is contained in the product.

### Difference between the China RoHS directive and the EU RoHS directive

The China RoHS directive allows no restriction exemption unlike the EU RoHS directive. Although a product complies with the EU RoHS directive, a hazardous substance in the product may be considered to be above the limit requirement (marked "×") in the China RoHS directive.

The following shows some restriction exemptions and their examples according to the EU RoHS directive.

- Lead as an alloying element in steel for machining purposes and in galvanized steel containing up to 0.35% lead by weight, lead as an alloying element in aluminum containing up to 0.4% lead by weight, and copper alloy containing up to 4% lead by weight, e.g. brass-made insert nuts
- · Lead in high melting temperature type solders (i.e. lead-based alloys containing 85% by weight or more lead)
- Electrical and electronic components containing lead in a glass or ceramic other than dielectric ceramic in capacitors, e.g. piezoelectronic devices
- · Electrical and electronic components containing lead in a glass or ceramic matrix compound, e.g. chip resistors

### Status of our products for compliance with the China RoHS directive (Chinese)

The following table is written in Chinese according to "Management Methods for the Restriction of the Use of Hazardous Substances in Electrical and Electronic Products".

| 部件名称        |        | 有害物质(物    | 勿质名称/阈值/      | (基准) *1   |                 |      |      | 环境保护                     | 备注    |

\*1 O: 表示该有害物质在该部件所有均质材料中的含量均在GB/T26572规定的限量要求以下。

×: 表示该有害物质在该部件的至少一种均质材料中的含量超出GB/T26572规定的限量要求。

根据"电子电气产品有害物质限制使用标识要求"、[SJ/T11364-2014]的表示

该标志表示在中国制造/销售的产品中含有特定有害物质。

只要遵守本产品的安全及使用方面的注意事项,从生产日算起的环保使用期限内不会造成环境污染或对人体、财产产生深刻的影响。

\*2

该标志表示制造的产品中不含有特定有害物质。

## Appendix 14 Encoder output pulse setting method

Setting value Servo motor/direct drive motor Linear servo motor \_0\_ Set the output pulses per revolution with [Pr. PA15 Encoder output Selecting "0" will enable dividing ratio setting, because the output (Output pulse pulse setting is not available. pulses] setting) Output pulse = a value set in [Pr. PA15] [pulse/rev] Selecting "Load side encoder ( 1 )" of "Encoder selection for encoder output pulse" in [Pr. PC03] triggers [AL. 37 Parameter error]. 1 Set the dividing ratio to the resolution per servo motor revolution Set the dividing ratio to the travel distance of the linear servo motor (Dividing ratio with [Pr. PA15 Encoder output pulses]. with [Pr. PA15 Encoder output pulses]. setting) Output pulse = Resolution per revolution [pulse/rev] Output pulse = Travel distance of linear servo motor [pulse] [Pr. PA15] setting [Pr. PA15] setting Set the A-phase/B-phase pulse electronic gear with [Pr. PA15 Set the A-phase/B-phase pulse electronic gear with [Pr. PA15 3 (A-phase/B-phase Encoder output pulses] and [Pr. PA16 Encoder output pulses 2]. Encoder output pulses] and [Pr. PA16 Encoder output pulses 2]. pulse electronic Output pulse = Output pulse = Resolution per revolution × [Pr. PA15] setting [pulse/rev] Travel distance of linear servo motor × [Pr. PA15] setting [pulse] gear setting) [Pr. PA16] setting [Pr. PA16] setting [AL. 37 Parameter error] occurs. A/B-phase pulse of A/B/Z-phase differential output encoder is 4 (A/B-phase pulse outputted. This is enabled only when A/B/Z-phase differential through output output encoder is used. setting) Output pulse = A/B-phase pulse of A/B/Z-phase differential output encoder [pulse] The value set for "Encoder output pulse phase selection" in [Pr. PC03] is not applied. When another encoder is connected, [AL. 37 Parameter error] occurs. Selecting "Standard control mode (\_\_0\_)" of "Operation mode" in [Pr. PA01] triggers [AL. 37 Parameter error]. The values set for [Pr. PA15 Encoder output pulses] and [Pr. PA16 Encoder output pulses 2] are not applied.

For details of "Encoder output pulse setting selection" in [Pr. PC03], refer to the following table.

Α

# Appendix 15Adjustment method for error excessive alarm level

The error excessive alarm level can be adjusted as required.

### Parameter

The following parameters allow the error excessive alarm level to be increased.

| Parameter   | Symbol | Name                                                                                                                                                                                    | Setting range | Unit            |
|-------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|-----------------|
| PC01        | ERZ    | Error excessive alarm level                                                                                                                                                             | 0 to 1000     | [Per rev or mm] |
| PC06<br>"x" | *COP3  | Error excessive alarm/error excessive warning level unit<br>selection<br>0: Per 1 rev or 1 mm<br>1: Per 0.1 rev or 0.1 mm<br>2: Per 0.01 rev or 0.01 mm<br>3: Per 0.001 rev or 0.001 mm | 0 to 3        | _               |

### Checking the error excessive alarm margin

Use the graph function of MR Configurator2 to monitor the error excessive alarm margin. The error excessive alarm margin is the maximum pulse when the command position and feedback position match. Also, when the error excessive alarm margin is 0 pulse, [AL. 52 Error excessive alarm] occurs. Calculate the pulse difference from the maximum and minimum pulses of the "error excessive alarm margin".

### Adjusting the error excessive alarm level

Adjust the error excessive alarm level with [Pr. PC01] and "x \_ \_ " of [Pr. PC06] so that the following formula is met. [Pr. PC01] × Unit set with "x \_ \_ " of [Pr. PC06] > Difference in the error excessive alarm margin / Resolution per revolution For linear servo motors, the resolution per revolution is the following value.

[Pr. PL02 Linear encoder resolution - Numerator] / [Pr. PL03 Linear encoder resolution - Denominator] × 1000

### **Warranty**

### 1. Warranty period and coverage

We will repair any failure or defect hereinafter referred to as "failure" in our FA equipment hereinafter referred to as the "Product" arisen during warranty period at no charge due to causes for which we are responsible through the distributor from which you purchased the Product or our service provider. However, we will charge the actual cost of dispatching our engineer for an on-site repair work on request by customer in Japan or overseas countries. We are not responsible for any on-site readjustment and/or trial run that may be required after a defective unit are repaired or replaced.

[Term]

For terms of warranty, please contact your original place of purchase.

[Limitations]

- (1) You are requested to conduct an initial failure diagnosis by yourself, as a general rule.
- It can also be carried out by us or our service company upon your request and the actual cost will be charged. However, it will not be charged if we are responsible for the cause of the failure.
- (2) This limited warranty applies only when the condition, method, environment, etc. of use are in compliance with the terms and conditions and instructions that are set forth in the instruction manual and user manual for the Product and the caution label affixed to the Product.
- (3) Even during the term of warranty, the repair cost will be charged on you in the following cases;
  - 1. a failure caused by your improper storing or handling, carelessness or negligence, etc., and a failure caused by your hardware or software problem
  - 2. a failure caused by any alteration, etc. to the Product made on your side without our approval
  - a failure which may be regarded as avoidable, if your equipment in which the Product is incorporated is equipped with a safety device required by applicable laws and has any function or structure considered to be indispensable according to a common sense in the industry
  - 4. a failure which may be regarded as avoidable if consumable parts designated in the instruction manual, etc. are duly maintained and replaced
  - 5. any replacement of consumable parts (battery, fan, smoothing capacitor, etc.)
  - 6. a failure caused by external factors such as inevitable accidents, including without limitation fire and abnormal fluctuation of voltage, and acts of God, including without limitation earthquake, lightning and natural disasters
  - 7. a failure generated by an unforeseeable cause with a scientific technology that was not available at the time of the shipment of the Product from our company
  - 8. any other failures which we are not responsible for or which you acknowledge we are not responsible for

### 2. <u>Term of warranty after the stop of production</u>

- (1) We may accept the repair at charge for another seven (7) years after the production of the product is discontinued. The announcement of the stop of production for each model can be seen in our Sales and Service, etc.
- (2) Please note that the Product (including its spare parts) cannot be ordered after its stop of production.

### 3. Service in overseas countries

Our regional FA Center in overseas countries will accept the repair work of the Product. However, the terms and conditions of the repair work may differ depending on each FA Center. Please ask your local FA center for details.

### 4. Exclusion of loss in opportunity and secondary loss from warranty liability

- Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to:
- (1) Damages caused by any cause found not to be the responsibility of Mitsubishi.
- (2) Loss in opportunity, lost profits incurred to the user by Failures of Mitsubishi products.
- (3) Special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than Mitsubishi products.
- (4) Replacement by the user, maintenance of on-site equipment, start-up test run and other tasks.

### 5. Change of Product specifications

Specifications listed in our catalogs, manuals or technical documents may be changed without notice.

### 6. Application and use of the Product

- (1) For the use of our AC Servo, its applications should be those that may not result in a serious damage even if any failure or malfunction occurs in AC Servo, and a backup or fail-safe function should operate on an external system to AC Servo when any failure or malfunction occurs.
- (2) Our AC Servo is designed and manufactured as a general purpose product for use at general industries. Therefore, applications substantially influential on the public interest for such as atomic power plants and other power plants of electric power companies, and also which require a special quality assurance system, including applications for railway companies and government or public offices are not recommended, and we assume no responsibility for any failure caused by these applications when used.

In addition, applications which may be substantially influential to human lives or properties for such as airlines, medical treatments, railway service, incineration and fuel systems, man-operated material handling equipment, entertainment machines, safety machines, etc. are not recommended, and we assume no responsibility for any failure caused by these applications when used. We will review the acceptability of the abovementioned applications, if you agree not to require a specific quality for a specific application. Please contact us for consultation.
