# MITSUBISH ELECTRIC 

Programmable Controller MELSEC iQ-F

MELSEC iQ-F
Inverter Control for Automated Warehouses
Function Block Library Reference

## SAFETY PRECAUTIONS

(Read these precautions before use.)
Before using this product, please read this manual and the relevant manuals introduced in this manual carefully and pay full attention to safety in order to handle the product correctly.
This manual classifies the safety precautions into two categories: [ $\$$ WARNING] and [ $\$ CAUTION].

$\triangle$ WARNING
Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.

## $\triangle$ CAUTION

Indicates that incorrect handling may cause hazardous conditions, resulting in minor or moderate injury or property damage.

Depending on the circumstances, procedures indicated by [ $\$$ CAUTION] may also cause severe injury.
It is important to follow all precautions for personal safety.
Store this manual in a safe place so that it can be read whenever necessary. Always forward it to the end user.

## INTRODUCTION

Thank you for purchasing the Mitsubishi Electric MELSEC iQ-F series programmable controllers.
This manual describes the module function blocks for the relevant products listed below.
It should be read and understood before attempting to install or use the module.
Always forward it to the end user.

## Target module

- FX5S CPU module
- FX5UJ CPU module
- FX5U CPU module
- FX5UC CPU modules

## Regarding use of this product

- This product has been manufactured as a general-purpose part for general industries, and has not been designed or manufactured to be incorporated in a device or system used in purposes related to human life.
- Before using the product for special purposes such as nuclear power, electric power, aerospace, medicine or passenger movement vehicles, consult Mitsubishi Electric.
- This product has been manufactured under strict quality control. However when installing the product where major accidents or losses could occur if the product fails, install appropriate backup or failsafe functions in the system.

## Note

- If in doubt at any stage during the installation of the product, always consult a professional electrical engineer who is qualified and trained in the local and national standards. If in doubt about the operation or use, please consult the nearest Mitsubishi Electric representative.
- Since the examples indicated by this manual, technical bulletin, catalog, etc. are used as a reference, please use it after confirming the function and safety of the equipment and system. Mitsubishi Electric will accept no responsibility for actual use of the product based on these illustrative examples.
- This manual content, specification etc. may be changed, without a notice, for improvement.
- The information in this manual has been carefully checked and is believed to be accurate; however, if you notice a doubtful point, an error, etc., please consult your local Mitsubishi Electric representative. When doing so, please provide the manual number given at the end of this manual.

DL100 Operating instructions (manual product number: 8014753)

## TERMS

Unless otherwise specified, this manual uses the following terms.

| Term | Description |
| :--- | :--- |
| CC-Link IE Field Network Basic | CC-Link IE Field Network Basic is an FA network using the standard Ethernet. Data are communicated periodically (cyclic <br> transmission) between the master station and remote stations using link devices. |
| Cyclic transmission | A function by which data are periodically exchanged among stations on the same network using link devices (RX, RY, <br> RWw, and RWr) |
| Distance meter | A sensor that can measure a distance of the range from hundreds of millimeters to tens of meters. Various types of the <br> sensors are available and users can choose it according to the measurement method or the output method for distance <br> data. |
| Engineering tool | A tool used for setting up programmable controllers, programming, debugging, and maintenance |
| Link device | A device (RX, RY, RWr, or RWw) in a CPU module for the purpose of communicating with remote stations |
| Link refresh | Processing of data transfer between link devices of the network module and CPU module devices. <br> Link refresh is performed in "END processing" of the sequence scan of the CPU module. |
| Master station | A station that controls the entire CC-Link IE Field Network Basic. Only one master station can be used in a network. |
| Positioning control | Control that moves a stacker crane used for conveyance to a target position (stop position) by using distance meters. |
| Remote station | A station that performs cyclic transmission with the master station on CC-Link IE Field Network Basic. This station <br> exchanges I/O signals in units of bits and I/O data in units of words. |
| Stacker crane | A conveyer that stores and retrieves goods in a swift and reliable manner by controlling the following three axes: lift axis <br> for making the loading platform go up and down; fork axis for transferring goods to the rack; travel axis for moving the <br> wheeled platform. |

## GENERIC TERMS AND ABBREVIATIONS

Unless otherwise specified, this manual uses the following generic terms and abbreviations.

| Generic term/abbreviation | Description |
| :--- | :--- |
| FB | An abbreviation for "Function Block". A function block is created from a ladder block repeatedly used in a sequence <br> program so that it can be used as a component in a sequence program. <br> Using FBs helps to develop programs more efficiently, reduce mistakes, and improve quality of programs. |
| FR-A800/FR-E800 | A generic term for Mitsubishi Electric general-purpose inverter FR-A800 series, FR-A800 Plus series, and FR-E800 series |
| FX5 CPU module | A generic term for FX5S CPU module, FX5UJ CPU module, FX5U CPU module, and FX5UC CPU module |
| Pr. | Parameter number (Number assigned to function of inverter) | OVERVIEW

The function blocks in this reference manual mean the FB libraries for controlling stacker cranes used for conveyance in automated warehouses by connecting a MELSEC iQ-F series programmable controller and FR-A800/FR-E800 series inverters via CC-Link IE Field Network Basic.

### 1.1 Features

This section describes the features of this function.

## Positioning control via CC-Link IE Field Network Basic communications

This function calculates the speed command from a deviation between the positioning control position command (target position) and the distance meter feedback position (current position) to perform the full-close positioning control that uses inverters and CC-Link IE Field Network Basic communications.

## Flexible system design

The flexible system design can be realized by combining the (charge-free) FB libraries optimized for logistics conveyance and users' own programs (such as saving the operation history).

## Application example

The following figure shows an application example of this system to stacker crane equipment. The system uses three motors and performs positioning control with FBs.

### 1.2 List of FB Libraries

The following table lists the FB libraries in this reference manual.

To use these FB libraries, set the parameters using the engineering tool. (以 Page 21 Parameter Settings)
O: Required, 一: Not required

| Name | Description | Parameter setting |
| :--- | :--- | :--- |
| M+AWH_PosVelGen_F (positioning operation command <br> generation) | Generates speed and position commands for controlling <br> positioning to the target position. | O |
| M+AWH_PIDControl_F (PID control) | Performs position deviation correction during positioning control. | O |
| M+AWH_VelConv_F (frequency conversion) | Converts the speed command (m/s) to the set frequency (Hz). | O |
| M+AWH_MotorSwitch_F (motor switching control) | Switches commands to the inverter when one inverter operates <br> two motors by selecting and switching a motor to be operated. | O |
| M+AWH_AntiSwayControl_F (anti-sway control) | Applies the notch filter to the position command to suppress <br> swinging at positioning stop. | O |
| M+AWH_FREQROL_CCLinkIEFBasic_F (inverter <br> communication) | Controls and monitors the inverters connected to CC-Link IE <br> Field Network Basic. | O |
| M+AWH_ScaleIF_SerialComm_F (distance measurement: serial) | Performs serial communication with distance meters and gives <br> feedback about distance measurement values. | O |
| M+AWH_ScalelF_EN_F (distance measurement: Ethernet) | Performs Ethernet communication with distance meters and gives <br> feedback about distance measurement values. | O |
| M+AWH_DecDistance_F (deceleration distance calculation) | Calculates a distance required for deceleration stop during <br> positioning control. | - |

For these FB libraries, please consult your local Mitsubishi representative.
For the FB library registration method, refer to the following.
$\square]$ GX Works3 Operating Manual

### 1.3 System Configuration

The following figures show examples of system configuration for using the FB libraries in this reference manual.

## When a serial communication compatible distance meter is used

- Line topology

- Star topology

| No. | Device |  | Description |
| :---: | :---: | :---: | :---: |
| (1) | FX5 CPU module | Built-in Ethernet port | Used for connection with an inverter. Communication method: CC-Link IE Field Network Basic |
|  |  | Built-in RS-485 port | Used for connection with a distance meter. <br> Communication method: Serial communication through the predefined protocol support function (two channels maximum) |
|  |  | FX5-485-BD |  |
|  |  | FX5-485ADP |  |
| (2) | Inverter | FR-E800 series | CC-Link IE Field Network Basic communication compatible model Star topology and line topology are available. |
|  |  | FR-A800 series | CC-Link IE Field Network Basic communication compatible model Star topology is available. |
|  |  | FR-A8AP / FR-A8AP E kit | Vector control compatible option for FR-A800 and FR-E800 |
| (3) | Distance meter | DL100 Pro (SICK AG) <br> Distance meters other than above | Serial communication (RS-485 or RS-422) compatible models <br> For the procedure of using general-purpose distance meters, refer to the following. <br> $\longmapsto$ Page 100 Operation Examples of General-Purpose Distance Meters |
| (4) | Switching hub | - | Used for connection with an inverter (for star topology). Communication method: CC-Link IE Field Network Basic |

When an Ethernet communication compatible distance meter is used

- Line topology

(2)

$\Gamma^{(4)}$
${ }^{(4)}$
- Star topology

| No. | Device |  | Description |
| :--- | :--- | :--- | :--- |
| $(1)$ | FX5 CPU module | Built-in Ethernet port | Used for connection with a switching hub. |
| $(2)$ | Switching hub | - | Used for connection with an inverter. <br> Communication method: CC-Link IE Field Network Basic |
|  |  | Used for connection with a distance meter. <br> Communication method: Ethernet (predefined protocol: UDP) |  |
| (3) | Inverter | FR-E800 series | CC-Link IE Field Network Basic communication compatible model <br> Star topology and line topology are available. |
|  |  | FR-A800 series | CC-Link IE Field Network Basic communication compatible model <br> Star topology is available. |
|  |  | FR-A8AP / FR-A8AP E kit | Vector control compatible option for FR-A800 and FR-E800 | SPECIFICATIONS

This chapter describes the common specifications of the FB libraries in this reference manual.

### 2.1 FB Library Specifications

The following table shows specifications of the FB libraries in this reference manual.

| Item | Description |  |
| :--- | :--- | :--- |
| Ethernet-equipped module | FX5 CPU module (Use the built-in Ethernet port.) |  |
| Inverter | FR-A800, FR-E800 <br> (CC-Link IE Field Network Basic compatible device) |  |
| Communication type | CC-Link IE Field Network Basic <br> Predefined protocol support function (serial/Ethernet) |  |
| Topology | Star topology or line topology (supported by only FR-E800) |  |
| Maximum number of connected inverters | 2 | 2 |
| Maximum number of connected distance meters | DL100 Pro (SICK AG) | 3 |
|  | AMS308i (Leuze) | 8 (64 maximum) |
| Number of registered protocols (in the predefined protocol support function) | DL100 Pro (SICK AG) | 6 (64 maximum) |
|  | AMS308i (Leuze) |  |
| Number of steps in a project | 13.56 K steps |  |
| Label capacity of a project | 1.44 K points [Word] |  |
| Latch label capacity of a project | 0K points [Word] |  |

## Project performance values

The following tables list the performance values in the project data of the FB libraries.

## Positioning operation with distance meters (serial communication) (2-axis)

| Project performance value ${ }^{* 1 * 2^{* 3}}$ | Minimum scan time (ms) | 1.161 |
| :--- | :--- | :--- |
|  | Maximum scan time (ms) | 2.86 |
|  | Maximum link scan time (ms) | 69.522 |

*1 These values are performance values for the program described below.
$\longmapsto$ Page 84 Positioning Operation with Distance Meters (Serial Communication)
*2 When the program capacity is set to 128 K steps, the processing speed may become slow.
*3 The standard area is used for labels.

## Positioning operation with distance meters (Ethernet communication) (3-axis)

| Project performance value ${ }^{* 1^{*} 2^{*} 3}$ | Minimum scan time $(\mathrm{ms})$ | 0.951 |
| :--- | :--- | :--- |
|  | Maximum scan time $(\mathrm{ms})$ | 3.015 |
|  | Maximum link scan time $(\mathrm{ms})$ | 92.977 |

*1 These values are performance values for the program described below.
$\longmapsto$ Page 93 Positioning Operation with Distance Meters (Ethernet Communication)
*2 When the program capacity is set to 128 K steps, the processing speed may become slow.
*3 The standard area is used for labels.

### 2.2 FB Library Correlations

The FB libraries process data between the FX5 CPU module and an inverter and between the FX5 CPU module and a distance meter.

The following figure shows the correlations of the FB libraries.
Between the FX5 CPU module and an inverter

(1) User-created program processing
(a) Data processing by user
(2) FB processing
(b) Data processing by FB
(3) Global label definition (device assignment) ${ }^{* 1}$
(c) Data processing performed by other than users and FB
(4) Link refresh ${ }^{* 2}$
(5) CC-Link IE Field Network Basic

*2 For details on the setting method, refer to the following. $\leftrightarrows$ Page 26 Ethernet communication

### 2.3 FB Library Configuration Example

The following figure shows an FB configuration example of using the FB libraries to control the stacker cranes.

## Point/

- Use M+AWH_AntiSwayControl_F (anti-sway control) and M+AWH_MotorSwitch_F (motor switching control) according to the user's system and the expected operation.
- A different FB is used depending on the distance meter's communication type.

Serial communication: $M+A W H$ _ScaleIF_SerialComm_F (distance measurement: serial)
Ethernet communication: M+AWH_ScaleIF_EN_F (distance measurement: Ethernet)

- The position command that is created by M+AWH_PosVelGen_F (positioning operation command generation) is used for speed command correction.

### 2.4 List of Global Labels

The following table lists the global labels used for the FB libraries.

| Name | Description |
| :--- | :--- |
| M+AWH_INV_IF | Used for storing link device information transferred through communication with inverters. |
| M+AWH_ScalelF | Used for storing current position information received through communication with distance meters. |

## M+AWH_INV_IF

| Label name | Name | Data type | Class | Description |
| :--- | :--- | :--- | :--- | :--- |
| G_bRX $^{* 1}$ | Remote input (RX) | Bit | VAR_GLOBAL | Stores a remote input (RX) value. |
| G_bRY $^{* 1}$ | Remote output $(R Y)$ | Bit | VAR_GLOBAL | Stores a remote output (RY) value. |
| G_wRWr $^{* 1}$ | Remote register (RWr) | Word [signed] | VAR_GLOBAL | Stores a remote register (RWr) value. |
| G_wRWw ${ }^{* 1}$ | Remote register (RWw) | Word [signed] | VAR_GLOBAL | Stores a remote register (RWw) value. |

*1 This global label adds an index register to assignments. For details, refer to the following.
$\longmapsto$ Page 21 Parameter Settings

## M+AWH_ScaleIF

| Label name | Name | Data type | Class | Description |
| :--- | :--- | :--- | :--- | :--- |
| G_d3CurrentPos $^{* 1}$ | Current position | Double word [signed] (0..2) | VAR_GLOBAL | Stores the current position [m] measured by the distance <br> meter. <br> G_d3CurrentPos[0]: Travel axis <br> G_d3CurrentPos[1]: Lift axis <br> G_d3CurrentPos[2]: Fork axis ${ }^{* 2}$ |
| G_w3SensorStatus ${ }^{* 1}$ | Distance meter status | Word [signed] (0..2) | VAR_GLOBAL | Stores the distance meter status (error information). <br> G_w3SensorStatus[0]: Travel axis <br> G_w3SensorStatus[1]: Lift axis |
| G_w3SensorStatus[2]: Fork axis ${ }^{* 2}$ |  |  |  |  |

*1 This global label adds an index register to assignments. For details, refer to the following.
$\longmapsto$ Page 21 Parameter Settings
*2 Used for M+AWH_ScaleIF_EN_F (distance measurement: Ethernet).

### 2.5 List of Structures

The following table lists the structures used for the FB libraries.

| Name | Description |
| :--- | :--- |
| PID_PR | Set proportional gain, integral time, and others for PID control. |

## PID_PR (PID setting)

| Label name | Name | Data type | Setting range | Description |
| :---: | :---: | :---: | :---: | :---: |
| eKp | Proportional gain | Single-precision real number | - 0.000000 <br> - $2^{-126}(1.175494 \mathrm{E}-38)$ to 150.000000 | Set the proportional gain [ $\mathrm{sec}^{-1}$ ]. |
| eTi | Integral time | Single-precision real number | - 0.000000 <br> - $2^{-126}(1.175494 \mathrm{E}-38)$ to 10.000000 | Set the integral time [s]. <br> When the integral control enabled is on, set a value larger than 0 . |
| eTd | Differential time | Single-precision real number | - 0.000000 <br> - $2^{-126}(1.175494 \mathrm{E}-38)$ to 10.000000 | Set the differential time [s]. |
| eDeadBand | Dead band setting | Single-precision real number | - 0.000000 <br> - $2^{-126}(1.175494 \mathrm{E}-38)$ to 300.000000 | Set the dead band [m]. |
| eHighLimit | Output upper limit | Single-precision real number | - 0.000000 <br> - $2^{-126}(1.175494 \mathrm{E}-38)$ to 10.000000 | Set the compensation speed output upper limit [ $\mathrm{m} / \mathrm{s} \mathrm{s}$. |
| eLowLimit | Output lower limit | Single-precision real number | $\begin{aligned} & \cdot-10.000000 \text { to }-2^{-126}(-1.175494 \mathrm{E}-38) \\ & -0.000000 \end{aligned}$ | Set the compensation speed output lower limit [ $\mathrm{m} / \mathrm{s} \mathrm{s}$. |
| eDeviationOver | Excessive error level | Single-precision real number | - 0.000000 <br> - $2^{-126}(1.175494 \mathrm{E}-38)$ to 300.000000 | Set the allowable range of the position deviation [ m ] for excessive error detection. |
| bPrelease | Proportional control enabled | Bit | On, Off | Set whether to enable the proportional control. <br> - On: Enabled <br> - Off: Disabled |
| blrelease | Integral control enabled | Bit | On, Off | Set whether to enable the integral control. <br> - On: Enabled <br> - Off: Disabled |
| bDrelease | Differential control enabled | Bit | On, Off | Set whether to enable the differential control. <br> - On: Enabled <br> - Off: Disabled |
| blntInit | Integral initialization | Bit | On, Off | Set whether to reset the integral control manipulated amount. <br> - On: Reset <br> - Off: Do not reset |
| bintFreeze | Integral held | Bit | On, Off | Set whether to hold the integral control manipulated amount. <br> - On: Hold <br> - Off: Do not hold |

### 2.6 Link Devices

The following tables list the link devices accessed using the FB libraries.
The letter " n " in a device number represents a value determined by the station number.

## Point $\rho$

The tables show the link devices for using the FR-E800 series.
When using the FR-A800 series, refer to the following.
$\longmapsto$ Page 109 When the FR-A800 Series Is Used

## RYn/RXn mapping

$O$ : Can be changed, $\times$ : Cannot be changed

| Master station to Inverter (RYn) |  |  | Inverter to Master station (RXn) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Device No. | Device name | Mapping | Device No. | Device name | Mapping |
| RYn0 | Forward rotation command | $\times$ | RXn0 | Forward running | $\times$ |
| RYn1 | Reverse rotation command | $\times$ | RXn1 | Reverse running | $\times$ |
| RYn2 | High-speed operation command (terminal RH function) | $\bigcirc$ | RXn2 | Running (terminal RUN function) | $\times$ |
| RYn3 | Middle-speed operation command (terminal RM function) | $\bigcirc$ | RXn3 | Up to frequency | $\times$ |

*1 The list shows the devices when Pr. 544 is set to " 0 " (compatible with CC-Link Ver.1). For link devices when Pr. 544 is not set to " 0 ", refer to the manuals for the inverters used.

### 2.7 Parameter Settings

The following describes the parameter settings for using these FB libraries.

## CC-Link IE Field Network Basic settings

Use GX Works3 to configure settings to connect the FX5 CPU module and inverters via CC-Link IE Field Network Basic.
The following example shows a system configuration where the FX5U CPU module and two FR-E800-E inverters (station No. 1 and station No.2) are connected.

(1) Serial communication adapter + FX5U CPU module (station number 0, master station)
(2) FR-E800-E (station number 1, axis 1 (travel axis))
(3) FR-E800-E (station number 2, axis 2 (lift axis))

- Link device and global label (M+AWH_INV_IF) assignment examples

| Station No. | Link device (RX) | Refresh target device (X) | Global label (bRX) |
| :--- | :--- | :--- | :--- |
| 1 | RX0 to RX3F | X1000 to X1077 | G_bRX[0] to G_bRX[63] |
| 2 | RX40 to RX7F | X1100 to X1177 | G_bRX[64] to G_bRX[127] |
| Station No. | Link device (RY) | Refresh target device (Y) | Global label (bRY) |
| 1 | RY0 to RY3F | Y1000 to Y1077 | G_bRY[0] to G_bRY[63] |
| 2 | RY40 to RY7F | Y1100 to Y1177 | G_bRY[64] to G_bRY[127] |
| Station No. | Link device (RWr) | Refresh target device (W) | Global label (wRWr) |
| 1 | RWr0 to RWr1F | W0 to W1F | G_wRWr[0] to G_wRWr[31] |
| 2 | RWr20 to RWr3F | W20 to W3F | G_wRWr[32] to G_wRWr[63] |
| Station No. | Link device (RWw) | Refresh target device (W) | Global label (wRWw) |
| 1 | RWw00 to RWw1F | W40 to W5F | G_wRWw[0] to G_wRWw[31] |
| 2 | RWw20 to RWw3F | W60 to W7F | G_wRWw[32] to G_wRWw[63] |

## Network configuration settings

1. Open the Ethernet port setting window.

5 [Navigation window] $\Rightarrow$ [Parameter] $\Rightarrow$ CPU module $\Rightarrow$ [Module Parameter] $\Rightarrow$ [Ethernet port]
2. Set the IP address and subnet mask of the programmable controller.

8
[Basic Setting] $\Rightarrow$ [Own Node Settings] $\Rightarrow$ [IP Address]

| Setting Item |  |
| :---: | :---: |
| Item | Setting |
| Own Node SettingsIP Address |  |
|  |  |
| - IP Address | 192.168.3.250 |
| - Subnet Mask | 255.255 .255 .0 |
| --. Default Gateway | . . . |
| - Communication Data Code | Binary |

3. Set [To Use or Not to Use CC-Link IEF Basic Setting] to "Enable".[Basic Settings] $\Rightarrow$ [CC-Link IEF Basic Setting] $\Rightarrow$ [To Use or Not to Use CC-Link IEF Basic Setting]

| Setting Item |  |
| :---: | :---: |
| Item | Setting |
| $\square$ CC-Link IEF Basic Settings |  |
| - To Use or Not to Use CC-Link IEF Basic Setting | Use |
| - Network Configuration Settings | <Detailed Setting> |
| - Refresh Settings | <Detailed Setting> |

4. Open the network configuration window.

7 [CC-Link IEF Basic Setting] $\Rightarrow$ [Network Configuration Settings] $\Rightarrow$ <Detailed Settings>
5. Add FR-E800-E inverters.

Select FR-E800-E inverters in "Module List", and drag and drop them to the network map or the list of stations.
6. Set the IP address of each station.

## Restriction

Set the target stations (inverters) to be controlled by this FB library left-aligned. If the target stations are set with another station put in between, FB cannot access link devices correctly and fails to operate correctly.

## Refresh parameter settings

1. Open the Ethernet port setting window.
© [Navigation window] $\Rightarrow$ [Parameter] $\Rightarrow$ CPU module $\Rightarrow$ [Module Parameter] $\Rightarrow$ [Ethernet port]
2. Open the refresh setting window.
[Basic Settings] $\Rightarrow$ [CC-Link IEF Basic Setting] $\Rightarrow$ [Refresh Settings] $\Rightarrow$ <Detailed Settings>

3. Specify the devices to be assigned to $R X / R Y$ and $R W w / R W r$. The following shows a setting example.

| Remote station 1 | Remote station 2 |
| :---: | :---: |
| - RX0 to RX3F $\Leftrightarrow$ X1000 to X1077 (128 points) | - RX0 to $\mathrm{RX} 3 \mathrm{~F} \Leftrightarrow \mathrm{X} 1100$ to X1177 (128 points) |
| - RY0 to RY3F $\Leftrightarrow$ Y1000 to Y1077 (128 points) | - RY0 to RY3F $\Leftrightarrow$ Y1100 to Y1177 (128 points) |
| - RWr0 to RWr1F $\Leftrightarrow$ W0 to W1F (64 points) | - RWr0 to RWr1F $\Leftrightarrow$ W20 to W3F (64 points) |
| - RWw0 to RWw1F $\Leftrightarrow$ W40 to W5F (64 points) | - RWw0 to RWw1F $\Leftrightarrow$ W60 to W7F (64 points) |

## Global label settings

To enable the FB of M+AWH_FREQROL_CCLinkIEFBasic_F, add the index register $Z 9$ to devices assigned in the refresh settings and set the devices to the global labels ( $\mathrm{M}+\mathrm{AWH}$ _INV_IF).

- Setting example: (G_bRX: X1000Z9, G_bRY: Y1000Z9, G_wRWr: W0Z9, G_wRWw: W40Z9)

## Point ${ }^{\rho}$

- To change the assignment (devices/labels) with the global labels, users need to copy them and change them. ( $\leftrightarrows$ Page 101 FB library registration and duplication)
- To input data by users, the users need to enter the label name, data type, class, and assignment (device/ label) for each item. ( 5 Page 17 List of Global Labels)

## Setting for communication with distance meters

Use GX Works3 to configure settings for the FX5 CPU module to communicate with distance meters.
Separately, set the distance meters according to the configuration.

## Global label settings (common to Ethernet communication and serial communication)

Set the following global labels and assign the file register to enable the FBs of M+AWH_ScaleIF_SerialComm_F and M+AWH_ScaleIF_EN_F.

## Point ${ }^{\rho}$

- To change the assignment (devices/labels) with the global labels, users need to copy them and change them. ( $\hookleftarrow$ Page 101 FB library registration and duplication)
- To input data by users, the users need to enter the label name, data type, class, and assignment (device/ label) for each item. ( $\Im$ Page 17 List of Global Labels)

## Serial communication (built-in RS-485 port)

CPU module: FX5U/FX5UC CPU module

1. Open the 485 serial port settings.

5 [Navigation window] $\Rightarrow$ [Parameter] $\Rightarrow$ CPU module $\Rightarrow$ [Module Parameter] $\Rightarrow$ [485 Serial Port]
2. Set "Communication Protocol Type" to "Predefined Protocol Support Function".
[Basic Setting] $\Rightarrow$ [Communication Protocol Type]

3. Set Data Length, Parity, Stop Bit, and Baud Rate according to the distance meter to be used. The following shows a setting example.
[Basic Setting] $\Rightarrow$ [Detailed Setting]

| Setting Item |  | Setting |
| :--- | :--- | :--- |
| $\square$ Advanced Settings | Set detailed setting. |  |
| Data Length | Sbit |  |
| Parity Bit | Even |  |
| Stop Bit | 1 bit |  |
| Baud Rate | $115,200 \mathrm{bps}$ | $\checkmark$ |

## Serial communication (FX5-485-BD or FX5-485ADP)

CPU module: FX5S/FX5UJ/FX5U/FX5UC CPU module* ${ }^{*}$
*1 The FX5UC CPU module does not support FX5-485-BD.

1. Open the "Module Configuration" window.[Navigation window] $\Rightarrow$ [Module Configuration]
2. Mount the communication adapter on the CPU module. (Drag and drop the communication adapter to be used to the side of the CPU module.)[Element Selection window] $\Rightarrow$ [Communication Adapter]

3. Set the parameters.
(Edit] $\Rightarrow$ [Parameter] $\Rightarrow$ [Fix]
4. Check the parameters.
[Tool] $\Rightarrow$ [Check Parameter]
5. Open the module parameter setting window of the added module.
[Navigation window] $\Rightarrow$ [Parameter] $\Rightarrow$ [Module Information] $\Rightarrow$ [FX5-485ADP]
6. Set "Communication Protocol Type" to "Predefined Protocol Support Function".
(Basic Setting] $\Rightarrow$ [Communication Protocol Type]

| Setting Item |
| :---: | :---: | :---: |
| Item Setting  <br> $\square$ Communication Protocol Type Set communication protocol type.  <br> Communication Protocol Type Predefined Protocol Support Function $\checkmark$ |

7. Set Data Length, Parity, Stop Bit, and Baud Rate according to the distance meter to be used. The following shows a setting example.[Basic Setting] $\Rightarrow$ [Detailed Setting]

| Setting Item |  |  |
| :---: | :---: | :---: |
| Item | Setting | $\wedge$ |
| $\square$ Advanced Seltings | Set detailed setting. |  |
| --. Data Length | 8 bit |  |
| -.- Parity Bit | Even |  |
| - Stop Bit | 1 bit |  |
| - Baud Rate | 115,200bps | $\checkmark$ |

## Ethernet communication

1. Open the External Device Configuration of the Ethernet port.
[Navigation window] $\Rightarrow$ [Parameter $] \Rightarrow$ CPU module $\Rightarrow$ [Module Parameter $] \Rightarrow$ [Ethernet Port $]$ [Basic Settings] $\Rightarrow$ [External Device Configuration] $\Rightarrow$ <Detailed Setting>
2. Select the external device in "Module List", and drag and drop it to the network map or the list of connected devices to add the distance meter.
3. Set "Communication Method" to "Predefined Protocol" and set the IP address and port number according to the distance meter to be used. The following shows a setting example.

## Point $P$

Port numbers 1 to 1023 are typically reserved port numbers (WELL KNOWN PORT NUMBERS) and 61440 to 65534 are used by other communication functions, so it is recommended to use 1024 to 5548 or 5570 to 61439 for the own station port numbers.

## Predefined protocol support function setting

Use GX Works3 to set predefined protocols to establish communication with distance meters.
For details on the setting method, refer to any of the following according to the distance meter communication method.
For details on the serial communication, refer to the following.
[ $]$ MELSEC iQ-F FX5 User's Manual (Communication)
For details on the Ethernet communication, refer to the following.
[] MELSEC iQ-F FX5 User's Manual (Communication)
The following section describes how to use the protocol setting data provided with the FB libraries and their precautions.

## Serial communication

Use the protocol setting data "fb-awhfreqrol_SerialComm.rpx". This protocol setting data enables serial communication with DL100 Pro (SICK AG) distance meters.

1. Register the protocol setting data "fb-awhfreqrol_SerialComm.rpx" to the CPU module.

For details on the protocol setting data registration method, refer to the following.
[]] MELSEC iQ-F FX5 User's Manual (Communication)
2. The protocol setting data is registered.

- If an additional protocol for communications with another device needs to be registered with this protocol setting data, add the protocol to the top or bottom of the existing protocol settings. (For protocol settings that are configured with existing protocol numbers 1 to 8 , ensure that their protocol numbers appear consecutively.)
- This protocol setting data uses file register areas R32700 to R32708 to enable various communications with distance meters through the predefined protocol support function.

## Ethernet communication

Use the protocol setting data "fb-awhfreqrol_EN.tpx". This protocol setting data enables Ethernet communication with AMS308i (Leuze) distance meters.

1. Register the protocol setting data "fb-awhfreqrol_EN.tpx" to the CPU module.

For details on the protocol setting data registration method, refer to the following.
[] MELSEC iQ-F FX5 User's Manual (Communication)
2. The protocol setting data is registered.

## Point ${ }^{\rho}$

- If an additional protocol for communications with another device needs to be registered with this protocol setting data, add the protocol to the top or bottom of the existing protocol settings. (For protocol settings that are configured with existing protocol numbers 1 to 6 , ensure that their protocol numbers appear consecutively.)
- This protocol setting data uses file register areas R32700 to R32708 to enable various communications with distance meters through the predefined protocol support function.

## Inverter parameter setting

Use FR Configurator2 to set the inverter parameters (FR-E800 series).
For the parameter settings for the FR-A800 series, refer to the following.
$\longmapsto$ Page 109 When the FR-A800 Series Is Used
The setting value is an example for use with a sample program.

## Point 9

For details on parameters, refer to the manuals for the inverters used.
For details on how to use FR Configurator2, refer to the following.
[]FR Configurator2 Instruction Manual

| Inverter parameter |  |  |  | Description |
| :---: | :---: | :---: | :---: | :---: |
| No. | Name | Initial value | Setting value |  |
| 7 | Acceleration time ${ }^{* 1}$ | 5 | 0 | As the operation pattern is generated using an FB, set the acceleration/deceleration time to 0 for the inverter. |
| 8 | Deceleration time ${ }^{* 1}$ | 5 | 0 |  |
| 9 | Electronic thermal O/L relay | Inverter rated current | 2.55 | Set the rated motor current. <br> Set the parameter in accordance with specifications of the motor used. |
| 13 | Starting frequency** | 0.5 | 0 | As the operation pattern is generated using an FB, set the starting frequency to 0 for the inverter. |
| 18 | High speed maximum frequency ${ }^{* 1}$ | 120 | 200 | Set the maximum output frequency to 200 Hz . |
| 45 | Second deceleration time | 9999 | 1 | Used for motor switching for the travel/fork axis by "M+AWH_MotorSwitch_F". <br> Set the parameters in accordance with specifications of the motor used. |
| 46 | Second torque boost | 9999 | 1 |  |
| 47 | Second V/F (base frequency) | 9999 | 60 |  |
| 48 | Second stall prevention operation level | 9999 | 150 |  |
| 51 | Second electronic thermal O/L relay / <br> Rated second motor current | 9999 | 0.68 |  |
| 71 | Applied motor | 0 | 23 | Set the parameters to change the control method to Vector control. Set the parameters in accordance with specifications of the motor used. |
| 80 | Motor capacity | 9999 | 0.4 |  |
| 81 | Number of motor poles | 9999 | 4 |  |
| 83 | Rated motor voltage | 200/400/575 | 200 |  |
| 84 | Rated motor frequency | 9999 | 60 |  |
| 96 | Auto tuning setting/status | 0 | 1 | Set the parameter to perform offline auto tuning. |
| 183 | MRS terminal function selection ${ }^{* 1}$ | 24 | 24 | Assign the MRS (Output stop) signal to terminal MRS. |
| 190 | RUN terminal function selection ${ }^{* 1}$ | 0 | 0 | Assign the RUN (Inverter running) signal to terminal RUN in positive logic. |
| 191 | FU terminal function selection ${ }^{* 1}$ | 4 | 4 | Assign the FU (Output frequency detection) signal to terminal FU in positive logic. |
| 192 | ABC terminal function selection*1 | 99 | 199 | Assign the ALM (Fault) signal to terminals A, B, and C in negative logic. |
| 359 | Encoder rotation direction | 1 | 1 | Set the parameters in accordance with specifications of the encoder used under Vector control. |
| 369 | Number of encoder pulses | 1024 | 1000 |  |
| 451 | Second motor control method selection ${ }^{* 1}$ | 9999 | 40 | Set the parameter to perform V/F control for the fork axis motor. |
| 502 | Stop mode selection at communication error | 0 | 0 | When Ethernet communication is used, the operation at a communication error can be selected. The operation at a communication error can be selected when Pr. 1431 is " 3 " or Pr. 1432 is not "9999". <br> Set the parameter in accordance with specifications of the system used. |
| 541 | Frequency command sign selection*1 | 0 | 1 | The start command (forward/reverse rotation) can be inverted when a minus sign is added to the value of the frequency command. |
| 800 | Control method selection*1 | 40 | 0 | Change the control method to Vector control. |
| 1429 | Ethernet function selection $3^{* 1}$ | 45238 | 61450 | Set the parameter to use CC-Link IE Field Network Basic. |

| Inverter parameter |  |  |  | Description |
| :---: | :---: | :---: | :---: | :---: |
| No. | Name | Initial value | Setting value |  |
| 1431 | Ethernet signal loss detection function selection | 3 | 3 | Set the availability of the signal loss detection and select the action when Ethernet communication is interrupted by physical factors such as cable disconnection. <br> Set the parameter in accordance with specifications of the system used. |
| 1432 | Ethernet communication check time interval | 1.5 | 1.5 | A signal loss detection is performed between the inverter and all the devices with IP addresses in the range for Ethernet command source selection (Pr. 1449 to Pr.1454). If a signal loss is detected (a communication stops), a communication error (E.EHR) occurs and the inverter output will be shut off. <br> Set the parameter in accordance with specifications of the system used. |
| 1434 | IP address 1 (Ethernet) | 192 | 192 | Enter the IP address of the inverter to be connected to Ethernet. |
| 1435 | IP address 2 (Ethernet) | 168 | 168 |  |
| 1436 | IP address 3 (Ethernet) | 50 | 3 |  |
| 1437 | IP address 4 (Ethernet) | 1 | 1 |  |
| 1438 | Subnet mask 1 | 255 | 255 | Enter the subnet mask of the network to which the inverter belongs. |
| 1439 | Subnet mask 2 | 255 | 255 |  |
| 1440 | Subnet mask 3 | 255 | 255 |  |
| 1441 | Subnet mask 4 | 0 | 0 |  |
| 1449 | Ethernet command source selection IP address 1 | 0 | 192 | To limit the network devices that send the operation or speed command through the Ethernet network, set the range of IP addresses of the devices. <br> When Pr. 1449 to Pr. 1452 are " 0 (initial value)", no IP address is specified for command source via Ethernet. In this case, operation commands cannot be sent via Ethernet. <br> The range for command source depends on the settings in Pr. 1451 and Pr. 1453 , and Pr. 1452 and Pr. 1454. <br> When the setting values on the left are set for Pr. 1449 to Pr.1454, the range becomes as follows. <br> - IP address range: 192.168.xxx (3 to 255).xxx (0 to 255) |
| 1450 | Ethernet command source selection IP address 2 | 0 | 168 |  |
| 1451 | Ethernet command source selection IP address 3 | 0 | 3 |  |
| 1452 | Ethernet command source selection IP address 4 | 0 | 0 |  |
| 1453 | Ethernet command source selection IP address 3 range specification | 9999 | 255 |  |
| 1454 | Ethernet command source selection IP address 4 range specification | 9999 | 255 |  |

*1 For this parameter, set the setting value shown in the list.

The project files of FR Configurator2 included in the FB libraries contain parameter setting examples.
For parameter setting examples, refer to the project files corresponding to the inverter used.

- Project file for the FR-E800: fb-awhfreqrol_E800.frc2
- Project file for the FR-A800: fb-awhfreqrol_A800.frc2

## Distance meter setting

Set distance meters as described in the following setting examples according to the CPU module setting. The examples show the settings that can work with the sample program.
For details on the setting method, refer to the manuals for the distance meters to be used.

| AMS308i |  |  |  |
| :---: | :---: | :---: | :---: |
| Setting item |  |  | Setting value |
| Ethernet interface | Address |  | Set the IP address of AMS308i. |
|  | Gateway |  | Set an IP address in the same network as AMS308i. |
|  | Net mask |  | Set the subnet mask of AMS308i. Example: 255.255.255.0 |
| HOST communication | UDP | Activation | UDP: On ${ }^{* 1}$ |
|  |  | IP address | Set the IP address of the CPU module. Example: 192.168.3.250 |
|  |  | Port number | 10001 (first axis), 10002 (second axis) |
| Position resolution |  |  | $0.1 \mathrm{~mm}^{* 1}$ |
| Output cycle |  |  | 5 |

The setting value must be set as specified.

## DL100 Pro (Standard mode)

| Setting item |  | Setting value |
| :--- | :--- | :--- |
| RS-422 | CntMode | Off Requirement ${ }^{* 1}$ |
|  | Protoc | Standard mode |
|  | Baud | 115.2 kBd |
|  | Format | $8, \mathrm{e}, 1^{* 1}$ |
|  | ResDst | $0.1 \mathrm{~mm}^{* 1}$ |

*1 The setting value must be set as specified.

## DL100 Pro (CRLF code)

| Setting item |  | Setting value |
| :--- | :--- | :--- |
| RS-422 | CntMode | Off Requirement ${ }^{* 1}$ |
|  | Protoc | CRLF mode |
|  | Baud | 115.2 kBd |
|  | Format | $8, \mathrm{e}, 1^{* 1}$ |
|  | ResDst | $0.1 \mathrm{~mm}^{* 1}$ |

[^0]
### 2.8 Precautions

Before using the FB libraries in this reference manual, check the following precautions.
For precautions specific to each FB, refer to "Precautions" in DETAILS of FB LIBRARIES.

## Description

The FBs in this reference manual do not include the error recovery processing. Prepare the error recovery processing separately to suit the user's system and the expected operation.
Note that an error that occurs during FB operation will be cleared when recovery from the error is completed.
The FBs in this reference manual do not detect an alarm or fault output that occurs in inverters. Separately create the alarm and fault output monitoring processing for the inverters used. For alarms and fault output that occurred in the inverters, refer to the manuals for the inverters used.
The FBs cannot be used in an interrupt program.
Do not use the FBs in programs that are executed only once, such as a subroutine program or FOR-NEXT loop, because i_bEN (execution command) cannot be turned off and the normal operation cannot be acquired. Always use the FBs in programs that can turn off the execution command.

The FBs require the configuration of a ladder block for every input label.
To use more than one FB, care must be taken to avoid duplication of the target axis to prevent more than one program for the target axis from starting at the same time.
If an FB terminates with an error, turn off the execution condition of the FB that terminated with an error before executing a new FB. If the execution condition of the FB that terminated with an error remains on, the termination processing will not be performed and the newly executed FB will not operate normally.
While an FB is being executed, do not perform the online change.
The FB libraries use file register (R) areas R32700 to R32708.

Commands to the inverter depend on the scan time.

## 3.1 <br> M+AWH_PosVelGen_F (Positioning Operation Command Generation)

## Overview

This FB generates speed and position commands for positioning to the target position.

| (1) - | M+AWH_PosVelGen_F |  |  |

| FB compilation method | Subroutine type |
| FB operation | Always executed |

## Function description

- When i_bEN (execution command) is rising and o_wState (status output) is 0: Stop (initial status), this FB outputs speed and position commands for positioning to the target position in the direction of i_eTargetPos (target position), starting from i_eCurrentPos (current position).
- Positioning is executed while i_bEN (execution command) is on. While positioning is being executed, o_bBusy (positioning executing) is on.
- For position and speed commands, the current scan time is obtained for each control cycle, and the results calculated from the maximum speed, acceleration rate, deceleration rate, acceleration jerk, and deceleration jerk values and the elapsed time are output. The speed shows an S-shaped waveform.
The acceleration and deceleration processing (positive direction) based on the acceleration/deceleration rate and jerk settings in this FB is shown below.

| Area |  | Processing |
| :--- | :--- | :--- |
| A | Acceleration area 1 | The acceleration rate is changed (increased) by the specified acceleration jerk from the start of acceleration <br> to the target acceleration rate. |
| B | Maximum acceleration area | Acceleration is performed at the target acceleration rate. |
| C | Acceleration area 2 | At the end of acceleration, acceleration is performed by changing (decreasing) the acceleration rate by the <br> specified acceleration jerk from the target acceleration rate to acceleration rate 0. |
| D | During constant speed (target speed) | Control is performed at the target speed. (Acceleration and deceleration rates = 0.0) |
| E | Deceleration area 1 | Deceleration is performed by changing (increasing) the deceleration rate by the specified deceleration jerk <br> from the start of deceleration to the target deceleration rate. |
| F | Maximum deceleration area | Deceleration is performed at the target deceleration rate. |
| G | Deceleration area 2 | At the end of deceleration, deceleration is performed by changing (decreasing) the deceleration rate by the <br> specified deceleration jerk from the target deceleration rate to deceleration rate 0. |

- To stop a control target at the specified target position, this FB starts deceleration when the following condition is met, and o_wState (status output) transitions to 3: During deceleration for positioning completion.

Deceleration distance + Accumulated travel distance $\geq$ Total travel distance

To calculate the deceleration distance, call M+AWH_DecDistance_F (deceleration distance calculation) from this FB.

- i_eTargetPos (target position) can be changed while the FB is operating. Changes can be made when o_wState (status output) is 1: During acceleration/deceleration or 2: During constant speed (target speed), and there is a distance required for deceleration stop. However, it is not allowed to change to the target position in the reverse run direction with respect to i_eCurrentPos (current position).
- i_eTargetSpd (target speed) can be changed while the FB is operating. Changes can be made when o_wState (status output) is 2 : During constant speed (target speed).
- If o_wState (status output) is 1: During acceleration/deceleration or 2: During constant speed (target speed), positioning is interrupted at the falling edge of i_bEN (execution command). During positioning interruption, o_wState (status output) is set to 5 : During deceleration for positioning interruption, and deceleration stop is performed at the values set for i_eDeceleration (deceleration rate) and i_eDecJerk (deceleration jerk). After the interruption processing has been completed, the output value of o_ePosCmd (position command) is held, and the output other than o_ePosCmd (position command) becomes off or 0 .
- If $\mathrm{i} \_$bEN (execution command) is on and o_wState (status output) is 1: During acceleration/deceleration or 2: During constant speed (target speed), positioning is interrupted when i_bRapidStop (sudden stop) becomes on. During positioning interruption, o_wState (status output) is set to 6: During deceleration for sudden stop, and deceleration stop is performed at the values set for i_eRapidStopDec (deceleration rate for sudden stop) and i_eRapidStopJerk (deceleration jerk for sudden stop).
However, if i_eRapidStopDec (deceleration rate for sudden stop) or i_eRapidStopJerk (deceleration jerk for sudden stop) is set to 0 , deceleration stop is performed at the values set for i_eDeceleration (deceleration rate) and i_eDecJerk (deceleration jerk).
After the interruption processing has been completed, o_bBusy (positioning executing) becomes off.
- When i_bEN (execution command) changes from off to on, and o_wState (status output) is 3: During deceleration for positioning completion, 5: During deceleration for positioning interruption, or 6: During deceleration for sudden stop, the on state of the execution command is not accepted because the previous deceleration is being processed. Change i_bEN (execution command) from off to on when o_wState (status output) is 0 : Stop (initial status).
- If the input labels listed in the table below are out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, a corresponding error code is stored in o_uErrld (error code). (

| Input label | Error code |
| :--- | :--- |
| i_eTargetPos (target position) | 110 H |
| i_eTargetSpd (target speed) | 111 H |
| i_eCurrentPos (current position) | 112 H |
| i_eAcceleration (acceleration rate), i_eDeceleration (deceleration rate) | 113 H |
| i_eAccJerk (acceleration jerk), i_eDecJerk (deceleration jerk) | 114 H |
| i_ePosMin (minimum position value) | 115 H |
| i_ePosMax (maximum position value) | 116 H |
| i_eRapidStopDec (deceleration rate for sudden stop) | 117 H |

| Input label | Error code |
| :--- | :--- |
| i_eRapidStopJerk (deceleration jerk for sudden stop) | 118 H |

- If the input labels listed in the table below are changed to out of range while the FB is operating, o_bErr (error completion) will turn on. (The FB will continue to operate.) In addition, a corresponding error code is stored in o_uErrld (error code). ( $\mathfrak{F}$ Page 44 Error code)

| Input label | Error code | FB operation |
| :--- | :--- | :--- |
| i_eTargetPos (target position) | 11 AH | The operation continues with the setting value of $i_{\_}$eTargetPos <br> (target position) before the error occurred. |
| i_eTargetSpd (target speed) | 11 BH | The operation continues with the setting value of $\mathrm{i}_{-}$eTargetSpd <br> (target speed) before the error occurred. |
| i_eCurrentPos (current position) | 11 CH | The operation continues. ${ }^{* 1}$ |

*1 i_eCurrentPos (current position) is used when changing i_eTargetPos (target position). If the current position is an abnormal value, i_eTargetPos (target position) cannot be changed.

## Timing chart of I/O signals

■Completed successfully

Positioning interruption (i_bEN (execution command) changes from on to off.)

Positioning interruption (i_bRapidStop (sudden stop) turns on while i_bEN (execution command) is on.)

■Error completion
When an error occurs at start of the FB

When an error occurs while the FB is operating (when the target position is out of range)

## Precautions

o_eSpdCmd (speed command) is calculated with single-precision real numbers, so a rounding error may occur.

## Parameter settings

There are no parameter settings specific to this FB. For details on the common parameter settings, refer to the following. $\longmapsto$ Page 21 Parameter Settings

## Performance values

The performance values of this FB are as follows. These performance values show the performance combined with M+AWH_DecDistance_F (deceleration distance calculation).

| FX5 CPU module | Measurement condition |  |  |  |  |  |  | Processing time | Maximum scan time | Number of scans |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Input label |  |  |  |  |  |  |  |  |  |
|  | i_eTarget Pos (Target position) | i_eTarget Spd (Target speed) | i_eCurrent <br> Pos <br> (Current <br> position) | i_eAccele ration (Accelera tion rate) | i_eDecele ration (Decelera tion rate) | i_eAccJer k <br> (Accelera tion jerk) | i_eDecJer k <br> (Decelera tion jerk) |  |  |  |
| FX5S CPU <br> module | 100 | 1 | 0 | 1 | 1 | 2 | 2 | 101520 ms | 1.818 ms | $\begin{aligned} & 147118 \\ & \text { scans } \end{aligned}$ |
| $\begin{aligned} & \text { FX5UJ } \\ & \text { CPU } \\ & \text { module } \end{aligned}$ | 100 | 1 | 0 | 1 | 1 | 2 | 2 | 101550 ms | 1.501 ms | $\begin{aligned} & 166252 \\ & \text { scans } \end{aligned}$ |
| FX5U/ <br> FX5UC <br> CPU <br> module ${ }^{*_{1}{ }^{*} 2}$ | 100 | 1 | 0 | 1 | 1 | 2 | 2 | 101550 ms | 1.307 ms | $\begin{aligned} & 192948 \\ & \text { scans } \end{aligned}$ |

*1 When the program capacity is set to 128 K steps, the processing speed may become slow.
*2 The standard area is used for labels.

## Error code

| Error code | Description | Action |
| :---: | :---: | :---: |
| 110H | The setting value of i_eTargetPos (target position) is out of range. | Check and correct the setting, then execute the FB again. |
| 111H | The setting value of i_eTargetSpd (target speed) is out of range. | Check and correct the setting, then execute the FB again. |
| 112 H | The setting value of i_eCurrentPos (current position) is out of range. | Check and correct the setting, then execute the FB again. |
| 113H | The setting value of i_eAcceleration (acceleration rate) or i_eDeceleration (deceleration rate) is out of range. | Check and correct the setting, then execute the FB again. |
| 114H | The setting value of i_eAccJerk (acceleration jerk) or i_eDecJerk (deceleration jerk) is out of range. | Check and correct the setting, then execute the FB again. |
| 115H | The setting value of i_ePosMin (minimum position value) is out of range. | Check and correct the setting, then execute the FB again. |
| 116H | The setting value of i_ePosMax (maximum position value) is out of range. | Check and correct the setting, then execute the FB again. |
| 117H | The setting value of i_eRapidStopDec (deceleration rate for sudden stop) is out of range. | Check and correct the setting, then execute the FB again. |
| 118H | The setting value of i_eRapidStopJerk (deceleration jerk for sudden stop) is out of range. | Check and correct the setting, then execute the FB again. |
| 11AH | The setting value of i_eTargetPos (target position) is out of range. i_eTargetPos (target position) is held at the value before the error occurred. | Check and correct the setting. |
| 11BH | The setting value of $i_{\text {_ e TargetSpd }}$ (target speed) is out of range. i_eTargetSpd (target speed) is held at the value before the error occurred. | Check and correct the setting. |
| 11CH | The setting value of i_eCurrentPos (current position) is out of range. | Check and correct the setting. |

### 3.2 M+AWH_PIDControl_F (PID Control)

## Overview

This FB performs position deviation correction (PID control) during positioning control.

## Labels

## Input labels

| FB operation | Always executed |

## Function description

- Turning on i_bEN (execution command) performs position deviation correction (PID control) during positioning control.
- Position deviation correction is performed by PID control as shown in the block diagram below.

P: Proportional operation, I: Integral operation, D: Differential operation
Kp: Proportional gain, Ts: Sampling time, Ti: Integral time, Td: Differential time, $\mathrm{Z}^{-1}$ : Previous value, n : Derivative gain coefficient ( 0.2 fixed)

- When i_bEN (execution command) is off, all outputs become off or 0 .
- If i_ePosCmd (position command) is out of range, o_bErr (error completion) turns on and the processing of this FB is interrupted. In addition, the error code 130 H is stored, and the output value of o_eCompSpd (compensation speed) is 0. ( $\preccurlyeq$ Page 48 Error code)
- If i_eCurrentPos (current position) is out of range, o_bErr (error completion) turns on and the processing of this FB is interrupted. In addition, the error code 131 H is stored, and the output value of o_eCompSpd (compensation speed) is 0 . ( $\Im$ Page 48 Error code)
- If i_stPID_Pr (PID setting) is out of range, o_bErr (error completion) turns on and the processing of this FB is interrupted. In addition, the error code 132 H is stored, and the output value of o_eCompSpd (compensation speed) is 0 . (以 Page 48 Error code)
- If the absolute value of the position deviation (i_ePosCmd (position command) - i_eCurrentPos (current position)) exceeds the setting value of i_stPID_Pr.eDeviationOver (excessive error level of PID setting), o_bErr (error completion) turns on and the processing of this FB is interrupted. In addition, the error code 230 H is stored in o_uErrld (error code), and the output value of o_eCompSpd (compensation speed) is 0 . ( $\Im$ Page 48 Error code)
- If i_stPID_Pr.eDeviationOver (excessive error level of PID setting) is 0 , no judgment is made.

## Timing chart of I/O signals

■Completed successfully

(1) Compensation speed [ $\mathrm{m} / \mathrm{s}$ ]: While the FB is being executed, a calculated value is output every scan.

## Error completion

When an error occurs at start of the FB

When an error occurs while the FB is operating (when the position command is out of range)

(1) Compensation speed $[\mathrm{m} / \mathrm{s}]$ : While the $F B$ is being executed, a calculated value is output every scan.

## Parameter settings

There are no parameter settings specific to this FB. For details on the common parameter settings, refer to the following. $\longmapsto$ Page 21 Parameter Settings

| FB operation | Always executed |

## Function description

- Turning on i_bEN (execution command) converts the speed command [ $\mathrm{m} / \mathrm{s}$ ] to the set frequency [ Hz ] according to the machine specifications (maximum frequency and maximum speed) and outputs it.
- When i_bEN (execution command) is off, all outputs become off or 0 .
- If i_wMaxFreq (maximum frequency) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 140 H is stored in o_uErrld (error code). ( 3 Page 52 Error code)
- If i_eMaxSpeed (maximum speed) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 141 H is stored in o_uErrld (error code). ( Page 52 Error code)
- If the absolute value of i_eSpdCmd (speed command) exceeds i_eMaxSpeed (maximum speed) while the FB is operating, o_bErr (error completion) will turn on. (The FB will continue to operate.) In addition, the error code 142H is stored, and o_wSetFreq (set frequency) is held at the setting value of i_wMaxFreq (maximum frequency). ( $\lessgtr$ Page 52 Error code)

## Timing chart of I/O signals

■Completed successfully

(1) Set frequency [ 0.01 Hz increments]: While the FB is being executed, a calculated value is output every scan.

## Error completion

When an error occurs at start of the FB

When an error occurs while the FB is operating (when the absolute value of the speed command exceeds the maximum speed)

(1) Set frequency [ 0.01 Hz increments]: While the FB is being executed, a calculated value is output every scan.
(2) Maximum frequency [ 0.01 Hz increments]: o_wSetFreq (set frequency) is held at the setting value of $i \_w M a x F r e q$ (maximum frequency).

## Precautions

In a program using this FB library, turning off the execution command of this FB while the inverter is running may cause sudden stop as the output frequency to the inverter becomes 0 . Turn off the execution command in a program that can safely stop the inverter.

## Parameter settings

There are no parameter settings specific to this FB. For details on the common parameter settings, refer to the following.
$\longmapsto$ Page 21 Parameter Settings

## Function description

- Turning on i_bEN (execution command) outputs commands for the first motor when the second motor selection (i_bMotor2) is off, or commands for the second motor when i_bMotor2 is on.
- Motor switching is enabled when the inverter running (i_bRUN) is off.
- When i_bEN (execution command) is off, all outputs become off or 0 .
- If i_wSetFreq1 (first motor set frequency) is out of range, o_bErr (error completion) will turn on. (The FB will continue to operate.) In addition, the error code 150 H is stored in o_uErrld (error code). ( $\beta$ Page 58 Error code) If the first motor is controlled and the setting value of i_wSetFreq1 (first motor set frequency) exceeds $\pm 200 \mathrm{~Hz}$, the frequency is limited to $\pm 200 \mathrm{~Hz}$. However, if i_wSetFreq1 (first motor set frequency) is out of range while i_bEN (execution command) is rising, processing of the FB does not start.
- If i_wSetFreq2 (second motor set frequency) is out of range, o_bErr (error completion) will turn on. (The FB will continue to operate.) In addition, the error code 151 H is stored in o_uErrld (error code). ( 3 Page 58 Error code) If the second motor is controlled and the setting value of i_wSetFreq2 (second motor set frequency) exceeds $\pm 200 \mathrm{~Hz}$, the frequency is limited to $\pm 200 \mathrm{~Hz}$. However, if $i \_w S e t F r e q 2$ (second motor set frequency) is out of range while i_bEN (execution command) is rising, processing of the FB does not start.

## Timing chart of I/O signals

■Completed successfully

(1) First motor set frequency: While the FB is being executed, the calculated value is output every scan.
(2) Second motor set frequency: While the FB is being executed, the calculated value is output every scan.

## Error completion

When an error occurs at start of the FB

When an error occurs while the FB is operating (when the first motor is controlled and the setting value of the first motor set frequency is out of the setting range)

(1) First motor set frequency: While the FB is being executed, the calculated value is output every scan.

## Precautions

In a program using this FB library, turning off the execution command of this FB while the inverter is running may cause sudden stop as the output frequency to the inverter becomes 0 . Turn off the execution command in a program that can safely stop the inverter.

## Function description

- When i_bEN (execution command) is turned on, the notch filter is activated according to the input label settings, and the position command during positioning control is compensated.
- When i_bEN (execution command) is off, all outputs become off or 0 .
- If i_ePosCmd (position command) is out of range, o_bErr (error completion) turns on and the processing of this FB is interrupted. In addition, the error code 130 H is stored in o_uErrld (error code). The output value of o_ePosCmd (position command) becomes the same as the value of i_ePosCmd (position command). ( $F$ Page 62 Error code)
- If i_eNotchFilterFreq (notch filter frequency) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 160H is stored in o_uErrld (error code). The output value of o_ePosCmd (position command) becomes the same as the value of i_ePosCmd (position command). ( $\gg$ Page 62 Error code)
- If i_eNotchFilterGain (notch filter gain) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 161H is stored in o_uErrld (error code). The output value of o_ePosCmd (position command) becomes the same as the value of i_ePosCmd (position command). ( Page 62 Error code)

| (8) | i_bMRS | Output stop | Bit | Always | On, Off | Specify the status of the output stop signal of the inverter. Turning on this label shuts off the inverter output. |
| (9) | i_bRST | Error reset | Bit | Specified | On, Off | Specify the status of the error reset request flag of the inverter. <br> At the rising edge of i_bRST (error reset) during an inverter fault (o_bALM (Fault) is off): An error reset request is output to the inverter. |

## Output labels

| No. | Label | Name | Data type | Default value | Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
| (10) | o_bENO | Execution status | Bit | Off | On: The execution command is on. <br> Off: The execution command is off. |
| (11) | o_bOK | Normal completion | Bit | Off | The on state indicates that execution of control and monitoring of the inverter has started normally. |
| (12) | o_bErr | Error completion | Bit | Off | The on state indicates that an error has occurred in the FB. |
| (13) | o_uErrld | Error code | Word [unsigned]/ bit string [16 bits] | 0 | The error code of an error that occurred in the FB is stored. |
| (14) | o_wCurrent | Output current | Word [signed] | 0 | The first monitor value of the inverter is stored. <br> In this FB, the output current value [0.01 A/0.1 A increments $]^{* 1}$ is stored. |
| (15) | o_wFreq | Output frequency | Word [signed] | 0 | The second monitor value of the inverter is stored. <br> In this FB, the output frequency value [ 0.01 Hz increments] is stored. |
| (16) | o_bRUN | Running | Bit | Off | The inverter running signal is stored. <br> The on state indicates that the inverter is operating at an output frequency equal to or higher than the setting value of [Pr. 13 Starting frequency] ${ }^{*}$. |
| (17) | o_bFU | Frequency detection | Bit | Off | The frequency detection signal of the inverter is stored. <br> The on state indicates that the inverter output frequency is equal to or higher than the setting value of [Pr. 42 Output frequency detection] ${ }^{* 2}$ or [Pr. 43 Output frequency detection for reverse rotation] ${ }^{* 2}$. |
| (18) | o_bALM | Fault | Bit | On | The fault signal of the inverter is stored. <br> The off state indicates that the inverter's protective function is activated (fault occurs) to stop the output. |

*1 The unit of the output current differs depending on the inverter model used. For details, refer to the manuals for the inverters used.
*2 For details on Pr, which is parameter numbers (numbers assigned to functions of the inverter), refer to the manuals for the inverters used.

## Function description

- When i_bEN (execution command) is turned on, input commands are sent to the inverter connected to CC-Link IE Field Network Basic communication, and the monitor values from the inverter are received and output.
- If both i_bSTF (forward rotation command) and i_bSTR (reverse rotation command) are on, the inverter will receive the commands as the stop command.
- During an inverter fault (o_bALM (Fault) is off), turning on i_bRST (error reset) outputs an error reset request to the inverter. - When i_bEN (execution command) is off, all outputs become off or 0 , and the stop command is output to the inverter. However, if the Ethernet cable is disconnected, the stop command will not be output to the inverter.
- If i_uStationNo (target station number) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 170H is stored in o_uErrld (error code). When a value out of the setting range is specified for the FX5UJ CPU module and the FX5S CPU module, the error code 270 H is stored. (
The following table shows the setting values for i_uStationNo (target station number) and the corresponding error codes for each CPU module.

| Module | Error code |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | i_uStationNo $=\mathbf{0}$ | $\mathbf{i} \_$uStationNo $=\mathbf{1}$ to $\mathbf{8}$ | i_uStationNo $=\mathbf{9}$ to $\mathbf{1 6}$ | i_uStationNo = $\mathbf{1 7}$ or $\mathbf{m o r e}$ |
| FX5S/FX5UJ CPU module | Error code: 170 H | - | Error code: $\mathbf{2 7 0 H}$ | Error code: $\mathbf{1 7 0 H}$ |
| FX5U/FX5UC CPU module | Error code: 170 H | - | - | Error code: $\mathbf{1 7 0 H}$ |

- If i_wSetFreq (set frequency) is out of range, o_bErr (error completion) will turn on. (The FB will continue to operate.) In addition, the error code 171 H is stored in o_uErrld (error code). ( $\leftrightarrows$ Page 69 Error code) If the setting value of i _wSetFreq (set frequency) exceeds $\pm 200 \mathrm{~Hz}$, the frequency is limited to $\pm 200 \mathrm{~Hz}$. However, if $\mathrm{i} \_w S e t F r e q$ (set frequency) is out of range while i_bEN (execution command) is rising, processing of the FB does not start.
- This FB uses SD1536 to check the cyclic transmission status of the station number specified in i_uStationNo (target station number). If the bit of the target station number is not on (cyclic transmission is not performed), o_bErr (error completion) will turn on. (The FB will continue to operate.) In addition, the error code 270 H is stored in o_uErrld (error code). (↔ Page 69 Error code)

## Timing chart of I/O signals

■Completed successfully

(1) Set frequency [ 0.01 Hz increments]: While the FB is being executed, the value is written to the inverter every scan.
(2) While the FB is being executed, the value is written from the inverter every scan.
(3) Output current [0.01 A/0.1 A increments]: While the FB is being executed, the value is read from the inverter every scan.
(4) Output frequency [ 0.01 Hz increments]: While the FB is being executed, the value is read from the inverter every scan.
(5) While the FB is being executed, the value is read from the inverter every scan.

## Error completion

When an error occurs at start of the FB

When an error occurs while the FB is operating (when the setting value of the set frequency is out of the setting range)

(1) While the FB is being executed, the value is written to the inverter every scan.
(2) Output current [ $0.01 \mathrm{~A} / 0.1 \mathrm{~A}$ increments]: While the FB is being executed, the value is read from the inverter every scan.
(3) Output frequency [ 0.01 Hz increments]: While the FB is being executed, the value is read from the inverter every scan.
(4) While the FB is being executed, the value is read from the inverter every scan.

## Precautions

- This FB uses the index register Z9. When using an interrupt program, do not use this index register.
- Although a double coil warning may occur during compilation, it does not cause any problem when using the FB.
- In a program using this FB library, turning off the execution command of this FB while the inverter is running may cause sudden stop as the stop command is output to the inverter. Turn off the execution command in a program that can safely stop the inverter.
- If the Ethernet cable is disconnected while the inverter is running, this FB cannot control the inverter. Consider the system configuration where a failsafe is enabled. ( $\hookleftarrow$ Page 21 Parameter Settings)
- For this FB, the setting values for function assignment to some I/O terminals of the inverter are fixed. (↔ Page 21 Parameter Settings)

## Parameter settings

To execute this FB, configure the CC-Link IE Field Network Basic settings. For details on the parameter setting method, refer to the following.
F Page 21 Parameter Settings

## Performance values

| FX5 CPU module | Measurement condition | Processing time | Maximum scan time | Number of scans | Maximum link scan time |
| :--- | :--- | :--- | :--- | :--- | :--- |
| FX5S CPU module | Target inverter: FR-E800 | 0.099 ms | 0.886 ms | 1 scan | 6 ms |

## Function description

- Turning on i_bEN (execution command) causes the predefined protocol support instruction (S.CPRTCL) to execute the protocol registered with the predefined protocol support function of GX Works3. After execution of the protocol specified by i_uExeProtocolNo (execution protocol number specification), o_bOK (normal completion) turns on.
- The execution of the protocol enables communication with a distance meter capable of serial communication (RS-485 or RS-422) to feed back the current position.
- When i bEN (execution command) is off, the output value of o eCurrentPos (current position) is held, and the output of other than o_eCurrentPos (current position) becomes off or 0 . However, during communication by the predefined protocol support instruction (S.CPRTCL), the operation continues until the communication is completed.
- If i_uCh (target channel) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 180H is stored in o_uErrld (error code). ( $\longmapsto$ Page 76 Error code)
- If i_uExeProtocolNo (execution protocol number specification) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 181 H is stored in o_uErrld (error code). ( $\leftrightarrows$ Page 76 Error code)
- If i_uSensorType (distance meter model name) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 182H is stored in o_uErrld (error code). ( $\ddagger$ Page 76 Error code)
- If i_uAxis (target axis) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 183H is stored in o_uErrld (error code). ( $\leftrightarrows$ Page 76 Error code)
- This FB uses SD9102 to check whether the predefined protocol is prepared normally. If the check result is abnormal, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 184H is stored in o_uErrld (error code). (以 Page 76 Error code)
- If an error occurs in the distance meter (serial communication), o_bErr (error completion) turns on. (The FB will continue to operate.) In addition, the error code 280 H is stored in o_uErrld (error code), and o_eCurrentPos (current position) is held at the value before the error occurred. ( 5 Page 76 Error code)
- If a distance measurement value error occurs due to blocking of light from the distance meter (serial communication), o_bErr (error completion) turns on. (The FB will continue to operate.) In addition, the error code 281H is stored in o_uErrld (error code), and o_eCurrentPos (current position) is held at the value before the error occurred. ( 5 Page 76 Error code)
- If an error occurs during the predefined protocol's send/receive operation, o_bErr (error completion) turns on. (The FB will continue to operate.) In addition, an error code is stored in o_uErrld (error code). For error code details, refer to the following.
[] MELSEC iQ-F FX5 User's Manual (Communication)

## Timing chart of I/O signals

■Completed successfully

(1) While the FB is being executed, the predefined protocol support instruction (S.CPRTCL) is executed at any time.
(2) A value obtained from a distance meter

## Error completion

When an error occurs at start of the FB

When an error occurs while the FB is operating (when a distance measurement value error occurs due to light blocking)

(1) While the FB is being executed, the predefined protocol support instruction (S.CPRTCL) is executed at any time.
(2) A value obtained from a distance meter
(3) Measurement value
(4) The light from the distance meter is blocked.
(5) A cause of blocking of light from the distance meter is removed.

## Precautions

- Use in combination with the protocol setting data "fb-awhfreqrol_SerialComm.rpx" included with the sample program.
- In a configuration using this FB library, if the execution command of this FB is turned off while the inverter is running, the current position cannot be updated, and speed correction cannot be performed normally.
- Set $100 \mu \mathrm{~m}(0.1 \mathrm{~mm})$ as the measurement position unit in the distance meter. ( $\Im$ Page 21 Parameter Settings)
- Since the number of channels that can be set in the predefined protocol support function (serial communication) is two channels, distance meters for up to two axes can be used.
- This FB uses the predefined protocol support instruction (S.CPRTCL). For details, refer to the following.
[] MELSEC iQ-F FX5 User's Manual (Communication)

## Parameter settings

From GX Works3, set the parameters for serial connection and the predefined protocol support function settings. For the steps to set the parameters, refer to the following.
$\longmapsto$ Page 21 Parameter Settings

## Function description

- Turning on i_bEN (execution command) causes the predefined protocol support instruction (SP.ECPRTCL) to execute the protocol registered with the predefined protocol support function of GX Works3. After execution of the protocol specified by i_uExeProtocolNo (execution protocol number specification), o_bOK (normal completion) turns on.
- The execution of the protocol enables UDP-based communication with a distance meter that supports Ethernet connection to feed back the current position.
- When i bEN (execution command) is off, the output value of o eCurrentPos (current position) is held, and the output other than o_eCurrentPos (current position) becomes off or 0 . However, during communication by the predefined protocol support instruction (SP.ECPRTCL), the operation continues until the communication is completed.
- If i_uConnectionNo (connection No.) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 190H is stored in o_uErrld (error code). ( Page 82 Error code)
- If i_uExeProtocolNo (execution protocol number specification) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 181 H is stored in o_uErrld (error code). ( $\wp$ Page 82 Error code)
- If i_uSensorType (distance meter model name) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 182 H is stored in o_uErrld (error code). (
- If i_uAxis (target axis) is out of range while i_bEN (execution command) is rising, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 183H is stored in o_uErrld (error code). ( $\ddagger$ Page 82 Error code)
- This FB uses SD10692 to check whether the predefined protocol is prepared normally. If the check result is abnormal, o_bErr (error completion) turns on and processing of the FB does not start. In addition, the error code 184H is stored in o_uErrld (error code). ( $\longmapsto$ Page 82 Error code)
- If an error occurs in the distance meter (Ethernet communication), o_bErr (error completion) turns on. (The FB will continue to operate.) In addition, the error code 290 H is stored in o_uErrld (error code). ( F Page 82 Error code)
- If a distance measurement value error occurs due to blocking of light from the distance meter (Ethernet communication), o_bErr (error completion) turns on. (The FB will continue to operate.) In addition, the error code 291H is stored in o_uErrld (error code). ( $\Im$ Page 82 Error code)
- If an error occurs during the predefined protocol's send/receive operation, o_bErr (error completion) turns on. (The FB will continue to operate.) In addition, an error code is stored in o_uErrld (error code). For error code details, refer to the following.
[] MELSEC iQ-F FX5 User's Manual (Communication)

## Timing chart of I/O signals

■Completed successfully

(1) While the FB is being executed, the predefined protocol support instruction (SP.ECPRTCL) is executed at any time.
(2) A value obtained from a distance meter

## Error completion

When an error occurs at start of the FB

When an error occurs while the FB is operating (when a distance measurement value error occurs due to light blocking)

(1) While the FB is being executed, the predefined protocol support instruction (SP.ECPRTCL) is executed at any time.
(2) A value obtained from a distance meter
(3) Measurement value
(4) The light from the distance meter is blocked.
(5) A cause of blocking of light from the distance meter is removed.

## Precautions

- Use in combination with the protocol setting data "fb-awhfreqrol_EN.tpx" included with the sample program.
- In a configuration using this FB library, if the execution command of this FB is turned off while the inverter is running, the current position cannot be updated, and speed correction cannot be performed normally.
- Set $100 \mu \mathrm{~m}(0.1 \mathrm{~mm})$ as the measurement position unit in the distance meter. ( $\Im$ Page 21 Parameter Settings)
- This FB uses the predefined protocol support instruction (SP.ECPRTCL). For details, refer to the following.
$\square]$ MELSEC iQ-F FX5 User's Manual (Communication)

## Parameter settings

From GX Works3, set the parameters for the settings of Ethernet connection configuration with external devices and the predefined protocol support function. For the steps to set the parameters, refer to the following.
$\longmapsto$ Page 21 Parameter Settings

## Performance values

| FX5 CPU module | Measurement condition | Processing time | Maximum scan time | Number of scans |
| :--- | :--- | :--- | :--- | :--- |
| FX5S CPU module | Target distance meter: AMS308i (Leuze) | 16.321 ms | 1.167 ms | 19 scans |
| FX5UJ CPU module | Target distance meter: AMS308i (Leuze) | 17.718 ms | 0.753 ms | 24 scans |
| FX5U/FX5UC CPU module ${ }^{* 1 * 2}$ | Target distance meter: AMS308i (Leuze) | 18.167 ms | 0.544 ms | 28 scans |

*1 When the program capacity is set to 128 K steps, the processing speed may become slow.
*2 The standard area is used for labels.

## Error code

| Error code | Description | Action |
| :--- | :--- | :--- |
| 181 H | The setting value of i_uExeProtocolNo (execution protocol number <br> specification) is out of range. | Check and correct the setting, then execute the FB again. |

| 290 H | An error occurred in the distance meter (Ethernet communication). | Check if the distance meter is working correctly. |
| 291 H | A distance measurement value error occurred due to blocking of <br> light from the distance meter (Ethernet communication). <br> The current position is not updated by the distance meter while this <br> error is on. | Remove the cause of light blocking. |
| Module error code | The error code generated by the module is returned. <br> (Error code during Ethernet communication) | Lal MELSEC iQ-F FX5 User's Manual (Communication) |

### 3.9 M+AWH_DecDistance_F (Deceleration Distance Calculation)

## Overview

This FB calculates a required distance for deceleration stop during positioning control.

## Function details

## Basic specifications

| Item | Description |
| :--- | :--- |
| FB compilation method | Subroutine type |
| FB operation | Always executed |

## Function description

This FB is called from $\mathrm{M}+\mathrm{AWH}$ _PosVelGen_F (positioning operation command generation) and calculates a required distance for deceleration stop during positioning control.

## Precautions

Do not use this FB in user-created programs because it is used in other FBs.

### 4.1 Positioning Operation with Distance Meters (Serial Communication)

The following describes the usage procedure to perform the following operations: communicate with distance meters capable of serial communication; give feedback about current position information; execute the positioning operation for the two axes (travel axis and lift axis) of the stacker crane.
In this operation, the following FBs are used.

- M+AWH_PosVelGen_F (positioning operation command generation)
- M+AWH_PIDControl_F (PID control)
- M+AWH_VelConv_F (frequency conversion)
- M+AWH_AntiSwayControl_F (anti-sway control)
- M+AWH_FREQROL_CCLinkIEFBasic_F (inverter communication)
- M+AWH_ScaleIF_SerialComm_F (distance measurement: serial)
- M+AWH_DecDistance_F (deceleration distance calculation)

## Overview

This operation enables communication with two inverters and performs positioning control for the travel axis (axis 1 ) and lift axis (axis 2 ) of the stacker crane.

Input the following positioning control settings in the global labels for the sample program. Then, operate the global labels for executing each FB to move the stacker crane to the target position.

## System configuration

## Positioning control setting example

| Item | Setting value |  |
| :--- | :--- | :--- |
|  | Travel axis (axis 1) | Lift axis (axis 2) |
| Target position | $100.0[\mathrm{~m}]$ | $30.0[\mathrm{~m}]$ |
| Command speed | $1.0[\mathrm{~m} / \mathrm{s}]$ | $0.5[\mathrm{~m} / \mathrm{s}]$ |
| Acceleration/deceleration reference speed | $1.0[\mathrm{~m} / \mathrm{s}]$ | $0.5[\mathrm{~m} / \mathrm{s}]$ |
| S-curve time | $0.5[\mathrm{~s}]$ | $0.5[\mathrm{~s}]$ |
| Acceleration/Deceleration time | $1.0[\mathrm{~s}]$ | $1.0[\mathrm{~s}]$ |
| Acceleration/Deceleration rate | $1.0\left[\mathrm{~m} / \mathrm{s}^{2}\right]$ | $1.0\left[\mathrm{~m} / \mathrm{s}^{2}\right]$ |

## Positioning operation details

As shown in the following figure, move the stacker crane from the operation start position to the target position set in the global label.

The acceleration rate and deceleration rate and the acceleration jerk and deceleration jerk can be calculated from the acceleration/deceleration reference speed, the acceleration time and deceleration time, and the S-curve time.

| Item | Abbreviation | Description | Calculation formula |
| :--- | :--- | :--- | :--- |
| Acceleration/deceleration reference speed | V | Command speed $[\mathrm{m} / \mathrm{s}]$ that is the basis of the acceleration/ <br> deceleration section | - |
| ${\text { Acceleration time }{ }^{* 1}}^{\text {Veceleration time }{ }^{* 1}}$ | Ta | Period of time [s] for which acceleration is enabled | - |
| S-curve time ${ }^{* 2}$ | Td | Period of time [s] for which deceleration is enabled | - |
| Acceleration rate | Ts | Period of time [s] for which S-curve acceleration/deceleration <br> is enabled | - |
| Deceleration rate | A | - | $\mathrm{V} \div \mathrm{Ta}$ |
| Acceleration jerk | D | - | $\mathrm{V} \div \mathrm{Td}$ |
| Deceleration jerk | Ja | - | $\mathrm{A} \div \mathrm{Ts}$ |

*1 The acceleration/deceleration time in the actual equipment may be different.
*2 Set the S-curve time value to be shorter than the acceleration time value.

## Process flow

The following describes a process flow from the wiring and parameter settings of the FX5 CPU module, inverters, and distance meters to the use of the FB library for control of inverters for automated warehouse.

1. FB library registration

Register the FB library. For the operating procedure, refer to the following.
[] GX Works3 Operating Manual
2. Wiring

For the wiring method, refer to the manual of each distance meter.
3. CPU module setting

- Use GX Works3 to set CC-Link IEF Basic and the global labels. (↔ Page 21 Parameter Settings)
- Use GX Works3 to set predefined protocols to establish communication with distance meters. ( $\mathfrak{F}$ Page 27 Predefined protocol support function setting)

4. Inverter setting

Use FR Configurator2 to set the inverters. (5 Page 29 Inverter parameter setting)
5. Distance meter setting

Set distance meters according to the CPU module setting. ( $\ddagger$ Page 31 Distance meter setting)
6. Programming

Create programs. ( 5 Page 88 Programming)

## Wiring

The following figure shows an example of wiring between the distance meter DL100 Pro and the MELSEC iQ-F series FX5-485-BD.

For details on wiring, refer to the manual of each distance meter.

## Programming

This section describes programs used in the application example.
In these programs, only the circuits required to operate each function are described, and such a circuit as an interlock for safety is not included. Add such a circuit as an interlock according to your device.

| Data name in sample programs | Execution type | Description |
| :--- | :--- | :--- |
| awhfreqrol_sample1_main | Scan | Executes the positioning control main processing. |
| awhfreqrol_sample2_main | Scan | This item is not used in this example. Delete the item. |
| awhfreqrol_sample_initial | Initial | Sets initial values in labels that require input for positioning control. |

*1 This is a global label used for calculations in the sample programs. Do not change it.

## Predefined protocol setting

Use the predefined protocol support function to enable serial communication with distance meters.
Ex.
Enabling serial communication with the distance meter (DL100 Pro, Standard Binary code) on the lift axis In the initial execution program "awhfreqrol_sample_initial", set "G_uLiftAxis = 2 (lift axis)" and "G_uLiftExeProtocolNo = 3 (specify Axis2 Position)".

## Program example

## Positioning target value input and control program

This program manipulates input bits to execute the following operations:

- Input the target positions and target speeds for positioning the travel axis (axis 1 ) and lift axis (axis 2 ).
- Input execution commands to FBs.
- Initialize input bits and target positions.

| Input bit | Corresponding operation | Operation description |
| :---: | :---: | :---: |
| M0 | (1): Target value input (travel axis) | Inputs the target position (100 [m]) and target speed (1.0 [m/s]) for positioning the travel axis. |
| M1 | (2): Target value input (lift axis) | Inputs the target position ( 30 [m]) and target speed ( 0.5 [ $\mathrm{m} / \mathrm{s}$ ]) for positioning the lift axis. |
| M10 | (3): Start of the inverter control and distance measurement | Starts the current position feedback from the distance meter. Execution commands are input to the following FBs: <br> - M_AWH_ScalelF_SerialComm_F_1 (travel distance measurement: serial) <br> - M_AWH_ScalelF_SerialComm_F_2 (lift distance measurement: serial) |
| M11 |  | Starts the command output to the inverters. Execution commands are input to the following FBs: <br> - M_AWH_VelConv_F_1 (travel frequency conversion) <br> - M_AWH_FREQROL_CCLinkIEFBasic_F_1 (CC-Link IE Field Network Basic communication with inverter 1) <br> - M_AWH_VelConv_F_2 (lift frequency conversion) <br> - M_AWH_FREQROL_CCLinkIEFBasic_F_2 (CC-Link IE Field Network Basic communication with inverter 2) |
| M12 | (4): Start of positioning <br> (6): Initialization after execution | Generates positioning operation commands in the order of the travel axis and lift axis and executes the positioning. <br> Execution commands are input to the following FBs: <br> - M_AWH_PosVelGen_F_1 (travel axis positioning operation command generation) <br> - M_AWH_PosVelGen_F_2 (lift axis positioning operation command generation) <br> After completion of the positioning, initializes the input bits and target positions. |

(2) Speed command $\rightarrow$ Frequency conversion to inverter communication

### 4.2 Positioning Operation with Distance Meters (Ethernet Communication)

The following describes the usage procedure to perform the following operations: communicate with distance meters capable of Ethernet communication; give feedback about current position information; perform the positioning operation for the two axes (travel axis and lift axis) of the stacker crane; operate one inverter to switch the motor between the travel axis and fork axis.
In this operation, the following FBs are used.

- M+AWH_PosVelGen_F (positioning operation command generation)
- M+AWH_PIDControl_F (PID control)
- M+AWH_VelConv_F (frequency conversion)
- M+AWH_MotorSwitch_F (motor switching control)
- M+AWH_AntiSwayControl_F (anti-sway control)
- M+AWH_FREQROL_CCLinkIEFBasic_F (inverter communication)
- M+AWH_ScaleIF_EN_F (distance measurement: Ethernet)
- M+AWH_DecDistance_F (deceleration distance calculation)

## Overview

This operation enables communication with two inverters and performs positioning control for the travel axis (axis 1 ) and lift axis (axis 2) of the stacker crane.
Input the following positioning control settings in the global labels for the sample program. Then, operate the global labels for executing each FB to move the stacker crane to the target position.
Also, two motors of the travel axis (axis 1 ) and fork axis (axis 3 ) can be controlled by switching them with one inverter. (For the fork axis (axis 3 ), only the V/F control can be performed.)

## System configuration

| No. | Device | Description | Station No. |
| :--- | :--- | :--- | :--- |
| $(1)$ | FX5U CPU module | Programmable controller | Master station |
| $(2)$ | FR-E800 + FR-A8AP E kit (axis 1 (travel axis)) | Inverter for travel axis control (with Vector control compatible option) | 1 |
| $(3)$ | FR-E800 + FR-A8AP E kit (axis 2 (lift axis)) | Inverter for lift axis control (with Vector control compatible option) | 2 |

| No. | Device | Description | Station No. |
| :--- | :--- | :--- | :--- |
| $(4)$ | AMS308i (axis 1 (travel axis)) | Distance meter for positioning for travel axis (Ethernet communication) | - |
| $(5)$ | AMS308i (axis 2 (lift axis)) | Distance meter for positioning for lift axis (Ethernet communication) | - |
| $(6)$ | Motor (axis 1 (travel axis)) + PLG | Motor for driving stacker crane's travel axis and PLG | - |
| $(7)$ | Motor (axis 2 (lift axis)) + PLG | Motor for driving stacker crane's lift axis and PLG | - |
| $(8)$ | Motor (axis 3 (fork axis)) | Motor for driving stacker crane's fork axis | - |
| $(9)$ | Switching hub | Used for connection with various devices. | - |

## Positioning control setting example

| Item | Setting value |  |  |
| :--- | :--- | :--- | :--- |
|  | Travel axis (axis 1) | Lift axis (axis 2) | Fork axis (axis 3) |
| Target position | $100.0[\mathrm{~m}]$ | $30.0[\mathrm{~m}]$ | - |
| Command speed | $1.0[\mathrm{~m} / \mathrm{s}]$ | $0.5[\mathrm{~m} / \mathrm{s}]$ | - |
| Acceleration/deceleration reference speed | $1.0[\mathrm{~m} / \mathrm{s}]$ | $0.5[\mathrm{~m} / \mathrm{s}]$ | - |
| S-curve time | $0.5[\mathrm{~s}]$ | $0.5[\mathrm{~s}]$ | - |
| Acceleration/Deceleration time | $1.0[\mathrm{~s}]$ | $1.0[\mathrm{~s}]$ | - |
| Acceleration/Deceleration rate | $1.0\left[\mathrm{~m} / \mathrm{s}^{2}\right]$ | $1.0\left[\mathrm{~m} / \mathrm{s}^{2}\right]$ | - |
| Running frequency (axis 3) | - | - | $60[\mathrm{~Hz}]$ |

## Positioning operation details

Refer to the following.
$\longmapsto$ Page 84 Positioning Operation with Distance Meters (Serial Communication)

## Process flow

The following describes a process flow from the wiring and parameter settings of the FX5 CPU module, inverters, and distance meters to the use of the FB library for control of inverters for automated warehouse.

1. $F B$ library registration

Register the FB library. For the operating procedure, refer to the following.
[] GX Works3 Operating Manual
2. Wiring

For the wiring method, refer to the manual of each distance meter.
3. CPU module setting

- Use GX Works3 to set CC-Link IEF Basic and the global labels. ( $\longmapsto$ Page 21 Parameter Settings)
- Use GX Works3 to set predefined protocols to establish communication with distance meters. ( 5 Page 27 Predefined protocol support function setting)

4. Inverter setting

Use FR Configurator2 to set the inverters. (ङ Page 29 Inverter parameter setting)
5. Distance meter setting

Set distance meters according to the CPU module setting. ( $\Im$ Page 31 Distance meter setting)
6. Programming

Create programs. ( $\leftrightarrows$ Page 95 Programming)

## Programming

This section describes programs used in the application example.
In these programs, only the circuits required to operate each function are described, and such a circuit as an interlock for safety is not included. Add such a circuit as an interlock according to your device.

| Data name in sample programs | Execution type | Description |
| :--- | :--- | :--- |
| awhfreqrol_sample1_main | Scan | This item is not used in this example. Delete the item. |
| awhfreqrol_sample2_main | Scan | Executes the positioning control main processing. |
| awhfreqrol_sample_initial | Initial | Sets initial values in labels that require input for positioning control. |

## Label list

The following labels are used in these programs.

## [Local labels

|  | Label Name | Data Type |  | Class | English(Display Target) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | M_AWH_PosVelGen_F_1 | M+AWH_PosVelGen_F | VAR | $\checkmark$ | Travel positioning operation command generation |
| 2 | M_AWH_PIDControl_F_1 | M+AWH_PIDControl_F | VAR | - | Travel PID control |
| 3 | M_AWH_VelConv_F_1 | M + AWH_VelConv_F | VAR | - | Travel frequency conversion |
| 4 | M_AWH_MotorSwitch_F_1 | M+AWH_MotorSwitch_F | VAR | - | Travel/fork motor switching control |
| 5 | M_AWH_AntiSwayControl_F_1 | M+AWH_AntiSwayControl_F | VAR | - | Travel damping control |
| 6 | M_AWH_FREQROL_CCLinkIEFBasic_F. | M+AWH_FREQROL_CCLinklEFBasic_F | VAR | - | Inverter 1CC-Link IEFBasic communication |
| 7 | M_AWH_ScalelF_EN_F_1 | M + AWH_Scalelf_EN_F | VAR | - | Travel distance measurement: Ethemet |
| 8 | M_AWH_PosVelGen_F_2 | M+AWH_PosVelGen_F | VAR | - | Lift positioning operation command generation |
| 9 | M_AWH_PIDControl_F_2 | M + AWH_PIDControl_F | VAR | - | Lift PID control |
| 10 | M_AWH_VelConv_F_2 | M + AWH_VelConv_F | VAR | - | Lift frequency conversion |
| 11 | M_AWH_AntiSwayControl_F_2 | M+AWH_AntiSwayControl_F | VAR | - | Lift damping control |
| 12 | M_AWH_FREQROL_CCLinkIEFBasic_F | M+AWH_FREQROL_CCLinklEFBasic_F | VAR | - | Inverter 2CC-Link IEFBasic communication |
| 13 | M_AWH_Scalelf_EN | M + AWH_Sc | AR |  | Lift distance measurement: Ethemet |

## Global labels

|  | Label Name | Data Type |  | Assign (Device/Label) | English(Display Target) |

*1 This is a global label used for calculations in the sample programs. Do not change it.

## Predefined protocol setting

Use the predefined protocol support function to enable Ethernet communication with distance meters.

## Ex.

Enabling Ethernet communication with the distance meter (AMS308i) on the lift axis
In the initial execution program "awhfreqrol_sample_initial", set "G_uLiftAxis = 2 (lift axis)" and "G_uLiftExeProtocolNo = 3 (specify Axis2 SND)".

## Program example

## Positioning target value input and control program

This program manipulates input bits to execute the following operations:

- Input the target positions and target speeds for positioning the travel axis (axis 1 ) and lift axis (axis 2 ) and input the running frequency for the fork axis (axis 3 ).
- Input execution commands to FBs.
- Initialize input bits and target positions.

| Input bit | Corresponding operation | Operation description |
| :---: | :---: | :---: |
| M0 | (1): Target value input (travel axis) | Inputs the target position (100 [m]) and target speed (1.0 [m/s]) for positioning the travel axis. |
| M1 | (2): Target value input (lift axis) | Inputs the target position ( $30[\mathrm{~m} \mathrm{l}$ ) and target speed ( 0.5 [ $\mathrm{m} / \mathrm{s}]$ ) for positioning the lift axis. |
| M2 | (3): Target value input (fork axis) | Inputs the frequency setting ( $60[\mathrm{~Hz}]$ ) for operating the fork axis. |
| M10 | (4): Start of the inverter control and distance measurement | Starts the current position feedback from the distance meter. Execution commands are input to the following FBs: <br> - M_AWH_ScalelF_EN_1 (travel distance measurement: Ethernet) <br> - M_AWH_ScaleIF_EN_2 (lift distance measurement: Ethernet) |
| M11 |  | Starts the command output to the inverters. Execution commands are input to the following FBs: <br> - M_AWH_VelConv_F_1 (travel frequency conversion) <br> - M_AWH_FREQROL_CCLinkIEFBasic_F_1 (CC-Link IE Field Network Basic communication with inverter 1) <br> - M_AWH_MotorSwitch_F_1 (motor switching between the travel axis and fork axis) <br> - M_AWH_VelConv_F_2 (lift frequency conversion) <br> - M_AWH_FREQROL_CCLinkIEFBasic_F_2 (CC-Link IE Field Network Basic communication with inverter 2) |
| M12 | (5): Start of positioning <br> (6): Fork axis operation <br> (8): Initialization after execution | Generates positioning operation commands in the order of the travel axis and lift axis and executes the positioning. <br> Execution commands are input to the following FBs: <br> - M_AWH_PosVelGen_F_1 (travel axis positioning operation command generation) <br> - M_AWH_PosVelGen_F_2 (lift axis positioning operation command generation) <br> After completion of the lift axis positioning, switches the motor between the travel axis and fork axis and performs the fork axis operation. <br> The input labels are operated for the following FB: <br> - M_AWH_MotorSwitch_F_1 (motor switching between the travel axis and fork axis) <br> After completion of the positioning and fork axis operation, initializes the input bits and target positions. |
| M13 | (7): Start of positioning (for homing) <br> (8): Initialization after execution | Generates positioning operation commands in the order of the lift axis and travel axis and executes the positioning (for homing). <br> Execution commands are input to the following FBs: <br> - M_AWH_PosVelGen_F_1 (travel axis positioning operation command generation) <br> - M_AWH_PosVelGen_F_2 (lift axis positioning operation command generation) <br> After completion of the positioning, initializes the input bits and target positions. |

## Travel axis positioning control

(1) Distance measurement value feedback to speed/position commands generation

(2) Speed command $\rightarrow$ Frequency conversion, travel/fork motor switching control, inverter communication

## Lift axis positioning control

(1) Distance measurement value feedback to speed/position commands generation

(2) Speed command $\rightarrow$ Frequency conversion to inverter communication

## 4.3 Operation Examples of General-Purpose Distance Meters

This section describes the usage procedure for communications with distance meters other than distance meters (DL100 Pro (SICK AG) and AMS308i (Leuze)) whose operation is verified in these FB libraries.
In the usage procedure, users are required to edit programs by using the following FBs.
Users are also required to create and add predefined protocols to be used for the predefined protocol support function according to the distance meter to be used.

- $\mathrm{M}+\mathrm{AWH}$ _ScaleIF_SerialComm_F (distance measurement: serial)
- M+AWH_ScalelF_EN_F (distance measurement: Ethernet)

## Process flow

The following describes a process flow from the wiring and parameter settings of the FX5 CPU module and distance meters to the use of the FB library for control of inverters for automated warehouse.

1. $F B$ library registration and duplication

Register and duplicate the FB library. ( 5 Page 101 FB library registration and duplication)
2. Wiring

For the wiring method, refer to the manual of each distance meter.
3. Distance meter setting

Set distance meters according to the CPU module setting. For the setting method, refer to the manuals for the distance meters to be used.
4. Predefined protocol support function setting

Add protocol settings to create predefined protocols. (↔ Page 102 Predefined protocol support function setting)
5. Programming

Create programs. ( 5 Page 104 Programming)

## FB library registration and duplication

The programs in FBs that are registered from the FB library are not editable. To edit the programs, users need to duplicate (copy) the FBs.
The following describes how to register the FB library, duplicate program elements (FBs) in the library to reuse, and edit the programs.

## Registering the FB library

Register the FB library. For the operating procedure, refer to the following.
[] GX Works3 Operating Manual

## Pasting elements to the Navigation window

1. Select a program element on the [Library] tab in the Element Selection window. (Multiple elements can be selected.)
2. Drag and drop the program element to $[F B / F U N]$ in the Navigation window.

## Duplicating reused program elements (FBs)

1. Select and copy an FB to be duplicated in [FB/FUN] in the Navigation window.

- When a serial communication compatible distance meter is used: Copy M+AWH_ScalelF_SerialComm_F.
- When an Ethernet communication compatible distance meter is used: Copy M+AWH_ScalelF_EN_F.

FFB name $\Rightarrow$ Right-click $\Rightarrow$ [Copy Data]
2. Duplicate the copied FB into the FB file.

2 FB file name $\Rightarrow$ Right-click $\Rightarrow$ [Paste Data]
The plus sign $(+)$ in the data name of the reused program element will be changed to the underscore ( $($ ) after duplication.

## Distance meter setting

For details on various distance meter settings and the setting method, refer to the manuals for the distance meters to be used. For the required setting items in the distance measurement value setting, refer to the following.
O: Setting is required, 一: Setting is not required

| Setting item | Setting value | Serial communication compatible | Ethernet communication compatible |
| :--- | :--- | :--- | :--- |
| Unit of distance <br> measurement value | 0.1 mm | $\bigcirc$ | $\bigcirc$ |
| Data length | 8 bits | $\bigcirc$ | - |
| Parity | Even number | $\bigcirc$ | - |
| Stop Bit | 1 bit | Set the IP address of the distance meter <br> to be used. | - |
| IP address | Set an IP address in the same network <br> as the distance meter to be used. | - | - |
| Gateway | Set the subnet mask of the distance <br> meter to be used. | - | $\bigcirc$ |
| Subnet mask | UDP | - | $\bigcirc$ |
| Protocol to be used | - | $\bigcirc$ |  |
| Destination IP address | Set the IP address of the CPU module. <br> Example: 192.168 .3 .250 | - | $\bigcirc$ |

## Predefined protocol support function setting

This section describes the settings required for communications with general-purpose distance meters other than distance meters (DL100 Pro (SICK AG) and AMS308i (Leuze)) whose operation is verified.

## Adding protocol settings

To communicate with a general-purpose distance meter, add a predefined protocol for the used distance meter to the protocol setting data. Register the protocol setting from GX Works3.
For the detailed method, refer to any of the following according to the distance meter communication method (serial communication or Ethernet communication).
For details on the serial communication, refer to the following.
[] MELSEC iQ-F FX5 User's Manual (Communication)
For details on the Ethernet communication, refer to the following.
[] MELSEC iQ-F FX5 User's Manual (Communication)

## Point ${ }^{\rho}$

If an additional protocol for communication with another device needs to be registered with the protocol setting data provided with the FB library, add the protocol to the top or bottom of the existing protocol settings. (For protocol settings that are configured with existing protocol numbers, ensure that their protocol numbers appear consecutively.)

## Creating predefined protocols

Create predefined protocols to enable communication with distance meters.
Create a predefined protocol and add the protocol setting according to the specifications of the distance meter to be used.
For the specifications of the predefined protocols, refer to the manuals for the distance meters to be used.
When creating predefined protocols, for storage locations for the received data of current position and status (error information), refer to the following memory maps.

| Predefined protocol support function memory maps (file register) |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| R32700 | R32701 | R32702 | R32703 | R32704 | R32705 | R32706 | R32707 | R32708 |
| Current position |  |  |  |  |  | Status (error information) |  |  |
| (First axis) |  | (Second axis) |  | (Third axis) |  | (First axis) | (Second axis) | (Third axis) |
| G_d3CurrentPos[0] |  | G_d3CurrentPos[1] |  | G_d3CurrentPos[2] |  | G_w3SensorStatus[0] | G_w3SensorStatus[1] | G_w3SensorStatus[2] |

Set the protocol so that its components (received data items) can be stored in the specified file register.

## Programming

The following describes programming required for communication with general－purpose distance meters．

## Editing programs in FBs（for serial communication compatible distance meters）

Edit programs in the copy of $\mathrm{M}+\mathrm{AWH}$＿ScalelF＿SerialComm＿F（distance measurement：serial）according to the following instructions．

## Restriction

If the programs are not changed according to the following instructions，and the FB is executed with the input label＂i＿uSensorType（distance meter model name）＝K9＂，the FB does not properly operate．

## Protocol communication processing

This processing is triggered by the predefined protocol support function instruction（S．CPRTCL）to execute the protocol communication according to the predefined protocol setting．

```
/Protocol Communication Processing(for DL 100 Pro)_ブロトコル通信処理(DL100Pro用)
    IF uSensorType = K1 THEN
        [2] := uExeProtocolNo; //Send/receive status information(protocol number n)_ステータス情報送受信(プロトコル番号n)
        18CtrlData[3]:= uExeProtocolNo +1; //Send/receive Position information(protocol number n + 1) 位置情報送受信(->フロトコル番号 n+1)
        Executes communication protocol support function instructions_通信プロトコル支援機能命令を実行
        S CPRTCL(bCprtcl_Run AND NOT b2Cprtcl_Result[0],'U0',u18CtrlData,uCh,K2,b2Cprtcl_Result);
    END_IF;
1. IIF uSensorType = K9 THEN
        *)
        //Executes communication protocol support function instructions_通信可㕷トコル支援機能命令を実行
        __CPRTCL(bCprtcl_Run AND NOT b2Cprtcl_Result [0],'U0',u18CtrlData,uCh_, 32,b2Cprtcl_Result);
```

1．Uncomment the protocol communication ladder program for general－purpose distance meters．
2．Specify the protocol numbers to be executed in u18CtrIData（control data）according to the created predefined protocol setting．For details on the control data of the predefined protocol support function instruction（S．CPRTCL），refer to the following．
［］MELSEC iQ－F FX5 User＇s Manual（Communication）

## Point $\rho$

By default，two protocol numbers are specified．Add or delete the protocol numbers according to the number of protocols to be executed．

3．Specify the number of protocols to be executed in series according to the created predefined protocol setting（the number of protocols specified in step 2）．

## Sign detection processing

The sign of a distance measurement value is detected based on the status of the G＿w3SensorStatus（status（error information））bit received from the distance meter．

## Restriction

Do not perform the following procedure when the distance meter to be used outputs distance measurement values as signed values．

```
1.//Universal range tester code detection_汎用距離測定器用符号検出
-7/IF uSensorType = Kg THEN
IF G_m3SensorStatus[0].A THEN
bSignVal:= TRUE;
ELSE
bSignVal := FALSE;
ND_IF; 2.
        ELSIF uAxis = K1 THEN
                                IF G_w3SensorStatus[1].A THEN
                                bSignval := TRUE;
                ELSE
                bSign\psial := FALSE;
            END_IF;
        ND_IF;
```

3. $/ /$ Convert distance measurements to single-precision real numbers_距離測定値を単精度実数に変換
//DL 100 Pro: When the distance measurement is signed data_DL100Pro: 距離測定値が符号付ぎデータの場合
IF NOT i _bSensorDirection THEN
eCurrentPos := (DINT_TO_REAL(G_d3CurrentPos[uAxis])/ 1.0E+4) +i_e0ffsetVal
ELSE
eCurrentPos := i eOffsetVal -(DINT TO_REAL(G_d3CurrentPos[uAxis])/1.0E+4)
ND IF;
//Universal range finder: If the sign is bit management_汎用距離測定器用: 符号がビット管理の場合
4. 7/IF i_bSensorDirection = bSignval THEN
eCurrentPos := (DINT_TO_REAL(G_d3CurrentPos[uAxis]) / 1.0E+4) +i_eOffsetVal;
LSE
eCurrentPos:= i_eOffsetYal -(DINT_TO_REAL(G_d3CurrentPos[uAxis])/1.OE+4);
ND_IF;

1．Uncomment the sign detection ladder program for general－purpose distance meters as well as the ladder program for single－precision real number conversion of a distance measurement value（when the sign is managed with a bit）．
2．For the processing for detecting the sign of a distance measurement value，change the statements according to the G＿w3SensorStatus bit to be referenced．

3．The default program（when DL100 Pro is used）includes statements to work with a case where a distance measurement value is output as a signed value．Therefore，delete the statements．

## EError detection processing

The error code is output based on the status of each G＿w3SensorStatus（status（error information））bit received from the distance meter．

```
1//Error detection for universal range tester_汎用距離湘定器用エラー検出
uSensorType = Kg THEN
IF UAXIS = KO THEN
    IF G_w3SensorStatus[0].1 OR G_w3SensorStatus[0].2 THE
            @_uErrId := c_uErr280;//Distance measuring error距離測定器エラー}\mathbf{2}
    ELSIF
        G_w3SensorStatus[0].3 OR G_w3SensorStatus[0].4 THE
        uErrId := cuErr281;//Shading error 遮光エラー 3.
    END_IF;
        ELSIF uAXis = K1 THEN
            IF G_w3SensorStatus[1].1 OR G_w3SensorStatus[1].2 THEN
                M_WEmId := c uErr280;//Distance measuring error距離測定器エラー= 2
    ELSIF
            G_w3SensorStatus[1].3 OR G_w3SensorStatus[1].4 THEN
            uErrId := c uErr281; //Shading error 遮光エラー
                3.
    END_IF;
        END_IF;
        NDIF;
```

1．Uncomment the error detection ladder program for general－purpose distance meters．
2．For the processing for detecting distance meter errors，change the statements according to the G＿w3SensorStatus bit to be referenced．

3．For the processing for detecting the distance measurement value errors due to light blocking，change the statements according to the G＿w3SensorStatus bit to be referenced．

## Editing programs in FBs（for Ethernet communication compatible distance meters）

Edit programs in the copy of M＋AWH＿ScalelF＿EN＿F（distance measurement：Ethernet）according to the following instructions．

## Protocol communication processing

This processing is triggered by the predefined protocol support function instruction（SP．ECPRTCL）to execute the protoco communication according to the predefined protocol setting．

```
7/Protocol Communication Processing (for AMS308i)_フロトコル通信処理(AMS308i用)
    IF UsensorType \(=K 1\) THE
        u18Ctr|Data[2]: = uExeProtocol No; //First transmission/reception (protocol number n \& n+1) _初回送受信伝文 (プロトコル番号 \(n, n+1\) )
        al8CtriData[3]:= uExeProtoco \(\mathrm{No}^{+1}\)
        uEnet_ExeCount := K2;
    ELSE
        ul8CtrIData[2]:= uExeProtocolNo+1; //Only receive after the second time (protocol number \(n+1\) ) 2回目以降は受信 (プロトコル番号 \(\mathrm{n}+1\) ) のみ
        uEnet_ExeCount := K1
    END_IF;
    Executes communication protocol support function instructions 通信プロトコル支援機能命令を実行
    SP_ECPRTCL(bEcprtcl_Run AND NOT b2Ecprtcl _Result[0],'U0', uConnect ionNo, uEnet_ExeCount, , 18 8CtrlData, b2Ecprtcl_Result )
    END_IF;
1. 7 Protocol communicat ion processing for universal range tester_沉用距離測定器用プロトコル通信処理
    u18CtrlData[2] : = uExeProtocolNo; //Protocol number (n)プロトコル番号 \((n)\) 番号 \((n+1) 2\)
    (EXecutes communication protocol support function instructions, 通信フロトコル支授機能命令を実行
```

```
    3.
```

1．Uncomment the protocol communication ladder program for general－purpose distance meters．
2．Specify the protocol numbers to be executed in u18CtrIData（control data）according to the created predefined protocol setting．For details on the control data of the predefined protocol support function instruction（SP．ECPRTCL），refer to the following．
［］MELSEC iQ－F FX5 User＇s Manual（Communication）

## Point $\rho$

By default，two protocol numbers are specified．Add or delete the protocol numbers according to the number of protocols to be executed．

3．Specify the number of protocols to be executed in series according to the created predefined protocol setting（the number of protocols specified in step 2）．

Depending on the distance meters to be used，protocol communications（send／receive）of position information may become limited to receive processing only on the second and subsequent data exchanges．For details， refer to the manuals for the distance meters to be used．

Limiting the protocol communications to receive processing only enables reduction of the takt time of communications for obtaining position information．
As a program example，bReqDone（first send completion）label used for AMS308i controls the predefined protocol to communicate data as follows：both sending and receiving data for the first time；only receiving data for the second and subsequent times．

## Sign detection processing

The sign of a distance measurement value is detected based on the status of the G_w3SensorStatus (status (error information)) bit received from the distance meter.

## Point $\rho$

- Perform only step 3 in the following procedure when the used distance meter outputs distance measurement values as signed values.
- Perform only steps 1 and 2 in the following procedure when the used distance meter uses a bit to manage the sign of a distance measurement value.

```
79
80

108
109
110
111
112
113
114
115
116
117
```

1. Uncomment the sign detection ladder program for general-purpose distance meters as well as the ladder program for single-precision real number conversion of a distance measurement value (when a distance measurement value is a signed value).
2. For the processing for detecting the sign of a distance measurement value, change the statements according to the G_w3SensorStatus bit to be referenced.
3. The default program (when AMS308i is used) includes statements to work with a case where the sign of a distance measurement value is managed with a bit. Therefore, delete the statements.

## Error detection processing

The error code is output based on the status of each G＿w3SensorStatus（status（error information））bit received from the distance meter．

```
1. //Error detection for universal range tester_沉用距離測定器用エラー検出
1. II IF USensorType = K9 THEN
    IF uAxis = K0 THEN
        IF [\begin{array}{l}{\mathrm{ G_w3SensorStatus[0].1 OR G_W3SensorStatus[0].2 THENN}}\\{0,uErrId := c_uErr290; /DDistance measuring error 距離測定器エラ- }\end{array}2.
        ELS:
            G w3SensorStatus[0].3 OR G w3SensorStatus[0].4 THEN
            o uErrId := c uErr291; //Shading error遮光エラー
        END_F;
    LSIF uäris = K1 THEN
        IF G_M3SensorStatus[1].1 OR G_w3SensorStatus[1].2 THEN
            0_uErrId := c_uErr290; //Distance measuring error 距離湘定器エラー2.
        ELST
            G_w3SensorStatus[1].3 OR G_w3SensorStatus[1].4 THEN
                -uErrId := c_uErr291; //Shading error 遮光エラー
                            3.
        END IF;
    ELSIF uăkis = K2 THEN
        IF G_M3SensorStatus[2].1 OR G_M3SensorStatus[2].2 THEN
                ou_uErrld := c_uErr290; //Distance measuring error 踤離測定器エラー 2.
        ELS
            G_w3SensorStatus[2].3 OR G w/SensorStatus[2].4 THEN
                0uErrId := cuErr291; //Shading error_遮光エラー 3.
            END_F;
    ENDIIF;
```

1．Uncomment the error detection ladder program for general－purpose distance meters．
2．For the processing for detecting distance meter errors，change the statements according to the G＿w3SensorStatus bit to be referenced．
3．For the processing for detecting the distance measurement value errors due to light blocking，change the statements according to the G＿w3SensorStatus bit to be referenced．

## APPENDIX

## Appendix 1 When the FR-A800 Series Is Used

For the FR-A800 series, the link device assignment and some parameter contents are different from those of the FR-E800 series.
The following tables list the settings when the FR-A800 series is used.

## Link devices

The letter " n " in a device number represents a value determined by the station number.
$\bigcirc$ : Can be changed, $\times$ : Cannot be changed

| Master station to Inverter (RYn) |  |  | Inverter to Master station (RXn) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Device No. | Device name | Mapping | Device No. | Device name | Mapping |
| RYn0 | Forward rotation command | $\times$ | RXn0 | Forward running | $\times$ |
| RYn1 | Reverse rotation command | $\times$ | RXn1 | Reverse running | $\times$ |
| RYn2 | High-speed operation command (terminal RH function) | $\bigcirc$ | RXn2 | Running (terminal RUN function) | $\times$ |
| RYn3 | Middle-speed operation command (terminal RM function) | $\bigcirc$ | RXn3 | Up to frequency (terminal SU function) | $\bigcirc$ |
| RYn4 | Low-speed operation command (terminal RL function) | $\bigcirc$ | RXn4 | Overload warning (terminal OL function) | $\bigcirc$ |
| RYn5 | JOG operation command (terminal JOG function) | $\bigcirc$ | RXn5 | Instantaneous power failure (terminal IPF function) | $\bigcirc$ |
| RYn6 | Second function selection (terminal RT function) | $\times$ | RXn6 | Frequency detection (terminal FU function) | $\times$ |
| RYn7 | Current input selection (terminal AU function) | $\bigcirc$ | RXn7 | Fault (terminal ABC1 function) | $\times$ |
| RYn8 | Selection of automatic restart after instantaneous power failure (terminal CS function) | $\bigcirc$ | RXn8 | - (terminal ABC2 function) | $\bigcirc$ |
| RYn9 | Output stop (terminal MRS function) | $\times$ | RXn9 | Pr. 313 assignment function (DO0) | $\bigcirc$ |
| RYnA | Start self-holding selection (terminal STOP function) | $\bigcirc$ | RXnA | Pr. 314 assignment function (DO1) | $\bigcirc$ |
| RYnB | Reset (terminal RES function) | $\bigcirc$ | RXnB | Pr. 315 assignment function (DO2) | $\bigcirc$ |
| RYnC | Monitor command | $\times$ | RXnC | Monitoring | $\times$ |
| RYnD | Frequency setting command (RAM) | $\times$ | RXnD | Frequency setting completion (RAM) | $\times$ |
| RYnE | Frequency setting command (RAM, E2PROM) | $\times$ | RXnE | Frequency setting completion (RAM, E2PROM) | $\times$ |
| RYnF | Instruction code execution request | $\times$ | RXnF | Instruction code execution completion | $\times$ |
| $\begin{aligned} & \mathrm{RY}(\mathrm{n}+1) 0 \text { to } \\ & \mathrm{RY}(\mathrm{n}+1) 7 \end{aligned}$ | Reserved | $\times$ | $\begin{aligned} & \mathrm{RX}(\mathrm{n}+1) 0 \text { to } \\ & \mathrm{RX}(\mathrm{n}+1) 7 \end{aligned}$ | Reserved | $\times$ |
| $\mathrm{RY}(\mathrm{n}+1) 8$ | Not used (initial data process completion flag) | $\times$ | $\mathrm{RX}(\mathrm{n}+1) 8$ | Not used (initial data process completion flag) | $\times$ |
| $\mathrm{RY}(\mathrm{n}+1) 9$ |  |  | $\mathrm{RX}(\mathrm{n}+1) 9$ |  |  |
| $\mathrm{RY}(\mathrm{n}+1) \mathrm{A}$ | Error reset request flag | $\times$ | $\mathrm{RX}(\mathrm{n}+1) \mathrm{A}$ | Error status flag | $\times$ |
| $\mathrm{RY}(\mathrm{n}+1) \mathrm{B}$ to | Reserved | $\times$ | $R X(n+1) B$ | Remote station ready | $\times$ |
| $\mathrm{RY}(\mathrm{n}+1) \mathrm{F}$ |  |  | $\begin{aligned} & R X(n+1) C \text { to } \\ & R X(n+1) F \end{aligned}$ | Reserved | $\times$ |

## Inverter parameter

Use FR Configurator2 to set the inverter parameters.
The setting value is an example for use with a sample program.

## Point ${ }^{\circ}$

For details on parameters, refer to the manuals for the inverters used.
For details on how to use FR Configurator2, refer to the following.
L $]$ FR Configurator2 Instruction Manual
\(\left.\begin{array}{l|l|l|l|l}\hline No. \& Name \& Initial value \& Setting value \& Description <br>
\hline 7 \& Acceleration time{ }^{* 1} \& 5 \& 0 \& As the operation pattern is generated using an FB, set the <br>

acceleration/deceleration time to 0 for the inverter.\end{array}\right]\)| Set the rated motor current. |
| :--- |
| Set the parameter in accordance with specifications of the motor |
| used. |

| No. | Name | Initial value | Setting value | Description |
| :---: | :---: | :---: | :---: | :---: |
| 1432 | Ethernet communication check time interval | 9999 | 1.5 | A signal loss detection is performed between the inverter and all the devices with IP addresses in the range for Ethernet command source selection (Pr. 1449 to Pr. 1454). If a signal loss is detected (a communication stops), a communication error (E.EHR) occurs and the inverter output will be shut off. Set the parameter in accordance with specifications of the system used. |
| 1434 | IP address 1 (Ethernet) | 192 | 192 | Enter the IP address of the inverter to be connected to Ethernet. |
| 1435 | IP address 2 (Ethernet) | 168 | 168 |  |
| 1436 | IP address 3 (Ethernet) | 50 | 3 |  |
| 1437 | IP address 4 (Ethernet) | 1 | 1 |  |
| 1438 | Subnet mask 1 | 255 | 255 | Enter the subnet mask of the network to which the inverter belongs. |
| 1439 | Subnet mask 2 | 255 | 255 |  |
| 1440 | Subnet mask 3 | 255 | 255 |  |
| 1441 | Subnet mask 4 | 0 | 0 |  |
| 1449 | Ethernet command source selection IP address 1 | 0 | 192 | To limit the network devices that send the operation or speed command through the Ethernet network, set the range of IP addresses of the devices. When Pr. 1449 to Pr. 1452 are "0 (initial value)", no IP address is specified for command source via Ethernet. In this case, operation commands cannot be sent via Ethernet. The range for command source depends on the settings in Pr. 1451 and Pr.1453, and Pr. 1452 and Pr.1454. When the setting values on the left are set, the IP address range for command source via Ethernet is "192.168.xxx (3 to 255).xxx (0 to 255)". |
| 1450 | Ethernet command source selection IP address 2 | 0 | 168 |  |
| 1451 | Ethernet command source selection IP address 3 | 0 | 3 |  |
| 1452 | Ethernet command source selection IP address 4 | 0 | 0 |  |
| 1453 | Ethernet command source selection IP address 3 range specification | 9999 | 255 |  |
| 1454 | Ethernet command source selection IP address 4 range specification | 9999 | 255 |  |

*1 For this parameter, set the setting value shown in the list.
