

Wide data linkage between site and IT system

◆ Features

◆ Diagram

Direct connection to high-level IT system!

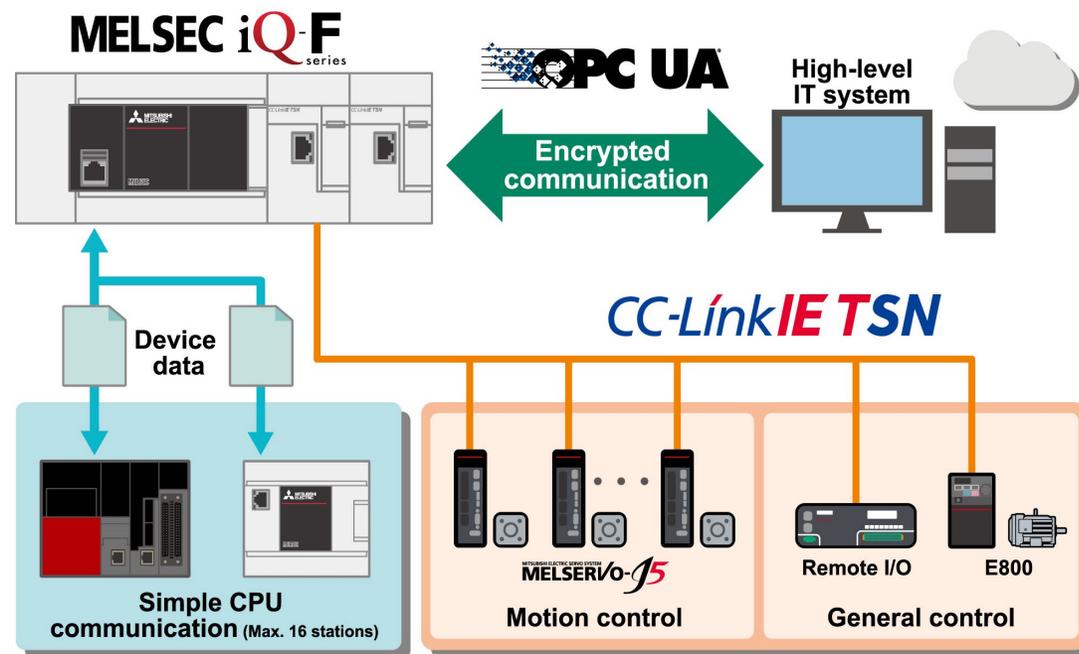

Even with stand-alone device, direct connect to high-level IT systems with OPC UA.

High speed and accuracy communication

Achieve flexible, high-speed, and high-accuracy communication with CC-Link IE TSN.

Simple CPU communication

Achieve easy, low-cost data linkage with built-in Ethernet port.

※ Connection to E800 using FX5-CCLGN-MS will be supported soon.

Advance equipment visualization using monitoring functions

◆ Features

◆ Diagram

“Monitor” Web server function

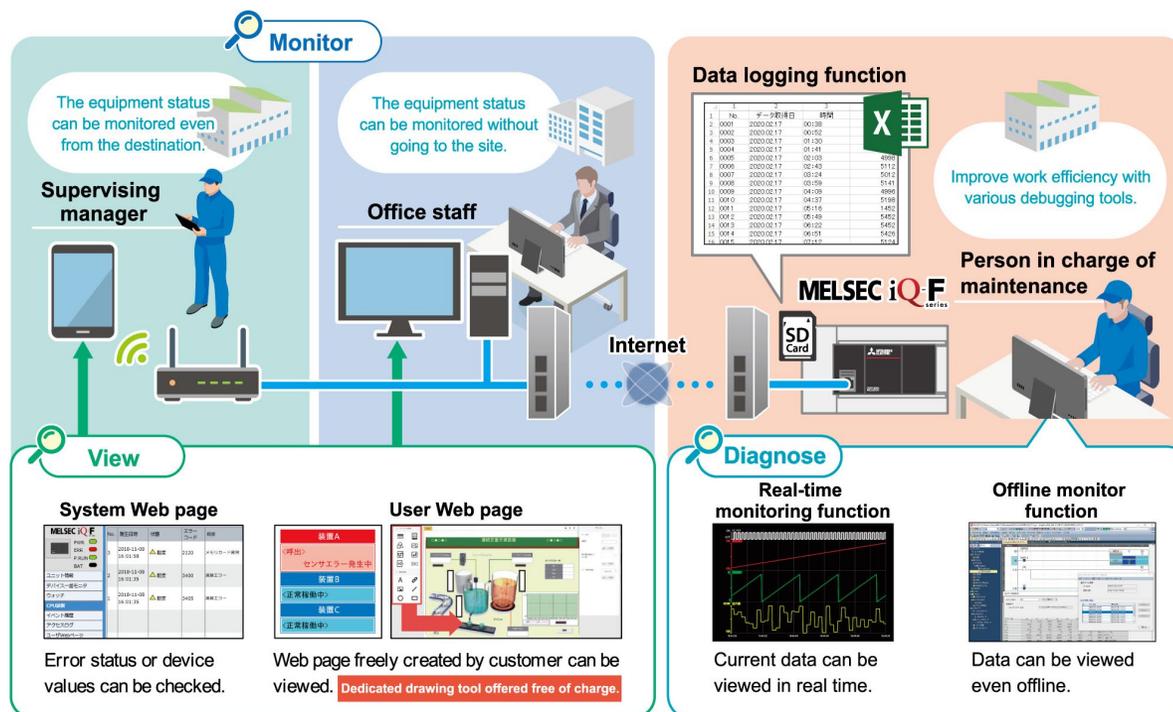

Monitor operating status without going to the site. Achieve remote monitoring from tablet and smartphone.

“View” Real time monitoring function

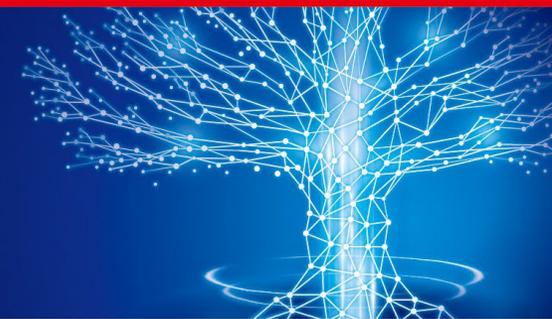

View equipment operating status graphically. Strong support for starting up and debugging.

“Diagnose” Data logging function

Collect and diagnose data. Achieve automation and digitalization of site data.

Site-oriented DX achieving through data utilization

◆ Features

◆ Diagram

Easy error analysis with camera linkage.

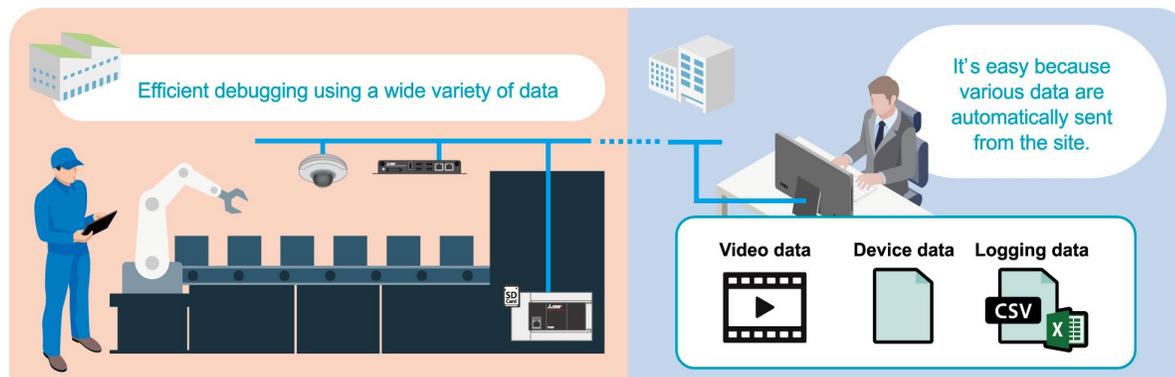

Camera and PLC data are linked.
The cause of the error can be easily analyzed.

File transfer function to support data utilization!

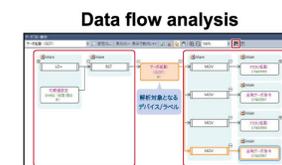

Automatic sending of recorded data to PC.
Achieve efficient data accumulation and utilization.

Reduce debugging time with analysis functions!

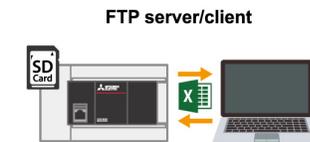

Analysis functions of many engineering tools greatly increase debugging efficiency.

Video data recorded by the network camera and device data recorded by PLC can be linked for debugging. Since device numerical data matched with video playback can be checked, work efficiency is greatly increased.

Relationships between devices or labels in the program can be displayed in flow form. Current location or recorded device data can both be linked to improve work efficiency.

Logging data can be transferred to high-level PCs. Various kinds of data collected on site can be checked while you're in the office.
