Innovative Power Devices for a Sustainable Future

Mitsubishi Electric HVICs contribute to the high reliability of various power supply equipment by equipping them with various the protection functions.

High-voltage integrated circuits (HVICs) are capable of directly driving the gates of power MOSFETs and IGBTs using signals input from microcomputers, thereby replacing power MOSFET and IGBT gate drivers that use pulse transformers and photocouplers. They are insulated by a level shift circuit inside the semiconductor chip. Since a variety of protection functions, such as power supply undervoltage, interlocking, input signal filter, and error output, are built into the IC, reliability of the power supply equipment is enhanced.

Mitsubishi Electric has many half-bridge products that are commonly used in drive circuits. Our HVIC products comply with the European Union’s Restriction of Hazardous Substances Directive for electrical equipment, 2011/65/EU and 2015/863/EU.

### Main Features

- **High voltage floating circuit is built-in because it is a high side gate drive.**
- **Built-in signal transmission (level shift) function for transmitting signals to the floating circuit.**
- **High side gate driver section has a high voltage isolation structure.**
- **Level shift section has a high voltage NMOS structure.**

---

[Diagram showing application examples and features of HVICs]
Mitsubishi Electric HVICs contribute to the high reliability of various power supply equipment by equipping them with various protection functions.

M81748FP with Desaturation Detection for Power Semiconductors

M81748FP achieves the high durability of 1200V that is most suitable for AC400V inverter systems.

- **High durable 1200V rating that is applicable to an industrial use like AC400V inverter systems**
  - The HVIC achieves low leakage current limited to a maximum 10uA of HVIC by applying a 1200V divided RESURF*1 structure to optimize its surface structure.
  - PolyRFP*2 structure of chip surface greatly enhances the durability.

- **High tolerance to switching noise helps achieve highly reliable inverter systems**
  - High latch-up immunity (parasitic Vertical -PNP transistor action) realized with chip’s low-impedance buried layers.

- **Desaturation detection for reduced power loss reduction in power semiconductors**
  - P-side and N-side desaturation detection prevents overcurrent thermal destruction of the power semiconductors by using 1200V P-channel MOSFET.
  - The HVIC directly detects shorts and earth faults in power semiconductors on P-side and transmits fault signals to N-side, shutting down systems.
  - Desaturation detection is superior to the detection method which is used the shunt resistor for the power loss reduction in power semiconductors.

2 PolyRFP: Polycrystalline silicon Resistor Field Plate**

M81767JFP for Automotive Applications

M81767JFP contributes to the high reliability and the optimized switching control of the voltage converter and the power semiconductor for automotive applications.

- **High reliability that is applied to the requirement of automotive application**
  - Operating temperature range of -40 to +125°C.
  - UVLO (Under voltage lockout) circuit prevents power semiconductor from the destruction by the power supply voltage drop.
  - High-temperature and long-term burn-in tests assure high reliability.
  - The HVIC contributes to the downsizing of the voltage converter by reducing the peripheral parts like the comparator and photocouplers in inverter system.

- **High performance supports effective control of the voltage converters**
  - The HVIC achieves low leakage current limited to a maximum 1uA of HVIC by applying a 600V divided RESURF structure to optimize its surface structure.
  - Easy to control the power semiconductors by matching the delay time of the high-voltage side and low-voltage side.

1 The floating power supply method

The emitter/source potential of high-side IGBT/MOSFET referenced to GND changes to the voltage of the HV terminal from 0V when operating the application. Therefore, to drive high-side IGBT/MOSFET, the power supply of the high-side drive circuit of HVIC should have potential which is higher by VBS than the emitter/source potential of high-side IGBT/MOSFET. One of the methods to apply this voltage is the floating power supply method. Fig. right shows the example of the floating power supply method.

2 Bootstrap circuit method and basic operation

Bootstrap circuit method is used in place of the floating power supply method. The bootstrap capacitor(C1) is charged through the resistor (R1) and bootstrap diode(D1) by VCC, and the high-side drive circuit of HVIC is driven by the voltage of the capacitor(C1). Fig. right shows the example of the bootstrap circuit method.

3 Electrical charge and discharge current route when HVIC is operated

Fig. right shows the electrical charge and discharge current route of C1 when HVIC is regularly operated.

■ Setting of bootstrap capacitor (C1)

To drive high-side MOSFET, the bootstrap capacitor is charged by turning on low-side MOSFET.

The inrush charging current is from the charging path on the right

\[ I_D = \frac{VCC}{R1} e^{\frac{t}{R1C1}} \]  

from the initial condition \( t = 0 \)

\[ V_{C1} = VCC - VF - VDS \]  

...(1)

\[ \Delta V = IBS \times T1 \]  

...(2)

IBS changes depending on gate capacitance of MOSFET and carrier frequency.

And (1) and (2) expression are simplified. So please set the capacitance value C1 based on evaluation of your system.

Bootstrap circuit method and basic operation

Electrical charge and discharge current route when HVIC is operated

The emitter/source potential of high-side IGBT/MOSFET referenced to GND changes to the voltage of the HV terminal from 0V when operating the application. Therefore, to drive high-side IGBT/MOSFET, the power supply of the high-side drive circuit of HVIC should have potential which is higher by VBS than the emitter/source potential of high-side IGBT/MOSFET. One of the methods to apply this voltage is the floating power supply method. Fig right shows the example of the floating power supply method.

Bootstrap circuit method is used in place of the floating power supply method. The bootstrap capacitor(C1) is charged through the resistor(R1) and bootstrap diode(D1) by VCC, and the high-side drive circuit of HVIC is driven by the voltage of the capacitor(C1). Fig_right shows the example of the bootstrap circuit method.

Fig_right shows the electrical charge and discharge current route of C1 when HVIC is regularly operated.

■ Setting of bootstrap capacitor (C1)

To drive high-side MOSFET, the bootstrap capacitor is charged by turning on low-side MOSFET. The inrush charging current is from the charging path on the right

\[ I_D = \frac{V_{CC}}{R_1} e^{-t/(R_1 \cdot C_1)} \]

from the initial condition \( t = 0 \)

\[ I_D = \frac{V_{CC}}{R_1} \]

\[ V_{C1} \]

is below. (\( V_F \): Voltage between D1 terminals, \( V_{DS} \): Voltage between drain and source of low-side MOSFET)

\[ V_{C1} = V_{CC} - V_F - V_{DS} \]

\[ \cdots (1) \]

Initial charge and the voltage between bootstrap capacitor (C1)

The capacitance value C1 is shown below. (\( T_1 \): Maximum on-time of high-side MOSFET, \( I_{BS} \): High-side drive circuit consumption current of HVIC, \( \Delta V \): Electrical discharge allowance voltage between C1 terminals)

\[ C_1 = \frac{I_{BS} \times T_1}{\Delta V} + \text{margin} \]

\[ \cdots (2) \]

\( I_{BS} \) changes depending on gate capacitance of MOSFET and carrier frequency. And (1) and (2) expression are simplified. So please set the capacitance value C1 based on evaluation of your system.

Keep safety first in your circuit designs!

- Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire, or property damage. Remember to take due consideration to safety when making your circuit designs, with appropriate measures such as (1) placement of substitutes, auxiliary circuits, (2) use of nonflammable material or (3) prevention against any malfunction or mishap.
